The Oimataifs add feveral particulars to what the Scripturen inturn us concerning the angel Gabriel. The Mahometans call him the faithful/pirit ; and the ?erfians, by way of metaphor, the peacock of heaven. We read, in the fecond chapter of the Koran, that
 was Gabriel, they believe, who brought to Mahomet their falfe prophtt the revclations which he publifhed; and it was he who conducted him to heaven mounted upon the animal Borak.

Gabrifl, St, an illand lying in the great river La Plata, South America, which was difcuvered by the celelbrated navigator Scballian Cabot, in the year $15=6$.
GABRIELITES, in ecclefiaftical hintory, a feat of Anabaptifs that appeared in Pomerania in 1530. They derive their name from Gabricl Scherling ; who, after having been for fome time tolerated in that country, was obliged to remove, and died in Poland.

GAD, a Jesilh prophet, the feer, or domeftic prophet of King David, who was his advifer in all matters of importance. When the difpleature of the Almighty was roufed againlt David and the children of Ifrael for namiscring the people, Gad received a commillion to "sit upon the hing, and make him an offer of three twils as a punihment for his offence. Thefe were famine, war, or peftilence, the lat of which was chofen by David, the ravages of which eere terrible beyond deferipion, and produed gemaine repentance in the harts of larvivers. 'To perpetuate the memory of this event, Gad ordered an altar to be creited in the tinelhing fifor of Ornan the Icbuftc, around which place, it is laid, the temple was afterwarls built. We learn fiom the Odd Thelmest that Gad was an author, who azote a hiling of his sw umes, of which much ufe apperes to have been made by the compilers of the kuels of Somucl and Chronicles. Gad was allo the Cle name of one of the twelve patriarchs, or fons of 1.s.

G wo in Facion: Gearaphy, a ditrict of the Tranfpuran Puletine, sitused bewen Gilead and the kingthom of Bunan to the morth, and the kinglom of Amo

bounded by various peoples on the ealt ; fo called from a tribe of that vance.

Gad, among miners, a fmall punch of iron, with a long wooden handle, ufed to break up the ore.

One of the miners holds this in his hand, directing the point to a proper place, while the other drives it into the vein, by ilriking it with a fledge hammer.
Gad-Bue, or Gad-Fly. See Oestrus, Extomology Inde:
GADAR 1, in Anciem Gengraphly, a town of the Perea, or Transjordan, in the Decapolis, a very Itrong place. Retlowed by Pompey a ter its demolition by the Jews (Jofephus). After Herod's death it was joined to the province of Sy ria by Auguitus.
GADARENORUM Ager, in Ancient Geograply, the country of the Gadarenes, called by Matherv the country of the Gergefene, becaule it was a diftrict that lay between Gadara and Gergefi, otherwife called $G e$ rafa, both which lay within the Decapolis on the other fide Jordan.
GADES, or Gadtra, in Atcicht (ieography, a fimall itland in the Attantic, on the Spaniih coatt, 25 miles from the Columns of Hercules. It was lometimes called Tarteffus and Ery/thia according to Pliny. Geryon, whom Hercules killed, fixed his refidence tha re. Hercules, furnamed Gaditanus, had there a celebrated temple in which all his labours were engraved with excellent workmanhip. The inhabitarts are called $\mathrm{G}_{\mathrm{a}}$ ditani.

GADUS, a genus of filhes belonging to the order of jugulares. This genus includes the cod, the whiting, the tork, \&c. See Ichthyology Index.
gaElic fanguge. See Highlands.
GÆTUL1A, in Ancient Geograply, a country of Africa, lying to the fouth of Mauritania, called Gictulia Propria, and Vetus. Gcetuli, the people, were di!tinguilhed by different epithets; as Nigri, Alutoicit, Dar:e and Baniurce, (Piiny). The Guetuli were among the firt inhabitants of Africa; a rough, unpolilhed people, living on venifon and the fpontaneous productions of the earth; a roving, wandering people, who two. up with the firlt place in which night furprited thom, (Salluil).

GAFF, a fort of boom or pole, frequently ufd in frmall hipe, to extend the upper edge of the mizen; and always employed for the fame purpofe on thofc fails whofe foremoll edges are joined to the malt by hoons or lacings, and which are ufually extended by a boom below. Such are the main fails of all iloops, brigs, and fchooners.

Gaffarel., Jamis, a French divine, and very leamed writer, born about 1601 . He acquired great thill in the oriental and leveral other languages ; and was particularly veifant in the cabbalific and uccult fience, which he learned, expoled, and refuted. Cardinal Kichelicu made choice of him for his library heeper, and lent hin into ltaly to colleat the bett mitnufcripts and books. He puilihed a book entiticd Che ris, itco Imnomier, i. e. Unheard-of Cuniofitics. It is taid the cardinai deligned to empioy hina in lia grand project for the reamion of religions. He died in $168 \mathbf{r}$, aged 85 . He had been labouring for many ycars, and lad almo! finithed a history of the fubterranean world; cont:inde sal account of the caves, grotocs, valts, catacombs,

Gaerees catacombs, and mines, he had met whin in 30 years traCi 道.
 In :

G-ICE, in our amcient cullome, fignibes a pleatese or pasn, given by way of fecurity. I he word is onty 1roperly ufed in focaking of moveables; for immoveables. heronlaca is ufed.

If the gage perill, the perfon who received it is n : to iafser for it, but ont for extaeme negligence, \& c.

Gider is alfo ufe for a challenge to combat: See (aktel). In which fenfe, it was a pledge, which the accufer or challenyer catt on the ground, and the other took up as accepting the challenge; it was ufully a slove, gauntlet, chaperoon, or the like. See Coumat, and Duen.

Gage, is only now retained as a fubllantive. Is a verb, the $G$ is changed into $I^{\text {; }}$, and of gave is formed sage: as to wage law, to wage deliverance, f. d. to give lecurity a thing thall be delivered. See Wige.

If a perfon who has diltrained be fued for not having delivered whet he had taken by diltrefs, he thould wase, or gage, or gacer, deliverance; that is, put in furety that he will celiver tliem.

Mort-Gage, is that which is left in the hands of the proprictor, fo that he reaps the fruits thereof.

In oppolition to riffale, where the fruits or revenues are reaped by the creditor, and reckoned on the foot of the debt, which diminihes in proportion thereto. The fecond acquits or dilcharges itfelf; the firlt doer not.

Gage, in the fea language. When one hip is to windward of another, the is faid to bave the weathergage of her. They ikewife call the number of feet that a vefiel finks in the water, the thips gage; this they find by driving a nail inte a pike near the end, and putting it down befide the rudier till the nail catch ford under it ; then as many feet as the pike is under कuter is the iliip's gage.

Cice, among letter founders, a piece of box, or oticer hard wood, varioutly notched; the ufe of which is to adjuft the dimention. Ropes, \&c. of the difierent furts of letters. See Forvidery.

G:ace, in joinery, is an inltrument made to frike a line tru'y parallel to the flrai ht dide of any board or piece of ruft. Its chief ufe is for gaoing of tenons trur, to fit into mortifes; and for gacing ituff of an cqual thicknef. It is made of ar oval piece of wood, sitted upon a fiuare tiick, to flide up and down ftiffly thereon, and with a touth it the end of a flalf, to fiore, to trike a line upon the ftaff at any ditance, according to the diftance of the oval from it.

Sliding G.age, a twol wited by the mathematical inItrument makers for meafuring and fetting ofl dittances.

Sed G.ags, an inltrument itwented by Dr Hales and Dr Defarulicrs fier finding the depth of the fea; the defcriptim whereof is this. AB (fig. t.) is the gage buitle, in which is cemented the gage tabe $\vec{F} f \cdot f$ in the brafe cape at $G$. The upger end of tube $F$ is hernetically lealed, and the open lower end $f$ is immerted in motreary, mosked C , on which fwims a fmall thickuefs forte of treacle. On the top of the hotele is ieren.
ed a tube of brafs IIC, pieseed with feveral hole to admit the "ater into the bottle Ab. The buly $K$ is a Weisht an-ine !y ite hatak $L$, in a loclet N, with a noteh on ure the at $m$, in whith in tised the cotch / of the firtin: $S$, and palin:: throrght the loke 1 , in the
 once hang on. ()athe tor, in the uper patt of t'e brafoture at 11 , is fixed a latge enny hal, os full blown dhader I, which mont ran be fo lave, best that the weight K my be abie to tak the whol. un le: witer.

The intrument thas contructeal is ufed in the fo: lowing mancor. The weheht K biver hang an, the gaze is let fill into decp water, and thas to the bote. t m : the focket X in fomen fat longer than the liond L ; and therefore, atter the weight K comes to the hottom, the gage will continue to defcend till the lower part of the focket titikes againt the weirht; this gives liberty to the catch to fly out of the hole 1., and let go the weight $\mathbf{K}$ : when this is done, the bati or bladder I inftantly buoys up the gage to the top of the water. While the gage is under water, the water having free accefs to the treacle and me cury in the bottle, will by its preflure force it up into the tule F $f$, and the height to which it has been forced by tho greateit preflure, viz. that at the bottom, will be thow: by the mark in the tube which the treacle leaves behind it, and which is the only ule of the treacle. This fhows into what fpace the whole air in the tube $\mathrm{F} f$ is comprefied ; and confequently the height or depth of the water which by its weight produced that compreffon, which is the thing required.

If the gage tube $\mathrm{F} f$ be of glafs, a fcale might lo drawn on it with the point of a diamond, thowing, by inlpection, what height the water 1 it and, above the bottom. But the length of 15 inches is not fullicient for fathoming depths at lea, fince that, when all the air ini fuch a length of tube is comprefled into half an inch, the depth of water is more than 634 feet, which is not half a quarter of a mile.

If, to remedy this, we make ufe of a tube 50 inches long, which for flrengeth may be a muket barrel, anci fuppole the air comprelled into an hundredth part at half an inch; then by laving, as $1: 99:: 100: 306=0$ inches, or $53^{\circ 2}$ feet ; even this is but little more thar half a mile, or 26.40 feet. But fince it is rafonable to fuppofe the cavities of the fea bear fome promortion to the mountaingus parts of the land, fome of which are more than three niies atove the carth', Curiace, therefore, to explure farh ereat depthis, the Doetne cortrived a new form for his fagase, or woller for the gage tube in it, as follows. BCDF (fir 2.) is a bollow metaline slobe communicution on the tow with a lone tube Al, wh Ne capacity is a minth rati of that glabe. On the lower part at D, it las alio it thort tube DE, to lland in the mencury and ticule. The air contained in the componal ange tule in e an prefied by the water as before : the the degree of e m 11 . pretion, or height to which the treacle has peen fors ced, camot there be feen throwent the tule: thecefore, to anduer that end, a fictutar rol of moval us wosd, with a knob on the top of the tube Al?, wil! reccive the mark of the treacle, and thow it vise: :t t.en out.

Bu天: : Sea GaGs, an indrument contrived by De Heles to find the difierent dogers of coolne's and tultnoes of the fa, at different depths: it contints of a common houfhold pail of lucke, with two heads: Whete heads have tach a romb hole in the middic, abrot four inches in diameter, conered with fquare valves orening upward; and that they may both open and that together, there is a frall inon rod nixed to the upper part of the lower valve, and the other end to the lorer fide of the upper vitlue. So that as the buchet dulcends with its finkinu weight into the lea, both the valves may open by the force of the rater, which by that means has a free paffege through the bucket. But shen the bucket is drawt: u-, then buth the valves fout by the force of the water at tha uyper part of the burleet; fo that the bucket is duawn up fall of the wenelf fa water to which it has delcorded. When the inchet is drawn up, the mencuia! thermometer fixed in it is examined; but great care muat be taken to cofr.ve the degree at which the mercury ftands, before the lower part of the thermometer is tilien out of the water in the loteket, left it be affected by the diferent emperature of the air. La order to heep the bucket i.s a right pofition, there are four cords fised to it, reaching about three feet belos it; to which the finha:f waght it fixed. The reluit of fiveral trials with whis gage wes, that when it was let do:n to different Wepth, from 360 feet to $534^{6}$ tect, in lat. 25.13. N. and long. 25.12. WV, it wa difoovered hy the thermoneter, that the cold increafed gradu! y in froportion to the depths, ti!! it dece: ded (1) 3920 teet, viz. near tho of a mile, whence the mere iy in the thermoneter came up at $53^{\circ}$; and though it was afterwards lunk to $534^{6}$ fect, i, e, a mile and 6 fert, it came up no lower: the wamth of the water upon the furface, and that of the air, was all that time $84^{\circ}$. When the water in the buchet was become of the fome temperature with that on the furface of the fea, equel cuantities of both wese weighed and tried by the hydrometer; thi.t from below was found to be the hearielt, and conSequenty the idelt.

Dr Hale was probably led to the conliracion of this tea sace fom an intrament invented by Ior Hook, and Levisned for the fame purfole. '1' i conthlo of a trquate nomen bucket C , whote ketacms are to colstrived, that as tle weight of $A$ imhe the iron $B$, :o which the bucket C is fathened by two hand!es 1 , 1, on: 1.se end of which are the moverible bettem or : whes ER, atd i'ereby draws down the incket, the rehita ce of the "ater heeps un the bickit in the polture C, vhore'y the whier, whint the bnalot wà defcending,

Ajuincrova! GaGE, is the name ot an afparcuus contor: d by Dr Hales, and apetied in various forms to the branke of tres, in order to determine ti.e fore with which thy imbibe noithere. Jett er, Fig. a. be a climdi: glat, e. gr. of an inch diameter within, sud ci,ht incles loig. Into this glats is i:ttroduced the braveia o: a young thation anple trec 1, about three fect long, with Intern! branches; the diameter of the trativere cut $i$ being ths of an inch. Having fitted the joint $r$ tu the tube at $r$, by folding a yiece of theep's fkin round the hem, it is c:mented with a mixture of bees kax and thapentime meited together, in fuch proportion as to make a very llift chamy ratte when cold, and over the cement folds of ve: bladders are bound firmly with pack thred. To the lower end $e$ of the large tube, a fmal. ler tube $\approx e$ is cemented, being about $\frac{t}{2}$ of an inch dianeter, and is inches long, and in futitance full $\frac{1}{5}$ or an inch thick. Thefe tubes are cemented tugether at $e$ with common hard brick duft or powdered chalk cemented, and the joint is farther fecured with the cement of bees wax and turpentine, over which a wet bladder is bound. The apparatus being thus prepared, the brach is turned downwards, and the glats tube upwards, and then both tubes are filled with water; with the finger applied to the open end of the fmall tube, it is inverted and immeried in the glats citem $x$, full of mercury and water. In this fituation the lower end of the branch was immerled fix inches in water, viz. fricm $r$ to $i$; the water was imbibed by the branch at its tranfierle cut $i$; and during its atcent into the fap vellis of the bramch, the mercury role in the tube $e \approx$ from the cifiem $x$, to that in half an hour it was rilen $5 \frac{3}{3}$ inches ligh, as far as a. The beight of the mercury indicata, in fome meafure, the force with which the fip was imbibed, though not the whole force; becoule, while the water was imbibed by the branch, its traniverfe cut was covered with innumerable little hemipheres of air, and many air bubbles illued out of the fap vonels, whish parlly filled the tube or $r$, as the water was dawn out of it : and therefore the height of the mercury could only be preportionable to the excefs of the quantity of water drawn of above the ruantity of t'e air whith iflued out of the wood. It the quastity uf air iffuing from the word had been equal to the quartity of water imbited, it is plain that the merch:sy could not rife at all, becaule there wothd he ros ro $m$ for it in the tube : but if nine part in twelse of the woticr be imiubed by the branch, and only three fuch jarts of ar ifice into the tube in the fime time the merculy muft rife near fix inche, and fo proportiondis in oular cates. Dr Haks obtesved, that t! e mesuiy whe hithest, in moth cafes, whin the fun wis char ald warm , and that it fubfided three or four ineters towards crening, but wie saran the neat isy as it frew watm, though feldom to thig as at thit. D) Habs adaphed the fize and theqe of the ghats aptaratu. - s-reat yaricty of tranches of feveral fizes atal of dine.cht hatac of trees, ond wrined the experiment

Gahnia rejectively $=d, c$, ns before. Then it is evident, $d^{2} x$. But the fe columns are equal, therefore $d^{2} x a c^{2}$ to and consequently $x=\frac{a c^{2}}{a^{2}}$. It is also evident that the column $A D$ is equal to the difference of the columns $A B, D B$; but the difference of the fe column is as $b c^{3}-c^{2} x$. Therefore $d^{3} r=b c^{2}-c^{2} x$. Whence we get $x=\frac{b c^{2}}{c^{4}+c}$.

The ufe of the fall tube of communication $a b$ (fig. 5.) is to check the undulation of the water, fo that the height of it may be read off from the feale with cafe and certainty. But it is particularly defigned to prevent the water from being thrown up to a much greater or lefs altitude than the true height of the cofum which the wind is able at that time to fultain, from its receiving a fudden impale while it is vibrating either in its accent or defcent. As in forme cafe the water in this inffrument might be liable to freeze, and thus break the tubes, Dr Lind recommends a filtrated folution of fra fall to be unfed inftead of it, which does not freeze till Fahrenheit's thermometer falls to 0 .

GAHNLA, a gems of plants belonging to the hexandrea chats. See Botany Index.

GAIETA, an ancient, bandfome, and flong town of Italy, in the kingdom of Naples and in the Terra di Lavoro, with a fort, citadel, harbour, and bihop's fee. It was taken by the Auftrians in 1707, and by the Spaniards in 1734. It is feted at the foot of a mountain near the fa, in E. Long. 13.37. N. Lat. 41. 32.

GAIN, the profit or lucre a perfon reaps from his trade, employment, or indultiy. Some derive the word from the German gewin: whereof the Italians had made guadagno ; the French and English gain.

There are legal and reputable gains, as well as forded and infamous one. What is gained beyond a certain fum, by gaming, is all liable to be rellored again, if the lofer will take the benefit of the law.

Gus, in Architequre, is the workman's term for the bevelling th mulder of a joist or other timber. It is used aldo for the lapping of the end of the joint, Sic. upon a trimmer or girder; and then the thicknets of the thoulder is cut into the trimmer; alto bevelling upwards, that it may fut receive the gain ; and fo the foil and trimmer lie even and level with the furface. This way of working is unfed in tors and lathe.

To (ian the II ta), in fa language, is to arrive on the weather fid: or to windward of Come other veffel in fight, when both are dying to windward or failing as bear the wind as polite.
(AANAGE, GAmacrey, in our ancient writers, fgnifics the draught oxen's, horfes, wain, plough, and furniture, for carrying on the work of tillage by the bale: fort of lokemen and villains.

Grimace is the hame with what is otherwife called

 © (t, the ainasiun fum. And again, lib. iii. tract. 2. 1.4j. 1. V. Wank non comerciabtar, niff filo wainazio Cue: For anciently, as it appears both by Magma

Charta and other books, the villain, when amerced, Gainage had his ganage or wainage free, to the end his plough might mot and till: and the lass, for the fame reafon, dues ital allow a like privilege to the husbandmen; that is, his draught horfes are not in many calces dilkrana. Die.

Gunsel is alfo unfed for the land itself, or the profit ratel by cultivating it.

GAINSBOROUGH, a town of Lincolnthire in England, 150 miles form London, fated on the river Trent nair the lea. It is a large well built town, with a pretty good trade, and has the title of an earldom. W. Lang. o. Ac. N. Lat. 53. 26. The north math in its neightourlacod is noted for horfe races. The Danes who invaded the kingdom brougitat their hips up to this place. It was here that Sweno the Dane was murdered by one of the English, who was never discovered.

G_LACIITES, in the hiftory of foils., a fubfrance much refombling the morochthus or French chalk, in many reflects; but different from it in colour. The ancients found it in the Nile and in forme rivers in Greece, and unfed it in medicine as an aftringent, and for delusions and ulcers of the eyes. At piefent it is common in Germany, Italy, and forme parts of France, and is wholly overlooked, being efteened a worfe kind of morochthus. See MoroniThus.

GALACTOPHAGI, and Gaiactopore, in antiquity, perfons who lived wholly on milk, without corn or the fe of any otlier food. The words are
 morns of $\pi$ ira, $I$ drink.

Certain nations in Scythia Afatica, as the Getie, Nomades, \&c. are famuos, in ancient hiftory, in quality of galachophasi, or milk-caters. Homer makes their loge, Iliad, lib. iii.

Ptolemy, in his geography, places the Calactophagi between the Riphsan mountains on one fide, and the Hyrcanian fa on the other.

GALANG>LS, in the Materia Medical. See Kжupreria.

GALANTHUS, the SNOW-DRUP, a genus of plants belonging to the hesandria class, and in the natural method ranking under the ninth order, Spathacece. See Botany Index.

GALATA, a great fuburb belonging to Conftantimople, uppofite to the feraglio, on the other fide of the harbour. It is here the Greeks. Armenians, Franks, Chriftians, and Jews inhabit, and are allowed the evercire of their reflective worhips.

GALATEA and Ginhthen, in fabulous history, a fea nymph, daughter of Nereus and Doris. She was pationately loved by the Cyclops Polyphemus, whom the treated with colduefs and didain; while Acis, a ftepherd of Sicily, enjoyed her unbounded affection. The happiness of the ie two lovers was difturbed by the jealousy of the Cyclops, who cruthed his rival to pieces with a piece of a broken rock while be repoled o: the bofom of Galatea. The nymph was inconfolable for the loft of Acis; and as the could not reflore him to life, the changed him into a fountain.

GALA'JA, the ancient name of a province of Ala Minor, now called slnufia. It was bounded on the call by Cappadocia, on the welt by Bithynia, on

## G A I $\quad$ i $\left.3^{21}\right] \quad$ i A I.

Gatar the fuash by P'mphyia, and on the north Ly the Easine fea. It was the north part of Physia Magna; but unon being occupied by the Gauls was called Galatia; and becauic fitunted amidet Greck colonics, and itlelf mixed with Grecks, Gall, grucia. Strabo calls it (iahatia and Galkegrecia; hence a tuofold name of the Feople; Galawe and Gall'ograci. 'The Greck called it Galia Parva; to dillinguith it from the Tranfa/pina, Loth which they called (ialatia. It was reduced under the fubjection of the Romans in the time of AuguRua, and is now in the hands of the Turks. Here St Panl founded a church, to which he directed that epifitle which is ftill known by the name of the Epiflc io the Galations, and was writen to reclaim them from the obtervation of Jewih crdina:ces, into which they had beon feduced by fome falle teachers.

GALAX, a genus of plant belonging to the pentandria clafs, and in the natural method ranking with thofe of which the order is doubtful. See Botasy.
GALAXY, in Afronomy, that long, white, luminow toack, which feems to encomp, is the heavens like a fiwath, fcarf, or girdle: and which is eafly perweivable in a clear night, efpecially when the moon does not appear. The Greeks call it $\mathrm{r}_{x} \alpha_{6}^{2}{ }_{6} \alpha_{5}$, Galavy, of $\Gamma \alpha \lambda \alpha, \gamma \omega \lambda \alpha \chi 10 \varsigma$, Mill ; on account of its colour and appearance: the Latins, for the fane reafons, call it sia lagea; and we, the milky way. It paffes between Sagittarius and Gemini, and divides the fopere into two part; ; it is unequally broad; and in fome parts is fingie, in others double.

The ancient pocts, and even philufophers, fpeak of the Galasy as the road or way by which the heroes went to heaven.

Ariftotle makes it a kind of meteor, formed of a crowd of vapours, drawn into that part by certain large flars difpofed in the regions of the heavens anfiwering hereto.

Others, finding that the Galaxy was feen all over the globe, that it always correfponded to the fame fived ilars, and that it tranfended the height of the highelt planets, let alide Ariftotle's opinion, and placed the Galaxy in the firmament, or region of the fixed thars, and concluded it to be nothing but an affemblage of an infinite number of minute thars.

Since the invention of the telefcope, this opinion has been abundantly confirmed. By directing a good telefcope to any part of the milky way; where before we only faw a confufed whitenef, we now defcry an innumerable multitude of little itars, fo remote, that a naked eye cotfounds them. See Astrosomy, $\mathrm{N}^{\circ} 21$ :

GALBA, Sergius Sifipiruts, a Roman emperor, horn the 24th of December, five ycars before the Chrillian era. He was gradually raifed to the greatelt ,,tices of the flate, and exercifed his power in the prosinces with the greateft equity and urremitted tilinence. He dedicated the greatclit part of hif time is folitary purfuit, chiciey to avoid the fufpicions of Nero. His difapprobation of the emperor's oppretive command in the provinces was the caufe of new diflarbances. Nero ordered him to be put to death; but lee efcaped from the hands of the executioner, and was publicly faluted emperor. When he was feated on the throne, the fuffered himfelf to be governed by favouritre, who expofed the goods of the citizens to fale to

Vol IX. Part I.
gratity :har avarice. Exemptions were fuld at a hig! a price; and the crime of murder was blotted out, and impunity purchafed, with a large fum of moncy. Such irregularitics in the emperor's minithers greatly displeafed the people; and when Galba refutit to poy the Coldiers the moncy whicla he had pomiod tiem when he was raifed to the throne, they affullumed him in the $73^{\text {d }}$ year of his age, and the eighth om with of his reign. The virtues which had thone fo bripht in Gaba when a private man, totally ditappeared when he afeended the throne; and be who thowed himble f the mort impartial judge, forgot the dusies of an emperor and of a father of his prople.

GALBANUM, in Pharmacy, a gum ifluing fom the flem of an umbelliterous plant growing in Peria and many parts of Africa. Sce Bubos.

The juice, as brought to us, is femipeliucid, fofi, tenacious; of a flrong, and to fome umplealant, finell; and a bitterih warm talte: the better fort is in pale coloured mafles, which, on being ovencd, aymer compofed of clear white tears. Geoffroy relate, that a dark greenith oil is to be obtaned from this hample by diltillation, which, upon repeated rectifications, becomes of an clegant thy blue colour. The purer forts of galbanum are faid by fome to difiolve entirely in wine, vinegar, or water; but thefe liquors are, only partial menitrua with regard to this drug; nor do fpirit ot wine or oils prove more effectual in this refpect : the belk diffolvent is a mixture of two parts fipitit of wine and one of water. Galbanum agrees in virtue with gun ammoniacum; but is generally accounted lefs eff. cacious in althmas, and more fo in byllerical complaint:. It is an ingredient in the gum pills, the gum plate:, and fonse other officinal compolitions.

GALE, in the fea language, a term of various im. port. When the wind blows not fo hard but that a fl is may carry her top-fails a-trip (that is hoifted up :, the highell), then they fay it is a loum gale. When it blows very ftrong, they fay it is a fiff, frons, $a=$ frelin gale. When two thips are near one another at fea, and, there being but little wind blowing, one of them finds more of it than the other, they fay that thic one thip gales away from the other.

Gale, Dr Yohn, an cminent and learned minite, anoong the Baptils, was born at London in 1690 . I1itudied at Leyden, where he diltinguifhed himfelf ver: early, and afterwards at Amterdam, under D: Limborch. He was chofen miniter of the Laptift congregation at Barbican; where his preaching, being chiedy practical, was greatly reforted to by people of all perfuaions. Four volumes of his femmons were publithed affer his death, which happenect in 1721 . 11is Reticetions on D: Wall's Hiffory of Infant Maptim is the beit defence of the Baptits ever publilhed, and the realing of that performance induced the learned $\mathrm{Mr}_{r}$ William Whiton and Dr Folter to become Baptitts.
Gale, Theoplidu, an eminent noncontormitt ma. nifer, horn in 1628 . He was invited to Wincheiter in 1657, and continued a flated preacher there until the re-eftablithment of the church by Charles II, when he rather chofe to fuffer the penalties of the ast of cunformity, than to fubmit to it contrary to his confrience. He was afterwards engaged by Philip lord Wharton as tutor to his fons, whom he attended to an academy at Caen in Normandy; and when this duty S 1

GALfiN, Chavors, in Latin Galenus, prince of the Greck phylicians affer Hippocrates, was born at Porgmus in the leder Ahia, about the year 131. His ther :ais polfered of a conliderable fortune; was well serfed in polite literature, philofophy, afrenomy, and germeiny, and "d alfo well thilled in architecture. He linfolf improted his for in the firt rudiments of :eamins, and :atcerwads procured tim the greateit mainers of the ace in philolophy and eloquence. Galen havios finithed his stwaies under their care, chofe phyfic Dor hie profelliun, abd chietly itudied the works of Hippocrates. Hiving at length exhauled all the
foures cf liteature that were to be found at honie, he refulved to trevel, in order to converte with the noot able thy uicima in all pasts, intencing at the fane time to thise every opportunity of infecting on the fpot the plats and druas of the comatrics through which he psificd. With this view he went to Alesandria, and ilaid fome years in that metropohis of $\mathrm{L}_{\mathrm{b}}$ ypt; from thence he taveiled tirnugh Cilicia; pafied through Palepme; wited the i.les of Crete and Cy pus; ama made two vorazes to Lemnos, in order to examine the Lemmian earth, which was then enteemed an admirable medicine. With the fame view he went into the Lower Syria, in order to obtain a thercugh infith into the nature of the ofotaliat um, or baim of Gilead: and having completed his dcfign, returned home by the way of Alexandria.

Galen had been four years at Pergamus, where his practice was attended with extraodinary applaufe, when fome feditious commations induced him to go to Rome, where he refolved to fettle: bat the proofs lic gave of his fuperior ikill, added to the refpect hown him by feveral perions of very high rank, created him fo many enemies among his brethren of the faculty, that he was obliged to quit the city, after having refided there four or five years. But he had not long returned to Pergamus, when be was recalled by the emperors Aurelius and Verus. After their death, he retized to his native country; where he died about the year 202. He wrote in Greek ; and is faid to have compofed two hundred volumes, which were unhappily burnt in the temple of Peace. The beft editions of thote that remain, are, that printed at Bafil in 1538, in five volumes, and that of Verice in 1625 , in teven volumes. Galen was of a weak and delicate contitution, as le himfelf afferts; but he neverthelefs, by his temperance and fkill in phyfic, arrived at a great age; for it was his maxim, always to rife from table with fore des ree of appetite. He is juitly confidered as the greatelt phyfician of antiquity, nest to Hippocrate: ; and he performed fuch furpriing cures, that be was acculed of magic.

Gales, a miltary townllip in the flate of NewYork, fituat do n the creek of Cauadaque, about 12 miles north-wel of Cayuga lake, and 13 fouth by eail of Great Sodas.

GALENA, a name given by minelalogits to a frecies of lead ore. It was alfo the original name given by Andronachus to the theriaca, from its effect in bringing on a pleafing calm over the blood and fyirits on taking it.

GALENiA, a genus of plants belonging to the cctandria clafs; and in the natural method rarking under the 13 th order, Succulente. See Botasy Index.

GAlenic, or Gaiexical, in Medicine, is that manner of confidering and treating difeafes, founded on the principles of Galen, or introduced by Gainex. This author, collecting and digefling what the phyiicians before him had done, and explaining every thing according to the ftrictelt doctrine of the Peripatetics, fet phytic on a new footing: he introduced the doctrine of the four elements; the cardinal qualitics and their degrees; and the four humours or temperaments.
G.anexte is more frequently ufed as contradiftinguilhed from chemical.

The dittinction of galcnical and chemical was occafioned

Gail. aceus ment and penance. On this fentence, he was detained Gall. a prifoner till 163.4 ; and his "Dialogues of the fyitem G.all. of the World" were burnt at Rome.

He lived ten years after this, leven of which were employed in making ftill further difcoveries with histejefcope. Eut by the continual application to that indirurient, added to the danage be received in his fight from the noctur)d air, his eyes grew gradually weaker, till he became totally blind in 1639 . He bore this calamity with patience and refignation, worthy of :a great philofopher. The lufs neither broke his lpirit, i.or hindered the courfe of his ttudies. He fupplied the defect by contimt neditation: whereby he prepared alarge quantity of materials, and began to dicłate his uns conceptions; when, by a ditemper of three months - ontinuance, waiting away by degrees, be expired at irceti near Florence, in Janury $16+2$, N. S. in the 7 Sth year of his age.

A mong varions uccul inventions of which Galileo was the autlor, is that of the timple pendulum, which he had made ule of in his attronmical experiments. He had thoughts of applying it to clocks; but did not exe(ute : : : lte glory of that invention war referved for Thens:o his !m, who made the experiment at Venice in 16.40 ; and 1. Huygens afterwards carried this invention to perfection. He wrote a great number of texetife, feveral of which were publified in a collection oy Signior Mendefli, under the title of L'opera di. Galico, Galidei Lyaceo. Some of thefe, with others of his pieces, were trandated into Englifh and publithed by Themas S.liltury, Eiq. in his mathematical cullections, \&c. in two volumes folio. A volume alfo of his letter to feveral learned men, and folutions of leveral problems, were printed at Bologna in quarto. Belides thefe, he wrote many others, which were unfortunately loft through his wife's devotion; who, folicited by her confefor, gave him leave to perule her hubband's manuferipts; of which he tore and took away as many as he faid were not fit to be publilhed.

GALIUNI, a senus of plants belonging to the tetrankria clati; and in the natural method ranking under the $7^{\text {th }}$ oder, Sidlatie. See Borsivy Intex.

GALL, in the animal economy. See Bile.
Gall was generally given amongft the Jews to perbons fuffering death tader the execution of the law, to make them lefs fenfible of their pain; but gall and myrrh are fuppofed to have been the fame thing; beculue at our Saviour's crucifixion, St Matthew fays, they gave him rinegar to drink mingled with gall; whereas St Mark calls it wine mingled with myrrh : The truth of the matter perhaps is, that they ditinguished every thing bitter by the name of gall. The Greeks and Romans alfo gave fuch a mistare to perfons fuffering a death of torture.

A great number of experiments have been made upen the gall of different animals, but few conclutions can be draxn from them with any certainty. Dr Percival, lowever, hath thown, that putrid bile may be teriectiy correfted and fiwectened by an adnesture of the wepetable acids, linegar, and juice of lemons. The fe, he obferve have this effect much more completely than the mineral ones: and heace, he thinks, arifes the great ufefuluefs of the vere entle arid, in autumal difafes ; which ate always :teme'ol :in a putretent difpofition
of the bile, owing to the heat of the preceding fummer. On this occafion he takes notice of a common miflake among phyficians, who frequently prefribe elixir of vitriol in thofe difeafes where vinegar or lemon juice would be much more effectual.

From this effect of acids on the gall, he alfo thinks, we may fee why the immoderate ufe of acids is to pernicious to digeflion. It is neceflary to health that the gall thould be in fome degree acrid and alkaleleent: but as acids laave the property of rendering it perfectly mild and fiveet, they mutt be proportionably pernicions to the due concuction and ailinilation of the food; which without an acrid bile cannot be accomplinhed. Hence the body is deprived of its proper nouribment and lupport, the blood becomes vapid and watery, and a fital cachexy unavcidably enfues. This hath been the cale with many unfortunate perfons, who, in order to reduce their exceffive corpulencs, have indulged themfilves in the too free ufe of vinegar. From the mild flate of the gall in young children, Dr Percival alfo thinks it is, that they are to much troubled wih acidities.
Gail-Bladide. See Anatomy, $\mathrm{N}^{\circ} 97$.
G.anı, in Aatural Hi/hory, denotes any protuberance or tumour produced by the puncture of infets on plants and trees of diffetent hinds.
Thefe galls are of various forms and fizes, and no lefs different with regard to their internal itracture. Some have only one cavity, and others a number of finall cells commanicating with each other. Some of them are as hard as the wood of the tree they grow on, whillt others are luft and fpongy ; the firft being termed gall mits, and the latter berry galls, of apple salls.

The general hiitry of the gall is this. An infect of the tly hind (the cins) is initructed by nature to take care for the lafety of her young, by lodging her eggs in a woody fubilance, where they will be defended from all injuries: the for this purpofe wounds the leaves or tender branches of a tree; and the lacerated velfels, difcharging their contents, loon form tumours about the holes thus made. The external coat of this excrefeence is dried by the air ; and grows into a figure which bears fome refemblance to the bow of an arch, or the roundnefs of a kernel. This little ball receives its nutriment, growth, and vegetation, as the other parts of the tree, by llow degrees, and is what we call the gall nut. The worm that is hatched under this fpacious vault, finds in the fubflance of the ball, which is as yet very tender, a fubfiffence fuitable to its nature; gnaws and digefts it till the time comes for its transformation to a nymph, and from that itate of exiftence changes into a Aly. After this, the infect, perceiving itfelf duly provided with all things requifite, difengages itfelf foon from its confinement, and takes its tlight into the open air. The cafe, however, is not limilar with refpect to the gall nut that grows in autumn. The cold weather frequently comes oa before the worm is transformed it to a fly, or before the Hy can pierce through its enclofure. The nut falls with the leaves: and although you may imagine that the fly which lies within is lon, yet in reality it is not fo ; on the contrary, its being covered up to clole, is the means of its prefervation. Thus it fipends the witter in a warn houfe, where every caach and cramy of the nut in well hopped up; and lies buried as

## O A L [ 325 [ G A L

of the Nike; furrounding the country of Gojam, and paling entibard hehind the counery of the $A$, tended the ir ponfeflons as far is the territories of the (Fangas and Gatan. Since that time the Nile has then the boandary of the ir posiedion ; thounht they have w. I: frepuentiy plundered, sud formonns conge red, the As finian provinces on the otise fif of the siver, Lut have never made any permanem: fettemete in thete part- A third divison has fintical t, the louthonat of the low coantry of thoa, which the goenen of tha proviace has pernited, in veder to fomm a baid T bus twist him and the territorets of tive cmperor, on thlom he farcely acknowledes my derendence.

The Galla are of a bronsa comptevion, and hase long black hair ; but lome of them who live in the wal. leys are entircly black. At fird their common food war milis and butter ; but fince t.eie intercourle with the Abytimans, they have leamed to plough ant fou facir l.m?, and to make breas. They feem to have predilection for the nuraber feven, and each of the three dithions already mentioned are fubdivided into kesen tribes. In behaviour they are extremely barbarous; and live in continull war with the Abylinians, whom they murder whithout mercy as often as they fall into their tatids. They cut off the privities of the men, and hang them up in their houfes by way of troplies; and are fo cruel as to rip up women with child, in hopes of thus deffroying a male. Yet notwithtanding their excellive cruclty abroad, they live under the thict-it dicipline at home; and every broil or quarsel is intantly punished according to the nature of the ofience. Each of the. three divitions of the Galla above mentioned has a king of its own; and they alfo have a kind of nobility, from among whom the fovereign can only be chofen: however, the commonalty are not excluded from rifing to the rank of nobles if they dillinguih themfless very much in battle. None of the nobility can be elected till upwards of $\not \supset$ years of age, unlets he has with his own hand killed a number of enemies whith added to his own age makes up to. There is a council of each of the feven tribes, which meets feparately iat it own diftrict, to fettle how many are to be left behind for the governing and cultivating of the territory, and other matters of importance. Thele nations have all a great veneration for a tree which grows plentifully in their country, called wanzel, and wich thefe fuperfitious people are even laid to adore as a god. Their allemblies for the choice of a king are all held under one of thefe trees; and when the fovereion is chofen, they par a bladgeon of this wood in his hand by way of fecptre, and a gatland of the Howers upm hi ; head.

The Galla are reported to be very good fuddiore, efpecially in cafes of furprife ; but, like mott other ba:banians, bave nu contancy nor perfererance ater the firtt attack. They will, huncser, perform extrandi. nary marches, fisimning rivers holding by the horfe's t.al, and thus bion enabled to d) very great aitheret by reaton of the rapidity of theis mosement. Thay are execllent light horfe for at resular army in a hotzile country; but are vory indifferenty domed on account of the farcity of iron anong them. That principhi atms are lances made of wood thatpened at the cond and hardened in the fire; and thoir thiolds are compred only of one dingle fold wi buils hade; fo that they are evtreacly apt worn by beat, or becons

Oak pll, put, in a very fimel quentity, into a fola. ton of vitricl in Water, thutelt thit a very vak one, give it a purple or viclet culour: which, as it grows ftionger, becomes black; and ca thin property depend the fit of making our writi:g ink, as alfo the arts of dyeing and drefling leather, and otler mandatures. See far. Chemistry Inder.

The belt gall, come from Aleppo: thefe are not quite round and linooth like the other forts, but have feveral tubercles on the fuatiace. Galls have a very muitere flyptic tale, without any fmell: they are very Atrons affingents, and as fuch have been fometimes made ule of buth internaily and eaternally, but are not much tahen notice of by the prefent practice. Some secommend an ointment of powdered galls and hoos lard as wery effectual in certain painful thates of hamorrhois; and it is alleged, that the internal wie of galls bas cured intermittents after the Peruvian bark has fai!ed. I misture of gills with a bitter and amontic has been propuded as a dubatitate for the bark.

Gili., $S$, a confiderable town in - Swifferand, and in the Upper thurgow, with a rich and celebrated abbey, whufe abbot is a prince of the empire. This place has for fome time been a republic, in alliance with the cantons. It is not very large ; but is well built, neat, fopulous. It contains about 10,000 inhabitants, who are chienly employed in the linen manufacture; and moke amually, it is faid, 40,000 pieces of linen, of 200 alls each ; which renders it one of the ticheft towns in Swillerlind. The inhabitants are Proteilants; for which reafon there are often great contelts between them and the abbey about religious affairs. It is feated in a narrow barren valiey, betweea two mountains, and upon two imall itream. E. Long. 29. 5. N. Lat. 47. 38.

Gell-Fiy. See Cyift, Extomology Indix.
GALLA, an Abytinian nation, originally dwelling, as Mr Bruce fuppofes, under the line, and exercifing the profeliton of thepherds, which they fill continue to do. For a number of years, our author telis us, they have been conitantly miseruting nortina ards, though the caufe of this migration is int hown. At firf they had no hories; the reaton of which was, that the comiry they came from did not allow the fe animal, to breed : but as they pruceeded northward and conquered fome of the Abydnian provinces, they foon furnimed themCelves witl' fuch numbers, that they are now almoit entisely cavalry, makiag little acrount of infantry in their a mics. On advancisg to tice trontier, of Ibylliais, the mulritude divided, and part directed their courfe toatalh the Indian ocean ; after which, hasing made a Settement in the castern part of the rontinent, they *urned fouthward into the countrics of Bali and Dawor, : hich they entirely conquered, and fettled there in the year 1537 . Another divinon havine taken a welterly ば. Cre A hemil!es in a !emicir le alomy the bank?

$\therefore \quad 3 \quad \therefore$ conter. Taey are excedingly cruel; r.ait. : thall buan noife at the beginning of ....................ent, which qreatly territies the hories, and we. n ea therbarou ritas which oppofe them.
T..e C. 71 , aconding to Mr Bruce's account, are f... e. hat ialow the midule ïre, bat extremely light af hamb. The women are fruitul; and fuffer to fole in thilllearing, that they do mot even confine hombelves for a fingle day after delives. They If uith, ferm. and reap the corn, which is troden out liy the catti: ; hut the men have all the charge of the rattle in the fillis. In thir culloms they are tithy to the lal degres; phating their hair with the guts of asen, which they likenife twith round their middle, and which by the quick putrefation occation an abominable itench. They anoint their head, and whole bodie, with butter or greafe; in wh ch, as well as in ohher refpects, they greatly refemble the Hottentots. It has been fuppoled that they have no religion whatever; but Mr Bruce is of opinion that this is a millake. The wanzey, he fays, is undou' tedly wormipped thy all the nations as 2 god; and they tave likewife cettan ftones which are worlhipped as gods: Lefiles thefe, they worihip the noon, and fome flars, whei in certain pofitions, and at fome particular featons of the year. They all believe in a refurrection; and liave fome faint notions of a flate of happinels, but no idea of future punihment. Some of the:m to the fouthward profefs the Mahometan religion, but tho'e to the eaft and weft are general': Pagans. All of them intermarry with each other; but will not alluw itrangers to lise amond them, though the Mors have at 1ff found out a method of trading fately with them. The commodities they deal in are blue Surat (lothe, myrrh, and falt; the lat being the moft valuable article.

The marringes among the Galla are celebrated with fome of the difgufting cultoms of the Hottentots; and aiter thefe ceremonies the bridegroom promiles to give the bride meat and drink while the lives, and to bury l.er when dead. Polygamy is allowed among them; trut it is sincular, that among thefe people the women folicis their hubands to take otbers to their embraces. The reation thicultom i, that the men may have runcerous amilies of chitdren, who may be ca able of defending them aqainit their enemies; as the Galla, according to our uthur, always fight in families, whether againt foreign enemics or with one another.
G.II.LAND, Avthovy, a learned antiquarian, member of the A adomy of I fcriptions, and profeflor of Arabic in the Ruyal Col'ree of Paris, was born of poor parents at Kolh, a willye in Picardy. Having fludicd at the Sorbone and other univerfities, he travelled into the eall ; where 'e acquired great kill in the Arabic tricuse, and in the mamers of the Mahometans. lic wiote feyeral works; the principal of which are, 1. In Acce, unt of the Death of the Sultan Oman, and he Cormation of the Soltan Muttapha. 2. A Callection of Maxim, drawn from the works of the (rientiks. 3. A Treatife on the Orizin of Cofiee. 4. GALLANI, or Ginint, a French tem adoptal into mar tar rane, and lignifuing polite, civil, and wall pred, whe a difpofitinn to plate, particulary the ladies. it atio fimsins have or courgeots.

GUIU, the name of fiverai engravers, of whem
the principal was Comelius, who flourithed about the 1600. He learned the art of engraving irom his idther, and inituted his atifi flyle, till ke wast to Rome, where le refided a contiderable time, and there acquiretl that freedom, tate, and correctnels of draving, which ae found in his bett works. He fettied at Antwerp upon his return fiom Italy, where be caricd on a condicicrable commerce in prints. His bett prime. are thore dunc atier Ruions.

GALL:ON, in naval affairs, a fort of atips employed in the commure of the Wed ladies. The Spaniard fend annually two theets; the one for Mexico, which they call the flota; and the other for Peru, which they cill the galleons. See Flota.

By a genern regulation made in Spain, it has been eftablihed, that there thould be twelve men of war and five tenders amually fitted out for the armada or alleons; eight thips of 600 tons burden each, and three tenders, one of 100 tons, for the illand Margarita, and two of $8 \rho$ each, to follow the armada; for the New Spain tleet, two thips of 602 tons each, and two tenders of 80 each; and for the Honduras fiect, two ftips of $5=0$ tons each: and in cafe no fleet happened to fill any years, three gatleons and a tender fhould be fent to New Spain for the plate.
'They are appointed to dail from Cadiz in Jinuary, that they may arrive at Porto Bello about the middle of April; where, the fair being over, they may take aboard the plate, and be at Havannah with it about the midde of June; where they are joined by the flota that they ma' return to Spain with the greater fafety.

GALLE JT, a fimall galiey lefigteed on'y for chafe, carying but one malt and two patteleroes; it can both fail and row, and has 16 or 2 oars. All the feamen on ! ara! are fol fers, and each nas a mulket by him on qui ng his oar.

GALILRY, in Architegure, a cosered piace in a houfe, much louger that broad, a: I ulually in the wings of a huilding, its ufe veing c-ielly to walk in.

GALLERIES, in Girdening, are certain ornaments made with trees of difireat kidd; which are ver: common in all the French gardens, rut are feldom introduced into the Britih ones, etper ially tince the tafte for clipped trees has been exploded. For thofe, however, who may fill choofe to have them, Mr Miller gives the following directions.

In order to make a galley in a garden with porticoes and arches, a lme mut firlt be draun of the length you defign the gallery to be; which being done, it is to be planted witi hornbeam, is the foundation ot the ga!lery. The management of galleries is not dimeult. They require only to be diaged round about; and theered a little when there is occafon. The chief curionty required is in the ordering the fore part of the galuy, and in forming the arches. Each pillar of the portico: or arches ought to be four feet ditant from another, and the gallery it feet high and io feet wide, that there may be room for two or three perfons to walk abreaf. When the hornbeams are grown to the height of thice fee:, the diatance of the pillars well regulated, and the ground work of the gallery tinibud, the nest thing to be done is to form the frontipiece; to perform which, you nuth Itop the bormbeam between two pilla:, for that furpofe, which forms the arch. Is it grows, you mult wita your iteers cut of thole beughs which otthoot the o.

GALLET, a kiod of hw that buht veffl, fuminted with one dech, and navifot.d with fails and oarc, particularly in the Nuditen mon. By the Giech nuthors under the eaft en empire, this hind $0^{*}$ velfel was called quxiex and $\gamma x$ xese; and by the Latin authors of the fame time, gala; slience, according to fome, the mod.rn deromitation. Some $f+y$ it was called faka, on account of a cafque or helnet which i carried on it prow, as Unid attells, de Trition. The Trench call it satere; by redion, they lay, that the top of the math is Limaly cut in the form of a hat, which the Itaims cell gair. Others derive botis selee, and galore, from a fan by
 fiwardffi, which this veltel refen les. Iatly, Others derive the gaiky, saika, schort, galcal/k, \&c. from the Sy riac and Chaldee gaul, and galin, a man expotiol on the water in a vellel of woed.

The largett fort of thefe vellels is employed only hy the Venetians. They are commonly 10 z feet long above, and 133 feet by the kecl; 32 feet wide, with 23 feet length of llem poit. They are funnihed with three malts, and 32 banks of oars; esery bank contairing two oare, and cvery oar being managed by fix or feven daves, who are bfually chained thereto. In the fore part they have thee little batteries of cannon, of which the lowelt is of two $3^{6}$ pounders, the decond of two $2+$ poanders, and the uppermolt of two 2 pownders: three 19 pounders are alfo planted on each quarter. The comylement of men for one of thefe galleys is 1000 or 1220 . They are eiteemed extremtly convenient for bombarding or making a deicent upon an elemy's coat, as drawing but litile water; and having by their oars fre quently the advantage of a dhip of war, in light wints or calm; by emnonading the latter near the furface of the sater ; by foouring he: whole length with their iloor, and at the fame time keeping on her quarter or bow, to as to be wi of tlee direction of lier catmon.

The galleys neat in fize io thefe, which are alfo called ha'f falltys, are from 122 to 130 fret long, 18 , feet broad, and nine or ten feet deep. They have two mats which may be ilruck at pleature ; and are furmilhed with two large lateen fail, and five pitces of camon. 'lisey lave commonly 25 banks of oars, as deferibed above. A fize liill lefo than theie are called quarter galicif, carting from 12 to 16 bumb of oass. Theme are very few gallevs now betades thofe in the Mediterranean, which are found by eaperience to be wf

 they were cunacl:s and Furyuian, and lan in theis dolem prorctions they danced, lamled, drommed, cut and haphed themedor, phayine upo timbrels,
 With the hacred hies and tumpery of their gocdes. When a woug man was to be initisted, he was to throw ofllis ciothes, rum erying alou 1 irsto the midt of the io twop, and there draw a foord ard catrate lisafif, ufter this he was to tun into the ftreet with the parts ce* oft, in his hand, throw them into fome boule, and in the lime houfe put on a womm? ditis.

Thace prieis had the names alto of Cureter, Cory Lonics, am? Dafyrio The chief prielt was called sirchiGalius. This order of priethoot is tound both amongt the Greel.; and Romans. Sec an account of them is. Lucra: lib. ii, and Fou. Sat. vi.

Gilli, the Gauls. Sue Gainia and Givis.
Gulli, fie imall defolate ilands on the coall of the Principato Citra of Noples. They are fuppoled to be the Sortenulx, or illands once inhalited by the Sirens, which Ulyfes paffed with fo much caution and hazard. Great revolutions, however, have been occafiored in their thaye, fize, and rumber, by the effects of futteranean tire; and funse leamed perions go fo far as to aflet, that thefe rocks have rifon from the bution of the fa fince Homer fang his rhaptodies; coniequently, that thofe montters dweit on tume otler fpot, probably Sicily or Capri. The tradition of Sirens refiding hercabouts is very ancient and miverlaly admitted; but what they really were, divelted of their falulous and poetical diguife, it is not ealy to difeover. See Sirex.

The Sirenuise were only three in number; and therefore if thele and the Galii be the lame, two more noth bave fince rifen, or the three hase been fplis into five br a fubterrancous convuifion. On the lazgets is a watcitower, and the neat has a delerted hernitage. The principal illand is only a narrow lemiciscular ridece covered with a ha llow coat of foil; two rether little illands and fome jayged rocks jut pecping above the waves, correfperd with this one fo as tir trace the out line of a volcanicn! erater. The compofition of then all is at top a calconcous rock extremely thaken, tumblal, and coufufed, mised with maflice of brecela, dilperd in a mott ince, ular manner; tolow thete is lav: and the deper the eye folions it the Aromer are the mahs of fire: telov the furfice of the water, and in forse flaces alone it, the loyer ate complete block of twallen. Hence it is prefimed by fome, the it central fires lave leaved lep $t$, light the turrefed furdance that orizinatly fay near their fou*, with all the intermediace flata that covered them from the fea. The layer inclise duwnwards from call to nett; the air feems $1 s$ hive forced its way into pat of the mafs while in tid ficn, wes by checking it , "orkinge cauled many lar. a checto to be leit in it. There inlards are uncuitivated and unimiabited fince the old hermit of St Antonio dies. Nyrtle covers moft of the furfacc.

GALIIIA, a large country of Europe, called Gola$\therefore$ as tie Greels. The inhabitants were called (iall;, C...., Cchinkeri, and Coltuscythe Ancient Gaul was divided int, four difierent part, by the Romans, cal!t! Gialia Beigsica, Narlonen/s, Alquitania, and Cellica. (i, llia Belgica was the largelt province, bounded by Cicmany, Gallia Narbonenis, and the German orean; and contained the modern county of Alface, Lorraine, Picardy, with part of the Low Countrics, and of Champagne, and of the Ille of France. Gallia Narbonenfic, wich centimed the provinces now called Languedoc, Provence, Dauphinc, Sa:ou, was bounded by the Alps and Prenean momntains, by Apruitania, Belgium, and the Mediterranem. Aquitania Gallia, now cailed the frozinces of Psitou, Santonge, Guienne, Berry, Limofin, Gefoogny, Ausergne, \&c. was fituated between the Garumna, the Pyrenean mountains, and the ocean. Gallia Cettica, or Lugdunenfis, was bounded by Belgium, Gallia Nurboncnfic, the Alps, and the ocean. It con$t$ ained the country at pretent known by the name of Lyomnai, Tourainc, Franche Compté, Senenois, Switzerland, and port of Normandy. Befides thefe grand diviifons, there is often mention made of Gallia Cifalpina or Citerior, Tranfalpina or Ulterior, which refers to that part of Italy which was conquered by fome of the Gauls who croffed the Alps. By Gallia Cifalpina, the Romans underftood that part of Gaul which lies in Italy, and by Tranfalpina, that which lies beyond the Alps, in regard only to the inhabitunts of Rome. Gallia Cifpadana, and Tranfpadana, is applied to a part of Italy conquered by fome of the Gauls; and then it means the country on this fide of the Po, or beyond the Po, with refpect to Rome. By Gallia Togata, the Romans underftood Cifalpine Gaul, where the Roman gowns, toga, were ufually worn. Gallia Narbonentis was called Braccata, on account of the peculiar covering of the iahabitants for their thighs. The epithet of Comata is applied to Gallia Celtica, becaufe the people fuffered their hair to grow to an uncommon length. The inhabitants were great warriors, and their valour overcame the Roman armies, took the city of Rome and invaded Grecce in different ages. They fpread themfilves over the greateft part of the world. They were very fupentitious in their religious ceremonies, and revered the facerdotal order as if they hed been gods. They long maintained a bloody war againtt the Romans, and Ceffar refided ten years in thair country before he could totally fubdue them. See Gacl.

Galliard, or Gagliarda, a fort of dance anciently in great requett; confifting of very different motions and actions, fometimes proceeding terra à terra or fmootlly along; fometimes capering; fometimes along the room, and fometimes acrofs. The word is French, gailliarde, or rather Italian; and literally fignifies " gay, merry, fiprightly." This dance was allo called Romane/qui, becaufe brought from Rume.

Thoinot Arbeau, in his Orchefography, deícribes it us conlifting of five fteps, and five poifions of the feet, which the dancers performed before each other, and
whereof he gives us the icore or tablature, which is of Galliads fix minims, and two triple times.

GAILIARDA, in the Italian mufic, the name of
Ganlipolis. a tune that belongs to a dance called a Galliard. The air of it is lively in triple time.

GALLIC icid. See Chemistry Irdix.
GAILICAN, anything belonging to France; thus the term Gallicon church denotes the church of France, or the aftembly of the clergy of that kingdom
GALLICISM, a mode of lpeech peculiar to the French language, and contrary to the rules of grammar in otier languages. With us it is ufed to denote fuch phrates or modes of fpeech in Englifh as are formed after the French idiom.

GaLLINACEUS lapis, a glofly mineral fubfance which is fuppufed by fome to be produced ty the operation of volcanic fires; and is thought to be the lame with the lapis ob/jdianus of the ancients.

GALLiNA, an order of birds. See Ornthology $\operatorname{Index}$.

GALLINACIOUS, an appeliation given to the birds of the order of the gallina.

GALling, or Excorlatios, in Medicine. See Excoriation.
Galling of a Horfe's Back, a diforder occafioned by hea, and the cbating or pinching of the faddle.
In order to prevent it, fome take a hind's ikin well garnithed with hair, and fit it neatly under the pannel of the faddle, fo that the hairy fide may be next the horle.

When a horfe's back is galled upon a journey, take out a little of the fulfing of the parnel over the fuelling, and lew a piece of foft white leather on the infide of the pannel: anoint the part with falt butter, and every evening wipe it clean, rubbing it till it grow foft, anornting it again with butter, or, for want of that, with greale: wah the fwelling, or hurt, every evening with cold water and foap; and ftrew it with falt. which thould be left on till the horfe be faddled in the morning.

## Gallinule. See Fulica, Orxithology

 Index.GALLIPOLI, a fea-port town of Italy, in the kingdom of Naples, and in the Terra-di-Otranto, with a billop's fee. It ttands on a rocky illand, joined to the continent by a bridge. From the remotal antiquity this was a ftation fo favourable to commerce, that every maritime power wilhed to fecure it ; and it is a reproach to govermment, that nothing has been done to improve its natural advantages: at prelent, Mr Swinburne informs us, it has neither harbour nor heiter for hlipping. Charles II. demolihed Gallipoli ior its adherence to Frederick of Arragon. The Venetians treated it with great cruelty in the 15 th century: and in 1481 it was pillaged by the Turks. To preferve it from future calamities, Charks V. repaired and ftrengthened its fortifications; and, fince that period, it has enjoyed the benefits of peace and trade, which have rendered it the moft opulent and gayeft town upon the coaft, thuugh its inhabitants do not exceed 6000 in number. Confumptions and fpitting of blood are rather frequent here, occafioned by the great fubtility of the air, which is ventilated from every quarter. The buildings are tolerable, and fome

 minlin, custon thectis. are manufatural bire, and fuachated by the fromenchli; for (iallionli has mo died imb with the metapolis. Stk and filion were former!'y objets of -atfic, but howy dutics and oprentai have curti! an to be dhandued. The wine of this tor wory is arol, but from drumef of climate, and thallomets of - IV the wintane fiequently tails in funt ty, and an the Gallipuliton have recturle to sitily for a Sipply. undertanding, and a lever of febence, happored to Gatrani, witnefe the fienomenen, of which fhe inftantly isformed her huband. On his arrival he repeated the experinient, and difcovered that the convulfions only happewed when the faliel was in contact with the rerve, and a fpat' was diawn from the conductor at the fame time. After an almoll endlefs variety of experiment, conducted with great ingenuty, which it would le foreign to the detign of this article to enumerate hore, he conciuded that all animals have within them an electricity of a feculiar nuture: that this fluid is containet in molt parts, but is mod apparent in the nerves and mufcles; that it is fecreted by the brain, and difured ky the nerves through varicus parts of the body.

He compared each mufeular fire to a fmall Leydern whit, at d attempted to exphin the phencmena of mut. cular motion by analogies taken from that imftrment. Fie firit thought of its p.thological influence in regat to rheun -tic, conwhive, paralytic, and other nerveus affections. His first publication on this grand difovery was entitled Aloy G: Gatani do wirilus Electricitatis in II Uu Muculari Commenterius, which made its appearance i. 4. , in the year 1791 , and was prinied for the I: fltitute of B logna. By this work the attention of philolopl:ers both in Italy and other countries was in itant ${ }^{1}$ y rouled, and it was foon folloned by numerus fullications, in fome of which the fentiments of Galvani were defended, and in others they were oppofed. The celebrated Vult, iumed his attention to the fubject, and adruced a number of arguments to prove that Galrani's op iticat relfecting animal eleciricity was erroneous, derising the phenomena from the ciccitic matter of the atmofphere, and allowing the nerves and mulcles no higher a place then that of the molt fenfible tells hitherto difcovered. The doctrine of Volta ruceived many admirers and advocates : yet there are fill numbers to be met with in the learmed vorid who fupport the fentiments of Galva. ni, who nill there to lis original theory, in the defence of whicn he dipiaved ruch candour and modelty, as well ar ingenaity, by which he may be juftly confidered as deferving that diftingaihed place among experinach:al phiviopters, which the union of his name with the moit intreiling natural phenomena will probably fecure to him for ever. bee Galvanism.

Thefe infuntan: inquince, joined to the duties of his ellice as a profelior, and his extenfive practice in the capacity of burgen and man-midwife (accoucheur), ia buth which he emincaily ex clied, afforded aumdant focpe fur his indefatigratile indutty. He compoled a verety of memoirs un tofics connceted with his profelion; but theic, as fur as we know, have never been pablithed. He delighted to converfe with men of ficence, in shwie company isow publications were read, and their meri inveitigatad, which was cortainly a valuable foures of iniellectual impurvement.

The character of Galsani in Jivate life is allowed to have seen moft aniable ; and his fomibility, which was matur:"ly ftre $\because$, reccived a wiolent 1 ock in the death of his amiand wife, in the yoar 1790 . This event brought opon lim the mot! abirning melancholy, which lie eves deligited to encouage, by vinting her tomb in the numery of St Catharine, and pouning forth his unavailin: lanemations over lice grave. He uas ever punctua! in the difharge of the duties of his religion,

## G A L $[33 \mathrm{I}] \quad$ C. A H

Gavani even to the minutcif rite, as he never lof the piow impretions which were male upon his mind at an eatly period of lite. To this cute we may probably trace lack his determination never to take what was called the civic oath of anegance to the Cifalpine republic, for which he was barbaroully deprived of all his orica and dignitic. Devoured by melancholy, and nearly reduced to a Itate of indigence, he took up his refidence ia the houre of his hrother Jomec, a man of refiectabiLets, where he fel! into a date of extenuation and debi-

# G A L Y A N I S M. 

TF TWO piece of metal, the one of zinc, and the other of lifver, or the one of zinc and the other of copFer, or, what andivers the purpole equally well, a perny piece and a half crown piece, be fo placed that the one fiall touch the upper furface of the tongue, and the other man! touch its under furface, while the edges project over the point; as often as the edges of the metals in this fituation are brought into contact, a peculiar fenfation is produced in the tongue; there is fomething like a ilight fhock of electricity, and there is perceived at the fame time an auftere, altringent, or metallic talie.

If a bit of tin-foil be placed on one of the eyes, and a bit of copper held between the teeth or touching the tongue, and a communication be formed by means of a wire between the piece of metal on the eye and that on the tongue, a flafh of light is feen, and this is produced as often as the communication is completed. Bet, in the above experiments, if metals of the fame kind be employed, no perceptible effect whatever is produced.

If a pile compofed of 50 or 60 pairs of plates of zinc and filver, or zinc and copper, be arranged in a regular feries, with pieces of cloth mointened in a folution of common fate placed between each pair ; and if one hand previoully moilkened with water tunch the lower pair, and the other hand, alfo moiltened, touch the upper pair of plates, the moment the communication between the bottom and top of the pile is completed, a lmart thock is felt; and if 50 or 60 pairs of plates of copper and zinc be arranged in a trough as will be afterwards defcribed, and the fpaces between the pairs be filled rith water, to which about $\frac{1}{10}$ of pretty itrong nitric
acid has been addel, a fimilor floch is percused, wiace the hands wetted with water touch the plates at the es tremities of the trough. If a communication by nean, of wires and two pieces of well-prepared charcoal be made between the extremitics of the trough, a very brill:ant combution is excited every time the two picio of charcoal are brought into contact. By placing tinfoil, gold leaf, white or yellow Dutch actal or brats leaf, on a wire comected with one end of the trough, and touching the metallic leaves with a plate of cupper or zinc connected with a wire from the otler cad of the trough, a ranid and brilliant deflagration is exhibited every time that the communication is effected.

The phonomena which are thus produced have re-whet is th. ceived the name of Galoan'm, from the name of Gal- 'r.tad ly vani, who firlt obferved and publithed an account of batwaifm. fome of them, and the power by which thefe cffects are produced has been denominated the galamic power or Alyd. From its efiects on animals being fimilar to thafe of the electrical 1luid, it was at firit called avimal eledricity; but then the knowledge of galvanim was limited to it; effects on animais, and it was fuppofed to depend on fomething peculiar to animal life.

In the following treatife we propufe to give a view of the progrefs and prefent fate of gavanifin; and for this purpule we thall arrange the whole under two great divitions. Under the firtt, we flall conlider the flenomena of galuanifm, or detail the facts which have been atcertained with regard to this power. The fecond part will be occupied in the hitory, progrefs, and theories, which have been held with regard to the nature of galanifm.

## PART I. OF THE PHENOMENA OF GALVANISA.

IN treating of the phenomena of galvanifm, it progrefive hitory fuggells an arrangement futficiently convenient for taking a view of the effects of the galvanic ihid. Thofe effects which are to be regarded as itristly chemical, were altorether unknown, till after its application to animals, and a great mafs of facts relative to itseffects on animal hife had been accumulated. We may therefore firf confider the effect, proluced on animals by the oferation of the galvanic that, and in the next place thofe effects which are l!rietly chemic:l.

But be₹ure we procecd to this, it in necofisry diat the nature and conllrution of the apparatus, by which thete effects were producel, thendd le underituod. Thefe topics, therefore, hall the the fubject of the three following chaptur. In the sirth we 1!all treat of the conAhretton of the apparatu by which the phenomena of galvasin are produced; the ficond will be emplosed i: combering the efferes of the galvanic thad on ani n .1. ; and the thied will compreliend a view of its chenical eff.ひ.

any other animal. Toptepare them for thete expelimend, wainto methods have bots fullowed. Some Thymugias propofe to remove only the integuments, and lay bare the mafles, while others open the cavitics of the thorax and abdomen, ramove the wifera Hish are cortained in the le cavities, and bring into Hew the netves and mufeles which are there difributd. Some again, affer the above previous preparation, "parate all the parts between the orixin of the nerve and it, infertion in the mufic, fo that the later may Fe attached by means of the nerves orly, to the trunk $\therefore$ the horly ; white other, afte a fincilar preparation, ut off the ammals head, that the cfice produced by falvanifm may not he confounded with the voluntary novements of the living animal. Ey mother made of preparation, each of the parts is feparated from the rody by difection, afier laying bare the mufles atad nerves.

But in general a frog is underfond to be prepareal when it in divided with a pair of fcitiors into two portims, threngh the middle of the body ond fine. The viccera are then removed, as vell as the integuments of the inferior extemities. As the fciatic nerves of this animal rife very hights upon the iqiue, they are diftinatly feen after this treatment. When it is intended, as in fome experiments, to arm tise nerves, as it is called, a pair of thary putel frimar is intobuced beneath
two natels.
6
The appratus we have now deferibed aitords an singlo gala ample of the implef equanic conbintion, or what varic comis ufin.l'y denominated a fingle galvanic combination, in natons Haw it may be whonved, that thes combination mull couint of thee diffe:cnt conducturs. The conduc ors of certhicity have beca ananged into two principal cl.ais : to the finf Lelons the metallic fublances and chate wit, which have teen otherwife ealied dey jod paliet conchaturs; the focond clafs confift of the impericel conductors, which are water and otler oxitang thild, and the fublazeece which contain the ie thuids. But al though the combuators of electricity, for the l.ke of comenciency, are thms arranged, they differ fiom caen other in their conducting power, and this differnce is greatelif anong the fulfences comprohended under the fecond claff. Now, it the three conduetors of the gal. wanic tluid be all of the firl elafe, or all of the fecom, the effect is fcarcely perceptible. An active, fimple galvenic combination, then, mult conill of three dit. ferent bolic, one conductor muft belong to one chas, and tho diffrent conductors mul be taken from the other chafs. In fat. 3 . and 4. are extibitcal exam, h; of active tinyle salvanic combinations. In fig. a.t le:ters $A$ is mank the bodies belonging to the firt clats or perfet conlutlons; and a mats the bodies belonging to the fecond clat, or imperiect conductors; and in fig. 3. A marks one body belonging to the fint clafs, ani ab two budies belonging to the fecond clafs, or the imperfect conda?tors. Of the three bodies forming a sulvanic combination, if two of them belong to the finft clafs, and one to the fecond, this combination is faid to be of the fi.t order; but if one of the three bodica only belong to the firth claf, and two to the fecond, the combination is faid to be of the fecond order. lig. . i. i a gatranic combination of the fint order, and fg. 4. is one of the fecond. This may be furthes illutrated b: cxamining fig. $5,6,7$, which contiol of two bodies only, and werefore are not active combinations; and :Hfo ly exmaining fig. 8 and 9 , which conlifl of thace bodies, but two of them are of the fame hind, and therefiric aet as a fingle bouly. In the latt five figures, the c:apital letiers denote the bodics belonging tis the firft clalk, and the fnall keters thofe belonging to the fecond.

In the fingle active $\mathrm{g}: \mathrm{l}$ vanic combination, or the fimple galvanic circle, the two bodies of one clafs muft be in comact with cach other in ote or more points, while, at the fame time, they are cometed together at other

 ivy this aparatu.
lat iny memer of cups or ghfs timblers A, B, C, i) 1i, the is. Elll then about three fourths full with y of the faine folutions, which will be aftewtards do. Ahee, 2, that of comnen falt or fal ar merioe in wa1.f. To cae extremity of a bent brals vise foluer a !ace of zinc of about two inclics in sfameter, and to ihe other extremity of the fame wire, fuhkr in the fame amaer a ple of copper of the iume diameter. Thele comecting wirs are reprelented in the figue by the Fetters $a, a, a, a$; and the plates of the different metals ate marked with the letters $Z$ and $\mathbb{C}$, viz. zinc and copce. In arranging the plates in the veflele, it ou ht to eoblerved, that a plate of zinc and a plate of copper tolonging to different wires, mult he in the lame seffel, and never two plates of the fame kind. Thus in the filf velfel $A$, there is a plate of copper; in the fecond B , connected by the flme wire, there is a plate of zinc ; in the tame veliel $B$, there is allo a plate of copper, Ahich is connected by means of another wire to a plate of zinc in the third veflel $C$. The fame order and arrangement are to be obferved to whatever number of whtcs and veffels the feries may extend.

Suppofe now that the apparatus has been arranged in the way defcribed above, and the veffels have been filled with a folution of common falt in water; if the numUor of veffels he not lefs than ten or twelve, a light shock will be felt by immerfing one hand in the veffel, at one cxtremity of the feries, and the other hand in the veflel at the other extremity; as for inflance, by putting the fingers of one hand in the veflel A, fig. 10. and fuddenly plungiug the fingers of the other hand in the reffel E. The fhock will perhaps be more fenfibly Selt by previoully netting the palms of both hands, and taking a filver or pewter foon in each hand, immerfe the handle of the onc into the veffel $A$, and the handle of the other into the vellel E.

Tlee frength of this apparatus depends on the numher of lecies of plates and veflels emplosed. But it is whious that this feries from the nature of the apparatus could not be greatly extended fo as to afford any great inereafe of power. This occurred very early to the ingenious difcoverer, as an infurmountable objcetion to the ufe of this apparatus. The views of this philofopher in inveltigating the nature of galvanifm, feem at this time to have been chielly directed to the difcovery of intlruments or apparatus, by means of which he might le cnabled to augment its power. In the profecution of his inquirics, therefore, he contrived another appa1:tus, "hich was afterward known by the name of the galvanic pile, and fometime, but more rarcly by that of the voltaic pile or pile of Volta, from the name of the difcoverer. This apparatus is conftructed in the following manner.
rangement is to be ublaved througliunt the whole ferics.

Suppofe the metats to he employed in the confuction of the pile are zinc and copper, (and thele from views of economy bave been molt frequently employed),
 leather, of the fame dameter with the metallic plates, is to be prepared. The ufe of thele pieces of cloth is to retain the moifture, by meane of which the communication between the plates is fomed, and the galvanic combinations are completed; and in proportion to the length of time during which the pieces of cloth or other fubflances retain the fluid which they have abforbed, the geration of the pile continues. The pile is formed ly placing a pair of plates, one of zinc, and one of copper, upon a liand, the one imme stely above the other. Upen this pair of plates is them piacod a piece of cloth which has been foaked in fome faline folution, as that of common falt, or fal ammoniac. $\mathrm{U}_{\mathrm{p}}$ on this piece of cloth is placed another pair of plates, arranged in the fame order as the firlt pair. It makes no difference which of the metals is placed firl in the Serics, only it is neceffiary to take care that the fame order be preferved throughout the whole pile. If the feries, for inflance, begins with copper, it runs in the following order : copper, zinc, cloth; cop;er, zinc, cloth, \&c. to whatever number of pairs of plates and picces of cloth the feries may extend.

But if the number of feries amount to 60 pairs, it will be neceflary to have rods to confine the pairs of plates, and to retain them in a perpendicular column; for without this the weight at top would be lo confiderable, that the leaf inclination to one fide (and this could not well be avoided) would derange the whole apparatus. The rods which have keen employed for this purpofe have been fometimes made of glafs, and lometimes of wood. When wood is ufed, it thould be pretty dry, or baked, by which means its conducting power is either greatly diminithed or entirely deitroyed.

The pile being conffructed in this manner, its effects may be obferved, by applying the fingers of one hand moitened with water to the lowefl pair of plates, and then touching with the fingers of the other land moiltened in the fame manner, the upper pair of plates, thus completing the communication between the extremities of the pile. Every time that this communication is made, a fenfation is experienced, fimilar to a dight theck of electricity. The intentity of this thoceis in proportion to the number of the pairs of plates, the nature of the hluid employed, and the care with which the pile has been erected, or the time that it has continued in action. With a pile of 60 pairs of plates, the thock will be perceptible through the fingers, or the whole of the hand, and in fome perfons, when it is in full acivity, it will extend as high as the chlows.

In making experiments with this kind of apparatus, it will be found that 50 or 60 pairs of plates will be a fufficient number to be erected in one pile; but to increafe the power of the galvamic thid, a number of piles may be conneded tegether. This may be done in two ways; either by combining the feparate ndion of the difierent piles employed; as, for intance, if three piles are conitrueded, het the pairs of plates be arranged

A pile of moderate frongth may be confructed of 60 pairs of plates ol zinc and copper, eath plate being about tho inches diameter; it may be conllructed alfo with timilar plates of einc and filser, or of almofl any two other dithmilar metals. Such piles have been very conseniently conliructed, with hulf crown pieces and plates of zinc of the fame fize, or more conveniently with penny pieces and plater of zine of the lame dianeter. But of whatever difierent metals this kind of mpur tu is to be conituced, the fame onder of ar-

t'on 6 Atpu:tis ing fublance, is wires, pus from the top ath d istom A. of each to an," comanon wanductor. In thi cate ve have the actiua of three ditierent curtont of the gatvaric theid: Lut whatever manicer of pilcs myy beaployed, theis muthai action may be fo corrbinid, that the whole atiet may be produced by o e tirgie current. Suppoic the metallic plates of otie pice are at ronged in the following order; copper, dirs, chais; ropper, zinc, cloth, sic, then the plates of the fosonal muit be armanced in a difforent order, warely, zitic, C.pper, choth; zinc, copper, cloth, Sic. and the plates of the third in the hame why the firs, viz. conpes, zinc, cloth; copfer, zine, cloth, se. The three piles Leing thu arranged, let a metnliic conductor, as a hin of cupper or zinc, he placed between the tops of the firft and tecond pile, and a dimilar conductor be placed between the b temen of the fecond and third pies; and when they are thas connezted together, let the fingers of one hand noidened, be placed at the lowent pair of plates of the firit pile, and the fingers of the other hand, alfo moisened, be brought in contack with the upper pair of plates of the thind, a siolent thock will be feit. The thock wilt be the fame as if the whole mumber of pairs of plates of which the three praes are compoided whe fornated into a fingle pile; for the lame order of arrangement beine wotervet from the britum of the firit Ille to the tup, androm the top of the fecond pile io the bottom, and adain from the bottom of the tlasd pile to the top, the curnctit pation uniatermptedly through the whale coies, as if it were miformly ar. ranged in one pile.

The efect, of this nppatiatis may be tartier obfersed in its chemical aztion. It the circle is completed, or the commaniention betven the extremities of the appatatus by means of charcoal be formed, a fpark is prodaced. 'litis is Jone by attaching a piece of well pre. fared charcoal to a wire which communicates with one extrenity of the appatatus, and another fintlor piece of charcoal to another wire communicating with the other extremity ; if the two pieces of charcoal be brought into contact, thus completing the circle, a fpark will be obferved, and this my be repeated as long as the ativity of the pile continues. 'the chomical effects of fuch an apparatus are allo exhibited in the decompohtion of water. The apparat:1s for eheeting thi decompention, and the method of timis it, will be afterwards acicribed.

But it vias luor fomd that the en. 7 s of this pile, although when it is tint erected it portites coniderathe energy, in a very thort time it bec mes castremely secule, and at lat sitousther imperecotible. ilhis is owing to the nieces of clotis or otimer fuhtance which is interpoled between the pairs of plates beita deprived of their moiture, either by cvaporation, or by beimg f.pueezed ont, from the wei lat of the plates. The lattur eqle?t, it is owvions, mut be in proportion to the beight, and confeptently the incumbent prethem of the weper on the lower part of the pile ; and betides this, ite lirutil on it oozes ont, trichlen down the files of the nile, is itat the different pair of phates are lef puate t-

 fuled met. 1 mag be cxpolded. The renluanthis is, that

 betnean this mitu! and uaf ger. Ye mean an this ttat:

 as it is attendel wita a lub ci tiaceal, 1 , to he as much as polibluavodul. I monl oftone of the dimonfions of the propoled fates (in this cale futer inches), and about cotecighth of an ins's in thentads, is to te prepared; but one formed of brais fornd to anfwer the furpofe fill better. When tie metal is in perfect fultion, the pietes shontd be calt as iucitly as pulfibe, bucule, as the motal cools rapld?s, cavties and imperficione woald aplear on the formeston th dowing wnegually.

The plates of anc Loins prepared, plates of copper which rued not exccel we-tenth oi tire thicknels of the zine plates are to be cut out of a lleet of copper to the requifite dimenfons, viz. corcffonding to the fze of the zinc phates. The coppe: j'atea mut be selaced by hammering to a finouth and plane furface that they nay apply exacily to the lurface of the zinc phates, atadia in contact in as many points as poilitse.

The plates being thus pepared are to be toldured to Sonderng getler ; but it mult be oulerved that it is nur to be the phates. through the whole extent of the plate. it is found quite futlicient to folder them alwat wae fuorth of an inch from the edges. The folder empluged fur this purpofe is fott folder; and great precimbion matt ie oblerved that the union at tie edges be lo clece as to prevent any of the liquid win which the cella in the trough are to le hlicd fium thtering between the phates; for othernife the poner of ats action would be greaty interrupted or perhaps entirtly dentrosed.

The operation of foldering was perfurmed with confiderable tilliculty by mony workmen; at leat, it was found tha in many cales the plates were either not in contact when the dimentions were large, or the joints were not perfectly fecure. We are not ceitain in what way this oncration is generally performed, but we know that this dificulty has been obviated by the following contrivance. The infide angles on the edges of the plates, that is, on the fides of the plates which are to be united together, are filed away, to that, when the plates are brought into clofe contact, a timengular groove all round the cigre of the pair of plates remains. This grone is filled with folder, and the uperation is conducted in the ufual way. Plates foldered according to this contivance have been found to anfwer the purpole extremely nell. But this incoavenience is now tendered lefs emburraling fince the difonsety of rendening zinc malleable and thexible was made, for plates of zinc of this defeription are of a much mose 'qual thickneis, are thimer and fmoother, to that the copper can be brought into a clofer contact. The plates which have been prepred of malleuble ziac lave the copper folded over the elge of the zine plates, and in this way they are fecared without ditficulty, by foldering.

In whatcver way the pairs of flates are to be fecured, fo that they may remain in clole contant, they are after-

We hase already atfersed, that feveral columis or piles may be to confiructed as to have the tull effect of their combin d action, in the fame way as if they formed a fingle pilc. By dimilur manacement, diferent troughs or battericmaty be fo arranged as to combine together the evthet of each, as if they conftituted a fingle trough or battery. And all that is necesfary to obferve is, that to whateres extent the feries may be carriol, the furface of each of

## 33.

G $\therefore$ I, V
contruce the $\frac{1}{2}$ at of wed to the furface of a diferent :on it
A1: 大itth plate; ins for inhane, the zinc furface of one of the plates wat be comit.ntly oppolite to the copper furface of the next phate in the leries. The different troughs thus undorm'y armaned, are to be connected togethor by netens of metwhic condurtors. A tlip of ceppor, for jutance, about half the width of the trough, is inferted 1. it oppolite ex:ranitios in the cells of the tads of wo of the troughs.

When the plates are of very large fize, their weight, Ath that of the ruantity of fluid requirat to fill the , ellw, aenders the trough very unmanareable. It is then mecellay to fix it in a frame of fufficient fltength, to Cupport its weight by means of axles of brafs or inon, Gerit to the outhle of the Lox. By this contrivance the thaid c:un be calily poured out into a proper veflel, f'red mader the trounth.

We thall afterwards fipeak more particularly of the - fiecls of plates of different extent of lurface; here, ; anicon, it may be necellary to obferve, that in conn-- i.. ing tugether two or more troughs or batterice, to have the rull effect of fuch a number of plates as may te enoluyed, in propertion to the extent of their furt.ces, the tirtace of the photes in each trough fuculd be lie fime, othmorwite, if troughs of different extent of faft... be cmployed, the action of that trough which ITa i lerght farace is diminimad, and reduced to that of the a tion of the trugh whofe plates have the fimalleft + Wint c§ f...i.cc. 'I lies circumbance is neceflary to be - :.a:del te, for, if it is overlooked in the confiruciien 1: cumbination of difierent batteries, the effects will be io fectic as to produce dibppointment without the caule being hown.

In making capcriments with the trough, the commanication is to be formed betwen the two entsemitie, or the circle is to be completed in the fame way ns has teen alrcady dirceled in the maragement of the pile. For this purpole there is a projucting picse of wood fined to the upper edge of each of the ends of the trourh; this is perforated to as to admit a piece of wire which Fafics through to the fond in the two laf cells at the exiremity of the trougit. If then the wires are placed in this fituation, and the moillened fingers of one hand touch the wire at one extremity, while the moiltened fingers of the other hand ane brought into contact with the wire at the other extremity of the trough, a lhock will te felt; and in this way the circle is completed.

The other parts of the apparatus which are necheraty to conduct exgerimonts with a trough of this defctiption, are fo fample as farcely to recuire any particular defription. All that is watted for detlagrating metals is to have a bent wire fixed at one extremity of the trough, and to have a polihed plate of copper or ziric communicuting with, the ctice ext:enity of the trough by means of a tlexible vire. The metal to be dethagrated is placed $u_{i}$ un the bont wire, and the metallie
plate is brouglit into contas with it.
'1he apparatus fur the deconnofition of water is the following. A glaf tule, G, H, fg. 11. about three incher lung, and inch in dianeter, is funnilled with a tight cols at the upper ead $G$, through which cork the wire $i$ communicating with the upper past of the pile, paffes. It may be alfo furmiliced with a cork at the other extromity II, Lut this matt have grooves cut on
its fides, to s.llow the watu to efepe from the tube. The wite $k$ commanating with the bottom of the file, luiss thanh this cort; or without the cork at ${ }^{4}$ Prsuc. thin caremity, it the the is retained in its perrendicular pofition by any cther cortrivance, the wire K m.y Le puned within the thbe. iflanthis operation is to conmence, the thlie is to be flled with water, the cor'. at the uper evormity $G$ being made air-tight, ath then it is to be inverted, and the extremity $H$ to be place $\ddagger$ in a frnall cup or batu of water; after which the whe K bing intoduced, the circle is completed tetwoon the wires though the nodium of the water in the twe, the decompolition of which will go on as long as the communication and the action of the pile are contimad. This proceis will be obfersed by bubbles of arr elicaping from one of the wires, and rifing to the inp of the tube; or if the wires are of gold or of platina, kubles of air will be feen pathing from the extremity of both vircs, and this air collecting at the top of the tube, forces out a quantity of water equal to the fpace vhich it $v=c u_{i} i e s$. The lame experment may be made by mean of a 1111 hmpler apperatus. If the wires communicating with the extremities of the pile are introducct into a frall elals phial flled with water, and inverted in a balon of water, the lame procels of decona pufition will go on.

Lut in apparatu; which is rather more complicated, but at the fame time fufficientily convenient, is ufuall: employed for this purpole. A fmall brafs cup E , fio 13. is fupported by the wire $\Gamma$, which is fived in the hole of tite prejecting piece of wood D, at one end ol the trough; from the centre of the cup there arifis a pair of Lrats pincers, which hold a piece of wire of cold or platian G. Over the pincers is placed a glafis tube HI, which has at the upper evtemity, I, a buals caf, to the infide of which is fixed another piece of wire of gold or platira. The two wires faonld be at a little dittance from each other, as they appear in the figure. The tube is than filhed with water, and is inverted over the pincers in the brais cup, which is allo filled with water; and thos, by means of the water in the tube, a commonication is formed between the two wires. A wire prococding from the other extronity of the trough C , is comected with the top of the tube 1 , and, as loon as this communication is formed, the proce's of the decompolition of the water in the tube comnences; for the galsanic circle, or the commanication between the extremities of the trough or battery is completed. The gates, as they are diengaged from the wires in the tube, rife to the top, and the water which occupied the fpace now filled with air, is forced ont into the cup. This procefs goes on as long as the commanication continues, or till the furface of the water is lower than the extremity of the upper wire, when the communication is interrupted, and then the opecation ceale.

With thefe offervations we conclude what was intenc. ed to be fad conceraing the conftruction of galvanic apparatus. We had notice what may be farther nece. fary to bee exphaned, in the courle of the detail which is to be given of the experiments in galvaniim, or of the intluence of the galvanic fluid on animats, as well as its chemical eftects. We, therefore, now proceed, in the iollowing chapter, to the contideration of fome of thefe phencmena.

Chap.

Frients of

Anim 1 ciecataity.

Ir has been alreaty obferved, that the frit effects of galvanim were exhibited on animals; and indeed it was furpofed that thefe effects could only be exhibited by means of animals, and hence, from the coincidence which was oblerved with the propertics of electricity already known, it was denominated animal clectricity.

The firlt experiments which were made in inveltigating the nature and properties of the galvanic fluid, were chielly performed on cold-blooded animals. It was indeed from obferving its effects on them, as sc thall find afterwards in tracing its hitory, that the difcovery was firt made. This difcovery was made on the frog, and dince that time the frog has been oftener the fubject of galvanic experiments than any other animal. From being found in great numberi, from being conseniently got, as well as from the irritability of the mafcular fibre, as it is denominated by plyffologifts, continuing for a long time, it has perhaps become the deroted victim of thefe inveitigations.

We have already mentioned a fimple exporiment with a prepared frog, in which it forms the communication between two difimilar metals. When the fros, as in fig. 1 . is prepared, that is, 1 kinned, and the lower extremitics feparated from the fpine, and fuppended on the iron wire AB , if the extremities of the frog be touched with a different metallic fubitance, fuch as gold or filver, while this metallic fubftance is in contact with the iron wirc at the point $D$, the limbs of the frog Gre thrown into convulfions, and this takes place as oftein as the communication is formed.

Soon after the difcovery of Galvani, and after the refult of his experiments and opinions on the fubject of this difcovery was announced to the world, the attention of pliliofophers became much occupicd in repeating and extending thefe experiments. Among others, Valli, an

Experi-
ment of
Valli and the Ficneh philoto. thers.

Italian phyfician, indituted a feries of experiments, an account of which was commuricated to the French philofophers, who foon afier repeated them. As theie experiment, afford us not only a pretty full view of the eff.fis of the galvanic fluid on animals, but alfo the Hate of galvanifm at the time, we thall here detail them.

Experiment 1.-When two metallic coatings or fifps of metal, the one of lead, and the other of filver, were placed on a frog, fallened to a table, the conting of lead being placed on the belly of the animal, and that of liver on the pelvis, and a communication being formed by means of a illip or wise of copper, ftrong convulitive motions were produced in the animal.

Exper. 2.-The coating or tlip of lead which was employed in the preceding experiment, was removel, and the abdomen was left bare. The copper wire was then applied to the abdomen the fame way :s before; while its other extremity was in contact with the crating of tilver on the pelvis, convulive motions were fiill produced, but they were lefs fenfible than in the firmer experiment, and fometimes did not fucceed a: atl.

Exper. 3.-When two coatings of the fane metrl were enployed, it, for intais., filter or gold, the effects produced by means of copier forming the com-
munication, vicre fond

or tin, and the netal formien : .onntimative was Aven the f.me, no cfiect whatern :Hoth when.

Exper: 4-My hacin; the conso on tio : biam , in a horizontal direction, fiethet the feint ost contart

 brought into fu! contả with il . fu: ...e of the alj. domen, it was ublerved that they becatace ciually powerful as before.

Eyper. 5-A frog was hinexcl and cat tatafor feiv though the middle; the nerves of the this's vece 3.fl bare, joined tonether, and placed on: a lip of goli, while the thighs themeses were in contact with it piece of dilver. When the metallic conductor of copper was applied, ilight contractions were produced. It :"... found alio that contractions took place when both the coatings were of filver; but vhen contings of tir, copper, or lead, were fubbituted for the fiver eonting which furrounded the nerves, powertal contristion took place. The gradation obfersed in the ation of the mietals, is the following. Lead produced the ftrongett contractions, nest the tin, and lafly the copper ; but in proportion as the vitality of the atimal diminithed, the metals nere foml atio to 1 fe their power of producing motion. The metals which re thined this property longet were lead, tin, and zinc.

Exper. 6.-When plumbers lead was employed on each inde as a coating, and when the metal forming the communication was the tame, no effict was produced: but when lead of different qualities, as, for inttarce, lead of the affayer and plumbers lead, wah uted, and the metal forming the comnunication beiner cither the one or the other, very fingular effects took place.

Whale it was found that thefe two kinds of leact, by changing the different metals, were noo longer fufecptible of producing any etfect in one of the coating, filver, gold, bifmuth, antimony, or zinc, fubifituted? f the lead, produced very poserful contractions; and, what feemed Itill more fingular, when the piece of lead in the firl part of this experiment were reapplied, dighte convultions tool. phare.

Exper. 7.-After a thont intemption of the experiments on the fame animat, it ippeared that it became fulceptible of pretty frorig convalive motion, when the fame experinents were repeatid.

Exper. $\delta$. When the ablvanic power feemel to be nearly exhouket in the frog. it was found that the different mottl, when they rodaced, by their costact, new convultions, did not, when this eftect could be no longer prodared, leave to the anmal the poner of evhibiting anew any contractions with coating of the different hivds of lead, as in experiment 6.

Ei, pro. y. The following is the gratation of the dimmution of effect, till it entirely ceafed, when the phombers leal alyays formed one of the contings. With the afioyers le forming the other coating, the :ation buame feeble, and it at lat ceded. The nevi in order was in, the sent antimony, and fo on in the vider in which they afe named on follows: zione, coilter, gold, filwer. Iron, it was obfervel, had loit its poser of producing any effect hefore the antimony ; but whether it wat deprived of this property hefore lead and tia, was not afcertamed.

Exper. IC. - Zinc, on loning the property of exciting convulions in a frog, on which experinients had been made for an hour, was not found fufceptible of any further actios, what the communication was formed by mocas of lead; but it was oblerved as a rety geine circumblace, that contravtions were biill proaucel by this metal the monent thet the perlon enfaged in the eyperiment removei the conduator, and intermped the circle. This experiment was trequently - eneated.

Eqper. 11.-Ile urrer part of a frog which was Kimed, and dwind tarivelely, bad the crurd norves, $\Rightarrow$ in the furmer cymbiment, armed with a prece of lead, and $I^{1 / n e d}$ it a glats dilled with water, white the lower pat was y taced in another glaf, allo filled with witer. Strong contracaions vere protuced when the commanic:tion was formed by means of differeat zutors holding exch cther by the hanl, while two of them touched the water in the shalies. One of them Seld in his lad a piece of mot?, whith was broufh! int - ura.t. with the conting wiled.

Ev, r. I2.- IV hen any onie incividual of the perfons … A. An fan : the chain of commanication between $\because$ c tal ginen withdew himitt, fo the the com-- wicalion $\because$. isterrupted, n) cfiect was peraptible.

Fyp.r. 13-When the frog was arraiged in the fore wa, in expement 1 t. having is part placed ㅅ. two siffer, wo motion was cacitel when a communiLati : was chablifed with the tinge: ; tor was any foot n prodecel. whos a pesia witn ore hand armed with a ficce of 1r.t: 1 , twached the body of the frot, while lee browith a finger of the other hand in contact with the metallic conting of the mural nerves. But by placin; one inger on the indenior part of the frog, he tuched with a piect of metal the coatings of the nerves, powerfal contraćtions wele produc $d$.

Exper. 14.-When the animal was touched with a metallic fubikance in an infulated itate, no perceptible efiect was oblenved; but when the metals ceated to be infulated, very comfder ble motions were insariabiy prodeced.

Exner. 1 s. - The fore ley of a rablit was feparated from the brity; the brachial nerves were laid bare, and arned with a bit of thect leal. The communiEation between the lead on the nerve and one of the contiguals mufeles wis made with a piece of filver, and Arong convultive contacions took place in the limb; but when this experimut was varied, by lubatituting for the metallic confuctore, plumbers and affayers lead, no farther motioa was produced. When one of the coatings employed was lead, and the other iron, nio perceptible motion w:s oblerved. But when lead as one of the coatings, was employed with filver, gold, copper, zinc, or antimony, as the other coating, the motions and contractions of the limb wate renewed. The motions were very thight, which were produced by means of a coating of bifmuth, along with a coating of lead.

Exper. 16.-This experiment was inztuted to alcerthin the thate of the eleericity in the animal which was the fubject of it. With tinis view, the animal was plaeed in a veffll containing one or two of Coulomb's electroneters, and it was then fuccethively eiectrifiel, both pofitively and negaticely, and ia both of thefe cates the balls of the electrometer were to mush induenced
by the animal, as to fhew, not only that its clectricity was in a ifate of parect weit, both betore and during the time of the experimen, but allo to exhibit in the fy tem of the body on which the experinent was made, in a very ditina and thiking manner, phenomesa quite analogous to thofe of the Leyden phial.

Ever. 17.- The lett craral neve of a liviag frose being tied with a ligature fo trongly, the the animat was deprie 1 of the pewer of motion in that past of the limb below the pont where the ligature was fix d; but when the nerve was amed with a metailic coating, in the way decribed in the former experiments, and a communication was formed between the part of the nerve above the ligature and the mufle, the motion and contraction of the limb were excited.

Eu/tr. 18.- The ligature was afterwarls placed of: the leit crural nerve, and brought in contaet widh the rubfece. It was alfo fixed in fuch a way on the sipl.t cural nerve, fo that part of it projeeted : the left jum of the ammal thas then quite patatiote, and withont motion, and the comblive contractions whith were produred when the commanication was formed, were cietistly limited to the right fide; but when the lame lut chural nerve wan more complately had bare, and le. parated liem the mulcu'ar fubitance which furrounded it, its conducting power was rettored, ond the cummanication being ellablided, the convahive motions bearse pretty heons. When, however, the ligature wis again bruaght into conticit with the mufcle, the lime was again deprived of its power of motion.

Expor. 19.-One of the crural nerves of a frog being litid bare, was armed with a piece of flect lad; and a commanication having been formed between this nerve and the other cruall nerve, which was unamed, very flrong conva'fic motions were produced.

Exper 20.-When one of the crursl nerves was armed nith two pieces of lend at different places in its courle, and a communication formed between the two parts by a metallic conductor, violent agitations followed. It was oblerved, too, that the fame efficts touk place, when the whole of the nerse was laid bare, and completely feparated from the lurrounding mufcle.

Eng:r. 21 - A fimilar experiment was made on a hot-blooded living suimal. The animal iclected for this purpofe was a guinea pig; but when the communication was ellablined in the ufun! way, no effect folluwed, from which any thing precile or fatisfactory could be deduced.

With a view to difcover duing what length of time frogs, which were made the fubjects of thicie experiments, could refit their effect, and retain the mution can poner of having motion excited in them, Valli madeduced on a number of experiments. At ro o'clock at nisht hetiogs. prepared two frosr, which on the following morning it feven o'clock he found had become extremely fecbic, but not entirely deprived of the poser of motion. Slight convalions were excited in both by means of the galvanic apparatus; but an hour having elapfed, they ceafed to afford any farther lymptom of vitality. Nio effort that could be made, fueceeded in producing motion. In other cafes he prepared frogs, which by the following morning were found to be quite dry, and then no fymptoms of motion could be exhihited, Ile feparated feveral of the mulcles from the body of a fr $F$, and after hoving turs them, he found it impolible

 fleht nute th vere pudaced. A nember of lizerds $\ell_{L} \cdots, \therefore+\cdots$ wit inueco, exhibied, at the time of their deoth . comvilive motiras; but they athll contimued to after! fymptom of vitality and motinn on the andication of salra itm.

Aimals wese detryed in a varietr of wave, with ? vell of atceraming what were the effects of galvamina, afore the minciple oi ife leemed to be extinguithed. At
fonall bird, which was for ome time immeried in lydragen giv, or intlammable air, thewed no fymptoms of vitality of motion ; btt, on the application of glvanim, convulive contractions of it, limbs were produced. Two kittens were killed in azotic gac, and the fre lege were demated and prepared in the utad way The tame effect, were produced as in the experiment with the bird.
Some animals were defloyed with the extraft of bemlock; but it did not appear that the eflects on the application of the galvanic apparatus were at all diminithed by means of this poifon. In frogs which were ex, uted to the exhalation of corrupted animal matters, perceptible murions were offerved by means of galvaniim; but the were very fecble.

Mreati deprived feveral frocs of life, by placing them in the racuum of an air pump; and when thefe were fis ${ }^{2}$ iected to expeiment with the galvanic apparathe, binh: motions sere produced; but it was oberved that thele, although they fuhlowed each other in repid fuccelfion, were escied with fome dithiculty. Here it was found that the !omed was extravafled in the cellular membrane of the metible, by which ite tich was tinged with a deep red colour. Fo this cireontance was alcribed the feeble eflicets produred in the above experiment, as it was fuapolad that the bloul carried off part of the galsanic thad, an ! thas prevented is attion on the mulculn fibes, through the medium of the nerves. This opinion was fuyported by another expeament, which was made on prepare frous, in which there was non evtruafation of blood; and in thi, cale the galvanic eilects did not leem to be in any degree diminitherd.

Before proreeding fartieer with an account of the experiments of the particular efreas of galvaniion on atimak, we flall here relate two co a more genetal nature, the one with rogard the the ffe ta 1 s)luced by the peculiar application of the motallic conductor, and the other with reffect to the velocity of the galvanic thuil being increafed, without increating is, intemity.

A diference, which appeared to be a very fitughlar foct, was chirved in the mole of 3pply ing the nuctallie

 natued for fome time wichow man tion. Wi.len the co:ndiktor wac denuesed to a very fay. ll ditance, motion Was agnim excite 1 in the aninal ; fon after, however, this cualed. Bit when an inn lated continetor was bousht to tise mutciev of liee to of, the :m tiu:s we. immadistely sencwed; and *..... thry ysain ceaicd, : commanication being formed betwes =he oteretor himfeit :and the coidictor, the atit Fion, wete asinis evdied. The corn lunon vilicin lie decued from the above exporiment was, that lle palvanic inmonence is condtantly the fame, however vains the mades of itapplin ation. The anne refule, honever, he obterves, would nut be obt aned, if the experiment were madr on an aninal in which the primciple of lite was in Al.! vigour.

From a number of experiments which were made by the hame phytiologits, it appeared that certain intermain were neceffity, in order $t$, otain the itme intentity of action in animals fubjected the infuence of the gat vanic tluid. Frozs, mice, rats, and tortoifes, were the 1ubjects of thele expertiants; they were detinoyel hy matis of different puifon, or hy refpiring fome of the noxious eratr. Ia applyine the suranic appatatas ! thefe animals, an interval of feveral minutes was refuited, when the motions extised lucame fecble, or inai neariy cealed; and then, after this interval had elate?, the fam? effect, and almott ennal! powerfiat on betur, were protuced.

With regard to the conlucting poncr of the btome venck, two questions were propued to Valli, by Vime I)'Azyr. I. Whether the blood-vetiels ate to be c ... ndered as conducturs of t'se ga? vanic tuid. An!, =. Whether, by corting the blout-vailels intiosel wit.. nerves, any manion thasuh their medium cousi be ex
 that the biood-venes ate untoulted? to be continnt is condurtors of tlie galvonir ditid; but in whit.. in = way this is effected, it leonin to be throusi the. nerves alone, in condequence of the : 7y in whin of ? are dipoled, that matcular mution can be caci- I. Efiecte of the defioftum. The memerancs alf, poliefs this conGalvanion $\underbrace{\text { uns Animix }}$ ducting power; but exhibit no mutions when the comnanication with the nerves is interrupted.

It had been oblerved, that the nerves, when dry, exhibited, by means of friction, fome fymptoms of elcet :icity. With a view to afcertain whether, in this dry late, the nerses were conductors of the galvanic fluid, and whether motions could be excited through this medium, Valli made feveral experiments; but in all thefe he was amfueceffful, for no motion was produced. In a ferie of experiments which were made on fowls, he found that ligatures applied to the nerves, did not prevent the contractions of the muicle, provided thefe liGatures were not applied to the nerves in immediate contact with the mutcles.

In order to afcertain what would be the effects of the gahanic fluid on animals which were drowned or foffoc:ted, Valli made a number of experiments. Several pullets were drowned, and kcpt fo long under water, that no fymptoms of life appeared. By the application of the galvanic apparatus, mufcular contractions were froduced in fome, while others, by the fame applicattion, exhibited no motion whatever. The fame experiment was repeated on fix pullets, which were alfo drowned; and on the application of the apparatus, flrong convulfive motions were produced. Thele continued for neatly the face of an hoor. In others which were allo drowned, the brain and wing were laid bare; and after this previous preparation, when the galvanic apparatus was applied, ilrong mulcular contractions were excited: none of the animall, however, as was expected, were reftored to life. Similar experiments, followed by the fame refult, were made on rabbit.

Several pullets were eapofed to the action of different gafes, as hydrogen, nitruas, and azotic gafes, and did not afterwards, by any mechanical itimulus whatever that coull be applied, exhibit fymptoms of life. The calvamic apparatus being appled, very feeble contractions wer produced; and thefe fucceeded each other after long intervals. Similar experiments were made witl the lame view, on fross, and it appeared that theie animals could refitt the effects of tho gades better than the others. Nitrous gas, he found, was more injurious that hydrogen gas. In fume of the frogs on which the experiment were made, the application of the salvanic apparatu- produced violent agitations; but having repeated three or four ilocks, no firther motion could be excited, not even after fome interval had elapfed.

To afcertain what were the effects of different kinds of air on animals fubjected to the gal anic apparatis, le feparated the hinder extrenities of a frog, expoled the one to the action of nitrous gas, and the otber to that of atmof perical air. Alter being ful.jeted fir a thort time to the action of thefe airs, the galvanic apparatus was applied. Contractions were p.oducel in 1 th ; but thofe which were induced in the limb expoled to the nitrous air, were feebler than the other; and when the action of the nitrous air was contincel be. yond a sery limited time, no motion whatever could be cacied. 'the tome experiment was made on limbs expoleal to the action of hydrogen gav and it appeased that ive effects in deflesing the irritability of the met. cular hare, or in diminibing is fufergubility of being teted upen by walanifa, we.e let foreaful the: the"

fecks on froge fomenhat fimitar. The heart was indeed Elezt of berved to palpitite atter the death of the animal; Gavamim but, in general, the contractions which were induced on Animals. by galvanim were extremely feeble.

It would lead us too much into detail to mention all the experiments whin were made by this naturalif. We fiall theretore only add a hort account of the general refults.

1. In fros newly killed, he found, that a fingle me-Remit of tallic conductor was fufficient to excite convulive con- Vali'sextractions; and that in producing thefe motions, it was penments. not found effenially necellary to apply a coating either to the mufcle or nerve. Sciffars, in which the tteel appeared to be of a bad quality, might be fuccefsfully employed as a conductor ; but gold, filver, copper, lead, and tin, in general, produced no effect.
2. The galvanic tluid was found to pafs through glafs and fealing wan; but it was necelfary that theef fubjances thould have their temperature confiderably increated.
3. Water, in which the temperature was pretty high, or when raiied to the boiling point, feemed to prevent the effects of galvanifm from taking place, or at leaft diminithed them greatly.
4. Water, the temperature of which was very much reduced, feemed alio to be deprived of the property of conducting the galvanic fluid.
5. It was found, that when an individual formed part of the chain in cafes where the galvanic apparatus was applied to the prepared feet of rabbits, cats, and dogs, the latter were unfufceptible of motion.
6. The diaphragm of a dog was immierfed in a veffel of water, and fo placed in the vellel, that the phrenic nerve, previoully armed, projected from it ; and on touching the coating with a piece of gold or filver coin, while one of the fingers of the other hand was put into the water, feeble contractions were excited in the mufcle. In fome other experiments on the fame mufcle of horfes, it was found that no motion could be induced by means of galvanifn, while the fame power, with the fame intenfity, conftantly excited contractions in that of dogs.
. A metallic wire, which was entiely covered with fealing was, procuced no motion in froge, which began to be exhautted when it was empioved as a conductor. This was ftated by Valli, as a proof that the galvanic fiuid paffes along the lurface of conductors.
\&. A ligature on the nerve, when placed near to the mufle, or in contact with it, interrutted or diminilhed the effeets of gatranifm : it was found alfo, that it ligature, applied in the lame way, prevented the effets of antiticial clectricity.
7. A ligature was applied, at a fmall ditance from the mulele, to the crural nerve of a frog, and another was prepared in the fame way, but withont any ligature ; thefe being fubjected to experiment, it appeared that galvanim produced a more purceptible action in the latter than in the former.
8. Weak thons of artificial electricity produce motion in the mulcles of thent leg only where no ligature ban been applied tu the nerve ; but in the other, nutiouI. commactions cmine evitud means of the galsaITe appatus. Vrem ti:-calcriment, it was attempted to beluce a motherd of whe rimg the intenfey of galsa-

Effect of 1 ifm to calchiation. If, Aur cample, it is toumb that
 on Anturn monting to nive, fi, or ferch deren and this power is bufticient to cacite contastion, whec ticy are youduced by mean of galvanam, it masy le fial that the latter is five, iis, of fisen degreen citulger than the former.

1t. Valli did not fuceed in efoeding the mutculat contraction of the heart by means of galsuminn : ner did he fucceed in finilar experment nade on the fiomach, intetimes, u: bladder, ahhough be anmed or apfied metahie coating to the nerves of all the of grans.
12. To produce contrations in the wing of a fonl, the nerwes of which were coat 1 and previonly decenel an oil, very premful thot:s of artincian elesticity were found requitic ; but the cluats of the gavanic aide did not, by this procsis, lem to bo at al diminilied: it netaiped is wh le energy.

Fohama, in bis experments and inverigations on this fubjec, found, that he could accelerate the mo. tions of the heart, when thefe motions were song on; and when ti.e moitons had ceafed, could briar it to Froduce contanims. By placiag the heats betweat two pleces of metal, zinc and antimony, to that it hall Le i: contact with both, and then forming a commenication ty mams of a met llic conductor between the iso metals, its modions are escited, even after it is teparated from the body and cat in pieces. Accordings is the esperiments of Namgha, pest of the heart of a sowl, phaceal on a piece of charecal, and another portion put on a picue of 1 ? ? eboard, covered with timith, gave repeated contractions, and was frongly convulied.
M. Detametherie made a variety of experimerts, at a

## by Detame-

 there, very early periok, on this fuljest. The folluwing are fone of the gene:al refults of the fe experiments.r. He found that the crecets of galvanitio in a prepared fitg were feetble.
2. That it polleffes the greatef intenfity at the time when the animal has been jull deprived of life; from this he infers, that the iatenfity of the effect muth be greater in the living animal ; from which he thinks it follows, that it is only by means of good conductors that the galvanic fuid cain be conveyed from the nerves to the mulcies of a frog; and it is by means of the metals, which may vary in the derree of their conducting power, that this commaniction is eftablibed.
3. Plumbago and chazcen were found to be inferior in their conducting poser to metallic futhances; but ty their means the galwaric thal could be conveyed from the nerves to the mailes of a froys.
4. He did aot find from lis est vinents that this effeet could oe yrefiaced be formine the communications by reans of anims: fiflance; for when a perfon teuche! at the fame time the nerves and mufcles of a froc which had been. laid bare, the fame eflect did not fullow.

Volt, wher nome las laten already mentioned as the inventor and inyrover of the apparatus by means of which the galwanic fowter could be great? increafd, "as, at the fame tirae, oue of the molt zenlous and the nod indefatizable inguecrs into it anture and properties. Ti.e vews which this plikfopher entertanied with seand to the sature of this iluid, we diforent
 ori, impliy, cathbit a irin of evetul invelligation, and Galvanten have hovid at an evt !lent ficmatation on which the fis on Animate, pertiractare of ababion was quichly aided. We hatl therefole sive a pretty full detail of the experimen's and rataing of thi, phil forher; and from the imporance of his wews, which we have thated above, it will nut be ki, accutable to the reader, if this detall be diven, an ve propofe to do, in his own words. In the, insed, fomethind of what belon": to the fecond part of this t:catife, will be unavoiddily anticipated; Lut the dacrifice of flime method to perfpicuity, wil!, we are perluaded, le wathy admithed as a duthicie" abratey for thi dicriation.
'lo underland clearly the peculiar views which Voite has combered ia the oblervations which we hate now reiknul in, it will be necelaty to anticipate a littic father, by diating, that, according to Galvani, the And which bear, his name is a peculiar kind of clectricit, "hifh rudes in the organs of the animal, and is chentaily and inleparaby connected with them. Bur, according to the theory of Volta, the whole phenomena of the galvanic fluid depend entirely on arinicial clec tricity, which is excited into action, or put in motion. when conducions of a different nuture are brought int. contact ; and thete, he thinks, are to be conderel as the primary exciters. The motion of this fluid is induced in three different wats, that is, by means of three conductors at leaft, winch are of a dillizent nature, being fo arranged as to iorm the communication or circic In the finf way, two met als or conducios of the fint clats, of a dillimilar nature, are employed. Thede are brought directly into contact by one of their extrenities; but the communication between the other extromitics is ellabilhed by means of moit conductors, or condutiors belonging to the fecond clats. This thuid is put in motion in another way, by a fingle metallic conduztor of the lint clats, placed between two moill condaiturs of a difimilar nature, between the latier of which a communication is eftablibet. In the third way of exciting the action of $t^{\prime} \therefore \therefore$ fluid, or purting it in motion, a cormmication is formed among three conducturs, each of which is of a different nature. To iilatrate the variety of ation oblerved in theie conduct ing fubitaces, the foimwing account of the experiments of this nat tralift, with his views and realonings, was communicated by him in letters to Gren.
" If a tin batin, fays lee, be filled with foar-itule, lime water, or a thotg ley, which is itill better, and if you then hy hold of the balon with beth your bunds, having firat moitsted them uitir pure water, and apply the tip of your tor"ue th the thaid in the bafen, you will immediateiy 4 fombie of an acid tate unon your tomgue, which is in contant with the alkaline liquo: This tade is wry peeantible, and, for the monewt, pretty thong; $1, \ldots$ it is changel atiornords into a dit. ferent ons, lefs acit, but most filine a'd poucer:, wr:i it at lat becomes alkatiec aro! !nato in :racorian as the lhad acte more upan the tonowe, and as lie activity of its peculiar ta e and its chemiol pnower, wore called forth, produce a gearo offiet in aword - uthe lenfotion of acidity ocentioned ly the ftre mo of the electuc theid, whech, by a continuel circulation, paike from the tin to the alkaline liquor, thence to the tongue, then danough the perfor :. the water, sad thence to the

Exth of un agein. I explain the phenomenon in this manner, da.serim according to my principles; and indecd it cannot be or. Anima'
riolained in any other, as crery thing tends to contimm matertion, and to prove it in various ways. The cound uf difierent conductors, particularly the metallic, at chaling pyrites and other minerals as well as charcoal, winch I call दry cordugore, or of the fren clafs, with nanit conduators, or conductors of the fecond clifs, andetes or difturbs the electrir fluid, or gives it a certan impule. Donnt aik in what manner; it is enourh that it is a principle, and g general principle. This impulie, whether proweed by attraction or any otier froce, in different of unlike, both in regard to the different metais and to tixc difierent noint condutors, fo that the direction, or :ut leat tie power with which the mectric fuid is impelled or excited, is difierent when the condacto: $A$ is applied to the conductur $B$, and to arnilier, C. In a perfect cincle of conductors, where either one of the fecond clafs is placed between two different fom earh other of the firft clafs, or, contratiwile, one of the frit clafs is placed between two of the fecund claf diferent from each other, an electric thream i- occafioned by the predominating force either to the right or to the left; a circulation of this tluid. which coafe only when the circle is broken, and which is aenewed shen the circle is again rendered complete. This methed of connectirg the difierent conductors will be more readily compreheaded by turning to the figute, where the capital letters denote the different conductors or exciters (moteurs) of the frit clafs, and the fnall-letters thole of the fecond clats. Fir. 3 . and ; exprefs the two cales abovementioned.
"I conider it as almolt fuperfluous to obferve, that when the circle coniits merely of two hinds of coniuctors, howevar different or however numerous the piecer mav be of which each confits, two equal powers sre eppoled to cach eher; that is, the electric Huid is impelled with equal furce in tho different directions, and conequently no tream can be formed from right to $k$, or, contronvile, caval le of exciting convulfive mevanchts.
" it here ate other cale", howevel, and other modes if combination, where the powers are equally in equiibsium, and where no current of the electric fluid can the flace; or, at leaf, none of fuch a rorce as to make an inrrefion on the tendereft nerve, or to eacite ant convive movement in thic beft prepared froe that thy be placed in the circle, notwithtanding the inter velifion of two or more difcrent kinds of metals. 'This in the rafe when each of thele metah is placed between two moill cunductors, or of the fecond clais, and which are very nearly of the tame kisd; nr when, in a circle of thee prece, two of them of the fanse metal, and one of a different metal, are fo comected, that the latter iinmerntely betwen the other two.
" When one of the ends of a piece of rat.al, whin is a cunductor of the firf claf, is immedintely inntind to ansther of the fame chafs, but, inftead of imme linte?y tomeling with the other end, the ether piece touch's at iin. rme liate $c$ ondufter of the fecond claf, eitles great or fmall, either a drop of water, a piese w faw or toiled fle hh, or of fuonce not meint, pate rit meal, itle, tutio, theefe, or the white of an egrg boiled to hardects; in this new conbination, where a conductor of the fecond claf is betheen two of the firt claf, the powers are no
longer oppofed to each other; and this is fufficient to Exect of determine an electric ftream. When, therffure, a pre- Galvanifn pared frog is placed as the conductor of the fcond onanimatso clati, it will alway be violeatly agitated as oiten as this circle is made complete.
". It may be readily perceived that the two latt exferiments coincide with thote anncusced by M. Humboldt, where a drop of water, a finall bit of frelh mea, or a very thin ffratum of any fiuid, performs the whoie wonder. When anoiles drop of water, or a:y other aqueous conducior, is applied between the other end of the firl conduetor and the other correfyonding ficce, each piece of metai is infulate3, as I thall evprets it, betwern two aquaus condutlurs; but then the powers trom right to left, and from left to right, are again completely oppofed to each other; contequently the electric Atream is impeded, and the frog remains without any movement. le is, therefore, abfolutely meceliaty that two different metais or conductors of the firth clat, mond be in immediate contact witin each other, on ti.e one Lide, while with thicir oppofite ends they touch conductors of the lecond clafs.
"We might confider this mutual contact of two different metals as the immediate caufe which puts the electric thad in motion, inflead of afcribing that power to the contact of the two metals with the moit conductors. Thu, for example, in fig. 3 . imhead of ahmitting two different actions, at lean, in regard to the magnitude of the power, one where B comes in contact with $a$, and ano her where A comes in contact with $a$ allo, by which an electric current arifes in the direction from A to $B$, we might fuppote only one action at the point where B comes in contact with A, which impels the fluid in that direction. In both fuppolitions the refult, as may ealily be feen, is the fame. But though I have reafons for adopting the firlt as true rather than the lecond, yet the latter reprefents the propontion with more limplicity, and it may be convenient to adlere to it in the explanation, as it affords a readier view of it. We may then fiy, that in the cafes above flated, no effect will be produced, becaufe here there is no mutual contact of difierent m:tals; the efiect alfo will be null, when a conductur of the firlt claf, on two oppufite fides. is in contact with two others of the fame claif; for the ations therefore are in equilibrium ; and, lanty, that an electric current will be occafioned by the action which anifes from the contact of conduitors of the firit chais, and which is counteracted by no other contact of the like kind.
"Having feen the refult of employing three pieccs. of metal, or conductors of the firl clas, viz. two of one kind and one of a different, when combined formetimes in one way and fometimes in another, with cunduesors of the fecond clat, we dhall now try what will be the refint, according to my principles, with Epur pieces of metal, two of which are ot oase kind, for example, zinc, when cmacted with muit condugurn of different kinds.
" I hall firlf oblerve, that when they are connested in a circle, the powers which endeavour to put the cleitac fund in a ftreaning movement, will be oppined to each other, and in perecte equilibrium, and that confequently no movenest can thke place in the frug, here fuppofed to be the moilt conductor $a$, or a past of it. however isritable and well prepared it may
 Galvorime necelfary precouthon, io that the ractas, in paticulte, be en Arimals very clean and dry at the pent- of costect, it will pes fectly confirm what I have above fin, the fore will es perience no agiation, no conveinive notment.
 as might be forecen irmm $n y$ prixiphe, ato whan I umitted one of the mitile vicus, as whe"ged the. ondet.

* Te onductors ei the Comen chin, whish, inall the teures, are conoted sy fmall lettere, m:y be cup with water, in which the chts of ine pieces of matal denoted by the largelettes, are inmerted; or ponges or uthor ludies whith have imlated aquentis matane.
 cicc or more pece, puricd they in in proper cont.... ; they ra, alio be perne, if that thin be nobitened at the yaats of cont.ett, Ne. Ny the let mothou the experiments anl te sety eantiful and incenme, when the circle comats eis that a moee perivas I have fommed

 of $11 \%$ er and two of ion, tim, and potticulaly zituc, I he change of effict, wher you chang the cumbection, is tiriking.
" Let the poftion be as reproieta in fig. Iq, where $g$ i the prepared trog, which the two perlow $/ / h^{\prime}$, hold in their hathes, onc on the one fice $L y$ the feet, and the dher un the opponte by the rump. $\mathrm{Z}, \mathrm{Z}$, are two plates of ziac, which are betd allo by thele pertions, and $1, A$ two ficus of nilver, which ane held by a third perion, lenoted allo by $p$. It mult not be forgutten that the hands hould be very moift, as the dry inin is not a confuctor fuficiently itrong. As in this chain the actions of the electric exciters are oppofed to each other, and in exact equiliorium, as may be readily perceived, no convohtion or agitation in the frog will take place.
. Now, let one of the metallic piece, $A, Z$, which fand between the two perions $F^{3}$, or between any other moilt conductors, te left in combination as it is; and let the pofition of the two other metallic pieces $A, Z$, be revelied, by converting fig. 1.4. into fig. 15. (io that the actions, inited of being contrary, will at together to impel the electric fuid to one lide or to produce the fame current); or introduce between A and $Z$ another yerfon, or any other conductor of the fecond clafs, fo that the cham be formed as in $\mathrm{i}_{\mathrm{n}} .16$. ; or take away one of the pieces $A, Z$, in fig. i $\downarrow$, and make the chain like thofe of ing. 17. and 19.; ur, in the lat place, renore the whole tso picen $\therefore, \ell$, cither in the one or the other did:, as repmetemol ine. io. (by which mean it will corvifond with lig. 17. at the whole chain $p, g, p, f$, nay be condidend is a tim le moin conductor of the fecond clati.) In all thele rombinations, which ate repteiented by fis. 15.16.17. 13. and 19. the aftoms aring from the metallic contat are no longer and rary to each obher, or in equihibrium, as they were in thg. ta; confuqutly ath electric itream is produced, and the fioe k, which I fobucte to be properly prepared, and whin foums a past of the chain, sill be vi, ently agivated a oftom an the eircle, when bruken at any one place, |amiculaly be: theen metal and met ${ }^{1}$, is again relloned.
" In regard to the experiment where a moif conduérot, or une of the fecond clals, is to be introduced

two

 0 A $4 t$ isis's. at enther fite to moift conduc) nre, or condat of the fecond clas. This metho! bas been comen ols enployed fince Gralvan's difowry, ad is in crot Fomention wh the diverity of metals, on which 1 ennor the "hole pheameme to depent.
"The nifer methen of combination, which is exmand !. for 4 . or that of a mettl placed between two "infern meft contuctore, for csamphe, between water on the one fide, and an aqueors, faponaceous, or faline What one cther, I lifenvered in the atumn of 179+; and though fince that perind 1 have repeated the much viriel e periments of difierent perlons, hoth forcigners ond uticre ament which was that of Humboldt, and thous 1 I wrote to feveral corrdpondents refpeefing it, that his hit has not yet been thrown on this new phenoh..ench which it feoms to deferve.
.. The fingular circumfance before mentioned, in trard to the acid tafte, when the tongue is brought in on comet with an alkaline lipuid, belonse, as you " . . perceive, to thi fecond methol of excitias the athe dab, and prating it in circulation (if the tin " "t 1 be trachad an the outfice by the hand moinered - ith wate, and of the in ble by the alhaline ligun), ad.ews that this carrert is no lefiftrong and active - hat excieed by the firt method, viz. by emolyine the fiffientily well chofen metale, fuch as lead and copper, fron and fitver, zinc and tin. I mult hare obferve, that though with tin alone, placed betweon water and an alksline licquor, you obtain nearly the effect which is prodeced by two of the moft dilferent metais, as filvor and zine, combined with any conductor whatever of the ferond clafs $;$ you can ohtain the fame, and even in a higher degree, with iron alone or filser alone, when the iron is int:oduced betwern water on the one fide and nitrous acid on the other, or when the filver is applied betheen water and a folution of fulphur of fot-afh.
" If you t.ke a fror, the bead of which has heen cut off, and which has been deprived of all life by thrulting a needle into the fimal marrow, and immerfe it, without thinning it, taking out the bowel, or any other preparation, into two glaffes of water, the rump into one, and the ley into the other as ufual, it will be firougly agitated and violently convulfed when you comet the water in both glafies by a bow formed of two very different metals, fuch as filver and tin or 'ead, or, what is better, filver and einc; but this will by no means be the cafe when the two metals are lefs different in regard to their power,, fuch as gold and filver, filver and copper, copper and iron, tin and tead. But what is more, the cheet will be fully produced on this fo little prepared frog when you immerfe in one of the two glaftes the end of a how merely of tin or zinc, and into the other glafs the other end of this bow, which has been rubbed over with a little alkali. You may perform the experiment ftill better with an iroa bow, one end of which has beeen covered with a drow or thin coating of nitrous acid; and bevond all expelation, when you take a filver bow having a little fuphlur of potafi athering to the cad of it.
" lig. ${ }^{21}$. reprefents the form of this experiment, where $z$ is the from, $a, a$, the two glefles with water, A the bow formed of one fingle metal, and $m$ the drop
or a thin tratum of a mucous, faline, Sic. fuid, with which the bow tas been rulbed over, and which on
t'in a' i, betwen the mel. and the water.
". The very c federable diffrence in regard to the rumaty of eilect in the before-memtioned experiments atren thers, that it the claciric itream e:cited by contact is itronel? tonards a ceitim metal, when that notal is placed lectween a cettan thid on the one fide, Wh atumer thid on the other, there are other tluids which produce a ertater efint with another hind of me al ; fo that it will be necefliry to difcover by elpeAment the particular arrangement of conductors luited to each metal, in which the fluids or condutors of the fecond clafs mont be difpofed according to their activity. I have paid great attention to th's circumflance, and have formed feveral tables, which 1 thall publith as foon as 1 have bronght them to perfection.
"I Gall lere, however, only olferse, that in order to clas, in fome manaer, the innumeable diferent mait condutors of this kind, I diftinguib them into aqucous, firituous, mucous, and getatinus, facchaniac, faponacemes, foline, acid, alkaline, anl fulthurcus (livers of fulphur liquid; that I mate fuld divisons in the acids down to the bell known timple nineral acide, (as I find in this refpect oreat difierence betucen the nitsons and the mariatic acids, comprehending the principal vecetable acids and the acid of gath; and do the lame in recsard to the faline lluids, aceording as they are folutions of neutral faits, earthy falts, and particulaly methilic faits.
"When it can be determinet in what order all the.e kinds of Huids follow each oher, in resard to the power in queftion, for the metal A. and another for the nutal B, \&c. we fhall then be in a condition to detergine what place mut be afigned to a great mumber of other beteogeneous fluids, whether minezal, vefotable, or anmal, which belong to feveral of the above clatits. In general, the order for the greater part of the metals hitherto obletved is as follews: ili, | ure water; 2.l, water mived with clay or chalk (which thews a pretty different effect when the before-mentioned experiment is made with two glafles, a bow of tin or zinc, and a properly prepared frog, which has a fufficient desree of vitality) ; 3d, a folution of fugar ; $4^{\text {th }}$, alcohol ; 5 th, milk; tith, mucilaginous Hluids; $7^{\text {th }}$, aninual gelatinous tuils; 8th, wine; gth, vinegar, and other vegetable juices and acids; 10th, faliva; Ifth, mucus of the nofe; 1ath, blond; 13th, brains; 1 the, fulution of fait; 15 th, foap-inds; 1 oth, chalkwater; 17th, concentrated minerai aceds; 18th, firong alkaline lew-; 1 oth, alkaline finid; 20 th, livers of futphar. With tome matal's there is, however, a confiderable deviation from this order, in regrard to livers of frlphur, alkaline fluids, and the nitrous and faline acids.
"As to the metals, which in their moffion betweet thefe different fluids are more or lefs proper for the eleciric effet in quelion, I have found in general: that tin exccen all others, and that ilves is the worft; excent when one of the lhid betnixt which the fiver is placed is water, or any other nquenus conduqtor, and the other liver of fulphur: in this cafe filver far excceds zinc, and even tin. Iron alfo prodices a mach greater eficet than any cther metal, when it is in conthet, wh the one fide, with mecre water or an aqueous conduafor,

## Fart I.

Eficets of conductor, and on the other with the nitrons achi, G.tvaning were it even only a drop. The excitement occanimed $\underbrace{\text { en Animests }}$ in both cafes is wonderful ; fince it exceeds, as I hate
alread. remarked, that produced, according to the ufual method, by means of a double metallic bow, everi of different metals, as zinc and filver, applied to condutors of the fecond clats of the lame kind. It is fufficiently theng and porroful to produce convulife movements in a half-prepared frog, the botels of which have not been taken out, when one of the two moint condecters is a concentrated alkaline folution, and the metal placed between them is zinc, or rather tin. With other metals and other Huids you can feldom procuce convulions in a frog, if it be not perfectly prepared, or at leat embowelled.
". The reader will readily perceive, that when a bow of one and the fame metal touches with both it, ends the fame linisd of faine water, the fame acid, the fame akalive fuid, \&c. an clectric ftream will not take place, as bappens alfo when it touches on each fide merely wa.ter: in that cafe two oppoite actions are oppofed to each other, and keep each other in equilibrium That thefe contrary powers, however, may be in perfect equilibrium, it is neceflay that the thids applied to both ends of the homogeneots metalline bow be caacily of the fame kind and of the famc itrength. For this reafon the mott careful attention and a certain dexterity are required, in order to enture tuccefs to the expriment, which I have often ferformed to the great aftoniliment of the fpectators, and which any one may repeat as was done by my friend Humboldt. That philofopher has already publifhed fome of the mott ftriking and decitive of thefe experiments in his fecond letter; and I fhall here give a more particular account of them.
" Ilaving placed a completely or only half-prepared frog as ufual in two glafies of water, take a very clean bow of filver (it will be beft when it has been wallued with water from the glafies), and immerfe both ends of it at once, or the one after the other, in the glafles; no egitation of the frog will be occationed. Repeat the experiment, after you have daubed over one end of the bow with the white of an egg, liquid glue, faliva, mucus, blood, a folution of tartar, or any other thad or conducting fubttance futiciently different from pure water. Firft, immerfe the pure end, or that moiftened merely with water, in the water of one of the glate, ; and afterwards the other end, daubed over with the above fubtances. in the water of the other glafs; you will then infallilly produce a convulfive movement in the frog, and feveal timen in fucceltion, if you draw out the bow and aysin immerfe it until nothing mare of the shove fubtances is left adhering to the metal, or until the wetal, with its ends in booth the glafies, touckes only pure, or nearly pure, water. Daul, both the above fubitances uniform'y over both ends of the bow, and immerfe them at the fame time in both the ylatios of water, and no convulions will arife. They nill often be produced in newly prepared and highly :nitable froge, when the faline iluid, or in general, the fumance with which the two ends of the bow are iabsed over, is not perfoclly the lame, or when the fubtance at the one e:id is more diluted that at the wlor, \&ec. Wah and elan carefully the one end of - he :, ', daub wer the wher more or lef, anid convul-
 complete by the duble inmertion of tie how. (em G.an
 the firt experiment.
" lor comprative enperiments of tha : Bin?, I would
 becaule the later ate tor foon dinfived in the water. It oft-times haperis that the convulinan of the frog, when it in completely prepared an! lighty intable, take place, though both endu of the meadly late are daubed orer with the fime hind of fline tat. The caufe of this is, that when one eal is immerie! in tis water after the othe (ard it mas be canly fien that it is impolible to do fo in a morient with iufinicut ac. curacy), the one end of the bow lofes a portion of its faline fubftance fooner than the other, or at lant the aihering part is more diluted by the water, fo that the fluid with which both ends have been daubed over is no longer the fame.
" For thefe experiments I would alfo recommend filver, as a metal that is lef liable than others to be atached and changed by baine and other liquils. Tin, lead, coppor, and in particular iron, are more fulcoptible of latting variations; fo that bows of thele metals, and of irom above all, etain for a long time the power of producing consulhow in a newly prepared and highly irritable frog, even whei both the ends of the how are immerfed in two glanes of water, athough the places of the metal, attach by any of the faline tluids, have been carefully wathel and cieaned. A fugerficial alteration in the metal is fufficient to produce this change, as may be canly feen. Thefe variations often fhew themfelves to the ese by a yellow blachih fipot, \&c. which it is difficult to remove. 1 do not here fpeak of lating variations, that proceed to a greater depth, which can lic produced in the end of the metallic bow, and particularly in iron, when its harduet is changed; a procel, by which fuch a bove ean be rendered capable of produciny not only convulions in fross, but alio a particular fenfation on the tongue, and lipht before the eyes, if both its end, made pericitly clean, are only brought into contact with pure water. Thefe, and many otier experiments of the like hind, form the chici fubject of my firit letter to the ablee Valalli, proflor of matural philolophy at Turin, written in the beginning of the sear 1794, and afterwards publihed with the other in Brugnatelli's lournal.
" If tiver be lef expoled to be att ached by fatine and other fluid (execpt by liver of fulphur, which inftantaneoully renders it blach); if it be lefinfafceptible of confiderable and lenting variations, and has thercfore this adcantage orer other metals, that it i hable to fever irregularitios; tin, on account of itc greater activiey, that is, the :lremgth of the eflects which it produces by being brought into contat wibh almont al moiti conductors, an I have aleady oblerved, is to be preferred to filver, and ia a centain degree to all other metal. The experment I have alsealy telfolibed with a sin baton filk well an alkaline theid, and held in the hands moikend with vatur, by which an acil fenfuton incecitad on the tonguc when brought into conthat with the alsove tiull, is a prorf of it; for it would be vain to expet a lithe elicit from a balon of lead, ion, or copper, and much more fo from one of fitece. Wath the latter it would be obtained only when it con$\mathrm{X} \times 2$ tainel

 foctonge a very percentile and pretty frons acid tat This e experiment will fucceed, though the effect i : Moss ally se incr, w's a chain of fever nl perLame who hail cert other's hand, after they have been mutitene i with water, $\because$ h: he fort apulia the tip of his tanta to the water io the hot on, and the int hay Sad with hes has so of the diver dona.
" If the fe experamonts, in regard to the tate * cite.] on the tun cue by the action of tho deferent metals, are firikiag, the where, in regard the the tate exerted, moA. A. d and changed by one metal between two diltement thine are no left, fo and they are allow never. Alley are til interefling on this account, that they dicowir to as the cafe of that taboo often percciscd in water or ? whet li in' which is more or lees conflemble or arno. $\because$ hen dah from velites of metal, and particu?early of tin. When the outer extremity of the veter is anglice to the under lip, rendered mont by the fall$\therefore$ a, and the tongue is catencled fo as to be in contact *it the water, beer, wine, \&c. in the vellel, or whens $\therefore$ in nyse is bent as is cone in drinking, is there not thea a compete circle, and i, not the metal between more or lifo different liquids, that is, between the felive of the under lip and the ligure in the cup or velfelt? A Alarager or waler ciectric llacam mut thereby be occafoner, accu-diter as the thuds are different-a fleam which will not fall in its way to affect the fenflbile organs of the ton que in the fid circle.
"Better the tho method already confileral, of predu ing an electric current, that is, by mean of one or more mott conductor, or conductors of the fecond clef, placed bet ween two different instal or conduaters of the feet chafe; or contrarisife by means of a conducters of the fill chafe placed between two of the fecome raf, atli different; there is til a third method of exciting the electric thud, thou h in a degree fo murk weather, that it is farcely capable of causing convullions in a perfectly prepared frog. in which there is frill a krone degree if vitality. This new method cont: in forming the cir 1. of three different conductor, all of the tecond chis, without the intervention
of one of the firft or a metal one: Some think they
find in this method a flong objection againt my printfind in this method a flong objection againt my primsiple.

Fig. 22. reprefents the third method compared with the other two. In the experiments of Profeflor Villi, reflecting which fo much neife has been made without any reafon, treprefents the log of the frogs, and patticularly the hard tendinous part of the mufculus ga/lracremits; $m$ the rump, or the mules of the back, or the ifchiatic nerves, to which the fail tendinous parts are applied; and $a$ the blood, or the vifons fagaceous or feline fluid, applied to the point of contact.
" 1 have fully deleribed this new method, where no metal is ufed, in my third and fourth letter to Profefior Tamari, written in the autumn and winter of the year 1-05. I have there mean, that the new fact, far from altering my ids as and princi les, leave rather to thablith them: and that they render more general the principle that the conductor, ty heroyeneous contact. that is, of two different fin each other, become okcites of lectsicty, and confmos the benuimil haw ami-

 doctors. You now foe in what the rhode ferret, the whole magic curtin? ; and that it depones the merely en metals, is mit ht lase hes believed, hut on all the diforent conductors. A longs we adtare to thee principles, it will be en ty to explain all the before-metstoned experiments without being reduced to the needpity of having recouple to any imaginary principle, or any peculiar and active clestrisy of the organs. By their alliance you will be enabled to invent new ciperiments, and to foretell the refult of them, as I have Several times dore, an! fill do daily. If you, however, abandon the fe primiple, you will find nothing but uncertainty and contraction, and the whole will be an inc pliable problem.
" home new fats, he observes in a farther communicadion, lately discovered, fem to thew that the immediate cafe whichescites the electric fluid, and puts it in motion, whether it be an attractive or a repulsive power, is to te aferibed much rather to the mutual contact of tiro diffferment metals, then to their contact with moil conducetoss. But, though it cannot be denied, that in the latter cafe there exiffs .n avion, it is proved that it exerts itself in a far more considerable degree when the two metals mutually touch each other. There arifes by the mutual contact, for example, of filter and tin, an action or power by which the former communicates the alectrice thud, and the latter receives it; on the fiver futfees it to efcape, and the tin attract, it. This !rodees, when the circle is rendered complete by moil condoctors, a ftream, or cominual circulation of the fluid. When the circle is complete, there is an arcunviation in the tin at the expence of the diver: which indeed is very foal, and fir under the paint neceftary to enable it to announce itfelf by the melt delicate electrometer. 1 have however been able, by the allatance of my condenfer, contracted on a new plan, and fill better by Nicholson's doubler, to render it very perceptible: I tall here communicate the refult obtained by my experiments, which I made forme time ago with great fati-faction.
"Experiment I. The three plates of the doubler are of bert. I took two firing wires, one of filter and

 vih t'e antenor mosulle alote, it hises up to it : 1"tie the electric !ai 1, and the latter aretomatate 2. = cech of it as pultion, , fopuently the eicerticiry ut : e f ate becomes potitise, as the fign + if the Ate fhews: wheress the tin staracto the electric hidi from the curefponding fixed plate, which by thefe means has negative electricity, as the fig: ( - ) of the plate indicates; and it oun communicntes this eloctricity to the other fixed phote, which i.eretcre hos the fion ( - ) alio.
" In far zevory thing is reverfed; the moreable Flate i nogatively electrifed ( -E ), white the two fixes phaie: becune noftive $(-+\mathrm{E})$.
"I n!e, in the 25 th and $25 \%$ figure, i is feen that t'fe tin a docets the electric fiuid from the brati plats with which it is in cortant. This plate is therefore t.c. setively electrifed, o: has - E; and by the acion ot is atmore occations poitive electricity $(+1)$ in the oth r plate ilanding oppofite, which is in communication, either with the thisd plate, as fig. 25, or, what is finit better, with other condutcre, astig. 26 . Thele opporite electaicities increafo atterwards with each rovolution of the maclinte : the action of which, aceordine to the theory of clectric atmo phere, prodaces this effect to the degree mentioned, and ivitifes the apill: tion of doubjer of eletricit, which has been givin to this inkrument.
"I now come to the experiment, whilh hew thet we are to feek fur the caute which calli forth the netion of the electric fluid; whichexcites it, of whatever hi: 1 i) be; determines its tranktion, sic. mach rether in the mutual contact of the metals, than in the coonet coth moit conducters with thete meth. 1 housh, uccordises to every circumftance, we mutt almit fume asti at of this kind in the lanter contact, iv eanmot be ciencol :as the former is certainly the moti cifictat. At pre et
 I contrived in fuch a manner that they may wrec: explain a quettion of this kind.
"V. I left the two fixed fhates of hafs rith " making any afteration; to.k of the third movande plate, and fuppli-d its place by one of tin; and art.... ged the machine in fich a manner, that the later it is oppolite to one of the other tan flates. I hata : plied to this tin plate a bat of las $\therefore$, ind to the unpan fised plate of brats a piece of tias, stiter a cunvent time, (for example an hour, wise: t: : weather war feetly dry), I tnuk aw, the the fores of me: 1 . only that of bras, an male the ano ctole fate :
or conduators，and he concluded that the contak of two dillimilar met als is an effential condition in the pro－ d．etion of the phemonema of galvanifn．It did m t on ammal indeed efape his obfervation，that in fome calis a lind le metal produced mufcular contraation，tut this he aterited to mechanical timulus，which escied a painful fentation in the animal，not quite dead，or to the im－ puity of the metal，contain ing fome portion of alloy， or filler．Future obiteration，however，proved，thit thefe motions could be produced without any met：l whatever．He found that the muft powerfil efict， were produced by emplosing zinc，in combination with g．t．or thiver．By means of thefe metals he produced comantions twenty－four hours after they had ceafed． In the experiment by which this was eltablithed，the nerve was coated with tin，and a diferent metal was employed to complete the circle betwcen the coating and the maicle．The fume philofopher allo found that the effects ware increafed in proportion to the bulk of the metal empluyed，and the extent of furface brought into contact ；that a communication might be formed between the metals in contach，and the nerves of the amimal which were expoled，by mcans of water；and that the temper：ture of the featon and the nature of the mimilh death ferm to have contiderable intluence on the duration of the phenomena．In many cafes he was able to produce contractions in a frog，after three days had claplect fium the time that the head had been fe－ parated from thic body．He feems to have directed his attention pasticularly to the conducting power of the fublances employed in galvanic apparatus，and in tracing the aratogy between this property and elec－ tricity．Aithounh metals were fourd to be good con－ ductors，this was not the cafe with the metallic oxides，or with the faits which have thefe oxides for their bafis．

An earth worm placed on a circular piece of zinc， exhibited cuntracionss fimilar to thofe produced in living frogs，when a piece of filver was brought in contact to complate the circle．Worms of the fame kind，fufpended acrof a filver rod，and the head and tail being at the fame time brought in contact with a piece of zinc，futhaned a thock which feemed to pafs through the whole body． A finilar experiment，followed by the fame refult，was made on leeches．If an earth－worm or leech be placed on a piece of fifver，reiting on a plate of zinc，the ani－ mal experiences a painful fenfation，when any part of its body comes in contad with the zinc．It feems to have the fame difagrecable fenfation when it is placed on the zine，and any pat of the body is brought into contact with the filver．

The inguiries of the fame plifofopher were alfo di－ rected to aice：tain wheher the nerves in general are all equally fubject to the galvanic inthence，or whether it effects are limited to thofe which are fubjeet to the puwer of the will．With this view the heart of a cow was ferarated from the body，foon afer the animal was hilled，and prepared in the＂ay which haw been already deteribed，in the preparation of frog－；and while the contracticns of the ：urides ttill continued，the interconal newe being coated，and the apparatus aranged，the metels were brought into contact，but feemed to have no ctlech whatever on the contractions white they con－ tinucd，and after they lad ceated，had not the poiver of

hesesi which w in cont at ath ：he piece of brak，to revolve Ginwion ainat 30 times．It then gave me very perceptibic 4 andinal maths of politive electricity．
＂VI．I reverfed the former experiment，and made the picce of braft touch the braf plate，and the piece of tin the flate of the fame metal．I，however，obtain－ ad nothing，or almoft nothing ；wen when the appara－ Lus was lett a much longer tume in that fituation，and when the machine had made twice or three times as ma－ ＂y revolutions．
＂Theie two experiments are reprefented by fix．2\％． and 28 ．；where L is the piece of brats，E that of tin， and $a$ a the muint condactors which comet the two dif－ ferent pieces of metal．
＂In the arrangement of fig．28．the fame contact of difierent metals，viz．brafs on the one fide，and tin on the other，with the fame hind of moilt conductor，takes place，as well as in the preceding experiment of fig． 27 ． The addition of the electric fluid in the one，and the qhatraction of it in the other，ought therefore equally to sake place，though in an inserted order，when the action on the fluid calls forth the moving power，by thio contact of the two metals L，E，with the moint con－ ductor between them；and yet this is not the cafe，as ro tigus of electricity are obtamed even after a long time，and when the raacline has been caufed to make twice or three times as many revolutions．The condi－ tion thentially needflary to obtain elcotricity is，that the different metals munt be in contact with eachother，which $\therefore$ the cafe in fig．27．but not in fig． 28 ．
＂When the machine has been repeatedly turned， fomething may be obtained．This arifes cither from fimall remanins of old electricity，which could not be dettroyed or difipated in the time during which the ar－ zangement of fig． 26 ．was conti：nued；or even from freth lectricity，which the moveable plate may have obtain－ sd fesin the atwofphere or vapours during the protty contidecable time of the machine being in a ftate of re－ Yolution ；or fome accidental difference，either between the two tin or the two braff pieces，may be the caufe of Sume adtion on the electric Huid，or of fome derange－ anent in regard to the equilibrium．In the laft place， ．he contact of the moill conductor with the tin on the me kide，or with thic brafs on the other，may have a different action，which，in my opinion，mufl be very Smaill，but yet is not entirely without effect．
＂Is it is maw proved that，according to the arrange－ ment of the fixth experiment，nothing，or almoft no－ thing，is oltained by 40,60 ，and even 80 revolutions of the doubler，while a gieat deal is obtained by that of the fifth with 20 or 30 ，we mult therefore conclude that tlic contact of two mettil of a different hind with moill conductors，without the mutual contact of thete ractal，themfelves（which is waning in the fixth experi－ anent，where brafs is in contact with brafe，and tin with （iin），produces nothing，or almolt nothing；and that， on the contray，the mutual contack of the tho metals
of a different hind，which tokes flace in the lifthex－ ！eriment，produce the whole，of almoft the whole， effect．＂

D）Frow he rimitute an elaborate ferics of experiments on thi fu＇ $\mathrm{h} \cdot \mathrm{3}$ ，in which he contirmed and extented many of the retates which had beon alecady obtainad in the exp riment，and inversen of other uaturilils． If Fund that met Mic fubterace on or the belt aynts

" ar.r. 8. - The effect of gatraifm in this experince \& were compared with thofe of other itimalats. F... $\because$ s purpure, the point of the fcalpel was applied to the 1 ores, and even introduced into the ful, itance of the If ' $C^{\prime}$ 'ot $r$ culati without producing the dightelt motion. The fam refult was obtained from the we of con ic ralatile alhali and conrentrated fuipluric acid. $3^{\prime}$ - horer even corroded the mulcle, without inlucing it to arions.
"Evoo. $9-\mathrm{H}$ - ring efoned the thoram and the fericardion, expofing the heatt in fru, I endeaveured to $t$ eselu Gtion in the venericle , but without fuccels. The ars was firs appliet upon the farface, then in the futhence of the forta, to the carnote colurather, to the faptar inttrick.', rum, and laftly, in the courfe of the nerves thy the comnary arteric, even with fialt water incerpulet but without the flighteit vinble action being induect.
"Exper. Ic.-In this taperiment the arc was conveged to the right auricle, and produced a confiderable contraition, withunt the intervention of falt water, but eiperiuly in that past called the cpponewe auricularis; in the left auticle Carcely any action was exhibited.
"Exper. 11 -Concuctors being applitd from the final marrox to the fibren of the biceps flater cutit., the gluteu mavimut, and the ga/frocmomius, leparately, ao conicierable action in the muflies of the arm and lisg wa produced.
"Evpr.12.-Thefciaticnerve being expofed between thie great tiochanter of the femur and the tuberofity of the nhlium, and lie are being enabliked from the fir nat marrow to the fierve divated of its theca, we obferved, $t$ our ait wifherent, thet no contraction whateier enfued in the mutcles, althnugite falt water was ufed at both extremities of the arc. But the conductor beitig node to commu vicate with the fibres of the muldes as di the cellular membratu, as trong an action as before was maniftiled.
"E Ept: 13.—By making the are to communicate with the fiatic nerve and the gater cnemius mufcle, a wery fecble ection was produced in the latter.
$\therefore$ Frover. 1 +-Conductors being applied from the f(iatic (i) the pernetal nerve, fearcely any motion was excited in the mukles.
"lever. 15 . - The kiatic nerve being divided about tiec midtle of the thiph, on applying the conductors from the liceps fleaor craris to the gallrocnemius, there entued a powerful contraction of both. I nust bere Joferve that the mufcles contined excitalle for feven thour and a half ofter the evecution. The troundis were irequ-ntly renewed, yet towards the clole they were viry mucl. exhautted. No doubt, with a tironger appa. ratus we might have obferved muicul a attion much longer; for, after the experiments had been continued for thrce or four houre, the poner of a dingle trough was mot fufficient to excite the setion of the mufcles. the affirance of a more powerfil apparatus was requir ed. This thows that fuch a lon- teries of esperiments could nit bave been ferformed by the fimple affication of netallic coatings. I am of opirion that, in Eeneral, thele coatings, inverted in the firit inflance by Calvani, are paflive. They ferve merely to con-
dact the fluid preecitent in the animsif frem ; where. as, with the galvanic batteries of Vola, the tu! hes are excited tw a tion by the infuence of the ryeratu it$f:$ if.
- From the above experiments there is realon to conclude :

1. Tha: galvanifm, confidered by itfelf, exerts a con- Cnctifions ficerable power wer the ne-vous and nufcular fyftems, and : om them: operates univerlally on the whole of the animal economy.
" 2. 'That the power of galvanifm, as a ftimulant, is flronger than any mechanical ation whatever.
" 3. What the effects of galvanim on the hman frame differ from thole produced by eleatricity communicated with common electrical machines.
" 4 . That gavanifm, whether adminitered by means of trou he, or piles, differs in its effects from thote produced by the limple metallic coatings empliyed by Gaivali.
" 5. That when the furfaces of the nerves and mufcles are armed with metallic coatings, the intluence of the galvanic bitteries is convesed to a greater number of points, and acts with contilerably nore force in producing contractions of the mufcular fibre.
"6. That the action of aivarim on the heart is different from that on othe: nuicles. For, when the heart is no longer fufceptible of the galvanic inficence, the ciher mulcies renain itill excitabse for a certain time. It is alto remarkable that the action produced by galvanifm on the auricles is difinent trom that procuced on the veltricles of the beart, as is ciemonfrated in experiment the tetth.
"7. That galvanim affords very power ful means of refufcitation in cafes of fufpended animation under common circumtances. The remedies already adopted in afphysia, drowning, \&ic. when combined with the influence of galvani m, will profuce much greater efied than either of them feparately."*

Excepting the experiments of Aldini which we have juit detailed, the greater number of thofe of which an account has been given, it has been aheady obferved, were made on cold-blooded animal, and lefides, the apparatis u ualiy rmploved, was a lingle qulvanic comhimation. After the combluction of the pile was know?, and itill more fo atier batteries in the form of troughs were invented and emploved, very different effects were ealibited on the animal body, both in the dead and isvins thate.

With batteries compoled of 200,300 , or 400 pairs of plates arranged in troughs, very powerful thocks will be felt when the circl: is completed between the extremities of the hatery by means of the two hand or any peri in, to that the tivid fhall pafs through the body. This experiment may be performed by touching with one hand wetted, a wire connected with one extremity of the battery, and with the other hand aho moitened a wire proceeding from the other end of the battery. Every time that the contact is made a hook is ielt. The effect will te maee powcrful it round balls of brafs having brafo rods attached to them after being well wetted, be pices in the palms of the hands alo well wet:ed, and a commonication be eftablibed between the ents of the tatery. The fame effect is produced when the circle is completed by means of a number of perfons joining hands together; but it mult be obferved, that each jertun nutit take care to have

## Patt I．

Efect of the l．ans，woil moitened，otherwile the intendity of the Gavanim thock will be ertaty diminilhed，or its cflcit entirely $\underbrace{\text { oun Animais }}$ obitructud．No caperiments lave been made，oo for as we recollect，to eicentain wit＇s any degre of precinon， how far the intentiy of the drock is diminihed by in－ creafing the number of perfons computing the circte of communication，or whether indect，when the experi－ ment is made with the requilite deriece of caution and attention，it fuffers any diminution．

It has been oblersed by fome，（and fo far as we can pared．
judge from our own feelings in numerous expriments made with a pile compofed of 6opairs of plate，or with a trough of 50 pairs，and fometimes with two and four rroughes of 52 pairs each combined，the obfenvation which we have made coincides with that of others），that the thock from the galvanic battery puffied fome pe－ culianty，by which the fenfation it excited was much more dilagreeable than a thock of artificial clectricity which feemed to be of no greater intenfity，But it nuit be allowed，that in the compariton of experi－ ments of fuch delicacy，the refult of which depends on the feelings，great ambiguity murt prevail；and thertfore，when the comparifon is unavoidably fo inac－ cur it can afford no precife conclulion．

I iu fenfation is extremely unpleafant when the fhock of galvanifn，even when it is very light，pafies through the finsers，if they have been foratched or wounded．

A light inock directed through the bead between the temntes，produces the fenfation of a fiah of light before the eyes，and an irrefitible contraction of the mufcles of the upper eyelids，fo that the perfon who is the fubject of the experiment involuntarily winks every time that the circle is completed．This experiment， uhich thould be repeated with caution，is performed in the following manner：Place a bit of tin foil which will adhere by wetting with water to the part to which it is applied，on each temple．Then having formed the communication between one end of the trough and one icrople by means of a metallic conduchor，that like a fmall tutton，in that part which touches the tin－foil； this is retained in contact with the tin－foil $b y$ an affint－ ant ；and by means of another alfiltant，another fimi－ lar conductor is applied to the tin－foil on the other semple．Things being thus arranged，the wire connec－ red with the latier，is by the operator brought in con－ ：act with the other extremity of the battery，or with that port of it to which the extent or intentity of the flook is to be limited．Every time that this contact is repeated，the fenfation of the flath of light，and the other effects，are produced．It has been linted above， that this experiment fhould be performed with caution． Not more than from 12 to 20 pairs of plates thould be employed，at lait on thofe on whom the effects of a fmell number have not been previoully tried；and per－ laps with that number，at lealt in the experiments of this kind which we have feen made，there are not many ferfons who would chufe to have them repcated on theutelves．But thefe effects，it may be added，will be ruore or lefs powerful in proportion to the period that tive Lattery has continued in action with the fame t：uid．

A batery compofed of 200 pairs of $1^{\text {lates }}$ will pro－ duce firong contractions in the limbs of a fon or rab－ bit，which has teen recemly killed．Iteefe eftects my te conce iently exinitud by introducing ote of the cer：－ トuI．1X．ऐust1．
lucting wires，ly mean of a look，inion the me ant，or 1．wing it ：shout the back part of the head of the nimal， and tixity a dimilar boul from anuber wire connetted with the other cod of the bettery reat the rump，is that ifse curtat of gatranic thaid ilall pu＇s through the body．When the commmbiation t，ctiven the extre mition of the battery is formet，the connente motices of the limbs of the animal take place，and ase reneated as often as the circle is completed．Simiine effects ：tre praduced on a dog or theep；but to induce ftrong con－ vulions in the larger animits，a more powerful if paritus mut be employed．It will be neceñary to 1 ： ia action a battery conithing of at leant $3=0$ or $A=2$ Fair of plates arranged in troughs．

With a battery of fuch extent and power，the cren valtive motions produced on the limbs of hories that were fuhjected to its astion，were fo ittong that they could icarcely be refited by the itrength of two pet－ fons．

The head of an ov，fon after it was feparated from the body，and while it was yct warm，was acted on by inx butcries，amounting to about 300 paits of plates． Strong comulive motions were produced；the cyes epencl，and the pupils were greatly dilated；the cirs wore alio rut in motion；and the tongue dawn olt and fiaed to the table with an iron dewer which entered the weod above half an inch，was retracted with fuch force as to detach ithit from the Ikewer which was thrown to fome height into the air．

It has been faid that the motions thus induced on the limbs of animals by means of galvanifin，refemble the convullive motions of epilpiy．Perhays the motions of animals during the truatles of death nay be cc：－ fidered as nearly limilar．Whether this be to or not， we have oberved that the convulive contractions ot animals fubiected to galvanim，greatly relemble the peculiar motions of eich animal in the trangles of death．This obfervation honcres only exten＇s to what has happened to fowls，rabbit，and iheep；but fo fat as it goes，it has been allowed by thofe to whom ws have remarked the circumftance to te pretty con rect．

With thefe obfervations we comel－ade this long cetait of the effects of galwanim on wimal．This feom－ ed to be neceffary in order to give the reader a ditinet view of what may be confidered as the dawn of this department of fcience；for as we have already hinted， the experiments and investigations of naturalits were at firf limited to its effects on atimals；and from their ha－ bours an immerie body of facts was accumulated before its chemical effects were much known or ditinctly af－ certained．We now therefore proceed to the confidera－ tion of the chemical effects of galvanim．Thele flall be the fubject of the nest chapter．

## Char．III．Of the CFinical Efficts of Galanifn．

Is the secount we propofe to ldy Lefore our readers． of $\mathrm{t}^{1}$ ，he edi．ct o wi the giv nic thid which are to be comidered as moze frictly chemical，we thall firft fate mose generally lum：of the esperiments by means of whith thele effects are inuitrated，and deicribe the me－ thed of performing them，and the：enter into at emed． antionlar delait of the experinents of cifferent phinoto－ Yy bluer
(hemical phers which tencici to inarove aind enarge the knowtill cts.

- plates, of three or four inches fquare, with proper management, a brilliast light may be produce from the nagement, a brilliast light may be produced from the
combuntun of chascont. Ite charceat ior this expori-

 the it roudd only be properly peefared by expoing it to a degree of heat equal to that of a glais-honfe furnace; but we hrow from experience that fo high a
temperure is ly no mears ablolutely necelary. We nace; but we hrow from experience that fo high a
temperare is ty no mears abfolutely necelary. We have prepared charcoal which wes fuend to arliwer the purpofe of the prefert experiment, with fuch a heat as can be eafily commanded in a fmall chemical furnace. The wood which is to be converted into charcont is divided ir:o lips of abcut one-furth of an inch fquare; it is :hen put into a crucible, which is filled up with fend, and my be covered with ancther crucible inverted, to as fill mere effectuali'y :n prevent the acceff of air. The crucilite is then placed in the middle of the fursace, which is to be filled up with charcoal, and a ftreng beat maintained for cight or ten hours. After this the charccal will be found futficiently prepared, and this is of forse ecnequerce to be attended to, tecaufe on the complete comerfion of the wood into this flate maich of the fuccefs of the experiment depends.

Slips of charcoal reduced to a fine point are attached to wires, which commanicate with the extremities of the battery. The charcoal may ke fixed to the coriluting wifes by means of a lis of thread, or fine ion or brals wire, or they may be fixed in fincers, or an initrument Limilar to that which is ufed for holding crayons or tlacklead pencils; but in whatever way this part of the aphoratus is contrive?, when the two pitces of clarcoal conceded by mans of met?llic conductors with the exthemities of the battery are Lrought into contact, combution immediately takes place. The rapidey or brilliancy of this combution is proportioned to the itrength and activity of the battery. The light produced by fuch a battery as that we have defcribed above, will be at times pretty sivid; but with two fuch batterie, whofe action is combined, it is fitll more brilliant. When four batterier, confifting each of $5 ?$ pairs of plates of cight inches fquare, are employed for this experithent, nothing perhaps ran exceed the brillancy of the light which is given out duting the combution of the charcoal. With the fmeller lattery, the proce's is occallonaly intertutted; but wh the lar弓e: appara'us the combulion gaes on for a hoort tirse, fiving ont a continsed ard uniform billiant light. When this is thic ciff, the rays feem to procced from the foit where the combulicr is foing on, and exhibis all the variety of the yriffatic colour.. When the iteces of charcoal are immerfed in water, and brought into contact under its ferface, the corrbuftion allo goes on with coniderable ratidity.

Exper. 2 - The dethagration and comatufion of many metallic atace: nay be alfo efleeed with a battery staperel of go pairs of thece inch phuts, and this ray
We thall limit the account of the cxperiments frit alluded to above to the combution of charcoal, the deflagration and comburtion of metallic fubitances, the deenmpefition of water and lime other fluids, and the preciftation of metals from their folution in acids.
Exper. 1.-With a battery compofed of 50 pairs of
he done with a very fimple apparatus. A bent wir, fuch as we have already defcribed, is inferted into the perforatcid, projeting piece of wood, at the extremity of the battcry. The wire is to be bent at a right angle to that part of it which is fixed ferpendicularly int, the extremity of the trough, and on the horizontal patt of it is placed the metalic fubitance to be deflagrated. A plate of copper, which mult be perfectly clean and free from oxide, is to be comected with the other end of the battery by means of a conducting wirc. When the apparatus is thus arranged, if the copper plate be brought into contact with gold or filser leat, for inflance. the combution of thefe fubtances will take place, and this combuition, it is fearce'y neceffary to add, will be in proportion to the power of the battery and itsenerg. In the fome way tin-foil, white and yan Duter metal, as it is catled, may be fubjeated to cyperment, and with a battery of moderate powe , a Lrilicatt cota. buttio: may be produced. When a battery of greater potrer is empleyed, a very brilliant and rapid combuftion of iteel wire can be eifeeted. This experiment is made by ftretchaing a piece of wire, fuch as that which is ufed for the fmaller flring;
of mufical intruments, between the iwo motalic cot. of wire, fuch as that which is ufed for the fmaller fling:
of mufical initruments, between the iwo metalic cor, ductors conneited with the oppofite extremities of the battery; and thas completing the circle, the combuftion
takes place. When the experiment fucceeds, fovera! battery; and thus completing the circle, the combuftion
takes place. When the experiment fucceeds, fevera! inches of the wire are almoft inftantzneouly reduced to the flate of oxide. In this way the encrgy of the battery may be in tome meafure afcertained, as it mult be in proportion to the lengtly of the wire which is bumt. When a very powerful battery is in action, 13 or 12 inches of fuch wire may be completely burnt; that is, not mercly made red hot, but havingundergone the procefs of combution, and having palied from the metallic flate to that of oxide.

Exper. 3.-We have already defcribed the apparatus De ${ }^{44}$.pcrifor the decompofition of water. To exhibit this ex-tion if 13 periment, it is only neceflary to fll some of the tubes ${ }^{\text {ter. }}$ which have been mentioned for this purpofe with water,
and to complete the circle of communication between which have been mentioned for this purpofe with water,
and to complete the circle of communication between the eatremities of the battery, the water in the tube to be decompofed forming part of this circle. If the conducting wires terminating in the tube confift of metais which do not readily undergo oxidation, fuch as gold or platina, the gales which are the conftituent parts of water are feparated from the wires, the oxygen gas from the one, and the bydrogen gas from the other, and are feen rifing in kutbles to the top of the tube, difplacing a quantity of water equal to the fpace occupied by the gafes evolved. Thit procefs goes on till the furface of the water falls below the condading wire paing through the top of the tube; and the ciacle being then interrupted, the procefs itups. When this is the eaff.
if the two conducting wire within the tube can by if the two conducting wires within the tube can by any contrivance be brought into contact, a fark i preduced, by which the gaics are fet fre to, and are again converted into the flate of water. This conbution is at:ended with an explefion. Or if the tube be careft? ly taken from the apparates under water, while the inger is placed upo: the open end, and thon invertect, the gas collected will rike through the wate:; it may then be let fire to by means of a bunier tuif, a mimlar combuthon rill tale: place, ateneda with as es $i^{\text {lef for. }}$

- mia!

Eret. he gales evored. Thir process goes on till he fore T..o...

## Part I.

Cherica! wfices.

## G 1 L ${ }^{r}$

But if the wi.. cerminating in the tube be of lunfs or iron, or any metal which is cafly oxidated, only ore of the gates is collected in the thbe; the ctior (the oxygen) combines with the n.e.tl, foming an wide, rhich culleat on the point of the aies.

By. a very fimple coatrivance the grles may be colleced feparat. With this view twe twbes in which the condusting wines thmate, are creroyed. Thefe tubes being filled with water, mun be inverted in the fame balon of water, the latter of which furm the commanication between the extremities of the battery.

Other tluids, as oil, alcohol, ether, and ammonia in folution, may be alfo decompofed by a fimilar procefs. For the decompoftion of oil, alcohol, and ether, the pieces of chascon! may be immerfed in vellels contain. isz thefe liguids; and, whe. they are brought into contwit, the deconmetron is efected, with the formation and evolution of carbonic acid gas, which is feen riting in bubbles to the furface.

Ever. 4.-By means of galvanifm, and with a battery of moderate power, metals may be precipitated from their folutions in acids. The apparitus to be employed for this purpofe is fimilar to that for the decomFoftion of water, and the tube is fllled with a folution of the metallic falt. The communication being then eft $1-$ blihed, the metal is precipitated, and appears in an arborefcent form on the point of the vire. In this way the acetate of lead, or fugar of lead, the nitrate ot $\mathrm{ni}^{i}$. ver, and many other metallic falts, may be revived.

Many other curious and amufing experiments might have been related, but what we have now given will enable the reader to have a diftinct notion of the chemical effects of galvanifm. Many other of the chemical effects of the galvanic fluid are to clufely connected with the peculiar views and theories of thofe who have difcovered and obferved them, that we thall not eriter into any detail of them till we come to comider that part of the fubject. In the mean time we fhall uecupy the remaining part of the prefent chapter with an account of fome of the experiments on the chemical effects of galvanifm which were obferved by philofophers in the earlier part of its progrefs.

Mr Cruick fhank, the inventor of the galvanic trough; very early directed his attention to this inguiry, and profecuted it with great ardour and fuccefs. In one of his early communications on this fubject we have a comprehenlive view of fome of the chemical phenomena of galvarifin. We thall, therefore, give it in his own words.
"I fhall not, fays he, sive any particu"ar accourt of the apparatios employed, being a pile, and not differing materially from that in ufe. I fhall only jut obferve, that it confited of thates of zinc and filver, of about 1.6 inches fquare, and that the number of each cmployod in the following experiment varied trom to 102 , according to the power required.
"I feund that a folution of the muriate of ammunia antiveral be:ter for moitening the intergoted dues than common water.
"When the rachine was in fall actior, fpatis whi h sere pericetly vilible in the day time, cualdte taken It prenfore, by making a communiction in the ufusl on. y hetween the extrem ties C : le e phe and a fmall :esort or far cuad be hetard: the fli-k :inen at ! ! a

In future, to avoid circumbetan, i thall call the wite attaclad to the filver plate, the filver wire, and the, other the zine wire. The tube was then placed uprigh: in a cup containing water, with the uncemented end dommasd. Is foon as the communication was made between the extremities of the pile by the wi:cs, a quat.. tity of inmall air bubbles begar to afend from the end of the wire connected with the inlver, as obierved by METH. Si holion and Carlite: but a white aul ${ }^{\circ}$ the forme time made its appearance at the one, yrocece ins from t'e zinc, or the zinc vise. This cisud radu. ally inereffed, and afumed a darker coluur, and at la if became turple, or even black. A very fea air Lubb? were likevife collected upon ond afended from !! wire, but when the machine was in full force, a ( 1 . fileralle fream could the obterved.
"The gas was collected, and found to be a mis.... of hydrozen and oxygen, in the proportion of thise parts of the Ermacr to one of the latter. Nu great d. pendence, however, wa, placed upon this in point of accumacy. The zinc wire was tound to be much corrode., and looked as if a conflemable purtion of it has buen dirulved. As the cloud which was formed ams this wire became purnle on expofure to the light, 1 fuficeted it might be luna comea, or moriate of nillot proceeding from the fiker, which had been fome how diffolved, and afterwad precipitated in this itate, y the muriatic falts in the common water. This 1e1: the folluwing experiment:
"Eyper. 2-The glats tube was now f!!ed with dit tilled water, to which a litele tincture of limus was a. ded; when the commanication was mate by the was as in the former experiment, a quanty of ges a:s: A.mm both wire, but in the ereath cuanity from th . . comected with the filver. In a few mimues a fine : . : Hine, estending fome w'y upwats, was patceived a: the extremity of t'e zime wire ; thin in recater, aw. 1 its

 looked of a ct:per Whe tiasa be -t: 'ta that thence ot purple beinit detiteryed.

Chem wire became pery pale，and almont colourl fis，nor could上守路 the fuole tiage exiend below its upper extrmity．

Fom th ee experiments it would appear，that an acid， recoally the ritrous，in produced at the wire procech－ ang from the zinc，and an alkali，probably ammonia， at that in consat with the filver．Thefe faats fulfi－ Gently exphan the aftion uron the filver wire，and the ratuee of the whitih choud proceeding from it，and af－ turwads becoming purple．When lime water was em－ nloyed imtiead of common or diftilled water，the wire was likewife aited upon，but in a lefs degree，and the Choul had at fint an olive colour，cxactiy relembling the precipitate of tilver by lime－water．
＂The quantity of filver diffolved or corroded，if I any uic the exprefinn，in thefe experiments，was very confideable，and where common or diftilled water had beca emplejed，a frall portion of it remained in folu－ tion，which was difcovered by the addition of the mu－ riatic acid．Injued a much larger quantity would pro－ bably have been futpended，had it not been for the al－ Eali generated th the fame time，and which manifeftly proluced a procipitate at，or near，the upper extremi－ y of the zine wire，where，after a certain time，a dark zone or Atratum was always formed．
＂Exar．4．－lt is a well known fact，that hydro－ gen gas when beated，or in its nafeent flate，refuces the catces of the metals； 1 expected，therefore，that by filling the glats tube with a metallic folution，I minght te emabled to separate the hydrogen from the exygen $g_{a}$ ，and thus procure the latter in its fimple or FGe ftate．With this view the tube was filled with a Clation of the actute of laad，to which an excels of whid wes aüch，to courteract the effeets of the alkali． Whe：a the cormunication was made in the ufual way， $\because$ ，ças could be perceivel，but after a minute or two， Some fine metaliic noedles were perccived at the extre－ mity of the wire connected with the filver．Thefe Sa incrufed，and affumed the form of a feather，or sather that of the crytals of the muriate of ammonin． The h．ad thes precipitated was perfectly in its metallic Atate，an 1 very brillinat；a litule gas efcaped from the are commeted with the zinc，and it was confiderably corruded as ufual．
＂A folution of the fupphate of copper was next em－ boyed，and with the fame refult，the copper being pre－ ipituted in its metallic form by the wire comected ath the fher．In this inilance the metal did not cry． CHize，laut formel a kind of button at the end of the wire，whe adhered io completely to the filver，that it ．．．in ！umd impontle to leparate it．
－＇The moit leatutfel precipitate，however，was that of ilvea from its，olution in the nitrous acid．In thi calc，the ：ntal hot intu tine ncedle－like crytal， antulat，os ated to each other，as in the Arbor ．）ia！
＂．What lecame of the caysea gas ufually prodaced at the crictiments？
＂A for．5．－A quantity of pure water mised with intilh sisegat was instolucel into the tube，and C．cel in the circle of comrunication；forme gas was W． 1 from the filver wir＂，but no cloud ajpeated Ci th cutremicy of the zi，c．Atres fome time，bow－ Mer， 1 tity of metallic ther was precip tated by the filuer wire，and this precipitate at latt becane very ：a trepoly finila feet was proluad，whea

A N I S M ．
the tube whis flled with very dilate filpipulic acid；in thefe cates the precipitated filser had the appearance of thining lales，like that thrown down by copper in the

## ulual way．It may be proper to obferve，that in all

 thele precipitations and reductions，nothing but wires of pure tilwer were employel，The refults in this lat ex－ periment were exactly what was expected ；the vinegar prevented the alkali from precipitating the filrer，difo folved by the generated acid；in conlequence of whicl， when a fufficient quantity of the metal was taken up，it was again thrown down by the filver wire in its metallic form．＂Evpcr．6．－A folution of the muriate of ammo－ nia being introduced into the tube，and expofed to this influence，a little gas was difengaged from the fil－ ver wire，while the zinc one was incrutted with a fub－ flance which foon became black，and was found to be luna cornea．The liquor which remained in the tube after the operation had been finithed，was highly alka－ line，and fmelled flrongly of ammonia；common falt was decompofed in a imilar manner．This experiment accounts for the decompofition of the muriate of foda and ammonia，which always takes place when the pa－ pers in the pile are moitened with a Colution of thefe dalts．
＂A folution of the nitrate of magnenia appeared to be likerife decompofed by this proceli；for after fome time，a white powder refembling magnefa，was preci－ pitated on the furface of the illver wire，very little gas was difengaged．
＂Exper．－．－In order to afcertain how far this in－ fluence might be carried，provided the circle of com－ munication was complete，two tubes were employed， and connected by a iilver wire paffing through cork，； the tubes were filled with water and fecured by corks； two other wires being then pafied through theie corks， the are was connected with the filver，and the other with the zinc，at the extremity of the pile．A quan－ tity of gas as ulual was difengaged at the extremity of the filver wire，and the portion of the comnecting wire in the fame tube was par：ly difolved，and as mention－ ed in experiment Ilt；but the other portion of the fame wire in the other tube gave out gas，while the commu－ nicating zinc wire was corroded．And I make no doubt that a fimilar effect would be produced，if any number of tubes were connected in a fimilar manner， by which means a large quantity of gas might be pro－ cured in a thont time．
＂Befides filver wires，I likewife employed thofe oz copper or iron，and it did not appear that thefe were mose corroded or acted upon than the filver；indeed，in fome of the above experiments，not lefs than half，c： three－quarters of an inch of the wire was entirely con－ fumed．The copper wire connected with the zire gives out a areenilh blue fubllance refombling the ni－ tate of copper with cacef of the metal，of when par： of the acid has been expelled by heat，\＆c．In exa－ mining the gas which was procured at diferent times， 1 whays fuund it mixed with a little oxygen gas，but fonetimes this did nut exceed cre eighth of the whule in balk；hoacver， 1 prid but litule attention to this fut of the procef，for as my wiecs were always co：－ roded，no conchution with regarl to the conapofition of Water could be drasn from it．＂＊．N．k．

Chemical Effects．

## Part II.

G A L. V A N I S M.
Hitory. perimerts, which have been made to afecrtain the chemical efiects of galvanifm, and to clucidate the nature and propestics of the thaid which is fuppofed to be eoncerned in thefe changes. In particular we might give an account of the later experiments and refearches of philofophers, in invelligating the formation of muriatic acid, and an alkali which is lunpoled to be foda, by means of this poter. This forms one of the anolt curicus fuhjects of inquiry which has yet occurred with
regard to galvanifm; but as fome part of the inveltig? tions of thole who have occupied their attention with this inquiry, is comefted with therettical views, we fhall relerve the conideration of the whole to the iccond part of this treatife, the object of which i to give a hitorical detail of the progrefs of galvanifm, with the opintons of philofophers concerning the nature of the galwanic tluid. To this therefore we now proceed.

## PaRT II. OF TIIE HISTORY AND PROGRESS OF GALVANISA.

IN the firl part of this treatie we have given a pretty full view of the method of conltructing apparatus tor the purpore of exhibiting the phenomena of galvanifn, and we have eatered at confiderable length into a detail of the experiments which have been made, to afcertain the effects of the galvanic fuid on animals, as well as thofe experiments by which its chemical effects are illuilrated, with fome of the the oretical views and opinions of thofe who have been engaged in refearches concerning the propertics of this fluid. It is now propofed, in the fecond part, fint, to confider the progreifive hillory of galvanifm, with the theories by which philofophers have attempted to account for its eifects; lecondly, we shall endeavour to trace the analocy between artificial electricity and galsunifm; and lattly, give an account of the experiments and inquiries which have been made coneerning the formation of muriatic acid and foda by means of this power. Thefo will form the fubjects of the three following chapters.

## Chap. I. Hijary of the Difourry and Progrefs of Galwanijm.

TaIE fint hint which is ufunlly quoteal as connected with the nhemomena of galvanifm, is extruted from a bock eatitied the General Theory of Pleafures, by Sultzot, which was publihed in the year 1767. In this work the auther paritcularly deforibe, the experiment with tro difimilar pieces of matal whicis we have releted at the beginning of this treatile, and by which we have endeavoured to illultrate what is underitood by galuanifn, in its efats on the living hody. The u.periment alludey to is that in which a lie.e. zine and a piece of hiver being placed, the one in contuct with the upper, and the cther with the under farfice of the tongut, and their propectivs chers being lown into contact, a talle is producel, which the author uthierves, refemble virni f if irom. Thi-liotion is catod:o a vibration ct the particion ot the mact...? whecting the merve of the :ongue.

 Sry: gioce :a decurat of them, cocouting thoni of Thinll, man'te of the ros abatony of Turim, who
 1. a teries of caterimet: which 1.0 L. 1 indo.ed. Thes !e dirow cu: a conmeture, thit a proino has

by which the electricity accumulated in any particulat part of the body is preterved and retained fur fome neceflary purpofe of its exitence. It had indecd been fuppofed by fome, that the animation of the blood depended oa the electric tluid, but according to others, this fluid and the nervous thid were to be confidered as one and the fame.

This fubject was particularly inveftigated and illulta- of ted, when in the year 179t a remarkable difowry duterery which was made by Dr Galvani, profeifor of anatomy in the univerity of Bologna in Italy, was anmanced to the world. This difoovery, like inof other, was accidental. Some frozs deprived of the dkin were placed upon a table near which the proftior happened th be engaged in experiments with an eleatrifying mothinc. The crural nerve of one of the frogs was torched by a perfona prefent, with the point of a fealpel during the time that the machine was worki:g. The whole animal was thrown into convulions. The fane experimeats were afterwards repeated with the fame fuccefo. Every time that the falpel was appliel to the nerve, white the macline was in motion, violent ennolions were produced. But when the machine coafel to move, on the application of the falpei to the nerva : 2 affect followed. To this accilertal diatoray this branch of fience owed its origin, and fiun the name ot the difoserer wa called Galamin.

Since the period of $t$ is ditcovery, a grat many onperiments have been made, and many conions phentmena have been oberved, which have ewited much intereit and attention amogg philufoph r. We thall now prefeat our readers wiha a liitorical iketh of the progrefs of the en diforec:ics.

The experimeat which ha: sen mentoned was ice perted by Galvani in every pollhle wiy he could thinh of. He varied it both by mems of artificial and at moffherical electricioy, and the reflelt of all thete cre friments he fond to be unitom and conimitut
 that the phenometa deperdel on omomen ei tif ifo pafing through the wingh wa which the eperimente were made. Ile hat oble- 1 that the fome eflets

the copper thectirg of dhips is faftened on by means of irnn mails，the nails，but particularly the copper，are readily corroded about the place of contact．A piece of cinc placed in water for a confiderable time farcely undergnes any change；but if a piece of tilver happen to thuch the zinc whilat it is in the water，it is toon cofroded or ovidated．

In the courfe of a very few years after the $f$ ublica． tion of Galvani＇s difovery，a great number of writers appeared，and prefented to the world a great body of facts which they had afcertained by experiments and obfervations．The following are among the molt im－ portant ：1．When a piece of metal is placed on the Recapit mufcle of an animal juft dead，and ftill moift，and ano－lation of ther piece of a different metal is placed on the nerve fact： which leads to the mufcle，or on another part of the mulc？e，and if the two pieces of metal ke brought into contact，a contraction or convulfion ot the mufcle takes place．2．A fingle piece of metal，or two pieces of the fame metal，have no effect in exciting contraction of the mufcle．It is neceflary to have two ferfect con－ duetors of electricity in contact，before any convulfion can be produced．3．The mufcle mult be moit．The effect is not prevented by a ligature on a nerve；but the fufceptibility of a mufcle to be thrown into convul－ foons is diminithed，and at latt dettroyed by the application of opium，which dettroys its irritability．The fame change takes place if the mufcle be allowed to remair for lome time after death．4．The different mufcles of the body are differently affected by the galvanic in－ fluence．They are not equally fufceptible of the fame decree of convulfive effect．5．If a plate of zinc be placed on the upper furface of the tongue，and a plate of nilver or coprer be applied to its under furface；and if the tho pieces of metal thus placed be brought into contact，a frong netaliic talte is immediately per－ ceived．An acid talte is perceived，when the tongur． is dipt into an alkaline folution contained in a tin or zinc cup held in the moift hand．6．If a piece of me－ tal，as a filver fpoon，be placed on the bali of the eye， and another piece of a different metal，as a piece of zinc，be placed on the tongue，and if the two pieces of metal be brought into contact，a flah of fire is in－ flantly perceived；and it is perceiver，both when the metals are brought into contact，and when they are fe－ parated．7．Another fact，which was afcertained by Aldini，who performed a great many experiments in galvanifm during his vifit to this country，is，that con－ vulfions may be cxcited merely by forming a proper chain of mufcles and werves．This is proved by the following experiment．He took a prepared frog，and held it fufpended in one hand by the fut．The fciatic nerves were brouglit into contact with the tongue of an ox，the head of which had been recently feparated from the body．He then irtroduced the other hand moit－ ened with a folution of common falt in water into the car of the inimal，this completing the circle．Every time that the communication＂as formed，the mufcles of the frog were thrown into convulions．

Mof of the fact which we have now re lated，were af－ cortained by the different phinfor hers，whoe referches were circited to the fuliject of ghvamim，hetween the year 1－9＇and 1594．Hitherto the connection le－ －xeer tomatim anin urina！＇vdice was conddered by

 rifered gatwatim a the action of a perultior thid on the anmad dibe. This thed i , developed by tie mutual action of the motal employed as exciting catufe, and it exits in other bodies as weil as in thote which are endowed with life. We have alrealy mentioned that: "no
 on the water which neither of them deparately could ettect. This was obferved by Fabroni, from wit ho he concluled that a chemical change was cifceted by the metals on each other. To this change he luppofd part at leat of the pixenomena of galvanifin was owing. Thus he explaned the necellity of two different metals and of moilture in the production of thefe phenoment. Thofe metals, be div olverved, which occaboned the moft rapil chanres on each other in water, were molt porerful in exciting galvanic convulfions.

Metals and charcoal, it wrs afcertained by Volia, beins good conductors of electricity, attrach and repel that flad with diflerent forces. When two fitiore it mosas in their natural itate of cle tricity are brot: at i: ) contact, elsceric matter paim trom the cite to tha cther; the o:ic becomes electrified pumikely, and t'e o. her nezatively. From this he conciudel, that the Evecricity which occationed the gilvanic phenomer? dis In trefide is the amimal fibres, hut in the met is enphoyed as exciters, and that the combliomi weve produces L; tiee ticitic matter patting through then ibres.

The feemins inconfifency which appeared in the opinions of Voita and Pasoni was reaonad by lac. ceeding ditco:eries, which Gemonutrated that heth cice sticity and chemiluy were eoncerned in the \& Ivathic phanomena. Galvanilm was now no longea corininoud \& fomething connextel with living matter, which was zotally inexplicable, but as Comething developed by the mutual action of inorganized fubttances on each other, the effect or eaergy of which might be ellimated and meafured by its action on the mufular nitres. The difeovery of the galvanic pile by Volta put it in tise power of philufophers to increate the power or energy of the galvanic influence at pleafure. This pile, and the method of conftructing it, have been already defcribed.

A delcription has alfo been given of a different apparatuc, the invention of Mr Cruick thank of Woolsich, whish has been employed in place of Volta's pile. This is called ti:e saitanic trough, and it comits, of a number of fquare plates of different metals as in the other, which are foldered together in pairc, and fiseld by means of cement in a box of baked wood, at a fmall
dillance from each other.

A ttriking analogy was at once obferved betwen this apparatus and charged electrics. A reat deal of difouifion tork place on the fubject; mach invertiyation followed: and philofone she held different opinions ronconing the phenomena of gilvanifin, whether it was in be considesed as the fame with common clatritity, of a) fom-thing fpecincally different.

 periect condurnt which is capable of oxidating the most oxidable of the perfect conduitors, conftitute the elements of the galvanic battery.

But fome of the moft impurtant fhenomena of galwanitu are ealibited in its chomical effects. Mant of thefe were firt cheresed by the chenical philofophers of this cumetry. We lave already detaled many of the eapentemen by which thefe efoels are ilhufrated: and we thall here only, for the lake of giring a conneted vicw of the Gilject, merely ruapitulate fome of them.

When water forms fart of the circle between the pxternitics of the battery, and the condentirg wires are brought vithin a fmall dittance of each cther, being imnueted in a plats of water, the way is cecompofed, and it will be recolleited that the fhenomena are different usconding to the mature of the vires employed. When the wises are of gold or platina, they undergo 1.0 change; oryge: gas is evalved in fnall bubbles 1ron the poltive wire, and hydrogen ghs from the nepaive wirt; and if the galo be collected feparately by We apparatus formenty defcribed, they are found to be in the proportions of the com whet parts of water. It whe of the wifes be immerfed into one glafs, and another into a feprate shai, by complting the circle wi:h is finger planged into each glafe, the procif goes on, and the hydrugen gas is extricatel in the one veniel, While the oxysen is given out from the wire in the ther. This fict wa firt dicovered by Mr Davy. IV ben fpritg water is ufed, or water having azotic gas a. Golution, an acid is formed at the extremity of the poffive wire, and an athali at the extremity of the nesative wirc. The acid was found to be nitric, and the Ik li anmunia. If the wires be plunged in different -laties, and the consexion be formed by means of an arimal bedy, the pofitive wire produces in the water tomet with an infurion of litmus, a red colour, while the negstive sire alio reddens an intulion of brafil wood.

If orther wires befide thofe of gold or platina be ufed, $i$ is furud that the politive wire undergoes oxidation, Wht little or no gas is leparated fiom it ; while the negasive wire, 35 in the fomer cafe, given out hydrogen gac. When the wires are immerfed into metalic folutions, as acetate of lead, nitrate of filver, \&c. the filver or lead is revived, and depulited on the negative wire; and if fulutions whicl contain fulphuric, nitric, or oxymuriatic acids, ase ufd for the immerion of the - onducting wires, the acids are decompofed, oxygen gas is evolved fiom the pufitive wire, and fulphur or A.vdrogen gas makes its appearance at the negative virc. The decoapofition of ammonia has already been mentioned. This was difovered by Mr Henry. The hyGrogen is given out by the negative wire, while the azoue gas is evolved by the politive wire. When plumLago or charcoal :re employed as condutors in place of +...als, it is found that carbonic acid is evolved from Ge pofitive end, and bydrogen gas from the negaS.

It may be acceffary here to defcribe a galvanic battry, conflucted by Mr Davy, on principles fomewhat different from that of Volta. In the Voltaic rile there sre two perfect conduafors, and one imperfect conduc. :or : Lan this condills of two imperfect, and one perfect condueter: the two ingericet conduet: an nitweno
acid and liquid fulphuret of potafh. A trough is di- Theory.
vided into cells with flips of horn and phates of zinc, arranged alternately; nitrous acid is poured into the firlt cell, and fulphuret of potalli into the fecond ; the two liquids being fepatated by the flip of hom, a conmunication is formed between them by means of a moit piece of cloth laid over the honn, and in the fime way the relt of the cells are filled. In this cale the liquids are the imperfect conductors, and the zinc is the perfict one; and the allion of the battery continues till the oviation of one of the furfaces of the zinc takes $1^{\text {lace, }}$ the other furface remaining unchanged.

Having finifhed the fhort view which we propofed to give of the hiltory and progrefs of galsanifm, we fhould next proceed to detail fome of the later experiments and dicoveries which have been made on this luhject. What we here chiefly allude to, is the difovery of the formation of nuriatic acid and foda by means of the galvanic fluid. But this is propofed to be the fubject of a feparate chapter. We thall therefore proceed in the next chapter to confider the hyputhefis by means of which the phenomena of galvanifm have been explained, and to point out the analogy between electricity and galvanifa.

## Chap. II. Of the Thicry of Galvaininn, and the Analogy betwoun the Galvenic Flusid and Electricity.

We have alrcady obferved, that the philofophers who were occupied in refearches on galvanifm, early divided themfelves into two parties. According to one party, with Volta at their head, the phenomena of galvanifm, were alcribed to the action of common elcetricity on the mufcular fibres; while another party maintained the opinion that they deperded entirely on fomething peculiar to animal matter. This was the opinion of Galvani himidf, the original difcoverer, and it was furported by his nephew Aldini, with certain modifications. The greater number of philofophers have now adopted the opinion of Volta, as being more confiftent with the phenomena. We thall therefore now give a more particular account of the hypothefis which has been more generally followed in explaining thefe phenomena on the principles of cleuricity.

According to the received principles of elearicity, Theory o: there is a fubtile fluid which exills in all bodies; but elechimes. the exiftence of this tluid can only be tecoguifed when the proportion which a body contains is greater or lefs than the quantity which is natural to it. When the quantity is greater than ulual, the body is faid to be electrified fiovity or pliss; and whien the quantity is lefs than ufual, the body is liad to be electrified nezatizely or minus. The electric thuid penetrates certain iodies, and pafes through them with facility, and thele bodies are called conduifer of chafricioz; ; but there are other bodies which it cance pal through with out difficulty, theic todies are called non-conducters of cícirmes. Of conductors these are two linds; cre of which is denominated porfit, lecaule the electric thuid pafies through theni with cale; the other is called imperfect condictors, becaute the fluid pofies through them with dilliculty. The perfed condustors are fulid bodics which are fufceptible of c.xidation ; :and when they enter into comination with exyen, they lofe their progertits as perfect condudioro. The mitals and charcual

Affiny of There is an ataity between the perit of condretorthe elect:c fond for conductors
 importect of sentur the e he dies whide cont in oxygen, and when thay are depeivet it it, they lole tha
 tudies, and whally canamin waler as one of their com-
 and the electric thaid. in con' puence of which this nuid remains in combintion wirh the perfect eonductor, till it is attracted ty firne beh, foe which it has it Itronger atfinity, or is casulied liy fisme body conshining vith the conduetor, for which the conductor has : fironger affinity tha it hos for the electric that. Perfect conductors pafich suthernt seter or degre of athnity for the electrn: is.id. 'Ihus, if iwo perfect conduthor be trought intw contal:, thie proportion of electric matter in eah ot them changes. That contuator which has the ftrongelt utinity for the duid. is electified potitively, or phay; an i the conductor which has the the wealier aflinity is electrined negrtives, or minus. If a thate of zinc and one of copper, eant of which poffifies its natural pioportion of ele ettic thaid, to be ought ias. contact, the zinc is elcetritied pias, and the copper mins: ; or, it iron and later be brosyint into contat. the iron is elenrined plus, and the fitver minus: and it no other circumftace oneate to change the atate of the eleftricity, thefe two itates will he permanent.

But, when a noriect condustor in the pookive tate of electucity, enters into combinstion with oxygen, it parts with the excefs of electric fluid which it contained, and the difcharge is mate towards that fide of the conduktur winch is combined with oxygen. The atinity of imperfect conductors for the ciectric thuid is weaker than that of the perfiot conductors, fo that, if a perfect and imporfect conduelor tee brought into contact, the pertect conducen becomes pluc, and the imperfect, minus; and this ita:e is not changed, if the imperfect conduct I connot communicate oxygen to the

Ferfect one.
Between the electric Inid and hydrogen there is alfo an affinity, to that the electric fluid combines uith hydrogen, provided this luter be prefent when the thid is feparated from a periect conductor. The fiectric fuid is diflerently conducted throush the bodies which are called perfect and imputict conductors. The thad pafies through the perfe of conduitors, in its finple and uncombined flate; but unlel, "le tuid be combined nith hydrogen, it cannot pafs through the imperfect conductors, and this compound of elecericity athl hydrogen is capable of pathing invility through linuid conductors.

Let us now fuppole a $f^{\prime}$ 'ate of copper and another of zine, to be brounht into en tact, the zine is immadiately eleatrified plus, and the copper minus; but let us tuppofe alfo, what the firface of the sine fartheal from the copper, is browhe isto contact with a liquid which can communicate onseen to "at furfare, to that it becomes oxidated, furh, for intance, is sater impregnated with cunmon dir, or with an acid. As foon, then, as the oyyen of the imperfe en conductor combines "ith the zinc, the excets of its electricity is feparated, and Jalles towards the imperiect conductor; but the zine is oxidated by the decompofition of the water, the oxygen of which combines with the metal, while the hydrogen is fet free. The electricity of the perfect conductor enVol, IX. Part I,
tav iuto orník tion wis? !
 th...? ilec inplatict comluans be ... cu.

(ren), therciore, is lat lo mis. h, ad :

 binm with the oxygen, and then hate the condactor in the matallic thate. Fut, fartiter, if:a jte of zince be in contact with a late of copmer, the that having a greater aftinty for the zine, will enter it ; and it the zinc be again followed by astother*impericet conductor, its iurlace is oxidated, the electinity is difensa ed ; it combines with hydrogen, and paifisthrough the imperfect conductor as in the former cale. Whatever the lamber of thefe lets of bojics may be, if they are arranged in the fame order, the fame phonomona will he eshibited.

Let u: now fuppofe, that a battery is rontructed, ei ther in the form of a pile or troush, of any given n: ber of pairs of plates; and fuppole, is this lvattery is i the form of a pile, that the uppermost plate is zan. the lomelt is therefore of colper: the zinc is etectity plus, and the copperminus. It, then, a communica tion is eltablifhed between the upper and lower plates os the pile, by means of conductors, according te the lan. of clectacity, the excels at the top of the pile imonediatcly pafies to the bottom. A current of elechicity, therefore, will pals through the pise, and will continue till the furfaces of the zinc next the imperfect condur tors ate completely oxidated, when the action ceation becaule the double decompoitions on which this actio:i depends, can no longer take place.

The number of repeated charges which pafs through Diffrent the pile, mult be in proportion to the number of plotes, effets tson fo that the intenlity of the pile increafes with the rum. .ante ber of plates of which it is compolet. Hence it is, that plat". the effects of galvanim on anima? is found o be in proportic ') to the number of plate en jloyed in the battery; but this depends upon is intenfity, or the mamerer of difcharges followed by momale, which pais thruagh the body in a given time.

63
But, on the wther hand, the cfice of the galvanic ant evter, fluid on metallic fublances depends on the abolute obrtace quantity which paties through the notal in a given time. But the ablolute quantity of fuid diblaresed from a lingle fair of plate, ment be pr portional to the lurfare of thefe places; and bonce it is, that the quan. tity of electricity dicharged from a pile ia a given time, depend upon the furface of the plasis. When a battery is dicharged, the fmall charge contained in eact: pair of plates, palles through the didcharger; but there nult be an interval between each of thole feparate charges, for they cannot be fuppoled to palis inttantaneouly, although the interval being too fmall to be perceptible, the difcharge of the battery teems to be inIf antmeous. Asthen the number of finall dificharges which are apparently inflantancous, when a battery is difcharged, is in proportion to the number of plates, $2 z$
:16 $\vdots, \quad=0$, sittle difhuse is proportiveral to the yacce whan the pair of plates occupies in the 1 : tey ; asd honce it is, that the thock is increated by the mumber of phates more rapicily than the effect of thic di.ticu $\%$ on metals is increated; but, on the contrary, the furface of the plates being increafed, the cffect on metals is alfo increaled, becate the quantity difcharged O once from the upper pair is increafed; and it feems to be in this way that the effect on metallic fubitances i. procuaced.

In the fame way the chemical changes which are efferied by mems of calvmifm may be explained. Let i: hu cepoled, that a gold wire, comnected with the upler ,uiu: of the batary, terminates in a glals of water, -Wa anotaer gold wie from the lower plate of the battery, tuminates in the fame water. The circle is then completed by the gold wire, which is a perfect comdutor. The current of eleatricity palfes through te wic which is connected with the uppermoft plate :o the bafe of the battery, and it would pafs uninterrate by, if these were no interval between the wires. This interval is Itpplied with water, and, when the clectric fluid reache the extremity of the wire, it mult paifs through the water, but it can only pafs through an imperfect conductor when it is in combination with hydrosen. It therefore combines with the hydrogen of the water, which is accordingly decompoled at the point of the wire. The oxygen is difengaged, and the hydr gen in combination with the electricity pafies through the water till it reach the point of the other wite; an I the alfinity betseen this wire and the electric find being seater than the affinity of the laster for water, the electric iluid enters the wire, and paffes on to the other end of the battery; but the hydrogen is previoully leparated from the extremity of this Fecond wire, in the frm of gas, becaule the tluid cannot enter the wire in combintion with hydrogen.

If the wires are immerfed in ammmia, the hydrogen i. derived from that fubtance of which it forms one of the component parts; the azotic gas, the bafe of which is its other conlituent, is evolved at the extremity of the firl wire, and bydrozen gas at the extremity of the lecond. But, if the wires are plunged in the water which contains common air, and confequently a certain portion of azote, as oxygen gas combines with azrite in its nafcent ftate, or at the moment of it.s evolution, the compound refulting from this combination is nitric acid. Hydrogen gas alfo, in its nafcent flate, will combine with azote, and ammonia is the refult of this combination. Hence it is, that in fome experiments nitric acid is found at the point of the pofitive wire, and anmonia at the point of the negative wire, when common water is employed.

When liquids holding in folution a metallic falt, the bafe of which is an oxide of the metal, are employed; as hydrogen gas polfefies the property of reducing or reviving metals, if in its nafcent itate it comes in cont.ect with their oxides, the metallic falts are in this cafe decompofed, and the metal is revived. It is found depofited on the negative wire. When copper or iron hires are employed to complete the circle, initead of wise of fold or platina, as oxygen has the property of combining with thefe metais, at the moment of its difenseatenent, is is depofited on the politive wire, and in this cale none is feparated from it; but if the circle

Lecong leted by momo of charcoal or phombage, and Thery. the inte: an bethien thete conducting fubtances be water, eabomic acid gas is feparated from the potitise condester, heatufe the oxyget in its nalient fate is lulceptibic of combimation with casbone; and the hydrogen in the leme flate combining with carbone, caboure thydrogen is given cut by the nes, ntive conduelor.

Such is the byfothetical explanation which has been given of the attion of galvanim, and the phenomena whicl it exhibits. A fuller view of the analogy between galvanifin and clectricity has been given by $\mathrm{Dr}_{r}$ Wollatom.
" Notwithflanding, he obferves, the power of Mr Volta's electric pile is now known to be propertional to the difpelition of one of the metals to be oxidated by the fluid interpofed, a doubt has been entertained by many perfons, whether this power arifes from the chemicat action of the nuid on the metal, or, on the contrary, whether the oxidation itfelf may not be occafoned by electricity, fet in motion by the contact of metals that have different conducting powers.
"That the oxidation of the metal is the primary Electricity caufe of the electric phenomena oblerved, is, I think, to evolved be inferred from the following experiments, which ex-during oxihibit the galvanic procefs reduced to its moft fimple dation. liste.
"E Eper. r.-If a piece of zinc and a piece of filver have each ore extremity immerfed in the fame vellel, containing fuphuric or muriatic acid diluted with a large quantity of water, the zinc is diffolved, and yields hydrogen gas, by decompofition of the water; the filver, not being acted upon, has no power of decompofing water; lut, whenever the zinc and filver are made to touch, or any metallic communication is made betwcen them, hydrogen gas is alfo formed at the furace of the filser.
" Any other metal befides zinc, which by aftistance of the acid employed is capable of decompoling water, will fucceed equally, if the other wirc confits of a metal on which the acid has no effect.
"Erpor. 2.-If zinc, iron or copper, is employed with gold in dilated nitric acid, nitrous gas is formed; in the fame manner, and under the fame circumfances, as thie hydrogen gas in the former experiment.
"Exper. 3 - Expeniments analogous to the former, and equaliy fimple, may allo be made with many met..llic tolutions. If, for inftance, the folution contains copper, it will be precipitated by a piece of iron, and apiear on its furface. Upon filier nerely immerfed in the fame folution, no fuch effeet is produced; but as foon as the two metals are brought into cuntad, the filver receives a cunting of copper.
" In the explanation of theie cyperiments, it is neceffary to advert to a peit ettablimed by means of the e!ectric pilc.
" We know that when water is placed in a circuit of conduciors of elutricity, between the two extremities of a pile, $i$ i the power is futficient to oxidate one of the wires of conmanication, the wire connected with the oppufic extremity affords hydrogen gas.
"Since the extrication of bydrogen, in this infance, is feen to depend on electricity, it is prubable, that in other imtances, electricity may be alfo requifite for its converfon into fas. It wonl appear, thereipre, that in the folution is a metal, electricity is evolved during

TatitI. G A I. Y A N i S M

Theory. tie ation of the acid upon it ; and that the formation of bydrogen ga, even in that cale, depend on a tramfition of electricity between the thuid and the metal.
" We fee, morcover, in the firit experiment, that the zinc, without contact of any other metal, bas the porver of decompofing water ; and we can have no reaton to fappofe that the contact of the tilver produces any new power, but that it ferves merdy as a conduchur of electricity, and thereby occations the formation of hydrogen gas.
" la the third evperiment allo, the iron by itfelf has the power of precipiating copper, by means, I preliume, of electricity evolved during its folution; and hare likewife the flver, by conducting that electricity, acquires the power of precipitating the copper in its metallic dlate.
" The explanation here given receives additional confirmation from comparative experiments which I have made with common electricity; for it will be feen, that the fame transfer of chemical power, and the lame appazent reverfion of the ufual order of chemical atinities in the precipitation of copper by tilver, may be effected by a common electrical machine.
" The machine with which the following experiments were conducted, comitts of a cylinder feven inches in diameter, with a conduator on each fide, 16 inches long, and three and a half inches diameter, each furnilhed with a dliding electrometer, to regulate the Alrength of the fpark received from them.
"Expor. 4.-Having a wire of fine filver $\frac{1}{r_{y}}$ of an inch in diameier, I coated the middle of it for two or three inclies, with fealing wax, and by cutting through in the middle of the wax, expofed a fection of the wire. The two coated extremities of the wire, thus divilted, were immerfed in a lolution of fulphate of copper, placed in an electric circuit between the two conductors; and fparks, taken at $T_{T}^{T}$ of an inch diftance, were paffed by means of them through the folution. After ico turns of the machine, the wire which communicated with (what is called) the negative conductor, had a precipitate formed on its furface, which, upon being burnilked, was evidently copper; but the oppofite wire had no fuch coating.
" C'pon reverfing the direction of the current of clectricity, the order of the phenomena was of courfe reverfed; the copper being fhortly re-difiolved by affiltance of the oxidating po:ser of pofitive electricity, and a fimilar precipitate formed on the oppofite wire.
" Exper. 5.-A fimilar experiment made with gold wires ${ }^{2} \div$ of an inch diameter, in a folution of corrofive fub: :mate, had the fame fuccefs.
" The chemical agency, therefore, of common electricity, is thus proved to be the fame with the power excited by chemical means; but, fince a difference has been obferved in the comparative facility with which the pile of Volta decompoles water, and produces other effects of oxidation and de-oridation of bodies expoled to its action, I have been at fome pains to remove this difficuly, and can at leaft produce a very clofe imitation of the galvanic phenometa, by common clectricity.
"It has been thought neceffary to employ powerful machines, and large leyden jare, for the decompofition of water; but when I confdered that the decompofition mult depend on duly proportioning the flength of the charge of eleftricity to the quantity of water.
 fice of communication depends on the cou: .if thest furfere, I hoped that, by raduan! tla fine on cone-

 tion, than have hitherto been whal ime the t parape: and, in this hope I hase mot icea dirmonicul.
 fold, and given it as fine a peint it 1 cacel, I in-
 ing the tube, fo as to make it allowe to the inem and cover it in every part, 1 gradully groma! it do.... til, whe a pocket lens, 1 could dheman the the amb of the gold was erpolad.
"The fuccels of this method eiscedins my ex. peations, I conted ficeral wires in the fure mane, and found, that whe: fyaks from the condeators be-fore-mentioned were made to pait through water, by means of a point fo guarded, a fpark pathing to the difance of one-eighth of an indy would decompofe water, when the point expofed did not exceed -' of an inch in diameter. With anather point, which 1 eflimated at $\mathrm{I}^{\prime}$, a fuccellion of parth, $A^{\prime}$, of an inch in length, aftorded a current of fmall bubbles of air.
"I have fince found, that the fance aparatus will decompofe water, with a wire $z^{2}$ of an inchataneter, coated in the manaer before deferibed, if the fark' from the prime conductor paties to the dillance of it of an inch of air.
" Exper. 7.-In order to try how far the flrength of the elearic fpark might be rcduced by proportional diminution of the extremity of the wire, 1 paffel a folution of gold in aqua regia throu h a capillary tube, and, by heating the tube, expelled the acild. There remained a thin film of gold, lining the inner farface of the tuine, which, by melting the tuls, was convered into a very fine thread of gold, through the fubltance of the glats.
"When the extremity of this thread was made the medium of commanication throwh water, I found th. the mere current of eletricity wold occaion a firem of very fmall bublles to rife from the extremity of tic gold, although the wire, by which it communicated with the politive or negative conductor, was placed in ablolute contact with them. Hence it appeare, that decompofition of water may take place by common electricity, as we!l as by the clestric pile, although no difcernibic farks are produced.
"The appearance of two currents of air ray alfo be imitated, by occationing the electricity to pafs by fine points of communication on both fides of the water: but, in fact, the refemblance is not complete; for, in every way in which I have tried it, 1 oblervel that each wire gave both oxygen and hydrogen gas, inflead of their being formed feparately, as by the electric pile.
" 1 am inclined to attribute the difference in this refpect to the reater intentity with which it is neceliary to employ comma electricity ; for, that politive and negative clectricity, fo excital, have earh the lame clemical power as they are obfersed to have in the elect ric pile, my be alcertained by other means.
" In the peecipitation of copper by filver, an inflance of de-oxidation (or ;hoghification) ly negative electuitity has becn mentioned ; the oxidating power of poLz 2
litiv.

Eive chatriny nas oc alo proved, by its effects on vegetahle blae conars.

" Difides the finilurity ulifoh has thus been traced xetwecs the efle fo at exetrifity racited by the common nart iwe, and thof obleat fiom the electric pite, I think it apens al probabi-, that they originate from - Le lix e fore

* With recari, to the latter, i. power is kno wn to $\therefore$ coude...s taication: io :ifo does the eacitement in fie: : 1 , of wery much to depond on the lame 11. if: fira,
"E. Fr. 0.-1 have found that, by ufig on amalgam of liker ut of platinn, which are not liable to be widate. I roulf obtam no electricity. An amalgam of in, on the contrary, afords a good de ree of exciten nt. Zian wis nith botter; but the beft amalnom is mate with both tin and zinc, a mixture which is more eadily oxil..ted than either retal ke nrately.
"Enper. re. But. as a fart er trial whether caidation athils in the poduclion of eleciricity, 1 mounted a fmall cylinder, with its cuflion and conductor, in a velie 1 fo contrived, that I could at plealure change the cuntained air.
" After trying the degree of cxcitement in common air, I fubplituted carbenic acid gas, and found that the excitement was immediately deffroyed, but that it retuaned upos re-admifion of atmofpleric air.
" In conturmity to this hypothelis, we find that the metal oxidated is, in each rale, in a dimilar tate of elec. tricity ; for the cuthion of the machine, by oxidation of the amalgam adhering to it, becomes negative; and in the fame manner, zinc, oxidated by the accumulated power of an elcetric pile, or fimply by action of an acid, is alo negative.
"This fimilarity in the means by which both electricity and galvanilm appear to be excited, in addition to the refemblance that has been traced between their effects, thews that they are buth effentially the fame, and confirms an opinion that has already been advanced by others, tinat all the differences difcoverable in the effects of the latter, nay be owing to its being lefs intenfe, but prodiced in much larger cuantity *."
This amocy was fill farther ettablifhed by the experiments of Van Marum, in whith be furceeded in charging an electrical battery, confilting of $157 \frac{1}{1}$ fipare fect, by means of the galvanhic pile. ()n examining the pawer of the fhorks which were given by the battery charged with the pile, it was found that the Theck from 100 pairs of plates was ahout equal to a fhock from the battery, when it was charged by meats of 200 . A pile i 200 pairs of plates feemed to have
fix times the power of an eltetrical machine, having a plate of 3 I inches diameter.

The following experiments made To Cuthere 65 with osimanic battcries, are fupmoled by him by 13 m to atord ing pro tric tluids. 1. Charcoal was deflagrated and ignitedtween galfor above an inch in lengtl. 2. Hron wire $\frac{1}{4}$ of an thin and inch diameter was melted into a ball of $\tau_{i}^{2}$ inch diame- eiectricity. ter. 3. Platina wire $\frac{1}{2}$ inch diameter, was melted into a ball ${ }^{1}$ inch diameter. ${ }^{2}$. Brafí wire $\frac{1}{2}$ inch diameter, three-fourths of an inch in length was ignited.
 6. Hon wire $\frac{1}{2}$ 于 inch diameter was red hot for 16 inches in length. 7 . 1ron wire, 12 inches deflagrated, and metted into a ball. 8. Iron wire fix inches in length wan detlagrated. 9. Iron wire eight inche's in length was ispited.

The firlt feven experinerts above were made with two trou hs, each contain ing 30 pairs of plates, hix inches fquare, but in the laf $t$ too experiments, one of the e troughs unly was uicd. The conclufion drawn from the four laft experimests is, that deuble quantities of galvanic fluid only burn double lengths of wire, and not the fquare, as electrical didcharges do*.

To difover what quantity of coated glafs would be Mug. xviii. required to tuke a chatge futhicient to igute the lame $3 y^{\circ}$ s. lenglis of wire, the two latt experiments were compared with common electrical difcharges. Two jars, each containing about 170 iquare inches of coating, wete lit to the cond.actor of a 24 inch fingle-plate clectricalmachine, with the author's univerff electrometer, loaded with 31 grains. Light inches of the fame kind of wire were laid in the circuit, and with 57 revolutions of the plate the ekecrometer difharged the jurs, and the wire was ignited as perfecily as in espetiment gth. Afterwards fix inches of the wire ling laid in the circuit, a difcharge was produced with the fame number of revolutions of the machine, and the wire was detlasrated, and fuled into balls, in the fame mamer as in the 8 th experiment. Hence he concluded, that 3 to $^{\circ}$ quare inches of coated glafs, pauperly conitructed, are fulficient to bear a charge equal to a galvanic battery of $1=8>$ fquare inches of furface. On comparing the above experiments with fome others made fome time beforc, the author finds it neceffary to modify the conclufion which he had deduced from them. With a pile of 16 pairs of plates, of 10 inches diameter, eight of which werc laid upon each other in the ufual manner, and cloths moiftened with diluted muriatic acid interpoled, he burnt half an inch of wire of $\frac{1}{5}$ inch diameter; and when the other eight pairs were added, he bumt four inches of the fame wire. This was repeated with the eight in pairs with the fame refult, with refeect to the burning of metals, but it gave ftrong and loud farks from netal to metal, which might be heard at the diflance of 300 vards. ' 1 his refult, he ablerves, had not been attained from troughs, to be heard at any dillanc. In the lalt experiment the cloths were moiftened with a ltrong folution of muriate of ammonia. Comparing this effect of the pile and the trough, Mr Cuthbertion thinks, there is fome defect in the arrangement or conftruction of the latter.

In many experiments which Volta made on piles compred of a fingle metal, and a fingle wet ftratum,

 1.) whic it enter. then conturung a tile it the

## Chap. III. Of the Furmation of hiuratic Aid and Sidt, by means of Galvanijin.

Sone of the m nt curious phenomena which have yet becn cxhibited in galvaritm, relate to the formation of muriatic acit by mens of thin power. In the accolnt which has been given of Mi: Cisickitanh's experiments, it will be recollected that he made the dicovery of the formation of an acid and alkali, daring the action If the galvanic battery. Thi, acid, he concluded, was the nitric, dud the akat, mmonia. The theory of the 1 roduction of thele funtances in the galvanic pile has been already mentioned, and it correfponds with the explanation of the principles which have been adopted for explaining the phencmena of galvanifm; latur refearches, however, have been conducted with more accarate oblervation, or have opened a wider field of difcovery. The truth of this remark will be fully collfirmed, if it be at laft finally afcertamed, that common falt, the compment part, of whicin are muriatic acid and fod?, is produced by the action of galvamim.

The fint hint of this difcovery was riven by Mr Pecl ot Cambrides, in a l.ter dated A. ril 1805, al-

" 1 therefore proceeded to evamine theie gradual Shanges of water thus lofing its onycen; and 1 at halt obferved a very fingular fact, which unequivocaily in dicated the formation of an acid. In other anteceilent experiments I had examined the nature of the air ob:amos befure arriving at this remarkable point, and I always found, by means of the cudiometer of Giobert, that it was very pure onygen, as the relidum licarcely amounted to onc-listieth.
" Haxing thus examined the nature of the air formdin varicus experiments, fiom the frit moment of decompofition, until there were evident indications of the fimmation of in acid, I began to endearour to determine, in a more pultive manner, the exifience and naare of thi acid.
"When the water, or, to fpeak more accurately, the yelidual fuid, occupied about half the capacity of the occeiver, which at firt contained the water, this refidual thuid prifented the following characters:

* Its colour was an orange yellow, more or lefs daep, according as the bulk of the relidual liquor was greater or lefs, and it reiembled in appearance a true folution of sold.
" Trom the inferior orifice of the veiel, which was clored with a piece of taflety, and then with double bladder, there efcaped a fmell which was eailly recognized to be that of oxygenated muiutic acid.
" The gold wire had in part lolf its metallic luftre, ard its furface appeated as if corroded by a folvent.
"The bit of taffety which liad been in contact with the coloured fluid, in confequence of its action, was eafily torn, as is ufual with fimilar bodies when lalf burnt ( fmi .ccoll a/fo).
" Around the edges of the veffel, on the bladder, there was formed a deep purple ring, which furrounded s circular face rendered entirely colourle's, or white.
"A drop of this fuid tinged the fk in of the hand, after fome hours, with a beautiful rofe colour.
"Having obtained, in various fucceflive experiments, the fame liquid, peffefing conftantly the fame propertiec, I chofe that obtained in the lall experiment to fublect it to chemical examination. The very able chemiat of this" univerfity, Signior Giuteppe Branchi, had the coodnefs to enter zealoully into my views; and in lis laboratory we eafily proved,
" I . The exilence of a volatile acid, by the white vapours which were formed by ammonia placed near it.
" 2 . That this aeid was certainly oxygenated muriatic acid, fince it formed in nitrate of filver a curdy precipitate, the luna cornea of the antients, or the muriate ff ilver of the moderns. From thefe facts we may draw the following pofitive and undeniable refults
(. 1. Muriatic acid is an oxide of hydrogn, and is therefore compofed of hydrogen and oxi ge?
" 2. Oxygenated muri tic acid, and of courfe muriatic :acid, contains lefs oxygen than water does.
"3. Hydrogen has mot oive deurice of ovggenation,

low it oygenated mumatic acid, and, betor this, there Enmmen is anveher which combtutes muriatic acid." of Mernatic

Mr Hemry of Nanche1ter, in an account of his in- Acid, ※̌e, vellirations on this fubjezt, obferves that there is a 60 confilerable point of difference between tise EnglihHerry'sreand tice Itaina chomitt. The refult of Mr Peel's ex. nurk. periment was found to be muriate of foda; but in Profeflor Pacchianis, in which an interrupted gold $v$ iut was employed, it appeared to be muriate of gold. This in enious chemit, with the fame view, mate tho following experiment. He took a glafs tube $4^{\top}$ inches long, $\mathbf{3} 5$ inches dimeter, in which were fecured with corks, two llips of platina, having their extremities at a proper difance to effect the decompotition of the water. The quantity of water, at the berimning of the experiment, amonnted to two drams. After being expoled to the galvanie action for lis dase, it was to far diminihed, that tinch of the tube iwas unfilled. The water which was employed was carcfully purified, by being firit ditilled, and then, after adding nitr..te of filver, by a fecond dillilation. After the experiment was finithed, with the addition of nitrate of iliver, it became opalefcent in a few leconds, and being expoled to the light, exlibited thofe changes which indicate the prefence of muriatic acid. It did not appear that muriate of platina had been pruluced, for muriate of ammonia being added to one portion, and carbonate of foda to ancther, produced no precipitation.

In making this experiment, Mr Henry fuggefts a very ufeful precaution. The water employed, he obferves, hould never, on any account, come into contact with the fingers, becaufe there is a confant excretion of muriate of foda from the ikin , and in this way the pureft water is very foon contaminated. He recommends alfo, that glafs foppers fhouid be eniployed in place of colks, for tranfmitting the conducting wires *. * Inid. 18 z: fubject, he relates the following experiments, which were undertaken, he fays,
" $\mathrm{In}^{7}$, To determine whether the difference in the $\mathrm{N}_{\mathrm{e}} 7^{\circ}$ refult of the before-mentioned experiments was owing neriments in any degree to my having employed lime to neutralize by Mr Peet the water employed in my fecond experiment, before it was ditiilled.
" 2 d , To afcertain whether the falts found in the refidual water, or any component part of them, came from the galvanic battery by means of the wires.
" To determine the firft point, I varied my experiment by employing fur decompefition water difilled under different circumbtances.
"Exper. 1.-The water employed in this experiment was dililled from water contaning lime. A portion of it was decompofed in the manner that has before been ftated. The remaining water yielded muriate of potain.
"Exper. 2.-Water difilled from water containing magnefia was decompofed in the lame manner. The refult was muriate of fyta.
"Exper. 3.-In this earriment doable difill. 1 fnow wien was monloved I $I$ vefuit was muriate of frda.

nfic . Fience it $i$, conciuhol that neither muriatic ach nor lida was formed in this experiment.

Same other rxperiments nade with the fame view hate :! failed; but according to De Buch, certain precatatons feem to be neceflary in conduting this experimont, which, if overlouled, it cannet be expected, he anke, to be followed with! !.eceefs. For the pirticulss $\therefore$ ri efe, fee Phil. Mag. svir. $2 \div 4$. For an account of tie analogy between the peculiarity of itructure of the torpedo, by which it is enabled to give electric thacks, and the galvanic battery, fee Tokiedo; and for the medical effects of galwaifin, fee Misteria Medica.

Tay: following facts, which feem to extend the analngy of galvanifm with electricity on the one hand, and with mignetifm on the other, vere onitted in the preceding treatilo.

Riter, one of the moil indefatigable philofophers, in Eruferuting experiments and inquiries on this fueject, has furceeded in cbaraing a piece of money with the Evanic duil, and nit this fome of the phenomena of galvanim can be exhibited. To effect this, he places a louis d'or between two pieces of pafteboard, thoroughjy wested, and keeps it for fix or eight minates in the thais of circulation connecied uith the pile. In this way the louis becomes charged, without being imme. diatety in contact with the conducting wires. If this loui, be afterwards applied to the crural nerves of a frog, recently prepared, the ufual contractions will be produced. It is found that the charge is retained, in proportion to the time that the piece has remained in the carcuit of the pile. Some have retained it for five
hutuits. Ritter has alfo dicoverci, that the piece of Fumation SH thaj glvaniled, caerts at once the aitic: of two of waric :ctule; $t$ half next the negative pole, whie in the icid, \&c. circle, lecome portive, and the half towards the palive pole buame ncgative. He allo tried the elle of goden reedles charged with galvanitim, and balmoed on a pive:, and he perceived, to his furprife, that thele needles l.ad a certain dip and varation :-that the angle of variation was uniformly the fame, differing, however, from that of the magnetic needle, and that the potitive pole shonva dips *.

If the facts which the above expe:iments feem to fournai, Frove, hould he fully afcertained, there is an obrious sii. g9. analoyy, not on? between electricity and gelvanimm, but alfo betreen the latter and magnetifm.

A galvanic pile has been conttrulted by Dr Baronio of Milan, entirely of vegetable matters. For this purpoie he cut difes of horie-radifh and beet-root, of two inches in diameter. He then prepared equal difcs of walnut-tree wood; the later difes were rafied at their edges, to contain a little folution of acidulous tantrate of potalh in vinegar, in which they had been previoully boiled to free the wood from rolin. Sixty pairs of curcs were enfloyed in the following orfer ; viz. herle-radith, bect-root, dics of wood, in each of which the fofution was pu:. The fital marrow or a prepared frog was connected with the pile, by means of a leat of cocholaaria; the mufcles of the fiog tiere connected with the top of the pile by means of a double band of gray payer wetted with vinegar, and as often a this circuit was completed, contractions were excited in the animal.

## G A L

GALiVAI, or Galioway, a county of Ireland, which is 82 miles in length, and 42 in breadth, bounded Ev the counties of Clare, Tipperary, King's County, Rofommon, and the fea. The river Shannon wathes the frontiers of the eatt and foutheant, and forms a lake devenat miles in leagth. There is another great lake called Cortis or Carib, which is near 20 miles long, and five broad. This county contains $15,+20$ boutes, 136 parifhes, 17 baronies, and 13 boroughs. The ca1 ital town is of the fame name.

Galway, a town of Ireland, in the county of the fame name, and province of Connaught, of which it is the eapital. It is leated on the bay of Galway on the we flema ocean, 108 miles weth of Dublin, and gives title of Vitiount to the family of Nonkton. It is firrounded with itrong walls, has large firaight itreets, and the houks are generally well built with fone. It has a grood trale into foreign parts, on account of its harhour, which iv defended by a fort. It is governed by a maror, flieriff, and recorder, and returss two member, to parliament. It has but one parith church, which is a large and beautiful Gothic itructure, an exchange, barracks for 10 companies of foot, a charter fchool, and an hofpital. This was one of the ftiongeft towns in the kinedom; it held out fome time agdinft Genetal Ginkle, who invelted and took it after the battle of Aughrim. Its fortification, were then repaired. The walls are flathed by baitions, but are moitly gone to decay. The falmon and herring fith-
eries are carnied on here with great fpirit, and employ Galway. 700 boats; the quantity of keip manufactured and exported is confictrable; and the growth of the linen manufacture, thoush of late introduction, is become very important. In :2g6, Sir Wiiliam de Burgh founded a monattery hare for Francifan friass, on St Stephen's illand, fituated without the north gate of the town. In 1381, there being two popes at Rome, and the people of Ireland being doubtful to which they fhould pay obedience, Pope Urban, to fix them entirely to his intereft, empowered the guardian of this monallery to excommunicate cuery perfon in the province of Connaught who fhould adhere to his rival, Clement VII. who he affured them was antipope.-Near the weft gate of the town, without the walls, was the monaltery of St Mary of the Hill: on the nuns forfaking it, the ficcular clergy entered into and $\mathrm{k} \rho \mathrm{p}$ poffeffion of it for a confiderable time; but on the petition of the inhabitants of the town to Pope Innocent VIII, it was granted to the Dominican friars, by a bull dated the $4^{\text {th }}$ December 1488 . There are no remains of this foundation except the cenctery; the whole building having been demolified by the townfmen in the year 1652 , in order to prevent Cromwell from turning it into a fortification againft themfelves: there was alio an Auguitinian friary, on a hill near this town, founded by Stephen Lynch, and Margaret his wife, in the year 1508, at the earneft folicitation of Richard Nangle, a frias of the fame order, who afterivards became bithop of Tuam.

Gama GAMA, Visio, or Visnsfen Dr, a celebrated navigator, was burn at binc, a liaport town in the province of Alentejo, in Portugal. When King Emanuel re- folved to exiend the dicoveries fommeny made of the fouthern parts of Atrica, and the feas lying between thee ind the Eut! laties, the ncll-known prudence and courge of De Gama pointed him out as a proper perfun to conduet fuch an enterprife. He lialed fiom Lifbut in the month of July 1497 , with nu more formidable a fquadron than three tmall anned vellel and a dione llip, with which he did not reach the Cape of Good Hope till the end of fuur months, owing to violent and contrary wiuds. He doubled this promontory, and afterwards coafted a'ong the fonth-eati dide of Africa, till he reached Melin, ba, baving touk hed at difterent ports un his whe. At this place he procured a Ashometan pilot, by whom he was condueted in lafety to the coaft of Nalisar, and he reached Calicut in the aronth of Ma. The prince at firlt received him in a hoppitable manner, that a plot being at length haid for his dulltuction by the Mabometan merchants, he made tha belt of his way to Europe as foon as he ditcovered it. He arrived at Litbon in September 1499, with the lofs of the majority of his crew, ariling trom fatigue and difeale. Having fpent fonie time in devotion at a hermitage, he made a plendid entrance into the city, and befides pecuniary rewards, was honoured by the hing with the title of comnt of Videgueiza. By this voyage the practicability of a new paflage to the Indies was fuily eltablithed. De Gama undertook a lecond woyge, with the title of admiral of the Indian, Pertian, and Arabian leac, having 20 tail of thips under lis command. This voyage began in February 1502 , and after compelling feveral prince, in his route to pay tribute to him, le arrived at Cochin, where a deputation from the Chrilians of St Thomas, to whom he promifed fretection, "aited upon him. The Zamorin being eatremeiy fu!picious of thele new vifitors, fitted out a fleet, but De Gama anticipated the defins: and began the attack, making a prize of two large veffels of prodigious value. He left a fquadron at Cananor after this victory, and failed for Liibon, at which place he arrived in the month of September 15c3. On the accelfion of John III. to the throne, De Gama, then very far advanced in years, was prevailed upon to undertake a third voyage, with the exalted rank of viceroy of the Indies. He conquered the people of Calicut in a naval engagement, and died at Cochin in the year 1525 .

GAMBIA, a large river of Negroland in Africa, running from eaft to well to the Atlantic ocean ; it is lippoled to be a branch of the Niger.

GAMBOGE is a concreted veget.able juice, partly of a gummy and partly of a retinous nature, chiedy brought in large cakes or rolls from Cambaja in the fatt Indies. See Chemistry and Matfria Mlui(a) Index.

GAMIE, in general, fixnities any diverion or fyort, that is performed with regulatity, and reflained to cerdin rule. See Gainsg.

Games are ufually ditinguithed into thofe of exer--ile and addref, and thofe of hazard. To the finf belong cheis, tennis, billiards. \&c. and to the latter 'towe performed with cards, or dice, as back-gam-

GlmLs, in maticuty, bere public cuverfors, exta bited on dolemn occainn. such amun the Gicets were the Oympic, l'staian, Lhmman, Nomean, 心r.

G.asm, in Law, tignines birds, or prey, taken or hithled ly fowling or hation.

The property of luch animals firie varura 3 , and Wown under the denomination of same, "ith the right of purluing, taking, and dettroying tacm, is vetted in the hing alone, and from him derived to lueh of his fubjects as have received the grants of a clatic, a park, or a free warren.

By the law of nature, indeed, every man, from the prince to the peafant, has an equal rigint of punning, and taking to his own ufe, all fuch creatures as are fore naiure, and therefore the property of noipoly, but liable to be feized by the tirit occupant. But it follows from the very end and conflitution of fuciety, that this natural right, as well as many others belonging to man as an individual, may be reitrained by politive laws enacted for reafons of thate, or tur the tuppofed benefit of the community. This reftretion may be either with refpect to the $\dot{f}$ ace in which this right may, or may not, be evercifed; with refpect to the arimals that are the fubject of this right ; or with refpect to the perfons allowed or forbiduen to eacrcile it. And, in confequence of this authority, we find that the municipal laws of many nations have everted fuch power of reftraint; have in general forbidden the entering on another man's ground, for my caufe, without the owner's leave; have "s'ended thicir protection to fuch particular animals as are ufually the objects of purfuit ; aed have invelied the prerogntive of hunting and taking fuch animals in the fovercign of the ftate only, and tuch as he thall authorife. Nany realons have concurred for mahing thede comlitutions: as, 1 . For the encouragement of agriculture and improvement of land, by giving every man an exclulive dominion over his own foil. 2. Vor the prefervation of the feveral fpecics of thele mimals, which would foon be extirpated by a reneral liberty. 3. For prevention of idlene's and dillipation in habandmen, artincers, and others of lower rank; which would be the unavidable confequence of univalal licente. 4 . For prevention of popular infurections and rembance to the $y$ vernment, by difarming the bulk of the people: which lat is a reaton oftener meant than avosed, by the mikers of forell or game iaws. Nur certainly, in thefe probibitions is there any natural injutice, as thme have weahly enough fuppotid: ince, as Puffendorf oblerves, the law does not bereby take from any man his prelent prnperty, or what was alredey his 0.an; but barely abridges him of one means of acquining a future property, that of occupancy ; which indeced the law of nature would allow him, bu of which the laws of fociety have in moft inftances very juftly and re.fonably deprived him.

Yet, however defenfible thefe provifions in general may be, on the footing of reafon, or jullice, or civil policy, we maft, notwithftanding, acknowledge, that, 3 A

in their freitht thape, they owe their imnediate or:ginal th flevery. li is net till iffer the irraption of the anthern nations into the Roman empire, that ve Irad of any otiea prohibitions, than thut natural one of nut tponting on any frivate grouncs nithut the onser" leave.

Witly remard to the rife and original of our prektit
 fance lans vere fatrotucel into Europe at the fame Wint. and $b y$ : fane puicy, ágave birth to the
 now their ne.al.en live, and bid the foundation of n.oft of the petiont aing dims of Eurupe, on the ruiv of the wettern empire. For when ac cumgueriag reas. ral came to fittle the cconny of a vamuihed country, and th prart it out amons his foldisis or feudnoric: who were to rether him miitary fervice for fuch donations ; it benond him, in ander to fecare his ne:: co, wifions, to betp the refilici or natives of the counry, and all who were not his militar: tenant, in as fow a condition os poffible, and elpecially to pohibt then tle ufe of arms. Authing cou'd do this move cheaunliy than a probiotion of hunting and fortins : and therefore it wan the poicy of the compueror to iefirve this right t. Comeze, and fish on whom he fleu'd Dethow it ; whele wre owly his capital foudmosies, or crepter thatos. ind, accerdincty, we find, at tive feudnl constations, ene and the fame lav proWhing the roy' a general from carying arms, and ..fo ircfatiting the whe of net, fuares, or ether enGaen for detroying the game. This exclulive priviLere weil fuited the martial genius of the conquering t. us, who delishte! in a port which in its purfuit and 1 hacher to:e ime refemblance to war. $l^{\prime} / a$ mon (hy, Coticr, fpeahing of the ancient Germans)
 Wiaitus in izke mamer ubterves, that gustes belia ${ }^{\text {n's }}$ "an:, natzomseatilus, phas per oriam tra:/gunt. And indeed, like fome of their modern fuccellors, they had other anu'ement to entertan their vacant hours; : they detpifed all arts as effeminate, and had no cher barning than what was courbed in fuch rude dittics as were fung at the foleman catoufals which fucceeded :hele arcient bunings. And it is remarkable, that, in -hele :astions whate the feodal policy remains the roof ancortupted, the forch or game lavis continue in their higheit rigour. Former!y in France, atl game was proDerly the king" : and in time parts of Germany it is Senth for a peafat to be found huming in the woods of ase rinkility.

W"in us, in Rritin, alfo bunting has cver been cfecmed a molt princely divertion and exercife. The $\because$ hol itiond was te lemilied with all lorts of game in the time of the Britons; who lived in a wild and pafaral maraer, without enclofing or improving their grounds; and derived niwch of their fubsilence from Go rhate, which they all enjoyed in common. Put wher humbudry touh place wider the Saxon governouch:, and lands begen to be calaveted, improved, and orc!ed, the beal ; naturally fled into the woody and ?fers tracte, which wet called the forifs; and, ha--iner were been difpoed of in the firit dilltibution of 1 inds, were therefore held to belong to the rowis These weee flled with great plenty of
game, wlich oar royal fportmen referved for their own divertion, on pain of a pecuniary forteiture ter f.h as interfered with their lovereign. But eveIV frchbolder had the full hiberty of forting $u$ : on his teritories, previded he abtained from the king's fo ent.

However, tipon the Norman conqueit, a new ductrine took place: and the right of puriaing and ta. king all teat's of chate or venary, and tuch other animan ace accounted same, wa then held to belong to the knc, or to fuch only as were authorized weder lime. And this, as wall uper the principles of the Euchal han, thet the king is tite ultimate proprictor of all the lands in: the kingdom, they being all held of him as the chiaf hard, or lord parameunt of the fee; and that thercfure he has the right of the univerial foil, t. chter thersen, and to chafe and tahe fuch creatures at his pleature: as alio upon another masim of the common law, that thele animals ate Ista racamia, and, having ro other ownet, belong to the hiag by his premuative. Is therctore the former reation was held to velt in the king a right to purfue and take them anywher:, the lattor was fuppofed to give the hing, athd tich as he floould autherik, a fole and evchuive right.

This right, thus newly wefted in the crown, was exerted with the utmolt rigour, at and after the time of the Norman etlablihment; not only in the ancient forefs, but in the new ones which the Concuerer made, by laying together valt tracts of country, deporulated for that purpofe, and referved folely for the king's royal diverlion; in which were exercied the motl horrid tyramies and opprelifions, under colour of foreft law, for the fake of prelerving the beats of chale; to hill any of which, within the limits of the torel? wa as penal as the death of a man. And, in purfuance of the fime principle, King John laid a total interdict upon the winged as well as the four froted creation : capturam avium per totam Angliam interdixil *. * M. Parizs, The cruel and infupportable hardihips which theie fo-30j. relt laws ceeated to the fubject, occafioned our ancetiors to be as zealous for their reformation, as for the relaxation of the feodal rigours and the other exactions introduced by the Norman family ; and accurdingly we tind the immunities of charta de forefla as warmly contended for, and extorted from the king with as muich ditliculty, as thofe of magna charta itfelf. By this charter, contimed in parliament + , many forells were difafiorefted, or ftripped of their opprellive privileges, and regulations were made in the regimen of fuch as remained; particularly killing the king's deer was made no longer a capital offence, but only punithed by a fine, imprifonment, or abjuration of the realm. And by a variety of fubfequent fictutes, together with the long acquiefence of the crown withont exerting the furcit laws, this prororative is now become no longer a grievance to the futject.

But as the hing referved to himfelf the foreft for his own exclufive divertion, fo he granted out from time to time uther tracts of lands to his fubjects under the names of chales or parks; or gave them licenfe to make fuch in their own grounds; which indeed are fmaller forells in the hands of a fubject, but not governed by the fueft less ; and by the common law no perfon is

## $G$ A M [ 3 MI $]$ 万, A II

Grme. at liberty to take or kill any beafts of chafe, but is h as have an ancient chafe or park; unlefs they be alio beats of prey.

As to all inferiur fuecies of game, called beafs and fow/s of warren; the liberty of taking or kiling them is another franchife or royalty, derived likewife from the crown, and called free warren; a word which lignifies prefervation or cuftody: as the exclufive liberty of taking and killing fith in a public itream or river is called a free fi/wery; of which, however, no new franchife can at preient be granted by the evpreci provilion of magna charta, c. 16 . The principal intemtion of granting a man thefe franchifes or liberties was in order to proteet the gane, by giving him a fole and exclutive power of killing it himlelf, provided he prevented other perfons. And no man but he who has a chale or free warren, by grant from the crown, or prefcription, which fuppoles one, can jultify hunting or fiporting upon another man's foil ; nor indeed, in thorough itrictnels of common law, either hunting or tporting at all.

However novel this doctrine may feem, it is a reguiar confequence from what has been before delivered, that the fole right of taking and dettroying game belongs exclufively to the king. This appears, as we!1 from the hiltorical deduction here made, as becaute he may grant to bis fubjects an exclufive right of taking them; which he could not do, unlefs fuch a right was frit inherent in himfelf. And hence it will follow, that no perfon whatever, but he who has fuch derivative right from the crown, is by common law entitled to take or kill any bealt of chafe, or other game whatfoever. It is true, that, by the acquiefcence of the crown, the frequent grants of free wamen in ancient: times, and the introduction of new penalties of late by certain itatutes for prelerving the game, this excluine prerogative of the ling is little known or conidered; every man that is evempted from thete modern penalties locking upon himfelf as at liberty to do what he pleales with the game: whereas the contrary is itrictly true, that no man however well qualined he may vulgarly be eiteemed, has a right to encroach on the royal prerogative by the killing of game, unlefo he can flow a particular grant of iree warren; or a prefcription which prefumes a grant: or fome authosity under an aft of parliament. As fur t'e latter; there ate but two initances wherein an exprels formifion to hill same was ever given by flatute: the one by I Jac. I. c. 2\%- altered by Jac. I. c. 12, a's d viruilly repert. ed by 22 and 23 Car. II. c. 2 ․ Which gave authority, fo long as they remmed it. \&ace, is the owners of frec warren, to lords of masers. atd to ail frechallers having 401 , per annum in letub of inheritanc-, or 801. for life or lives, or $400 \%$. perions. 1 etate ind their fervants), to take partril es and phealants, upon their own, or their mater's fre warmen, inheritance, or frechoid: the other by 5 Ann. c. $1+$. which em. posers lords and ladies of manors to apicint savere keepers, to hill game for the wic of fich lurd or lan; which with fome alteration jtill fubin: and phaill: iuspofes power not to have been is them before. The tath of the mater is, tat the an lay ho nideed qualifu mobody, except in the i. : whe of a a tme K-eper, to kill game: but only to :ase the treal le

who pritaj: too mty... remic the ofene, . utinthict abdationat penaltics, to lee rewerod : ion a
 from certain perions of infezior rans whon n: te : and
 that periops eveuid rom that ad minal peatat are theref ree auti, rize $d$ to hill game. The circum itance of having $1=2 l$, per anman, ars the reth, are t.0 properly qualific etions, but excmpt! ans. Aulthele per fons to exempted from the peration of theme itw tutes, are not on'y liable to acti sas of thambey the owners of the land; but ato if :h, $\because$ hill the linnts of any roval tranchite, they are limbe to th. actions of fuch who may have the night of chate of free warren therein.

Upon the whole, it appeare, that the ling, by his prerogative, and fuch perfons as have, under bis aythority, the ROYAL FRANCHINE of (HACE, P.ARK, of Free lWarase + , are the or'y perfons who my acquirets any property, however fugitive and tratifiory, in thefere mos animals fore nature, white living; which is laid to he refted in them prosicr pritilesum. And it muil al, be obforv:d, that luch rerfor, as mis thus lavfalt; huat, fih, or fowl, ra*is proves: have on'y a quis lified proverty in thele animals; it in torme atotue or permanent, but lakiny only fo lons as the creature remain within the limiti of fuch reinective fars lite or liberty, and cealing the imitat they voluatarily pals out of it. It is held indeel, that if a man diatis any game with:n his own rounds, and follows it itso another's and hills it there, the proverty remains in himfelf. And this is grounded on reaton and natural juf. tice: for the property conflts in the pefoflion ; which polfethon commeaces by the find.." it in his oxn liberty, and is continted by the immatiate farfuit. And to, it a itranger ltarts game in one maa. "s chate ur free warren, and hunts it into atother liler's, the pres.rty continues in the owner of the chatio or warmen: this propetty arining from privil, e, and not being dan aced by the act of a mere tranger. (1r if a man itarts game on anotber's private gromils, an? hills it there, thee property belongs to hia in where ground it waskilla', becaute it was allo itarted there : this propers ancin": ratime foil. Whareas if, after being tabted there, it is hilice in the grounds of a third perlion, the property belongs not to the owner of :he finit gumm!, lecause the property is luea! ; nor ye: to the a,mer of the tecond, lecanle it was not : inted in his foi! ; but i: weito

in infes fmall game. It is added that the birds were all thot on the wing.
" lu Cermany, during the menth of OCtober 1-y. Prinse Lichteaticin, and eleven other gentlemen, killed in one day, when they were out fourteen hours, 39,000 pieces of yame; it was of all inets, but chietly hares and pansiduce. The king of Naples and Sir W. Hamilton fillet soo leed, game in tho neighboulered of Ca-
farte, of which $6 \not+0$ were partridges, in a very flort fpace of time.
"Upon Mr Colquhoun's manor in our own country, at Writham in Norfolk, the late duke of Bedford, and fix other gentlemen, in 1796, killed 80 cock pheafants, 40 hares, befides partridges, in one day. At Houghton, in the fame county, the duke of Bedford, and feven others, killed in the fame fpace, 165 hares, 42 pheafants, 5 rabbits, a couple of woodcocks, and a brace of partridges; and this was done, although the woods had been beat five tunes before during the feafon." *
G.s.me Cuck, fighting cock, or one kept for fport ; a barbarous practice, which is a difgrace to any civilized nation. See Cock-Fighting.

GAMELIA, in Grecian antiquity, a nuptial feaf, or rather facrifice, held in the ancient Greek families on the day before a marriage; thus called from a cuftom they had of Ghaving themfelves on this occalion, and prefenting their hair to fome deity to whom they had particular obligations.

GAMELION, in the ancient chronology, was the eighth month of the Athenian year, containing 29 days, and anfivering to the latter part of our January and begiming of February. It was thus called, as being, in the opinion of the Athenians, the mott proper featon of the year for marriage.

GAMING, the art of playing or prastifing any game, particularly thofe of hazard; as cards, dice. tables, \&c.

Gaming has at all times been looked upon as a thing of permicious confequence to the commonwealth; and is therefore feverely prohibited by law. It is confidered as a practice generally intended to fupply, or retrieve, the expences oecafioned by luxury : it being a kind of tacit confefition, that the company engaged therein do, in general, exceed the bounds of theiz refpective fortures; and therefore they caft lots to determine upon whom the ruin fhall at prefent fall, that the reft may be faved a little longer. But taken in any light, it is an offence of the molt alarming nature, tending by neceflary confequence, to promote public idleneis, theft, and debauchery, among thofe of a lower clafs; and, among perfons of a fuperior rank, it hath frequently been attended with the fudden ruin and defolation of ancient and opulent families, and abandoned proftitution of every principle of honour and virtue, and too often hath ended in felf-murder. To reftrain this pernicious vice among the inferior fort of people, the flatute 33 Hen. VIII. c. 9. was made; which prohibits to all but gentlemen, the games of tennis, tables, cards, dice, bowls, and other unlawful diverions there fpecified, unlefs in the time of Chriftmas, under pecuniary pains and imprifonment. And the fame law, and alfo the statute 23 Geo . H. c. $2_{2}$. inflict pecuniary penalice, as well upon the matter of any public houle wherein fervants are permitted to game, as upon the fervants themicives, who are found to be gaming there. But this is not the principal ground of modern complaint: it is the gaming in high life that demands the attention of the magillrate; a palion to which every valuable confideration is made a facrifice, and which we feem to bave inherited from our anceltors, the sucient Germans; whom Tacitus defcribes to have been bewitched with the firit of play to a mont exorbitant

## G 1 N $[3 \%] \quad$ G A Mi

Gamine. A wd B play at fingle ofy 1 : 1 is the to gameller, io that he can cive B 2 in 3 . What is the axtio of their chances at a fingle throw ' Suppofe the chances as $\approx$ to 1 , and rile \&f1t its củe, wh:ch will be $z^{3}+3 z^{2}+3 z+1$. Now fince $A$ could cive B $\therefore$ ut of $\therefore, ~ 1$ might undertake to win threc throws yonving a wal conlepaently the chances in this cale wial Le as $z^{3}$ to $3 z^{2}+3 z+1$. Hence $z^{3}=3 z^{2}+3 z+1$; or $a z^{3}=3^{3}+3 z^{2}-3 z+1$. And the efore $z_{1}==2+1$; and, onsentatly, $z=\frac{1}{12-1}$. The chances, therefore, the $\sqrt{3}=-1$, and 1, refpeatively.

A gain, fuppofe 1 have two wagers deperting, in the for of whicin 1 bave 3 to 2 the bett of the lay, and in $\therefore$ fecond 7 to 4 ; What is the probabilisy I win both "ugers:

1. The pabability of winning the fort i, that is tare number of chances 1 have to win, divided by the :umber of all the chances: the probability of winning tre fecond is in: thererose, multiplying theie two fractions together, the produt will be $\frac{3}{3}$, which is the pa bability of wimizg both wazer. Now, this fraction being fubtracted from 1 , the remainder is and which is the probability 1 do net win both wagers : therefore the odjs ardinft me are 37 to 21 .
2. If I would know what the protability is of winning the frot, and loing the fecond, 1 a-gue thas; the Fobability of wimuing the frot is ', the probability of Whig the fecond is at: theacfore multiplying $\frac{3}{3}$ by $\frac{4}{12}$, the product $\frac{17}{5}$ will te the probabity of my winning the frit, and lofing the lecond, which beng fubtracten 1, there wili remain which is the probability 1 do not win the firll, and at the lame time lofe the fecu:d.
3. If 1 would know what the prob.illity is of winfiilz the eond, and at the fame time loing the finf, If fay thes: The probeblity of winning the fecond is $\therefore$; the probability of lofing the firt is $\frac{3}{5}$ : therefore, mulniplying thefe two fractions together, the product

* is the probability I win the fecond, and alfo love the fir: :.

4. If 1 would know what the prubability is of loing Foth wagers, 1 lay, the poobatility of loing the firl is 2 , and the probabiitity of loting the fecond $\frac{4}{5}$ : therefore the probability of loing them both is $\frac{4}{3 I}$ : which, teing fubtracted from 1, there remain $\frac{45}{5}$ : therefore, the odds of loing both wager is +7 to 8 .

This wry of realoning is applicable to the happening ar fuising of any event tiat mas fall under confidera:iun. Thus if 1 would hnow what the probabiity in of mifing an ace four time together with a die, this 1 consider as t':e faling of four different event, Now the problbili:y of miling the firt is of the ferond is alfo fo, the third , and the fuurth of therefure the probabitity is milling it fur tinien together in $\times \times \times 8=$ ins $^{2}$ : which leing fubtracted trom 1. there will remun if fur the probability of throwing it once or atener in four :ime : therefure the ouds of throwing an

Fu if t! bunging of an we was undertaken in three

or wftenct is three tintes: theefore the odds againft Gaming. throwing it in thee time, are 125 to 9 f . Again, fupp ofe we wold know, the nrobability of throwing an ace onte is four tanes, and no more; lince the probability of trowing it the niff sime is $\frac{5}{5}$, and of miting it the other t'ree times, is $-x-x \frac{5}{5}$, it follons, that the probabiity of throwing it the Erit time, and mifling it the atior ibree fucceffive times, i, $7 \times \frac{5}{5} \times \frac{5}{6} \times \frac{5}{6}=\frac{1}{8}$; but becaute it is romble to hit creay throw as well as the frit, it foilos, that the probability of throwing it once in form throws, and mifling it the other threc, is $\frac{4 \times 125}{1255}=\frac{600}{1295}$; which being fubftrated from 1 , there will remat ins for the probability of throwing it once. nd no more, in four times. theretore, if one undertahe to throw an ace once, and no more, in four time, he has $5=0$ to 796 the worlt of the lay, or 5 to 8 very near.

Sappofe two events are fuch, that one of them has twice as many chances to come up as the other; what is the probability that the cvent, which has the greater number of chances to come up, dees not happen twice before the otler happens once, which is the cafe of flingitz - with two dice before 4 unce: Since the number of chances is as 2 to 1 , the probat ility of the firf happening before the fecond is $\frac{2}{T}$, but the probability of its happening twice before it is but $\frac{2}{3} \times \frac{2}{3}$ or 4 : therefore it is 5 to 4, feven does not come up twice Lefcee four unce.

But, if it wete demanded, what mult be the proportion of the facilities of the coming up of two events, to make that which has the moit chances come up twice, betore the other comes up once? The anfwer i, 12 to 5 very merly: whence it fllows, that the probability of throwing the finit before the fecond is : 1 , and the frombility of throwing it twice is $\frac{1}{1} \times \times \frac{1}{2}$, or持 ; therefore the rrobability of not doing it is $\frac{3}{2} \frac{4}{5} \frac{5}{2}$; therctors the odds agmit it are as $1+5$ to 144 , which comes veiy near at: e juality.

Suppuie there is a heap of thirseen cards of one col wr, and another heap of thirtcen cards of another colour; illat is the probability, that, taking one card at a renture out of each heap, 1 indi take out the two act

The probaliaty of taking the ace vat of the firit heap is $\frac{1}{13}$ : the probability of taking the ace out of the fecond heap is 1 ; therefore the prabability of taking out both ace is $\frac{1}{3} \times{ }_{1}^{1}={ }^{\frac{1}{6}}$, which being fubtracted from 1, there will remain :6) theretore the -dje ascaint me are 168 to 1 .

In cates where the evente depend on one another, the marner of arguing is fomewhet altered. Tha, fu, mofe that out of one furgle henp of thirteen cards of one cwlour I thould undertake tw take out frit the ace; and, fecondly, the two: though twe probability of taking wht the :ace be , and the probatily of toking out the two be likenife sf: vet, the ace being fupposed as taken out alre:1, , there will remain only tielve wati it the hen , whic! will mare the protabiaity f thing ont the two to be $=$ : thentive the prisidity of thang ou: the i.ce, and sich the two, Wン1"

GARAMI.1, in Alncient Gersraphy, the capital of the Garamantes in Libya Interios; near the fprings of the Cinyphus, now in ruins. Garamantes the people. It lay to the fouth of Gettulia, extending from the fprings of the Cinyphs, and the adjacency of the river Gir, to the mountains which form at the V'allis Garamantica (lliny): or from the fprings of the Bagrades to the lake Nuba (Ptolemy ".

GARAMIOND, CIALDE, a very ingenious letterwunder, was born at Pari"; where he began, in the year 1510 , to found his printing types fiee from all the remains of the Gothic, or (as it is generally called) the black leter, and brought them to fuch petfection, That he had the glory of furpaffing all who went before him, and of being foarcely ever excelled by his fuccolts 1, in that ufeful ant. His types were prodigiounly nultiplied: both by the great number of matrices he firuck, and the types formed in refemblance of his in all parts of Europe. Thus in Italy, Germany, England, and Holland, the bookfellers, by way of
recommending their books, diainguilied the type by his name; and in particular the fimell Roma: was ly way of excellence known among the printers of theie nations by the name of Garamond's emelli Reman. By the ppecial command of King Francis 1. he founded three fizes of Greek types for the ufe of Robert Stephens, who with then printed all his beautiful editions of the New Teftement, a a d other Greek authors. He died at Paris in $\mathbf{1 5 6 1}$.

GARASSE, Fravis, a remarkable Jefuitical writer, the firft author of that irreconcilable enmity that itill fubhits between the Jefuits and Jmfenilts, in the church of Rome, was born at Angoulefme in 1585 , and entered the lefuits college in 1600 . As he had a quick imagination, a flrong voice, and a peculiar turn to wit, he became a popular preacher in the chief cities of France; but not content with this honour, he diltinguifhed himelf ftill more by his writings, which were bold, licentious, and produced much controveríy. The moft confiderable in its condequences was entitled La fomme thologique desverite capiales de la religion Cretienne; which was firlt attacked by the abbot of St Cyran, who oblerving in it a prouigious number of falifications of the Scriptures and of the fathers, befides many heretical and impious opinions, conceived the lonour of the church required him to undertake a refutation. Accordingly he pu'lilhed a full andwer to it ; while Garafle's book was allo under examination of the doctors of the Sorbonne, by whom it was afterwards condemned. Garaffe replied to St Cyran ; but the two parties of Jefuite and Janfenifts, of whom thefe were reffectively the champions, grew to an implacable animofity againft each other, that is not even now likely to fubide. The Jefuits were forced to remove their brother to a ditance from Pais ; where, probably wcary of his inactive obfcurity, when the plague raged at Poictiers in 1631 , he begged leave of his fuperior to attend the lick, in which charitable office he caught the diforder, and died.

GARBE, in Heraldry, a theaf of any kind of grain, borne in ieveral coats of arms, and faid to reprefent fummer, as a bunch of grapes does autumn.

GARBLE, a word ufed to lignify the action of feparating the drofs and duit from fice, drugs, \&c. Garbling is the cleanling and purifying the good from the bad; and may come from the Italian garbo, i. e. finery or neatnefs : and hence, probably, we fay, when we fee a man in a neat habit, that he is in handfome garb.

GARCILASSO, de la Vega, an eminent Spanifh poet, was born at Toleto, in 1503 . He was the younger fon of a man of rank, who had been employed in negociating bulinefs of importance. Garcilaffo was dittinguifhed for his wit and bravery. and in a particular manner for his poetical talents. He was chiefly inftrumental in giving popularity to an innovation of his friend Bofcan, who introduced meafires borrowed from the Italians. His works confilt chielly of pattorals, which have a tedious prolixity. He is chictly noted for tendernefs, which is remarkably confpicuous in fome of his fonnets. He is freer of hombaft than the generality of his countrymen, owing to his familiar acquaintance with the ancients; and it is faid that his learning and tafte were fuperior to his genius. He followed the profeffion of arms, and attended Charles V.

G-IRDANT, or Godremr, in HFratity, denotes any beat full facel. and looking bight forward.

GARDIN, Frivel, better known to the pui lic i'y the title of Lord Gardonfome, was Lorn at Ediuburgh Jume $24^{\text {th }}$, in the year $\mathbf{1 7 2 1}$. His father was Liexander Garden of Troup, an opulent landholder in Aberdeenthire; his mother was Jane, daughter of Sir Francis Grant of Cullen, S. C. I.

After pafing throush the ufual cquefe of liberal eduation at the fhool and the univerlity, he betook himfrlt to the fludy of lan for his protelfion; and in the year $17+4$ he war admited a member of the Faculty of Advocates, and called to the Scottith bar.

In his practice as an advocite he foon began to be ditinguihed, by a trong, native rectitude of underlianding; by that vivacity of appreder.ion and imagination, which is commonly denominated genius; by manly caidene in argument, of en mose perluafive than fuotlety and fophiftical artince; by powers which, with diligence, mizt catily attain to the highest eminence of the profisun. Bat the fame firenth, opennels, and ardour of mind, which difinguilhed him to advantageoully among the pleaders at the bar, tended to give him a fondnefs for the gay engoments of convivial intercourfe, which was unfavourable to his progrefs is juridical erudition. Shining in the focial and consivial circle, he became lef, fultitonly ambitious than he might othorwie hate been, of the character of an elopuent advocate, or of a profound and learned lawver. The vivacity of his genius was averfe from autitere and plodding tudy, wlile it was captivated by the fafcination of polite learming, and of the fine arts. Nor did he always fape thofe excelles in the purfuit of pleafure into which the temptationse of opening lie ace apt, occationally, to fofuce the mot liberal and in\%nlous youth. But his cheerful conviviality, his wit, .wmour, thite, guod-nature, and lenevolence of leart, rendered him the delight of all his açuaintance. Ht inecame his majely: folicitor July $3^{\text {d, }, 1764 .}$

At lexgth the wosth of his chaneter, and his abilities as a lusucer, recommended him to the vilice of a iudge in the cuurts of tellom and julliciary, the titprone judicatures, civil and crimina?, for seot. land. His place in the court of iellon he contmued to occupy till his death ; but had, fune years belore, rengned the vilice of a commilitoner of jutticiary, and a recompence got a penfion of 2001. per amum.

 oftered lahes of imatl firms, at.d of gant tha huiding

 viting to the laheorer and tratefaen of the A.wmods inf ruanty. Thele ctios were eazeriy lumbel tu. Bhose dethous to make the ate:npt benefil to the count: than to derive proft frow is to himbet, he worinduced, within a few years, to tedter hin groudrents to one-half of ti:e orisinti rate- Wraver, frit(1s, thoemabers, and other attilans in a conderable namber, reforted to fettle in the riing viibge. If is lorduip's earnetnefs for the fuccefs of his project, and to promote the profperity of the good people whom he had received und. : his protection, led him to engage in feveral undertakings; by the fatur of a hich he incurred confiderable lulle. Pryeets of a printfiedd, and of mar uffactures of linen an of tholings, attempted with languine hopes in the new villagc, and chietly at his lordhip's rifk and expence, misuse in fuch a maner as mi, he well have finally di, uhted anan of lels tieady and ardent philanthropy with every fuch engrgement. But the villase itill continucd to advance. It grew up under his lorditip's eye, and was the favourite object of his care. In the year 1779, he procured it to ke erccted into a burch of barony; lasing a magittracy, an annual fair, and a weckly marhet. He provided in it a good inn for the reception of travellers; and with an uncommon attention to the entertainment of the gueft, who might relort to it, furniliced this inn with a librany of books for their amuement. He invited an artid for drawing, from the continent. to fettle at Laurencekirk. Ile had the pleatiue of feeing a confiderable liner-manufature at length fised in it. A bleachfied was alfo entublithed as a natural counterpart to the limomanufacture. Before his lordhip's death, he faw his plan of improsing the condition of the labourrs. by the formatinn of a new village at Laurencehirk, crovned rith fuccets bevond lis molt fanguine hopes. He hat acknowled, th, wilh an amiable frathuels, in a memoir concotrmin this village, "That he had tried, in fome meafure, a variety nithe pleafures which makind purlue ; but ne ree rethlod any fis nuch as the phature ariing from the frogrels of his villaue."

In the year 1785 , upon the dath of hiv clider brother, Alexander Garden of Troup, M. P. tor A'e deenthire, Lerd Gardentone fucceded to the phltelion of the family edates, which were very comfiderahte. Unai! this time lis lordhip's income had never been more than adequate to the liberal expence into which his rank, and the generofty of his mature, wavoid: bly led him. But the addition of a fortune of about thete thoufand pounds a-year to his former revenue, save him the power of performing many acts of beneficence with which he could not belore wratily his good heart. It was happy, lihewile, that his fuceeffion to this ample income, at a period when the vigour 3 B

curten. of hi, cratituton was rapialy yidding to the infranition of 0 a a e, enobled him to teek relif, by a partint coltown wan huale, by tiavel, and by other ment, whith cund not have becn eafly compaible with the presius inate of 1 in frsiune.

It the munth of sent. $1: 86$, he fet out fom Lonira for Doser, atul phidedorerinto France. Atter viitins Raric, be probeled t Prownce, atd fent the witer nentw in the fenial climate of Hieres. In the
 rewa, S sityerlm!, t'e Nothertan!, and the Datch provices, aul pithas thr uhh Gemany into I:aly. With a fond curbolty, attentive aike to the wonde: of nature, to ti.e neite monameats of the ats, and to the cutul remains of ancient grandeur, with which Ialy atmonds, he vinted all its great citios, and furveycd almont ctery romatable and famous fene that it exhibits.

Hi frit object, i: thefe travel, was to obtain the relluration of bin declining health by the induence of a miller cifme by gemle, continued, and varied evercife; that pleafing owhizration of the temper and fpate shich is the let medicire to health, and is more tuce: ully produced to. frequent chanere of place, and
 tere mimt, in thole comentes through which he traThlu, cond mat hail to armact, in a powerful manner, the curctity of a mind cultwated and ingenious as his. He, whole brent ylued with the twork ardent philan. thope, could not view the varicd works and mances of a diwerfity of ntimis of his fellow men, without being deenly interthed ty ali thofe circumflances which misht apipear to maik their furtuncs as lappy or wetchad. He eigerly collected fecimens of the ipar, the thells, the Atrata, of recks, and the verins of meats, in the feveral countries through which he pafied. He amated alio caneos, medals, and paintings. He enguired into fience, literature, and local inatitutions. He whote down his oblerwations, from time to time; mit indeed wiht the minu:e care of a pedant, or the ofentatious labour of a man travelling with a defign to fablihh an account of his travels; but fimply to aid memory and imagination in the fature remembrance of oljects ufeful or agreedble.

After an abfence of about thice years, he returned ti) his native conaty. I be latt years were fent in the ditharge of the dutics of his office as a judge; in dicial intercourfe nith his fricuds, among whom was the ventrable Lord Monboddo, and others of the moit sefpectable charactecs that our cuuntry has to boall of; in the periormance of a thoutiand generous offices oi benevolence and humanity; in cherithing thofe fine ant, of which he was an cemient a liniter and judge; and above all, in promoting the comfert, and encoura ing the indully of his idependats, and in lending hi aid to every ratomal ittempt at the improvement of public econony and public virtue.

St Bernard's Well, in the neighbourhood of Edin turgh. ład leen, lones liace, dillinsuithed for the niedicinal virtes of its wate re. But various circunttanon had ahio concurred of lite to throw it into neglect. Yee is rutes being tram mineralized by a fulphuraied 1 ylrogenous gas, vere, ty :his mans, unjucftionabiy quathied to operate, with lighty benefirial effects, in tiee cure of various divarics. The qualisics of
this mincral watce fuling under Lord Garienfone"s nutice, he veis induced to purch fe the property of the wel, to diret it to be cleard from furrounding ob1..ci.es which contanis thed virtues of the water, or mato is i acceinle ; to erect a beautiful and commo. duce ifse orer it ; and to mrroint proper perfuns to d: hitute the water, for a yey tivial compcnfation, to the fubic. The wcil licat a ditance from Emburw, which is very coavenient for a fummer mors-
 face Lad Gardewone's Eenevolent care brought it intonotice, it has attrated many of the inhabinaus of that ciry to vift in the motines of $f$ ring and fummer. And, undoubtedly, the agreeable ex :-cile to which they have thas been allurel, and the Clutary effects of the water, have contiluted, in no mean degree, to difeel difenfe, and to confirm, or re-eftablith lealth. Such momuments are worthy to preferse the memory ot a patriotic and a good man!

A, an amufement for the laft two or three yoars of his life, when his increaling infirmitios precluded bim from more ackue exercif, and from mingling fo trequemtly in the tociety of his friends as was agreearle to his focial and convivisl temper, he bethongit himFelf of reviling fome of the jeux $d^{\prime \prime} e / p r i t$, and light fu, itive pieces, in wtich he had inculged the gaiety of his fancy, in his earlier days; and a folll velume of poems war pu'lilled, in which the belt pieces are, upon good authority, afcribed to Loid Gardenfone. He reviad alio the memorandums which he bad made uron his travels, and permited them to be fent to prets. The two formare volumes were publifhed one after ancther while his lordhip was yet alive; the third after his death. They met with a very favourable reception in the world, and were honoured with the ligh approbation of the moll refpedable writers of periodical criticifin. They convey much agreable information, and belpak an elegant, enlightened, and amabie mind. The lath wolune is flled chient with memorandums of his lordhip', travels in Italy ; and contains many intersting crisicifms upon fome of the noblett produc. tims of the fine arts of painting and fculpture.

His lordhif's leeath had long been declising; and he died a bachelor on the 22d of July 1793 , lamented by his relations and friends, by his teriants and humble dependants, and by all true patriots and good men to whom his merits and virtues were known.

GAKDEN, a picce of cround properly laid out, cultivated, and ornamented with a variety of plants, Howers, fruits, \&c. See Gardenteg.

Gardens are ufually diftinguifhed into flower garden, fruit garden, and kitchen garden : the firtt of which, being deligned for pleafure and ornament, is to be placed in the molt conficicuous part, that is, next to the back front of the houfe; and the two latter, being defigned for ute, thould be placed lel's in fight. But though the fruit and kitchen gardens are here mentroned as two ditimet garden, yet they are now ufually in onc; and that with good reaton, lince they both require a good ioil and expolure, aml equally require to be placed out of the view of the houle.

In the chooce of a place proper for a garden, the moft ellential points to be conidered are, the fituation, the foil, the expofure, water, and profpect.
iff, As to the ficuation, it ought to be fuch a one

## $\mathrm{G} A \mathrm{R}[3: 9] \quad \mathrm{C}$ A $\overline{\mathrm{F}}$

Garion as is wheforme, and in a place neither too hit in :tr too low; for if a garden be too high, it wiil be es. poid to the winds, which are very prejulicinal to tress; and if it be too low, the damplef, the vermine, and the venomoas creatures that breed in pon's and marthy plices, adid much to their infalu'rity. The mast hapoy nteation is on the fide of a hill, elpecithy if the flope be ealy, and in a manter imperceptible; if a nood deal of level ground be noar the houle; and if it a.oands with furings of water: for, being theltered from the fury of the winds and the violent leat of the fun, a temperate air will be there enjoyed; and the water that defends trom the top of the hill, either from ferings os rain, will not only fupply fountam, canals, and calcakes for ornament, but, when it has performed its office, will water the adjacent valleys, and, if it be not fuffeed to ltagnate, will sender them fettile and whol efome.

2 div, i good earth or foil is next to be confidered; For it is icarce polfible to make a fine garden in a bad ivil. There are indeed ways to melionate ground, but they are very expenfive; and fometimes, when the expence has been bettored of laying good earth three feet deep over the whole furface, a whole garden has been ruined, when the roots of the trees have come to reach the natural hotom. To judge of the quality of the foil, obferve whether there be any heath, thitite, or fuch like weeds, growing fontaneoully in it ; for they are certain figns that the ground is poor. Or if there be large trecs growing thereabouts, obferve whether they grow crooked, ill haped, and grubby; and whether they are of a faded green, and full of mofs, or inferted with vermine : if this be the cafe, the place is to be rejected. But, on the coatrary, if it be coverd with good grafs fit for paiture, you may then he encouraged to try the depth of the foil. To know this, dig hinles in feveral places, in feet wide and four deep; an! if you find three feet of good evrth it will do very well, but lefs than two will not be fullicient. The quality of good ground, is nether to be Ilony nor too hard to work ; neither too dry, too moilt, nor too fandy and light; nor too ftrong and clayey, which is the worth of all for gardens.

3 diy, The next requinte is water; the want of which is one of the greatelt inconveniences that can attend a garden, and will bring a certain mortality upon whatever is planted in it, etpecially in the greater droughts that often happen in a hot and dry fitution in fummer ; befides its ulefulnefs in fine gardens for making foun:aine, canals, calcades, \&c. which are the greatell omaments cf a garden.
$4^{\text {thly }}$. The latt thing to be confidered is the profrest of a fine country ; and though this is not fo abfolutely neceflary as water, yet it is one of the mol agreeable benuties of a fine garden: befidec, if a garden le plant ed in a low place that has no kind of profpect, it will noi only be difagreable but unnholefome.

In the laying out and planting of catdon, the beauties of nature flould always be fludied; for the nearer a garden approaches to nature, the longer it will plesie. According to Mr Miller, the area of a handtome garden may take up 32 or .1p acres, but wht more ; and the following rule, fhoud be oflerved i: the difpoftion of it. There ought 2 lonjs to be a difent of at lealt
 der the lou'c more dry and wholefome, anl ! ' profpest - .-
 that cught to prefent itcif, to vie: hand te at on"
 than the foot of the buhtis; and in theneh a one half mare that the nifle, it will have atere o fect: if a the fale of the lien a the te ate tra atatus irregularly, Ly way of upen gruice, the tegelatity of the lame will te token, and the whole madered niow like mature. Fur the converience of wall. g in chap weather, this lawn thond be lumomla wita a cave? walk, on the outide of which thould be bonds three or four feet wide for thowers: and from the batk of thicic the profpect will be agreably termina:ed by ilope of evergreen thrubs; which, hovever, thould nover be fuffered to exclude agreable prown, or tho view of handfome buildings. Thole wains may lan through the different plantations, ently winding dbour in an eafy natural manner ; which will be more agseeable than either thofe long itraight walls, to fiequer:ly feen in gardens, or thofe ferpentinc windings that are twifed about into fo many thest turns as to render it dillicent to walk in them; and as no gaden can be pleafing where there is a wate of fhade did theler, their waks ihould lead as foon as pollitie intu phant kiom, where perions may walk in private, and be thliered from the wind.
Narrow rivulcts, if they have a conkant fream, and are judiciuthy led about a garden, have a bettee efice: than many of the large llagnating pends or c.nals fo frequently made in large "arkens. When wilderneñ, are intended, they thould not be cut into flars and other ridiculous figures, nor formed in:o mazes of laby. rinthe, which in a great defign apicar triting.
In hort, the feveral parts of a garden hould be diverifed; but in places where the eye takes in the whole at once, the two lides fhould be always the fume. In the bufinels of defigns, the aim fould be always at what is natural, great, and noble. The general difo. fation of a garden and of its parts ought to be accommodated to the different fituations of the ground, to humour its inequalitiss, to proportion the number and forts of trees and hrah; to each part, a.d to flut out from the view of the garden no objects, that may become ornamental. But for a more eatended sie:s of this fu's. ject, fee the article Gindmanc.

A practical attention to a garden, is ly fome cfteemed a degrading employment. It is tru:, iadeel, that paftoral ard astriciltural mamere, if we may form a judgment from the digniticd detcrijtions of Virgi, are greatiy degenerated. The employments of the pheds and hulandmen are now become mean and fordid. The work of the garden is whally left to a meafunt. Nor is it unreafontule to allizn the habour, which wearies without amuement, to thole who are lufticieatly amufed by the profpegt of their wage. But the operations of graftinc, of inuculating, of promint, ot tramplanting. aic curious expecments in matural philu folly; and that they are pleating as well as curion, thofe ran tulify who aemenber what they telt on leeing their attempts in the andement of pratioal sade ing atombled with 1.acf. Snony the employments fuitabie to old aye, Cicuo :as cnumerated the luperintendence of a gation.

Gard.n. It requircs no eat excrtion of mind or body; and its Catief tions ate of that kind which pleafe whout violent ayitation. Its beneficial infuence on heatt? is an ndalisional reafon for an attention to it at an age whea informitie abound.

In amot every defcription of the feats of the blefled, ideas of a garden feem to have produminated.
 The teeds of Elyrium, that fivect resion of poetr, ase adorned with all that imagin tion con conceive to be delightut. Sone otthe mitt pleang paliages of Mitton, ate thofe in which he repreient: the hempy pair engreed in cultivating their bliwful abode. Poets have things been delithted with the beauties of a garden. Lucan is reucheated by Juvenal as repoling in bis grabt:. Vir il, Georgie, prove him to have been ceftionted with rural he nes; thoush, to the furprife of his reader, he has not aligned a book to the fubject of a quaden. Oar Sbenkene min!e it his ftudy; but, with all hi, t. ${ }^{2}$ e and fontuets for i. . he was ries lapas in i. The carticutions fienes whith he created at the 1.arionc. aftirted him, it is fide, littie pleafure in the abface dfoctators. The truth is, he male the embulahmets of hiv rounds, which howh have been the amument of his life, the bumbl of it; and involued hata it in tuch trouble, by the eapences it occaliunc 1, as seccharily escluded tranquil enjoyment.

It is the lot of few, in comarifon, to pofers territories like his, extenfive, and fuficiently well adapted to crontitute an ornamented farm. Still fewer are c?pable of fupporting the expence of preferviag it in good conlition. But let not the rich fuppote they have appropriated the rleafures of a garden. The polfeffor of an acre, or a fmaller portion, may receive a real pleafure, from oherving the progrefs of weseation, even in a plantation of culinary plants. A very limited trait, properly attended to, will furnih ample employment for an individual. Nur let it be thought a mean care; for the fame hand that raifed the cedar, formed the livfop on the wall. Even the orchard, cultivated folely for adrantage, exhibits beatic; unegualled in the lhrubbery; nor can the greenloute produce an appearance to esceed the blollom of the antle and the almond.

Hanzint $G$ rinorss, in antiquity, gardens raifed on ackes iy Nemuchadmezar king of Pabyon, in order to gratify his mife Amyctic, daughter of Aftyages king of Media. Ouintus Curtits makes them equal in height to the walls of the city, viz. $5=$ feet. They contained a fyuare of 400 feet on every fide, and were carried up into the ir in feveral terraces lad above on, another, and the :ffent from terrace to terrace was ty flairs is leet wite. The arehen futaining the whole pile sere railed ahove one another, and it vas ifrewthened by a $\therefore: .11$, farrouncing it on every ink, of 22 feet in thelinets. The floors of each of the terace were lad in the following maneer: on the top of the arches vere irtt lais large tiat tiones 16 fect

mised with a great quanti:y of bitumen, over which Garden. wate two rows of bricks clotely cemented together by plafter, and over all were laid thick thects of lead; and lattly, upon the lead was lail the mould of the garden. The mould or eartl was of fuch a depth as to admit the largelt tree to tale root and grow ; and it was covered with various hinds of trees, plants, and fiowere. In the upper termace there was an aqueduct or engine, whercby water was drawn ${ }_{2}$ out of the river for watering the whole garden.

Figaing Cakdens. We are informed by the albe Chavigero in his Hiltory of Mexico, that when the Mexicans were brought under fubjection to the Colhuan and Tepanecan nations, and confined to the miferable little itlands in the lake of Mesico, they ceated for fome years to cultivate the land, becaute they had none, until necelity and indutry together taught them to form moveable ficlds and gardens, which floated on the waters of the lake. The method which the purfued to make thefe, and which they itill practife, is extremely fiomle. They plait and twit wilhows and routs of marih plants or other materials to ether, which are lig'st, but capalie of lupporting the ear:h of the garden firm? y united. Upos this fundation they lay the light bultos which flo.t on the !ake; and over all, the mal and dirt which they draw up from the bot to:n of the tame lake. Their rogular figure is quadrangular ; their lencth and breadth various: but gen: rally they are ahout eight peaches long, and not more than three in breadth, and have lefs than a foot of elevation above the firface of the water. Thele were the firt fields winch the Mexicans owned after the feandation of Mexico; there they firt cultivated the maize, great pepper, and other phats neceltiry for their lupport. In procrefs of time, as thote fields srew numerous from the induitry of the people, there vere among them gardens of flowers and odoriterous plants, which were employed in the womhip of their god, and ferved for the recteation of the nobles. At prelent they culaivate nowers and every fort of garden herbe upon them. Every day of the year, at funcife, innomerable vefle's loaded with various kinds of flowers and herbs, which are cultivated in thofe gardens, are fon artiving by the cana's, at the ereat market place of that capital. All plauts thrive there furprifingly; the mad of the lake is an extremely fertile foil, and requires no water from the clouds. In the larget fardens there is commonly a little tree, and even a hitle lut to thelter the cultivator and defend him from rain or the fun. When the owner of a rarden, or the Cainampa as he is ufually called, wifues to clange his lituation, to moove from a difagreable neichbour, or to come nearer to his own family, he get into hi hitle whe!, and by his omn ilaength alone, if the garden is fimall, or with the affitance of cthers if it is large, he tows it after him, and conduc's it whorever he pleates with the little tree and hi.t upon is. That part of the lake where thof Hloating sardens are, is a place of infinite recreation, where the finis frocive the higheat pothble gratification.

## G $A R \mathrm{D}$ D N I N G;

TIIIE ant of plaming and cultivating gardens. In is utmol caten:, whatever contributes to rander the fcenes of nature delighthil, is among the foljeets of garlening : and animute as well in inammate olject, are circumflances of beauty or charater. The whole range of rature :s open to the gardener, from the parterre to the forell; and whateser is agrecable to the fentes or the imagination, he may appropriate to the frot he is to improve: it is a part of his butmet to collett into one place the delights which are genera!! difperled through different fuecies of country.
Hfory f Gardíning.
fHif.cf GiRDENixG, Mr Walpale + oblerves, was probably Moul. Gor- one of the firll arte that fucceeded to that of building dening, iub-houfes, and naturally attended property and individual joinel to the ith wol of he $A$ nco- were the cbiccts of every head of a family : it became doess of convenient to have them wihin reach, without keching Pahiting.
or Juan Fernandez " S'ct (continues our authur) what was that boatted Piradie with which
the gnds ondaived
To grace Alcinous and his hapy land,
Why, divented of harmonious Gucek and beritchisert poetry, it was a mall orcard and vineyard, with 1 me beds of herios and tho fourtains tiat watered the m, encload within a quackiet bedge. The whoe com, ato of this pompous garden cacloled-four acres:

Four acres was th' alloted fpare of ground,
Fenc'd with a green encloture all around.
The trees were apples, figs, pomegranates, pears, olives. a 1 d vines.

Tall thriving tiees confefs'd th:e fiuifful mold ;
The red'ning apple ripens into gold.
He re the blue fig with lucious juice o'erilows,
With deeper red the full pomegranate glous;
The branch here bends beneath the weighty pear,
And verdant olives fiourih round the year.
Beds of all various herbs, for ever green,
In beautcous order terminate the icene.
Alcinous's garden was planted by the poet, enrichoc by him with the fairy gift of eternal funmer, and no doubt an effort of imagination furpating any thing he had ever feen. As he has beitowed on the fame h.ppy prince a palace with brazen walls and columns of filver, he certainly intended that the gardens fhould be proportionably magnificent. We are fure, therefore, that, as late as Homer's age, an enclolure of four acre:, comprehending orchard, vineyard, and kitchen garden, was a flretch of luxury the world at that time had nerer beheld."

Previous to this, however, we have in the facred writings hints of a garden till more luxuriouly furnilhed. We allude to the Song of Solomon, part oi the fene of which is undoubtedly laid in a sardentor Cinon. it. Fioners and fruits are particularly fohen of an the of-1 naments and the produce (f it; and iselides thef, arumatic vegetable formed a comiderable part of the gratilications it afforded. The -mphiser and the cinn' mon tree, with all trees of franhinente, and atl the chicf fipices, fiourihed there $t$. Solomon tell. u in another place $\|$, That he made him grat norhs;-gar- : Cant. i. dens and orchards, and plantel in them trees of everg $1=$ hind. Indeed we math fuppote hiv gardens to have leet Est is. both amply and curioully furnihard, kieng the kind, + . nature, and peperties of the wetable tribes, leem to have been a farourite otudy with the rosal phibforlet, and to have been decmed a fulject worthy of his pent: for we are told, that he wrote of phata, fiom the areit cedar of Lecbanon duwn to the hyilop of the wall $\oint$. Kive Fountais and ftream of water apmear allo to have $3 z^{\circ}$. had a thare in the compuition, and probably for oma. ment as well as whe.
'the hanging gandens of Dabolon, mentowert in :
froculing urticie, were a alill greater prodigy. But es they are fuppoped to have been formad on terraces an: 1 the wall of the palace, whither foil was conveys on furpote, Mr Walpole concludes, ' they were what tumptuous gardens have been in all ages til the petert, umatural, en:ched by are, polibly with foumans, tawes, balutrades, and fimmer l.cutio, and were any thing bue verdant and ramal."

Others, however, have allowe them greater praite. They feem in many refpects, to have been laid out with good talic. Their elevation not on'y pruduced a variety and cuent of view, but was alfo uieful in moderating the heat. Such a fituation wonld likewile fint a gieater variety of trees and plats than a plain furface, and would contain a harger as well as a more diverified extent.

The fuitine of the fituation to the nature of the trees feems, from the accuunt given by Jofephus, to have been one view $\ddagger$ in the ere $\begin{gathered}\text { ing the building in }\end{gathered}$ i. fuch a manner. And the fuccefs ieems to have been anfiverable, as the trees are faid to have flourihed evtremely well $t$, and to have grown as tall as in their native fituations. On the whole, then, however dificrent thefe may apprar from modern gardens, they feem to have been forned with julpment and talte, and well adapted to the fituation and circumitances.

It fcems prubable, from feveral circumitances, that the eatlern gardcas were ar" "ning to the houie or palace to which they belongea. Thus, King Ahafuerus goes immediately from the banquet of wine to walk in the garden of the palace $\$$. The garden of Cyrus, at Sardis, mentioned by Xenophon *, was probably contiguous to the palace: as was that of Attalus, mentiuned by Juftin \|. The hanging gardens at Babylon, were not fo much adjacent to the palace, as a part of the palace ittilf, fincc feveral of the royal apartments were beneath them 9 .

It is not clear what the tafte for gardening was among the Grecks. The Academus, we know, was a wooded fhady place; alad the trees appear to have been of the olive fpecies. It was fituated beyond the limits of the walls, and adjacent to the tombs of the heroes; and though we are nowhere informed of the particular manner in which this grove was difpufed or laid out, it may be gathered from Paulanias, in his Attica, that it was an elegant ornameated place. At the entrance was an altar dedicated to Love, which was faid to be the firft erected to that deity. Within the Acad-mus, were the altars of Prometheus, of the Mufes, of Mercary, of Minerva, and Hercules; and at a fmall ditance was the tomb of Plato. So that in all probability, it was highly adapted by art, as well as nature, to philofophic reflection and contemplation.

We are told by Plutarch, that before the time of Cimon, the Academus was a rude and uncultivated frot: but that it was planted by that general, and had water conveyed to it ; whether this water was brought merely for ufe to refrelh the trees, or for ornament, does not anpear. It was divided into gymmalia, or places of execife, and philofophic walks, ilhaded with trees. Thefens' id? to have Hourihed very well, until deArusel by Sylta (when he betikged Atheno), as well is the ine in the Lyceum.

Nat the ackemy were the garden of the philofopher, of Plate and of the Elicurus; which, however,
were probably but fmal. ' lae fcene of rlato's Dialofuc cencerning Beauty is elegantly defcribed as being on the banks of the river Ilifus, and under the ininde of the plantain ; but no artificial rrangement of $o^{\prime}$; ats is memtion d, nor ary thing which will lead us to ina he the prufpect to be any other than merely naturni.

Among the Romzas, a taite of gardeang, any othersife than as a matter of utility, feems not to bave prevaled till a very late period; at leat the writers on hufbandy, Cato, Varro, Coiume:la, and Palladius, m whe not the leat mentim of a garden as an o'ject of pleature, but folely with refpect to its protuctions of herts and fruits. The Lucullan gardens are the frial we tind mentioned of renarkable magnificence; though probally from the extrawaynce to which thefe ware arrived, they were not the fird. Plutarch fpe:ks of them as incredibly expenfive, and equal to the magnifcence of kings. They contained artificial clevations of ground to a furprifing height, of buildings project. ed into the lea, and vait pieces of watcr made upon land. In fhort, his extravagance and expence were fo great, that he acquired thence the appeliation of the Roman Xerxes. It is not improbable, from the above account, and from the confideration of Lucullus having fent much time in Alia, in a fituation wherein he had an oppottunity of obferving the molt fplendid conftructions of this kind, that thefe gardens might be laid cut in the Aliatic ftyle. The vat maffes of building flaid to have been erected, might have borne lome refemblance, in the arrangement and ftyle, to the Babylomian gardens; and the epithet of the Roman Xerxes might be arplicable to the tafte, as well as to the fize and expence of his works.

The Tulculan vilh of Cicero, though often mentioned, is not anywilcre defcribed in his worke, fo as to give in aderuate illea of the flyle in which his gardens or grounds were difpoted.

There is but little to be traced in Virgil relative to this fubject. Pines + , it feems pobable, were a fa- $\dagger$ Eichs. vii. vowite ornament in gardens; and flowers $\$$, rofes $65 . \& 2 \mathrm{c}$. etivecially, were much etteemed, perfumes indeed hav- $\{$ Ger. iv. ing been always highly valued in warm climates. Vir- 113. gii places Anchifes in Elytium, in a grove of bays: and is carefal to remark, that they were of the fiect fcented hind. The Pxtan rofes were chictly valued for their evcelleat odour; and the fame quality appears to be the c:ulue why they were placed by 'livullus as ornaments to the Elyfian fields. There appears alfo to have prevailed among the Romans a piece of luxury relative to gardenc, which is equilly prevalent at prefent among us, namely the forcing of flowers at feafuns of the year not fuited to their natural blowing: and rofes were then, as at prefent, the principal towers upon which thefe expcriments were tried, as appears from Martial $\dagger$ and others.

of a whan furmerly, that in 1 " Cencean's architecturc, who lived in the time of Charles IX. and Heary III. there is fearce a ground plot without one of earl.

In Kip's Viens of the Seats oi our Nobrility and Gentry, we fee the fine tircfome and returning uniformity. Every houfe is approached by two or three gardens, confiting perhaps of a gravel walk and two eafs plats or borders of Howers. Each nicis alowe tie other by two or three fleps, and as mony walls and terrices, and io many iron gates, that we recollect thofe ancient romances in which every entrance was guarded by nymp's or dragons. Yet though theie and fuch prepolterous inconveniences prevailed from aze to age, good fenfe in this country liad perceived the want of fomething at once more grand and more natura?. Theferellections, and the bounds fet to the wafte nade by roval fooilers, gave origin to Parks. They wese contracted forelts, and extended gardens. Hentener fays, that, according to Rous of Warwick, the firlt park nas that at Wrodifock. If fo, it might be the foundation of a legend that Henry II. lecured his miftels in a labyrinth : it was no doubt more diff. cult to find her in a park than in a palace, where the intricacy of the woods and various lodges buried in covert might conceal her actual habitation.

It is more extraordinary that, having fo long ago flumbled on the principle of modern gardening, we thould have perfifted in retuining its reverfe, fymmetrical and unnatural gardens. That parks were rare in other countries, Hentzner, who travalled over great part of Europe, leads us to fuppofe, by obferving that they were common in England. In France they retain the name, but nothing is more different both in compafs and difpofition. Their parks are ufually fquare or oblong enclofures, regularly planted with walks of chefnuts or limes, and generally every large town has one for its public recreation.
"One nan, one great man we had (continues Mr Walpole), on whom nor education nor cullom conld impote their prejudices; who, ' on evil days though fallen, and with darknefs and folitude compatted round,' iudged that the miftaken and fantaffic ornaments he had teen in gardens, were unworthy of the Almighty hand that planted the delights of Paradife. He feems with the prophetic eye of tafte to have conceived, to have forefeen modern gardening; as Lord Bacon ammounced the diforcries fince made by experimental philotophy. The defcription of Eden is a warmer and more jurt picture of the frefent flyle than Claul Lorraine could have 1 inted from Hagley or Stourhead. The frrt lines we tall cuote exhibit Stourhead on a more magniticent fale :

Thro' Eden went a river large, Nur chang'd his courfe, but thro' the haggy hill, 1 'afs'd underneath ingulph'd : for God had thrown That momtain as his garden mound, high rais's! L'pon the rapid current

and then recollect, that the author of this fublime vifiou had never leen a glimple of any thing like what he has imagined ; that his favourite ancients had dropped not a hint of fuch divine fienery; and that the conceits in Italian gardens, and Theobalds and Norluch, were the brightell originals that his menwory could furnivh. His intellectual cye faw a nobler plan, fo little did he fuffer by the lofs of fight. It fuficed him to have feen the materials with which he could work. The vigour of a boundlefs inagination told him how a plan might be difpoled, that would embellifh nature, and rellore art to its proper oflice, the jult improvement or imitation of it.
" Now let us return to an admired writer, pofterior to Milton, and fee how cold, how infipid, how tallelefs, is his account of what he pronounced a perfect garden. We fpeak not of his fiyle, which it was not neceflary for lim to animate with the colouring and glow of poctry. It is his want of ideas, of imagination, of tafte, that deferve cenfure, when he dictated on a fubject which is capable of all the graces that a knowledge of be:utiful nature can beitow. Sir William Temple was an excellent man; Milton, a genius of the firlt order.
" We cannot uonder that Sir William declares in favour of parterres, fountains, and flatues, as necellary to break the famenefs of large gralis plots, which he thinks have an ill efiect upon the cye, when he acknowledges that he difcovers fancy in the gardens of Alcinous. Nilton dudied the ancients with equal enthuliafm, but no bigotry; and had judgment to dittinguilh between the want of invertion and the beaties of poetry. Compare his paradife uith Homer's garden, both afcribed to a celeftial delign. For Sir Willian, it is jult to obferve, that his ideas centered in a fruit garden. He had the honour of giving to his country many delicate
fruits, and he thought of little elfe than difpofing them to the beft adrantage.
"The belt figure of a garden (fays he) is either a $f_{\text {fuare }}$ or an oblong, and either upon a tlat or a defient : they have all their beautic, but the bell I elfecm an oblong upon a defcent. The beauty, the ai:, the view make amends for the expence, which is tery great in finithing and fupporting the terrace walks, ia levelling the parterres, and in the ftome ilairs that are necelfary from one to the other. The perfectelt figure of a garden I ever faw, either at home or abroad, wis that of Moor Park in Hertfordihire, when I knew it about 30 years ago. It was fade by the Countefs of Bediord, elteemed among the greatelt wits of her time, and celebrated by Dr Donme; and with very great care, excellent contrivance, and much coft ; but greater fums may be thrown away without effect or honour, if there want fenfe in proportion to money, or ' if nature be not followed; ; which I take to be the great rule in this, and perhaps in every thing elfe, as far as the conduct not only of our lives but our governments.' [We fhall fee how natural that admired garden was.] - Becaufe I take the garden I have named to have been in all kinds the mont beautiful and perfect, at leatt in the figure and difpofition, that I ever have feen, I will defcribe it for a model to thofe that meet with fuch a fituation, and are above the regards of common expence. It lies on the fide of a hill, upon which the houfe ftands, but not very iteep. The length of the houfe, where the beft rooms and of moft ufe or pleafure are, lies upon the breadth of the garden; the great parlour opens into the middle of a terrace gravel walk that lies even with it, and which may be, as I remember, about 300 paces long, and broad in proportion ; the border fet with Itandard laurels and at large diftances, which have the beauty of orange trees out of hower and fruit. From this walk are three defcents by many ftone fteps, in the middle and at each end, into a very large parterre. This is divided into quarters by gravel walks, and adorned with two fountains and eight flatues in the feveral quarters. At the end of the terrace walk are two fummer houfes, and the fides of the parterre are ranged with two large cloifters open to the garden, upon arches of ftone, and ending with two other furmmer houfes even with the cloifters, which are paved with fone, and defigned for walks of fhade, there being none other in the whole parterre. Over thefe two cloitters are two terraces covered with lead and fenced with balufters; and the paflage into thele airy walks is out of the two fummer houfes at the end of the firit terrace walk. The cloitter facing the fouth is covered with vines, and would have been proper for an orange houfe, and the other for myrtles or other more common greens, and had, I doubt not, been call for that purpofe, if this piece of gardening had been then in as much vogue as it is now. From the middle of this parterre is a defcent by many fteps tlying on each fide of a grotto, that lies between them, covered with lead and Hat, into the lower garden, which is all ftuit trees ranged about the feveral quarters of a wildernefs, which is very fhady; the walks here are all green, the grotto embellifhed with figutes of thell rockwork, fountains, and water works. If the hill had not ended with the lower garden, and the wall were not Enounded by a common way that goes through the Vur.18.1'm: 1
park, they might have whacd a thirs ganter of all greens; but this want is fuppited ly a garden on the other fide the houfc, which is .llto then tort, very mild, thaty, and alorned with rough rock wom and fiu: tains. This was Mow Park whon 1 was acrquatrued with it, and the fisectell place, 1 thisk, that 1 have feen in my life, either hefore or tince, at hume of abroad.
". It is unnecciliary to add any remaths on tinis $d$. feription. Any man might decign and build as fire ot : garden, who liad been born in and never thireet ou of Holborn. It was not, however, peculiar to Sir II: : liam Temple to think in that mamer. How many Frenchmen are there who have feen our gardens, and titll prefer natural flights of fteps and thady cloilters co vered with lead! Le Nautre, the archisect of the groves and grottoes at Verfilles, came hither on a milfion to improve our taife. He planted St James's and Greenwich Parks-no great monument, of his invention.
" To do farther juftice to Sir William Temple, we muit not omit what he adds. 'What I have faid of the bett forms of gardens is meant only of fuch as are in fome fort regular; for there may be other forms wholly irregular, that may, for ought I know, have more beauty than any of the others: but they mult owe it to fome extraordinary difpofitions of nature i:1 the feat, or fome great race of fancy or judgnent in the contrivance, which may reduce many difagreeing parts into fome figure, which fhall yet, upon the whole, be very agreeable. Something of this I have feen in fome places, but heard more of it from others who have lived much among the Chinefer, a people whofe way of thinking leems to lie as wide of ours in Europe as their country does. Their greatelt reach of imagination is employed in contriving figures, where the beauty thall be great and ftrike the eye, but without any order or difpofition of parts, that thall be commonly or cafly obferved. And though we have hardly any notion of this fort of beauty, yet they have a particular word to esprefs it: and when they find it hit their eye at irim fight, they fay the Sharawadgi is fine or is admirable, or any fuch expreffion of efteem: but I hould hardly advife any of thefe attempts in the figure of gardens among us ; they are adventures of too hard achievement for any common hands; and though there may be more honour if they fucceed well, get there is more difhonour if they fail, and it is twenty to one they will; whereas in regular figures it is hard to make any great and remarkable faults.'
"Fortunately Kent and a few others were not quite fo timid, or we might fill be going up and down liairs in the open air. It is true, we have heard much lately, as Sir William Temple did, of irregularity and imitations of nature in the gardens or grounds of the Chinefe. The former is certainly true: they are as whimfically irregular, as European gardens are formally uniform and unvaried:-but "ith regard to mature, it feems as much avoided, as in the fquares and oblongs and ilraight lines of our anceitors. An artificial perpendicular rock flarting out of a that plain, and comected with nothing, often pierced through in various places with oval hollows, has no more pretention to be duemed natural than a lineal terrace or a parterre. Thie Late Mr Jofeph Spunce, who had both tafte and zeal 3 C
for the prefent diyie, was fo perfuaded of the Chinefe troperor's pleature ground being laid out on principles refembing ours, that he tranflated and publihed, under the name of Sir Harry Beamont, a particular account of that enclofure from the collection of the ?etter, of the Iefuits. But except a detcrmined irreguiarity, one can find nothing in it that gives any dea of attention being paid to nature. It is of vait rircumference, and contaiis 200 palares, befides as many contrguous for the eunuchs, all gilt, painted, and varnithed. There are raifed hills from 20 to 60 feet himh, ftreams and lakes, and one of the latter five miles round. 'Thefe waters are paffed by briages:but even their bridges muit not be ftraight-they ferpentize as much as the rivulets, and are fometimes fo long as to be furnithed with relting places, and begin and end with triumphal arches. The colonnades undulate in the fame manner. In fhort, this pretty gaudy fcene is the work of caprice and whim, and, when we retlect on their buildings, prefents no image but that of unfubftantial tawdrinefs. Nor is this all. Within this fantaftic paradife is a fquare town, each fide a mile long. Here the eunuchs of the court, to entertain his imperial majefty with the buftle and bufinefs of the capital in which be refides, but which it is not of his dignity ever to fee, act merchants and all forts of trades, and even defignedly cxercife for his royal amufement every art of knavery that is practifed under his aufpicious government. Methinks this is the childifh folace and repofe of grandeur, not a retirement from affairs to the delights of rural life. Here too his majefty plays at agriculture : there is a quarter Set a part for that purpofe; the eunuchs fow, reap, and carry in their harveft, in the imperial prefence; and his majefty returns to Pekin, perfuaded that he has been in the country.
"Having thus cleared our way by afcertaining what have been the ideas on gardening in all ages as far as we have materials to judge by, it remains to show to what degree Mr Kent invented the new ftyle, and what hints he had received to fuggent and conduct his undertaking.
"We have feen what Moor Park was, when pronounced a ftandard. But as no fucceeding generation in an opulent and lifxurious country contents itfelf with the perfection eftablifhed by its anceftors, more perfect perfection was ftill fought; and improvements had gone on, till London and Wife had ftocked all our gardens with giants, animals, monfters, coats of arms, and mottoes, in yew, box, and holly. Abfurdity could go no farther, and the tide turned. Bridgman, the next fathionable defigner of gardens, was far more chafte; and whether from good fenfe, or that the nation had been ftruck and reformed by the admirable paper in the Guardian, $\mathrm{N}^{\circ} 173$, he banifhed verdant fculpture, and did not even revert to the fquare precifion of the foregoing age. He enlarged his plans, difdained to make cuery divifion tally to its oppofite; and though he ftill adhered much to ftraight walks with high clipped hedges, they were only lis great lines; the reft he diverfficed by wildernefs, and with loofe groves of oak, though llill within furrounding hedges. As his reformation gained footing, he ventured, in the royal garden at Kichmond, to introduce cultivated fields, and even morfels of a foreft appearance, by the fides of
thofe endlefs and tirefome walks that flretclied out of onc into another without intermifion. But this was not till other innovators lrad brokic loofe too from rigid fymmetry.
" But the capital ftroke, the leading ftep to all that has followed, was the deftruction of walls for boundaries, and the invention of foffes-an attempt then deemed fo aftonifhing, that the common pople called them Ha ! Ha's! to exprefs their furprife at finding a fudden and unperceived check to their walk.
"A funk fence may be called the liading fep, for thefe reafons. No fooner was this fimple enchantment made, than levelling, mowing, and rolling, followed. The contiguous ground of the park without the funk fence was to be harmonized with the lawn within; and the garden in its turn was to be fet free from its prime regularity, that it might affort with the wilder country without. The funk fence afcertained the fpecific garden ; but that it might not draw too obvious a line of diftinction between the neat and the rude, the contiguous out-lying parts came to be included in a kind of general defign; and when nature was taken into the plan, under improvements, every ftep that was made pointed out new beauties, and infpired new ideas. At that moment appeared Kent, painter enough to tafte the charms of landfcape, bold, and opinionative enough to dare and to dictate, and born with a genius to ftrike out a great fyftem from the twilight of imperfect effays. He leaped the fence, and faw that all nature was a garden. He felt the delicious contraft of hill and valley changing imperceptibly into each other, tafted the beauty of the gentle fwall or concave fcoop, and remarked how loofe groves crowned an eafy eminence with happy ornament; and while they called in the diftant view between their graceful ftems, removed and extended the perfpective by delufive comparifon.
"Thus the pencil of his imagination beftowed all the arts of landfcape on the fcenes he handled. The great. principles on which he worked were perfpective, and light and thade. Groupes of trees broke too uniform or too extenfive a lawn; evergreens and woods were oppofed to the glare of the champaign; and where the view was lefs fortunate, or fo much expofed as to be beheld at once, he blotted out fome parts by thick thades, to divide it into variety, or to make the richeit fcene more enchanting by referving it to a farther advance of the fpectator's ftep. 'Thus, felecting favourite objects, and veiling deformities by fcreens of plantation; fometimes allowing the rudeft wafte to add its foil to the richeft theatre; he realized the compofitions of the greateft mafters in painting. Where objects werc wanting to animate his horizon, his tafte as an architect could beftow immediate termination. His buildings, his feats, his temples, were more the works of his pencil than of his compaffes. We owe the reftoration of Greece and the diffufion of architecture to his fkill in landfcape.
"But of all the beauties he added to the face of this beautiful country, none furpaffed his management of water. Adieu to canals, circular bafons, and cafcades tumbling down marble fteps, that laft abfurd magnificence of Italian and French villas. The forced elevation of cataracts was no more. The gentle ftream was taught to ferpentize feemingly at its plafure ; and
where difontinucd by dificrent levels, its courfe appeared to be concealed by thickets properly interfperfed, and glittered again at a diflance, where it might be fuppofed naturally to arrive. Its borders were fmoothed, but preferved their waving irregularity. A few trees fcattered here and there on its edges fprinkled the tame bank that accompanied its neanders; and when it difappeared among the hills, fluades defcending from the heights leaned towards its progrefs, and framed the diftant point of light under which it was lolt, as it turned afide to either hand of the blue horizon.
"Thus, dealing in none but the colours of nature, and catching its mof favourable features, men faw a new creation opening before their eyes. The living landfcape was chaftened or polifhed, not transformed. Freedom was given to the forms of trees: they extended their branches unreftricted; and where any eminent oak, or matter beech, had efcaped maiming and furvived the foreft, buth and bramble was removed, and all its honours were reitored to diftinguilh and fhade the plain. Where the united plumage of an ancient wood extended wide its undulating canopy, and ftood venerable in its darknefs, Kent thinned the foremoft ranks, and left but fo many detached and fcattered trees, as foftened the approach of gloom, and blended a chequered light with the thus lengthened thadows of the remaining columns.
" Succeeding artifts have added new mafter ftrokes to thefe touches; perhaps improved or brought to perfection fome that have been named. The introduction of foreign trees and plants, which we owe principally to Archibald duke of Argyle, contributed effentially to the richnefs of colouring fo peculiar to our modern landfcape. The misture of various greens, the contraft of forms between our foreft trees and the northern and Weft Indian firs and pines, are improvements more recent than Kent, or but little known to him. The weeping willow, and every florid flurub, each tree of delicate or bold leaf, are new tints in the compofition of our gardens.
"But juft as the encomiums are that have been beflowed on Kent's difcoveries, he was neither without affiftance or faults. Mr Pope undoultedly contributed to form his taite. The defign of the prince of Wales's garden at Carlton houfe was evidently borrowed from the poet's at Twickenham. There was a little of affected modefty in the latter, when he faid, of all his works he was molt proud of his garden. And yet
it was a fingular effort of ans and taties in prefs to much variety and fenery on a fipot of fiv: acres. The pufting through the gloom from the grolto to the opening day, the retiring and again affembling fhades, the dulky groves, the larger lawn, and the folemnity of the termination at the cypreties that lead up to his mother's tomb, are managed nith exquifite judgment; and though Lord I'eterborought affitted him

To form his quincunx and to rank his vines,
thofe were not the moft pleafing ingredients of his litt perfpective.
"Having routed profeffed art (for the modern gat. dener exerts his talents to conceal his art), Fent, lih. other reformers, knew not how to ftop at the juif limits. He had followed Nature, and imitated her f, happily, that he began to think all her works wern equally proper for imitation. In Kenfington garden be planted dead trees to give a greater air of truth to the fcene-but he was foon laughed out of this excefs. His ruling principle was, that nature abhors a flraight line. His mimics (for every genius has his apes,) leemed to think that the could love nothing but what wa crooked. Yet fo many men of talle of all ranks devoted themfelves to the new improvements, that it is furprifing how much beauty has been fruck out, with how few abfurdities. Still in fome lights the reformation feems to have been puihed too tar. Though an avenue croffing a park or feparating a lawn, and intercepting views from the feat to which it leads, are capital faults; yet a great avenue cut through woods, perhaps before entering a park, has a noble air, and,

Like footmen rumning before coaches
To tell the inn what lord approaches,
announces the habitation of fome man of diftinction. In other places the total banihment of all particular neatnefs immediately about a houfe, which is frequently left gazing by itfelf in the middle of a park, is a defect. Sheltered and even clofe walks, in fo very uncertain a climate as ours, are comforts ill exchanged for the few picturefque days that we enjoy; and whenever a family can purloin a warm and even fomething of an old-falhioned garden from the landicape defigned for them by the undertaker in fathion, without interfering with the picture, they will find fatisfactions in thofe days that do not invite ilrangers to come and fec their improvements."

## PART I. PRINCIPLES OF GARDENING.

GARDENING, in the perfection to which it t.as been lately brought in Britain, is entitled to a place of confiderable rank among the liberal arts. It is (fays Mr Wheatley) as fuperior to landfcape painting as a reality to a reprefentation : it is an exertion of fancy; a fubject fur talte; and being releafed now from t.et rellaints of regularity, and enlarged beyond the purpofes of domeftic convenience, the mott beautiful, the moft fumple, the molt noble feenes of nature, are all
within its province. For it is no longer confincel to the fpots from which it takes its name; but, as already obferved, regulates allo the dipofition and embellithment of a park, a farm, a forcft, \&c. : and the bulinefs of 2 gardener is to felect and ap;ly whatever is great, elegant, or characecritic in any of them; to difcover, and to fhow all the advantages of the place upon which he is employed; to fupply its defects, to correct its faults, and to improve its beauics.

々 C 2
Sict.

Thire may be divided into two general claffics; Furaral and Fativus.

## § 1. Of the Nater,ai Materials.

Thefe, according to Mr Wheatley's enumeration, :re-Ground, Wood, Water, and Rocks.

1. GROUND. By this is meant that portion of 1..ked furface which is inclused within the place to be improved; whether that furface be fivamp, lawn, roushet, or broken ground; and whether it be a height, a ralley, a pian, or a compofition of fivells, cips, and levels.

The following paffage has been quoted from $\mathrm{Mr}_{r}$ Gilpin's obfervations on the W'ye + , as affording a fublime idea of what ground ought to be.-" Nothing (fays he) gives fo jult an idea of the beautiful fisellings of ground as thofe of water, where it has fufficient room to undulate and expand. In ground which is compofed of very refractory materials, you are prefented often with harih lines, angular infertions, and difagreeable abruptneffes. In water, whether in gentle or in agitated motion, all is eafy, all is foftened into itfelf; and the hills and valleys play into each other in a variety of the moll beautiful forms. In agitated water, abruptnefies indeed there are, but yet they are fuch abruptrefles as in fome part or other unite properly with the furface around them; and are on the whole peculiarly harmonious. Now, if the cocan in any of thefe fwellings and agitations could be arrefted and fixed, it would produce that pleafing variety which we admire in ground. Hence it is common to fetch our images from water, and apply them to land: we talk of an undulating line, a playing lawn, and a billowy furface; and give a much ftronger and more adequate idea by fuch imagery, than plain language could pollibly prefent."

The exertions of art, however, are here inadequate; and the artifl ought not to attempt to create a mountain, a valley or a plain: he fhould but rarely meddle even with the fmaller inequalities of grounds. Roughets and broken ground may generally be reduced to lawn, or hid with wood; and a fwamp may be drained or covered with water; whilit lawn may be variegated at pleafure by wood, and fometimes by water.
II. WOOD, as a general term, comprehends all trees and fhrubs in whatever difpofition; but it is fpecifically applied in a more limited fenfe, and in that fenfe we thall now ufe it.

Every plantation muft be either a wood, a grove, or clump. A wood is compofed both of trees and underwood, covering a confiderable fpace. A grove confilts of trecs without underwood. A clump differs from either only in extent : it may be either clofe or open; when clofe, it is fometimes called a thicket; when open, a group of trces; but both are equally clumps, whatcver may be the fhape or fituation.
I. One of the nobleft objects in nature (Mr Wheatt.e ef a ley oblerves) is the furface of a larse thick wood, comw. und. manded from an emincnce, or feen from telowhanging
on the fide of a lill. The latter is generally the more interetting object. Its afpiring fituation gives it an air of greatuefs; its termination is commonly the horizon; and, indeed, if it is deprived of that fplendid boundary, if the brow appears above it (unle!s fome very peculiar effect characterifes that brow), it lofes much of its magnificence: it is inferior to a wood which covers a lefs hill from the top to the bottom; for a whole fpace filled is feldom little. But a wood commanded from an eminence is generally no more than a part of the fcene below; and its boundary is often inadequate to its greatnefs. To continue it, therefore, till it winds out of fight, or lofes itfelf in the horizon, is generally defirable : but then the varieties of its furface grow confufed as it retires; while thofe of a harging wood are all diftinct, the furtheft parts are held up to the eye, and none are at a diftance though the whole be extenfive.

The varieties of a furface are effential to the beauty of it: a continued fmooth fhaven level of foliage is neither agreeable nor natural ; the different growths of trees commonly break it in reality, and their thadows ftill more in appearance. Thefe thades are fo many tints, which, undulating about the furface, are its greateft embellifhment ; and fuch tints may be produced with more effect, and more certainty, by a judicious mixture of greens; at the fame time an additional variety may be introduced, by grouping and contrafting trees very different in fhape from each other; and whether variety in the greens or in the forms be the defign, the esecution is often eafy, and feldom to a certain degree impoffible. In raifing a young wood, it may be perfect. In old woods, there are many fpots which may be either thinned or thickened : and there the characteriftic diftinctions hhould determine what to plant, or which to leave; at the leaft will often point out thofe which, as blemifhes, ought to be taken away; and the removal of two or three trees will fometimes accompliih the defign. The number of beautiful forms and agreeable maffes, which may decorate the furface, is fo great, that where the place will not admit of one, another is always ready; and as no delicacy of finifhing is required, no minute exactnefs is worth regarding; great effects will not be difconcerted by fmall obftructions and little difappointments.

The contrafts, however, of maffes and of groups muft not be too Alrong, where greatnefs is the character of the wood ; for unity is effential to greatnefs: and if direct oppofites be placed clofe together, the wood is no longer one object ; it is only a confufed collection of feveral feparate plantations. But if the progrefs be gradual from the one to the other, fhapes and tints widely different may affemble on the fame furface; and each thould occupy a confiderable fpace: a fingle tree, or a fmall clufter of trees, in the midif of an extenfive wood, is in fize but a fpeck, and in colour but a fpot; the groups and the mafles mult be large to produce any fenfible variety.

When, in a romantic fituation, very broken ground is overfpread with wood, it may be proper on the furface of the wood to mark the inequalities of the ground. Rudenefs, not greatnefs, is the prevailing idea; and a choice directly the reverfe of that which is productive of unity will produce it. Strong contrafl, even oppo-

Wood fitions, may be eligihle : the ..mm i rather th drant than to comet : a is ? hollow may fink into durk greens; an abrupt banh may be hown ba a riling thage of afpiring trec, a ? harp ridge by a narow line of cunical thapes: fire are of great wife upon furh occation; their tint, their form, their fimgularity, recomenend them.

A hanging wood of thin foreft trees, and fecn from below, is feldom plealing: thefe few trees are by the perfective hrought nearer together; it lofes the beauty of a thin wood, and is defective as a thick one: the molt obvious improvement, therefore, is to thicken it. But, when feen from an eminence, a thin wood is often a lively and elegant circumftance in a view; it is full of objects; and every feparate tree fhows its beauty. To increafe that vivacity which is the peculiar excellence of a thin wood, the trees thould be charaterilitcally diftinguifted both in their tints and their thapes; and fuch as for their airinefs have been proferibed in a thick wood, are frequently the moft eligible here. Difierences allo in their growths are a further fource of variety; each fhould be confidered as a dilinet object, unlefs where a finall number are grouped together; and then all that compofe the little cluiker mult agree: but the groups themielves, for the fame reafon as the feparate trees, thould be ftrongly contrafted; the continued underwood is their only comexion, and that is not affected by their variety.
Of the out-
Though the furface of a wood, when commanded, deferves all thefe attentions, yet the outline more frequently calls for our regard : it is allo more in our
power; it may fometimes be great, and may always be beautiful. The firt requifite is irregularity. That a mixture of trees and underwood fhould form a long ftraight line, can never be natural ; and a fucceflion of eafy fiseeps and gentle rounds, each a portion of a greater or lefs circle, compofing all together a line literally ferpentine, is, if poffible, worfe. It is but a number of regularities put together in a diforderly manner, and equally ditant from the beautiful both of art and of nature. The true beauty of an outline confifts more in breaks than in fweeps; rather in angles than in rounds; in variety, not in fucceffion.

Every variety in the outline of a wood muft be a prominence or a recefs. Breadth in either is not fo important as length to the one and depth to the other. If the former ends in an angle, the latter diminihihes to a point; they have more force than a fhallow dent, or a dwarf excrefcence, how wide foever. They are greater deviations from the continued line which they are intended to break ; and their effect is to enlarge the wood itfelf, which feems to ftretch from the moff advanced point, back beyond the moft diftant to which it retires. The extent of a large wood on a flat, not commanded, can by no circumfance be fo manifeitly thown as by a deep recefs; efpecially if that recefs wind fo as to conceal the extremity, and leave the imagination to purfue it. On the other hand, the poverty of a flallow wood might fometimes be relieved by here and there a prominence, or clumps which by their apparent junction thould feem to be prominences from it. A deeper wood with a continued outline, except when commanded, would not appear fo confiderable.

An inlet into a wood feems to have been cut, if the capoite points of the entrance tally; and that how of
ant depreciate its merit: but a dito it anly be tie fitantion of thote points, by briving one mate formard than the other, prevents the appearance, though theis forms be fimilar. Other point, whech diftinguith the obserezt. gre:t parts, fhould in seneral be firongly marked: a Gurdens. dhont turn has more fivit in it than a tedion circuity; and a line broken by angles has a precifion and tirnnefs, which in an undulated lise are wanting; the angles thould indeed commonly be a little fortened; the rotundi:y of the plant which forms them is fometimes fufficient for the purpole; but it they are mellowed down too much, they lofe all meaning. Three or four large parts thus boldly ditlinguithed, will break a very long outline. When two wools are oppofed on the fides of a narrow glade, neither hos fo much oceafion for variety in itfelf as if it were fingle; if they are very different from each other, the contratt fupplies the: defieiency to each, and the interval bet veen them is full of variety. The form of that interval is indeed of as much confequence as thei: own: though the outlines of both the woods be feparate! y beautiful, yet if together they do not calt the open fuace into an agrecable figure, the whole fcene is not pleafing; and a figure is never agrceable, when the fides too clody correfpond: whether they are exactly the fame, or exactly the reveffe of each other, they equally appear artificial.

Every variety of outline hitherto mentioned may be traced by the underwood alone; but frequent!y the fime effects may be produced with more eafe, and with much more beauty, by a few trees itanding out from the thicket, and belonging, or feeming to belong, to the wood, fo as to make a part of its five. Even where they are not wanted for that purpole, detached trecs are fuch agreeable objects, to diftinct, fo light, when compared to the covert about them, that 隹iting along it in fome parts, and breaking it in other, they give an unaffected grace, which can no otherwile be given to the outline. They have a ftill further effect, whe: they fretch acrofs the whole breadth of an inlet, or before part of a recefs into th = wood; they are themelves fhown to advantage by the fpace behind them ; and that fpace, feen between their items they in return throw into an agreeable perfpective.
2. The prevailing character of a wood is generally grandeur : the principal attention therefore which it requires, is to prevent the exceffes of that charaeter, to diverfify the uniformity of its extent, to lighten the unwieldinefs of its bulk, and to blend graces with greatnefs. The character of a grove is beauty. Fine trees are lovely objects: a grove is an affembluge of them ; in which every individual retains much of its own peculiar elegance, and whatever it lofes is transferred to the fupcrior beauty of the whole. To a grove, therefore, uhich admits of endlefs variety in the difpoltion of the trees, differences in their thajes and their greens are feldom very important, and fometimes they are detrimental. Strong contrats featter trees whichare thinly planted, and which have not the connevion of underwood; they no lunger form one plantation: they are a number of fingle trees. A thick grove is not indeed expofed to this rifctiet, and certain fituations may recommend different thapes and diffesent greens for their eifects upon the furface; but in the outline they are feldum mush segatded. Ite cyentracted into the derth oi tire grove, paines by little circumftances at the entrance ; even varieties in the form of the line do not always engate the attertion; they are not fo apparent as in a continutd thicler, and are icarcel; feen if the; are not confiderable.

But the furface and the outline are not the only circumflances to be atter fed to. Though a grove be beautiful as an object, it is befides delightful as a ipot to wall. ois to fit in ; and the choice and the difpofition of the trees for effects within, are therefore a principal confideration. Mere irtegularity alone will not pleafe: itict order is these more agreeable than abfolute confufion: and fome meaning better than none. A regular plantation has a degrec of beauty; but it gives no fatisfaction, becaufe we know that the fame number of trees might be more beautifully arranged. A difpofition, however, in which the lines only are broken, without varying the diftances, is equally improper. The trees fhould gather into groups, or ftand in various irregular lines, and defcribe feveral figures: the intervals between them thould be contrafted both in thape and in dimenfons: a large fpace thould in fome places be quite open; in others the trees thould be fo clofe together, as hardly to leave a paffage between them; and in others as far apart as the connexion will allow. In the forms and the varieties of thefe groups, thefe lines, and thefe openings, principally confilts the interior beauty of a grove.

The force of them is moft ftrongly illuftrated at
young plantation to fome large trees which gres there before, has confmed its variety. The groups are few and fmall : there was not room for larger or for more; there were no opportunities to form continued narrow glades between oppofite lines; the vacant faces are therefore chietiy irregular openines, fpreading every way, and great differences of ditance between the trees are the principal variety; but the grove winds along the bank of a large river, on the fide and at the foot of a very fudden aficent, the upper part of which is covered with wood. In one place, it prefles clofe to the covert; retires from it in another ; and ftretclies in a third acrofs a bold recefs, which runs up high into the thicket. The trees fomerimes overfpread the flat below; fometimes leave an open fpace to the river; at other times crown the brow of a large knoll, climb up a iteep, or hang on a gentle declivity. Thefe varieties in the fituation more than compenfate for the want of variety in the difpofition of the trees; and the many happy circumftances which concur,

## W-In Efher's peaceful grove, Where Kent and Nature vie for Pelham's love,

render this little fpot more agreeable than any at Claremont. But though it was right to preferve the trees al. ready ftanding, and not to facrifice great prefent beauties to ftill greater in futurity ; yet this attention has been a reftraint; and the grove at Claremont, confidered merely as a plantation, is in delicacy of tafte, and fertility of invention, fuperior to that at Efher.

It is, however, poffible to fecure both a prefent and a future effect, by fixing firft on a difpefition which will be beautiful when the trees are large, and then intermingling another which is agreeable while they are fmall. Thefe occafional trees are hereafter to be taken away; and muft be removed in time, before they become prejudicial to the others.

The confequence of variety in the difpofition, is variety in the light and thade of the grove; which may be improved by the choice of the trees. Some are impenetrable to the fierceft funbeam; others let in hese and there a ray between the large maffes of their foliage; and others, thin both of boughs and of leaves, only chequer the ground. Every degree of light and thade, from a glare to obfcurity, may be managed, partly by the number, and partly by the texture, of the trees. Differences only in the manner of their growths have alio correfponding effects: there is a clofeneis under thofe whoie branches defcend low, and fpread wide; a fpace and liberty where the arch above is high; and frequent tranfitions from the one to the other are very plealing. Thefe ftill are not all the varieties of which the interior of a grove is capable; trees, indced, whoie branches nearly reach the ground, being each a fort of thicket, are inconfiftent with an open plantation: but though fome of the characterific diftinciions are thereby excluded, oller varieties mere minute fucceed in their place; for the freedom of paniage throughout brings every tree in its turn near to the eyc, and fuljeces even differences in fuliage to obfervation. Thefe, flight as they may feem, are agreeable when they occur; it is true, they are net regretted when wanting; but a defect of ornament is not neceflarily a blemith.
3. It has been already obferved, that clumps differ Of Ciumrs. only

## Part. I.

 G A R D E N I N GWoad. only in extent from wool's if they are clofe; or from
1bid.
groves, if they are open : they are fmall woods, and imall groves, governed by the fame principles as the larger, after allowances made for their dimenfions. But befides the properties they may have in common with woods or with groves, they have others peculiar to themfelves which require examination.

They are either independent or relative: when independent, their beauty, as fingle objects, is folely to be attended to ; when relative, the beauty of the individuals muft be facrificed to thie effect of the whole, which is the greater confideration.

The occafons on which independent clumps may be applied, are many. They are often defirable as beautiful objeels in themfelves; they are fometimes neceflary to break an extent of lawn, or a continued line whether of ground or of plantation; but on all occafions a jealoufy of art conflantly attends them, which irregularity in their figure will not always alone remove. Though elevations fhow them to advantage, yet a hillock evidently thrown up on purpofe to be crowned with a clump, is artificial to a degree of difgult: fome of the trees thould thercfore be planted on the fides, to take off that appearance. The fame expedient may be applied to clumps placed on the brow of a hill, to interrupt its famenefs: they will have lefs ofteritation of defign, if they are in part carried down either declivity. The ebjection already made to planting many along fuch a brow, is on the fame principle: a fingle clump is lefs fufpected of art ; if it be an open one, there can be no finer fituation for it, than juft at the point of an abrupt hill, or on a promontory into a lake or a river. It is in either a beautiful termination, diftinct by its pofition, and enlivened by an expanfe of fky or of water about and beyond it. Such advantages may balance little defecor in its form : but they are loft if other clumps are planted near it ; art then intrudes, and the whole is difpleafing.

But though a multiplicity of clumps, when each is an independent object, feldom feems natural ; yet a number of them may, without any appearance of art, be admitted into the fame feene, if they bear a relation to each other: if by their fucceffion they diverfify a continued outline of wood, if between them they form beautiful glades, if altogether, they caft an extenfive lawn into an agreeable thape, the effect prevents any fcrutiny into the means of producing it. But when the reliance on that cffect is fo great, every other confideration mut give way to the beauty of the whole. The figure of the glade, of the lawn, or of the wood, are principally to be attended to: the fineit clump, if they do not fall eafly into the great lines, are blemilhes; their connexions, their contralts, are more important than their forms.

1II. WATER. All inland water is either running or fasnated. When itagnated, it forms a lake or a poo/, which differ only in extent; and a pool and a pond are the fame. Running waters are cither a rizulet, a river, or a riill; and theie differ oaly in breadula: a rivalet and a bro,k are fynonymous terms; a Arcam and a current are general names for all.

1. Space or expanfion is efiential to a lale. It cannot be too large as a fubiect of defciption or of conterarlation; but the eye tectives litule crasfation
when it has not a form on which to relt : the ocean itfelf hardly atones by all its grandeur for its infinity ; and a profpect of it is, therefore, always moft agreeable, when in fome part, at no great ditance, a reach of hore, a promontory, or an illand, reduces the immenfity into thape. An artificial lake, again, may be comparatively extravagant in its dimenfions. It may be fo out of proportion to its appendages, as to feem a watte of water; for all fize is in fome refpects relative: if this exceeds its due dimenfons, and if a flatnefs of thore beyond it adds thill to the drearinefs of the fcene; wood to raife the banks, and objects to diftinguish them, are the remedies to be emplojed. If the length of a piece of water be too great for its breadth, fo as to deftroy all idea of circuity, the extremities fhould be confidered as too far off, and made important to give them proximity; while at the fame time the breadth may be favoured, by keeping down the banks on the fides. On the fame principle, if the lake be too fmall, a low fhore will, in appearance, in creafe the extent.

But it is not neceflary that the whole feene be bounded : if form be imprefled on a confiderable part, the eye can, without difgult, permit a large reach to flretch beyond its ken; it can even be pleafed to obferve a tremulous motion in the horizon, which ihows that the water has not there yet attained its termination. Still hort of this, the extent may be kept in uncertainty; a hill or a wood may conceal one of the extremities, and the country beyond it, in fuch a manner as to leave room for the fuppofed continuation of fo large a body of water Opportunities to choofe this thape are frequent, and it is the moft perfect of any: the fcene is clofed, but the extent of the lake is undetermined; a complete form is exhibited to the eye, while a boundlefs range is left open to the imagination.

But mere form will only give content, not delight : that depends upon the outline, which is capable of exquifite beauty; and the bays, the cracks, and the promontories, which are ordinary parts of that outline, together with the accidents of $\dot{j} / \mathrm{lands}$, of inlets, and of outlets to rivers, are in their thapes and their combinations an inexhauftible fund of variety.

Bays, creeks, and promontories, however, though extremely beautiful, fhould not be very numerous: for a Chore broken into little points and hollows has no certainty of outline; it is only ragged, not divertified; and the diflinctuefs and implicity of the great parts are hurt by the multiplicity of fubdivilions. But inards, though the channels between them be narrow, do not fo often derogate from greatnefs : they intimate a fpace beyond them whofe bourdaries do not appear ; and remove to a dillance the thore which is feen in perifeedive between them. Such partial interruptions of the dight fuggell ideas of extent to the imagination.
2. Though the windings of a river are proverbially (): , K defcriptive of its courfe ; yet without being perpesually wreathed, it may be natural. Nor is the ci,aacter ceprefied only by the turnings. On the conaray, if the: are too trefuent ar doden, tice curretio is reduced into a number of forate prom, and the idea of progrefs is obfored by the dullicuity of tracms it. Lageta is the atrongeit famitoas of carination

Water. long reaches are therefore charateritic of a river, and they conduce much to its beauty; each is a comider.
able piece of watcr, and variety of beautiful forms may be given to their outlines.

A river requires a number of accombanimentr. The changes in its courfe furnin a variety of fituations; while the fertility, convenience, and amenity, which attend it, account for all appearances of inhatitants and improvement. Profufion of ornament on a fictitions river, is a juft imitation of cultivated nature. Every fecies of building, every ftyle of plantation, may abound on the barks; and whatever be their characters, their proximity to the water is commonly the happieft circumftance in their fituation. A luitre is from thence diffufed on all around; each derives an importance from its relation to this capital feature: thofe which are near enough to be refletted, immediately belong to it; thofe at a greater diftance ftill Chare in the animation of the fcene; and objects totalIy detached from each other, being all attracted towards the fare interefling comexion, are united into one compofition.

In the front of Blenheim was a deep broad valley, which abruptly feparated the caftle from the lawn and the plentations before it ; even a direct approach could not be made without building a monftrous bridge over the valt hollow; but this forced communication was only a fubject of raillery; and the fcene continued broken into two parts, abfolutely diftinct from each other. This valley has been lately tlooded: it is not filled; the botton only is covered with water; the fides are ftill very high; but they are no longer the eeps of a chaim, they are the bold thores of a noble tiver. The fame bridge is flanding without alteration: but no extravagance remains; the water gives it propriety. Above it the river firit appears, winding from behind a fmall thick wood in the valley; and foon taking a determined courfe, it is then broad enough to admit an ifland filled with the fineft trees; others correfponding to them in growth and difpofition, ftand in groups on the banks, intermixed with younger plantations. Immediately below the bridge, the river fpreads into a large expanfe: the fides ate ofen lawn. On that furthelf from the houfe formerly stood the palace of Henry II. celebrated in many an ancient ditty by the name of Fair Rofamond's Bower. A little clear fpring, which rifes there, is by the country people itill called Fair Rofamond's Well. The foot is now marked by a fingle willow. Near it is a fine collateral ftream, of a beautiful form, retaining its breadth as far as it is feen, and retiring at laft behind a hill from the view. The main river, having rectived this acceliion, makes a gentle bend: then continues for a confiderable length in one wide direct reach; and, juft as it dilappears, throws itfelf down a high cafcade, which is the prefent termination. On one of the bark; of this reach is the garden: the fleeps are there diverfified with thickets and with glades; but the covert prevails, and the top is crowned with lofty trees. (1) the other fide is a noble hanging wood in the park: it was depreciated when it funk into a hollow, and was poorly lott in the botom; but it is now a rich appendare to the river, falling down an eafy thope quite to the water's edge, whete, with overliadowach, is tellected on the furface. Another face of
the fame wood borders the collateral itream, with an outline more indented and various; while a very large irregular clump adorns the oppolite declivity. This clump is at a confiderable diftance from the principal river: but the ftream it belongs to brings it down to connect with the relt; and the other objects, which were before difperfed, are now, by the intereft of each in a relation, which is common to all, collected into one illuftrious fcene. The caftle itfelf is a prodigious pile of building; which, with all the faults in its architecture, will never feem lefo than a truly puincely labitation; and the confined fpot where it was placed, on the edge of an abyfs, is converted into a proud fituation, commanding a beautiful profpect of water, and open to an extenfive lawn, adequate to the manfion, and an emblem of its domain. In the midat of this lawn ftands a column, a ftately trophy, recording the exploits of the duke of Marlborough and the gratitude of Britain. Between this pillar and the caftle is the bridge, which now, applied to a fubject worthy of it, is eftablifhed in all the importance due to its greatnefs. The middle arch is wider than the Rialto, but not too wide for the occafion; and yet that is the narroweft part of the river ; but the length of the reaches is everywhere proportioned to their breadth. Each of them is alone a noble piece of water; and the laft, the fineft of all, lofes itfelf gradually in a wood, which on that fide is alfo the boundary of the lawn, and rifes into the horizon. All is great in the front of Blenheim : but in that vaft fpace no void appears; fo important are the parts, fo magnificent the object. The plain is extenfive, the valley is broad, the wood is deep. Though the intervals between the building are large, they are filled with the grandeur which buildings of fuch dimenfions and fo much pomp diffufe all around them ; and the river in its long varied courfe, approaching to every object, and touching upon every part, fpreads its influence over the whole.

In the compofition of this fcene, the river, both as a part itfelf, and as uniting the other parts, bas a principal fhate. But water is not loft though it be in fo confined or fo concealed a fpot as to enter into no view; it may render that fpot delightful. It is capable of the moft exquifite beauty in its form; and though not in fpace, may yet in difpofition have pretenfions to greatnefs; for it may be divided into feveral branches, which will form a clufter of iflands all connected together, make the whole place irriguous, and, in the ftead of extent, fupply a quantity of water. Such a fequeitered fcene ufually owes its retirement to the trees and the thickets with which it abounds; but, in the difpoition of them, one diftinction Rhould be conftantly attended to. A river tlowing through a wood which overfpreads one continued furface of ground, and a river between two woods, are in very different circumflances. In the latter cate, the woods are feparate; they may be contratted in their forms and their characters, and the outline of each ihould be forcibly marked. In the former no outline ought to be difcernible; for the river paffes between trees, not between boundaries; and though in the progrefs of its courfe, the ilyle of the plantations may be often changed, yet on the oppofite banks a fimilarity dhould contantly prevail, that thic identity of the wood may never be doubtfu!.
$*$ Vale of
Aylibury,
Bucking-
timhlure.

A rivel between two words may enter into a view; and then it mult be governed by the principles which regulate the conduct and the accompaniments of a river in an open expofure. But when it runs through a wood, it is never to be feen in a profpect ; the place is naturally full of obftructions; and a continued opening, large enough to receive a long reach, would feem an artificial cut. The river mut therefore necellarily wind more than in crolling a lawn, where the paffage is entirely free. But its influence will never extend to far on the fides: the buildings muft be near the banks: and, if numerous, will feen crowded, being ali in one track, and in fituations nearly alike. The feene, however, does not want variety : on the contrary, none is capable of more. The objects are not indeed fo differrent from each other as in an open view; but they are very different, and in much greater abundance; for this is the interior of a wood, where every tree is an object, every combination of trees a variety, and no large intervals are requifite to diftinguith the feveral difpofitions; the grove, the thicket or the groups, may prevail, and their forms and their relations may be conftantly changed without reftraint of fancy, or limitation of number.

Water is fo univerfally and fo defervedly admired in a profpect, that the molt obvious thought in the management of it, is to lay it as open as poffible; and purpofely to conceal it would generally feem a fevere felf-denial : yet fo many beauties may attend its paffage through a wood, that larger portions of it might be allowed to fuch retired foenes than are commonly fpared from the view, and the different parts in different ityles would be fine contrafts to each other. If the water at Wotton * were all expofed, a walk of near two miles along the banks would be of a tedious length, from the want of thofe changes of the fcene which now fupply through the whole extent a fuccefficn of perpetual variety. The extent is fo large as to admit of a divifion into four principal parts, all of them great in ityle and in dimenfions, and differing from each other both in character and fituation. The two firft are the lealt. The one is a reach of a river, about the third of a mile in length, and of a competent breadth, Nowing through a lovely mead, open in fome places to views of beautiful bills in the country, and adomed in others with clumps of trees, fo large, that their branches ftretch quite acrofs, and form a high arch over the water. The next feems to have been once a formal bafin encompaffed with plantations, and the appendages on either fide ftill retain fome traces of regularity; but the fhape of the water is free from them; the fize is about 14 acres; and out of it iffue two broad collateral ftreams, winding towards a large river, which they are feen to approach, and fuppofed to join. A real junction is however impoffible, from the difference of the levels; but the terminations are fo artfully concealed, that the deception is never fufpected, and when known is not eafily explained. The river is the third great divifion of the water; a lake into which it falls, is the fourth. Thefe two do actually join; but their characters are directly oppoSite; the fcenes they belong to are totally diftinct ; and the tranfition from the one to the other is very gradual ; for an ifland near the conflux, dividing the breadth, and concealing the end of the lake, modeYol. IX, PartI.
rates for fome way the fpace; and permitting it to ex. pand but by degrece, raifes an idea of greatnefs, from uncertainty accomparied with increafe. The reality does not ditappoint the expectation; and the inland, which is the point of view, is itlelf equal to the feene: it is large, and high above the lake; the ground is irregularly broke: ; thichets bang on the fides; and towards the top is pliced an lonic portico, which commands a nobie extent of water, not lefs than a mil. in circumference, bounded on one fide with wond, and open on the other to two floping lasms, the leath o* an hundred acres, diverified with ciunns, and bor. dered by plartations. Yet this lake, when foll in vieu, and with all the importance which fpace, form, and fituation can give, is not more interalting than the fequeitered river, which has been mentioned as the third great divifion of the water. It is jult within the verge of a wood, three quarters of a mile long, everywhere broad, and its courfe is fuch as to admit of infinite variety without any confufion. The hanks are cleared of underwood; but a few thickets titll remain, and on one fide an impenetrable covert foon begins: the interval is a beautiful grove of oaks, fcattered over a green fward of extraordinary verdure. Between thefe trees and thefe thickets the river feems to glide gently along, conftantly winding, without one thort turn or one extended reach in the whole length of the way. This even temper in the itream fuits the fcenes through which it pafles; they are in general of a very fober calt, not melancholy, but grave; never expofed to a glare; never darkened with gloon; nor, by ftrong contralts of light and fhade, exhibiting the excefs of either. Undifturbed by an extent of profpect without, or a multiplicity of objects within, they retain at all times a mildnefs of character; which is alill more forcibly felt when the fhadorss grow faint as they lengthen, when a little ruftling of Birds in the furay, the leaping of the fifh, and the fragrancy of the woodbine, denote the approach of evening; while the fetting fun fhoots its laft gleams on a Tufcan portico, which is clofe to the great bafin, but which from a feat near this river is feen at a ditance, through all the obfourity of the wood, glowing on the banks, and reflected on the furface of the water. In another fitill more dittinguihed fot is built an elegant bridge, with a colomade upon it, which not only adorns the place where it fands, but is alfo a pieturefque object to an octagon building near the lake, where it is lhown in a fingular fituation, overarched, encompafied, and backed with wood, without any appearance of the water beneath. This building in return is alfo an object from the bridge; and a Chinefe room, in a little ifland juit by, is another: neither of them are confiderable, and the others which are vifible are at a diffance ; but more or greater adventitious ornaments are not required in a fpot fo rich as this in beauties pecu. liar to its character. A profufion of water pours in from all fides round upon the view; the opening of the lake appears; a glimpfe is caught of the large bain : one of the collateral ftreams is full in fight, and the bridge itfelf is in the mid!t of the fineft part of the river: all feem to communicate the one with the other. Though thickets often intercept, and groups perplex the view, yet they never break the connexion between the feveral pieces of water; each may till be traced 3 D along
along large branches or little catches; which in fome places are overhadowel and dim; in others guiten through a glade, or glimmer between the boles of trees in a diftant peripective; and in one, where they are quite loft to the view, fome arches of the tlone bridee, but partially feen among the wood, preferve their connexion.
3. If a large river may fometimes, a fmaller current undoubtedly may often, be conducted through a soood: it feldom adorns, it frequently disfigures, a profpect, where its courfe is marked, not by any appearance of water, but by a confufed line of clotted grafs, which difagrees with the general verdure. A Rivilet may, indced, have confideration enough for a home fcene, though it be oyen; but a Rill is always molt agreeable when moft retired from public view. Its characterittic excellencies are vivacity and variety, which require attention, leifure, and filence, that the eye may pore upon the little beauties, and the ear liflen to the low murmurs of the ftream without interruption. To fuch indulgence a confined fpot only is favourable; a clofe copfe is therefore often more acceptable than a high wood, and a fequeitered valley at all times preferable to any open expofure : a fingle rill at a very little ditance is a mere water courfe; it loles all its charms; it has no importance in itielf, and bears no proportion to the fcene. A number of little itteams have indeed an effect in any fituation, but not as objects; they are interelting only on account of the character they exprefs, the irriguous appearance which they give to the whole.

The full tide of a large river has more force than activity, and !eems too unwie!dy to allow of very quick tranations. But in a rill, the agility of its motion accounts for every caprice; frequent windings difguife its infignificance; ftort turnings fhow its vivacity; fudden changes in the breadth are a fpecies of is variety; and however fantaltically the channel may be wreathed, contracted, and widened, it ftill appears to be natural. We find an amufement in tracing the little itream through all the intricacies of its courfe, and in feeing it force a paffage through a narrow ftrait, expatiate on every opportunity, ftruggle with obftructions, and puzzle out its way. A rivulet, which is the mean betwixt a river and a rill, partakes of the character of both: it is not licenfed to the extravagance of the one, nor under the fame rellraints as the other : it may have more frequent bends than the river, longer reaches than a rill : the breadth of a flream deter. mines whether the principal beauty refults from extent or from variety.

The murmurs of a rill are amongft the mof pleafing circumftances which attend it. If the bed of the Ateam be rough, mere declivity will occafion a conftant ripling noife: when the current drops down a defcent, though tut of a few inches, or forcibly bubbles up from a little hollow, it has a deep gurgling tone, not uniformly continued, but inceflantly repeated, and therefore, more engaging than any. The flatteft of all, is that found rather of the fplafling than the fa! of uater, which an even gentle flope, or a tame obllruction, will produce: this is lefs pleafing than th.e others; but none thould be entirely excluded : all in their turns ase agrecable; and the choice of them is such in cur fowtr. By obferving their caufes, we
may often find the ineans to ftrengthen, to we.ken, or to change them; and the addition or removal of a fingle flone, or a fers pebbles, will lometimes be futhcient for the purpofe.

A rill cannot pretend to any found beyond that of of $\stackrel{8}{8}$ a little water fall: the roar of a cafcade belongs only caius. to a larger flream; but it may be produced by a rivalet to a confiderable degree, and attempts to do more have generally been unfuccefful. A vain ambition to imitate nature in her great extravagancies betrays the weaknefs of art. Though a noble river, throwing itfelf headlong down a precipice, be an object truly magnificent, it muft however be confefled, that in a fingle thect of water there is a formality which its vaftnefs alone can cure. But the height, not the breadth, is the wonder: when it falls no more than a few feet, the regularity prevails; and its extent only ferves to expofe the vanity of affecting the fyle of a cataract in an artificial cafcade. It is lefs exceptionable if divided into feveral parts: for then each feparate part may be wide enough for its depth; and in the whole, variety, not greatnefs, will be the predominant character. But a flructure of rough, large, detached ftones, cannot eafily be contrived of itrength fufficient to fupport a great weight of water: it is fometimes from neceffity almolt fmooth and uniform, and then it lofes much of its effects. Several little falls in fuccellion are preferable to one great cafcade which in figure or in motion approaches to regularity.

When greatnefs is thus reduced to number, and length becomes of more importance than breadth, a rivulet vies with a river: and it more frequently runs in a continued declivity, which is very favourable to fuch a fuccelfion of falls. Half the expence and labour which are fometimes beftowed on a river, to give it at the beft a forced precipitancy in one fpot only, would animate a rivulet through the whole of its courfe. And, after all, the moft interelting circumftance in falling waters is their animation. A great cafcade fills us with furprife : but all furprife muft ceafe; and the motion, the agitation, the rage, the froth, and the variety of the water, are finally the objects which engage the attention : for thefe a rivulet is fufficient; and they may there be produced without that appearance of effort which raifes a fufpicion of art.

To obviate fuch a fufpicion, it may be fometimes expedient to begin the defent out of fight; for the beginning is the difficulty : if that be concealed, the fubfequent falls feem but a confequence of the agitation which characterifes the water at his firlt appearance; and the imagination is, at the fame time, let loofe to give ideal extent to the cafcades. When a ftream ifilues from a wood, fuch management will have a great effect : the bends of its courfe in an open expofure may afford frequent opportunities for it ; and fometimes a low broad bridge may furnifh the occalion: a little fall hid under the arch will create a diforder; in confequence of which, a greater cafcade below will appear very natural.

1V. ROCKS. Rocks are themfelves too valt and OfRoks too flubborn to fubmit to our controul; by the addition or removal of appendages which we can command, parts may be fhown or conceated, and the characters with their impreffions may be weakened or en-
forced

Rucks. forced to adopt the accompaniments accordingly, is 는 the utmort ambition of art when rocks are the fubject.

Their mof dilinguined charakers are, disnote, terre, and forme : the capections of all are contantly wild : and rometimes a rucky fecme i, only wid, without pretenion to any particular character.

Rills, rivulete, and calcades, abound among rocks : they are natural to the icene; and fuch fenes commonIy require every accompaniment which can be procured for them. Mere rock, unicf they pre particularly adapted to certain impretions, though they may furprile, camot be long engaging, if the rigour of their character be not luftened by circumftances which may belong either to thefe or to more cultivated fpots: and when the dreaninfs is extreme, little ttreams and waterfalls are of themelves infufticient for the purpofe ; an intermistare of vegetation is alfo neceflary, and on fome occafions even marks of inhabitants are proper.

Large clefts, floping or precipitous, with a dale at botton, furnith fane of the wildent nature. In fuch 1pots, verdure alone will give fome relief to the drearinefs of the fene; and Mrubs or buthes, without trees, are a fufficiency of wood: the thicket may alfo be extended by the creeping plants, fuch as pyracantha, vines, and ivy, to wind up the fides or clufter on the tops of the rocks. And to this vegetation may be added fome fymptoms of inhabitants, but they muit be night and few ; the ufe of them is only to cheer, nut to dettroy, the folitede of the place; and fuch therefore thould be chofen as are fometimes found in fituations retired from public refort; a cottage may be lonely, but it muft not here feem ruinous and negleeted ; it fhould be tight and warm, with every mark of comfort about it, to which its pofition in fome theltered recefs may greatly contribute. A cavity alfo in the rocks, rendered eafy of accefs, improved to a degree of coavenicnce, and maintained in a certain Itate of prefervation, will fuggeft fimilar ideas of protection trom the hitteref inclemencies of the 1 ky , and even of occafional refrefiment and repofe. But we may verture till further; a mill is of neceffity often built at fome diftance from the town which it fupplies; and here it would at the fame time apply the water to a ufe, and increafe its agitation. The dale may befides be made the haunt of thofe animals, fuch as goats, which are fometimes wild, and fometimes domeftic ; and which accidentally appearing, will divert the mind from the fenfations natural to the fcene, but not agreeable if continued long without interruption. Thefe and fuch other expedients will approximate the fevereft retreat to the habitations of men, and convert the appearance if a perpetual baniflment into that of a temporary re--irement from fociety.

But too itrong a force on the nature of the place al. ways fails. A winding path, which appears to be norn, not cut, has more effect than a high road, all attificial and level, which is too weak to overbear, and yet contradicts, the general idea. The oljects therefore to be introduced muif be thofe which hold a mean between fulitude and population; and the inclination of that choice towards either extreme, thould be directed by the degree of wildne's which prevails; for though that runs lometimes to an encefs which reguires correction, at other tines it wants encouragement, and at all times
it ought to be preferved: it is the predominast charneter of roc's, which mives with every other, and to which all the apondages mutt te accommodited; and they may be applicat foras eratly to inerea.ie it a licentious irregularity of won 1 and of groand, and a fantanic conduct of the trems, wether of which wostd be tolerated it the midt of cultivation, herons and imp rove romantic rocky foot-; even baildinas, patly ly their ftyle, but ftili more by their polition. in tiruse, difficult, or dangerous firuations, datinguble an! dggravate the native extrasugancies of the fecte.

Greatnefs is a chief inerredient in the character o: dignity, with lefs of widucis than in any other. The effect here depends more upon amplitude of furface, than variety of forms. The part, therefore, muit be large: if the rocks are only ligh, they are but flupendou, not majellic: brealth is equally eflentid to their greatnefs; and every lender, every grotefque thaye, is excluded. Art may interpofe to thow thefe large parts to the eye, and magnify them to the imagination, by taking :way thickets which itroth quite acrois the rochs, fo as to difgufe their dimensons; or by filling with wood the inall interval, between them, and thus, by concealing the want, prefersing the appearance of continuation. When rocks retire from the eve down a gradual declivity, we can, ty raing the upper ground, deepen the fall, lengthen the perfipective, and give both beight and extent to thole at a diffance this effect ma, be fill increafed by covering that upper ground with a thicket, which hall ceafe, or be lowered, as it defeends. It thicliet, on other occanons, makes the rochs which rife out of it feem larger than they are. If they dand upon a bank overfpread with ilarubs, their beginning is at the leat umcertain; and the prefumption is, that they blart from the bottom. Another wle of this brull underwood is to conceal the fragments and rubbih which have fallen from the fides and the brow, and which are citen unfightly. Rocks are feldom remarkable for the c!egance of their forms; they are too vall, ard too rude, to pretend to delicacy: hut their 1layes are often agreeable: and we can affeit the hapes to a cortain degree, at leal we can covce many blemithe in them, by condueting the growth of linabby and ciceping plants about them.

For all thele purpofer mere underwool fulinces: but for greate1 effect, larger tries ree reguitite. thry are worthy of the fienc; and not only improvements, but accefions to its grandeur: we ate uled to rank them among the nobleis ubjetts of nature; and when we fee that they cannot afpire to the midway of the leeghts around them, the rocks are raifed by the com? ariton. A fingle tree is, therefore, ofen preterable to a clamp: the lize, though really lefs, is moe remarkalle: and clumps are bendes generally evomionable in a very wild ipot, from the futpicion of art which attend them; but a wout is free from that fuipicion, amd its own character of greatnefs recomanends it to every feene of magnificence.

On the fame princiule all polfble conideration nould be given to the theams. No number of little rills aice equal to me 'road river; and in the princias curtent, fome varictics may lie facrificed to importanre. but a desree of frength hould always be preicred the water, though is necis not be furious, thould not be
becomes alarming, when a pati is carried allunt up the fide: a rail on the brow of a perpendicular hall, thows that the height is frequented and dangerous: and a conmmon fout bridge thrown over a cleft between rocks has a dill itronger effect. In all thefe intlances, the imagination immediately tranfports the fpectator to the fpot, and fuggeits the idea of looking down fuch a depth: in the laft, that deptll is a chatin, and the fituation is directly over it.

In other inflances, exertion and danger feem to attend the occupations of the inhabitants:
Hangs one that gathers famphire ; dreadful trade !
is a circumitance chofen by the great poet of nature, to aggravate the terrors of the fcene he delcribes.

The different fpecies of rocks often meet in the fame place, and compofe a noble fcene, which is not dittinguihed by any particular character; it is only when one eminently prevails, that it deferves fuch a preference as to exclude every other. Sometimes a fpot, remarkable for nothing but its wildnefs, is highly romantic: and when this wildnefs rifes to fancy; when the molt fingular, the molt oppofite forms and combinations are thrown together; then a misture alfo of feveral characters adds to the number of inftances which there concur to difplay the inexhaultible variety of nature.

So much variety, fo much fancy, are feldom found within the fame extent as in Dovedale *. It is about Nearafis two miles in length, a deep, narrow, hollow valley : bourne it both the fides are of rock; and the Dove in its paflage Derby fhere between them is perpetually changing its courfe, its motion, and appearance. It is never lefs than ten, nor fo much as twenty, yards wide, and generally about four feet deep; but tranfparent to the bottom, except when it is covered with a foam of the pureit white, under waterfalls, which are perfectly lucid. Thefe are very numerons, but very different. In fome places they itretch ftraight acrofs, or allant the ftream: in others, they are only partial; and the water either dafhes againt the ftones, and leaps over them, or, pouring along a fleep rebounds upon thofe below; fometimes it rulkes through the feveral openings between them; fometimes it drops gently down; and at other times it is driven back by the obffruction, and turns into an eddy. In one particular fpot, the valley almolt clofing, leaves hardly a paffage for the river, which, pent up and ftruggling for a vent, rages, and roars, and foams, till it has extricated itfelf from the confinement. In other parts, the ftream, though never languid, is often gentle; flows round a little defert ifland, glides between bits of bulrufhes, difperfes itfelf among tufts of grafs or of mofs, bubbles about a water dock, or plays with the flender threads of aquatic plants which float upon the furface. The rocks all along the dale vary as often in their ftructure as the flream in its motion. In one place, an extended furface gradually diminithes from a broad bafe almoft to an cdge: in another, a heavy top hanging forwards, overfhadows all beneath: fometimes many different fhapes are confufedly tumbled together; and fometimes they are broken into flender fharp piunacles, which are upright, often two or three together, and often in more numerous clufters. On this fide of the

Rocks. dale, they are univerfally bare; on the other, they are intermixed with wood; and the vaft heigbt of buth the fides, with the narrownefs of the interval between them, produces a further variety: for whenever the fun 'hines from behiad the one, the form of it is di ftinetly and completely caft upon the other; the rugged furface on which it falls diverifies the tints; and a Atrong reflected light often glares on the edge of the deepeff thadow. The rocks never continue long in the fame figure or fituation, and are very much feparated from each other: fornetimes they form the fides of the valley, in precipices, in feeps, or in flages; fometimes they feem to rife in the bottom, and lean back againft the hill; and fometimes they itand out quite detached, heaving up in cumbrous piles, or ftarting into conical mapes, like vaft fpars, 100 feet high; fome are firm and folid throughout; fome are cracked; and fome, iplit and undermined, are wonderfully upheld by fragments apparent!y unequal to the weight they fuftain. One is placed before, one over another, and one fills at fome diftance behind an interval between two. The changes in their difpofition are infinite; every ftep produces fome new combination; they are continually croffing, advancing, and retiring: the breadth of the valley is never the fame 40 yards together: at the narrow pafs which has been mentioned, the rocks almof meet at the top, and the iky is feen as through a chink between them: jult by this gloomy abyfs, is a wider opening, more light, more verdure, more cheerfulnefs than anywhere elfe in the dale. Nor are the forms and the fituations of the rocks their only variety: many of them are perforated by large natural cavities, fome of which open to the iky , fome terminate in dark receffes, and through fome are to be feen feveral more uncouth arches, and rude pillars, all detached, and retiring beyond each other, with the light chining in between them, till a zock far behind them clofes the perfpective: the noife of the cafcades in the river echoes amongtt them; the water may often be heard at the fame time gurgling near, and roaring at a diftance; but no other founds difturb the filence of the fpot: the only trace of men is a blind path, but lightly and but feldom trodden, by abofe whom curiofity leads to fee the wonders they have been told of Dovedale. It feems indeed a fitter haunt for mere ideal beings: the whole has the air of enchantment. The perpetual mifting of the feenes; the quick tranfitions, the total changes, then the forms all around, groteique as chance can catt, wild as nature can produce, and various as imagination can invent; the force which feems to have been exerted to place fome of the rocks where they are now fixed immove. able, the magic by which others appear ftill to be fufpended ; the dark caverns, the illuminated receffes, the Hecting fhadows, and the gleams of light glancing on the fices, or trembling on the ftream; and the lonelinefs and the fillnefs of the place, all crowding together on the mind, almoft realize the ideas which naturally prefent themfelves in this region of romance and of fancy.

The folitude of fuch a fcene is agreeable, on account of the endlefs entertainment which its variety affords, and in the contemplation of which both the sye and the mind are delighted to indulge : rarks of inhabitants and cultivation would dilturb that folisede:
and ornamental buildings are too artificial in a place Tense, ese. So abfolutely frec from teltraint. The only accom- paniments proper for it are wood and water; and by thele fometimes improvements may be made. When two rocks fimilar in thape and poftion are near together, by ikirting one of them with wood, while the other is left bare, a material diftination is ettablifhed betucen them: if the ftreams be throughout of one character, it is in our power, and fhould be our aim, to introduce another. Variety is the peculiar property of the fpot, and every acceffion to it is a valuable acquifition. On the fame principle, endeavours hould be ufed not only to multiply, but to aggravate differences, and to increafe diftinctions into contrails: but the fubject will impofe a caution againft attempting too mucb. Art mift almolt defpair of improving a fcene, where nature feems to have exerted her in. vention.

## § 2. Of Factiqious Acconpaniments.

These confift of Fences, Walks, Roads, Bridges, ${ }^{\text {Pradical }}$ Seats, and Buildings.
" I. The FENCE, where the place is large, becomes $i \pi z$, p. 6.95 . neceffary; yet the eye diflikes conftraint. Our ideas 8 :... of liberty carry us beyond our own fpecies: the imagination feels a dilike in feeing even the brute creation in a flate of confinement. The birds wafting themfelves from wood to grove are objects of delight; and the hare appears to enjoy a degree of happinefs unknown to the barriered Hock. Befides, a tall fence frequently hides from the fight objects the moft pleafing; not only the flocks and herds themfelves, but the furface they graze upon. Thefe confiderations have brought the unfeen fence into general ufe.

This fpecies of barrier it mult be allowed incurs a degree of deception, which can fcarcely be warranted upon any other occafion. In this inflance, however, it is a ipecies of fraud which we obferve in nature's, practice: how often have we feen two ditinct herds feeding to appearance in the fame extended neadow; until coming abruptly upon a deep funk rivulet, or an unfordable river, we difcover the deception.

Befides the funk fence, another fort of unfeen barrier may be made, though by no means equal to that, efpecially if near the cye. This is conftructed of paling, painted of the invifible green. If the colour of the back ground were permanent, and that of the paint made exactly to correfpond with it, the deception would at a diltance be complete; but back grounds ia general changing with the feafon, this kind of fence is the lefs eligible.

Clumps and patches of woodinefs fcattered promif. cuoully on either fide of an unfeen winding fence, alifit very much in doing away the idea of confltaint. For by this means

The wand'ring flocks that brow fe between the ftaades, beem oft to pafs their bounds; the dubious eye
Decide, not if they crop the mead or lawn.
Masos.
" II. The WALE, in extenfive grounds, is as necefiary as the fence. The beautics of the place are difcholed that they masy be feen; asd it is the office of the

Henco. \& wait to had the ge from view to view; in order that 1. 1. - whin the tute of health is puterved by the favourite cyerilie uf nature, the mind may he thrown into usifen Ly tic hamony of the furrounding oliech.

Ti: diection of the walk raut te cuided by the fonisio of val to which: it leale, and the nature of the fromd it pallo user: it ought to be rasade fubfervient to the natural impedimens (the grourd, wood, and watcr. which fall in its way, without appearing to lave any direction of its own. It can feldom run with propriety any ditatice in a traight line; a thing which rarely cocurs in a natural walh. The paths of the Negroes and the Indians are always crooked; and thote of the bute creation are wery fimilar. Mr Mafon's deferipton of this path of nature is happily conceived.

The peaiant driving through each thadowy lane His team, that bend beneath th' incumbent weight Of laughing Ceres, marks it with his wheel; At night and morn, the milkmaid's earclefs itep. Has through yon pafture green, from tile to ftile impreit a kindred curve : the foudding lare

Eng. Gard. v. 60.
" III. The ROAD may be a thing of necefifity, as an approach to the manion; or a matter of amufement only, as a drive or a ride, from which the grounds and the furrounding country may be feen to advantage. It fhould be the fludy of the artilt to make the fame road anfwer, as far as may be, the twofuld purpofe.

The road and the walk are fubject to the fame rule of nature and ufe. The direction ought to be natural and eafy, and adapted to the purpofe intended. A road 1f neceility ought to be firaighter than one of mere conveniency: in this, recreation is the predominant idea ; in that, utility. But even in this the direct line may be difpenfed with. The natural roads upon heaths and open downs, and the giafly glades and green roads ..crofs forells and extenfive waltes, are proper fubjects to be Aludied.
"IV. The BRIDGE fhould never be feen where it is 1.ot wanted: a ufelefs jridge is a deception; deceptions are frauds; and fraud is always hateful, unlefs when practifed to avert fome greater evil. A bridge without water is an abfurdity; and half a one illuck up as an eye-trap is a paltry trick, which, though it may Itrike the firanger, cannot fail of difgulting when the iraud is found out.

In low fituations, and wherever water abounds, tridges become ufeful, and are therefore pleafing objets: they are looked for; and ought to appear not is objects of ornament only, but likewife as matters of utility. The walk or the road therefore ought to be directed in fuch a manner as to crofs the water at the point in which the bridge will appear to the greatelt advantage.

In the conftruction of bridges alfo, regard mult be bad to ornament and utility. A bridge is an artificial production, and as fuch it ought to appear. It ranks ameng the noblett of human inventions; the thip and the fortrefs allone excel it. Simplicity and firmnefs are the Jeading priaciples in its conifretion. Mr WheatLey's whefreation is juit when he fay, "The tingle
wooden areh, now much in fahion, feems to me gene- Puildings.
rally mitapplid. Elevated without occafion raly milapphed. Llevated without occafion fo much
abive, it is totaliy detached from the river; it is ofun fien feradding in the air, without a glimpfe of vater to account for it ; and the oftentation of it as an ornamental object, divents all that train of ideas which its ule as a commu:ication might fuggent." But we beg leave to difier from this ingenious writer when be tells tis, "that it is polled if adorned; it is distigured if only painted of any other than a durky colour." In a dulfic fcene, where nature "wears ber own cuarfe garb, " the vulgar foot bridge of planks only guarded on one hand by a common rail, and fupported by a few ordinary piles," may be in character; but amidit a difplay of ornamented nature, a contrivance of that hind would appear mean and $F^{2}$ altry ; and would be an affictation of fimplicity rather than the lovely attribute itfelf. In cultivated fcenes, the bridge ought to receive the ormanents which the laws of architectural tafte allow; and the more polifhed the fituation, the higher fhould be the ftyle and finiftings.
"V. SEATS have a twofold ufe; they are ufeful as places of reft and converiation, and as guides to the points of view in which the beauties of the farrounding fcene are difclofed. Every point of view thould be marked with a feat; and, Speaking generally, no feat ought to appear but in fome favourable point of view. This rule may not be invariable, but it ought feldom to be deviated from.

In the ruder feenes of neglected nature, the fimple trunk, rough from the woodman's hands, and the butts or flools of rooted trees, without any other marks of tools upon them than thofe of the faw which fevered them from their items, are feats in character; and in romantic or reclate fituations, the cave or the grotto are admifiible. Eut wherever human defign has been executed upon the natural objects of the place, the feat and every other artificial accompaniment ought to be in union; and whether the bench or the alcove be chofen, it ought to be formed and finilied in fuch a manner as to unite with the wood, the lawn, and the walk, which lie around it.

The colour of feats fhould likewife be fuited to tituations: where uncultivated nature prevails, the natural brown of the wood ififlf ought not to be altered; but where the rural art prefides, white or fone colour has a much better cfect."
" VI. BUILDINGS probably were firl introduced into gardens merely for contrivance, to afford refuge $\mathrm{Mr} \mathrm{Wb}_{\text {zas }}$. from a fudden thower, and thelter againt the wind; or, at the moil, to be feats for a party; or for retirement. They have firce been converted into objects, and now the original $u / e$ is too ofien forgoten in the greater purpoles to which they are applied: they are confidered as objects only; the inlide is totally neglected, and a pompons ecificice frequcutly wants a room barety comfortable. Sometimes the pride of making a lavih difplay to a viltor without any regard to the owner's enjoyments, and fometimes too fcrupulous an atterticn to the fylc of the fitructure, cocafions a poverty and dulnefs witlin, which dopice the traldings of part of their utility. But in a gaden they ought to be contidered both as beauitial ebjects and as agreeable

## Part I.

Euildirge. greeable retreats: if a character becomes them, it is $\underbrace{\text { that }}$ of the fene they belong to; not that of their primitive application. A Grecian temple or Gothic church may adorn fpots where it would be affectation to preferve that folemnity within which it is proper for places of devotion: they are not to be exait models, fubjects only of curiolity or Itudy : they are alfo feats: and fuch feats will be little frequented by the proprietor ; his mind mult generally be indifpofed to fo much fimplicity, and fo much gloom, in the midt of gaiety, richnefs, and variety.

But though the interior of buildings fuould not be difregarded, it is by their exterior that they become objects; and fometimes by the one, fometimes by the other, and fometimes by both, they are entitled to be confidered as characterr.

Med. Garduring.

1. As object , they are defigned either to diffinguijh, or to break, or to $a d_{j} n$, the feenes to which they are applied.

The differences between one wood, one lawn, one piece of water, and another, are not always very apparent: the feveral parts of a garden would, therefore, often feem fimilar, if they were not diltinguihed by buildings; but thefe are fo obfervable, fo obvious at a glance, fo eanly retained in the memory, they mark the fpots where they are placed with fo much flrength, they attract the relation of all around with fo much power, that parts thus dittinguifhed can never be confounded together. Yet it by no means follows, that therefore every feene muft have its edifice: the want of one is fometimes a variety; and other circumftances are often fuficiently characteriftic: it is only when thefe too nearly agree, that we muft have recourle to buildings for differences: we can introduce, exhibit, or contralt them as we pleafe: the molt itriking object is thereby made a mark of difinction; and the force of this firit impreffion prevents our obferving the points of refemblance.

The uniformity of a view may be broken by fimilar means, and on the fame principle: when a wide heath, a dreary moor, or a continual plain, is in profpect, objects which catch the eye fupplant the want of variety : none are fo effectual for this purpofe as buildings. Plantations or water can have no very fenGible effect, untefs they are large or numerous, and almoft change the character of the fcene : but a fmall fingle building diverts the attention at once from the famenefs of the extent; which it breaks, but does not divide; and diverfifies, without altering its nature. The defign, however, mult not be apparent. The merit of a cottage applied to this purpofe, confifts in its being free from the fufpicion: and a few trees near it will both enlarge the object, and account for its polition. Ruins are a hackneyed device immediately detected, unlefs their ityle be fingular, or their dimenfions extraordinary. The femblance of an ancient Britith mouument might be adapted to the fame end, with little trouble, and great fuccefs. The materials might be brick, or even timber plaftered over, if ftone could not eafily be procured: whatever they were, the fallacy would not be difcernible; it is an object to be feen at a dillance, rude, and large, an l in character agreeable to a wild oren vicos. But no building ought to be introduced, which may not in reality belong to fuch a fituation: no Grecian tem-
ples, no Tukith mofques, no Esyptian otchiks or fy. Fithing. ramids; none imported from foreign countrice, and unutual here. The apparent artifice would deftroy an effect, which is fo nice as to be weakened, if objests proper to produce it are difplayed with too much oitentation; if they leem to be contrivances, not acci\}ents; and the advintage of their pofition appear to be more laboured than natural.

But in a garden, where objects are intended on? to adorn, every fpecies of architecture may be adimitted, from the Grecian down to the Chinefe; and the choice is fo free, that the mifchief moft to be apprehended is an abufe of this latitude in the multiplicity of buildings. Few fcenes can bear more than two or three: in fome, a fingle one has a greater effect than any number : and a carelefs glimple, here and there, of fuch as belong immediately to different parts, frequently enliven the landfcape with more firit than thofe which are indultrioufly thown. If the effect of a partial fight, or a diftant view, were more attended to, many fcenes might be filled, without being crowded; a greater number of buildings would be tolerated, when they feemed to be cafual, not forced ; and the animation, and the richnefs of the object 4 , might be had without pretence or difplay.

Too fond an oftentation of buildings, even of thefe which are principal, is a common error; and when all is done, they are not always fhown to the greatell advantage. Though their fymmetry and their beautic: ought in general to be ditinctly and fully feen, yet an oblique is fometimes better than a direct view : and they are often lefs agreeable objects when entire, tha: when a part is covered, or their extent is interrupted; when they are bofomed in wood, as well as backed by it; or appear between the flems of trees which rife before or above them: thus thrown into perfective, thus grouped and accompanied, they may be as important as if they were quite expoled, and are fre zuently more picturefque and beautiful.

But a ftill greater adantage arifes from this management, in connecting them with the fene: they are confiderable, and different from all around them; inclined therefore to feparate from the relk, and yet they are fometimes fill more detached by the pain, taken to exhibit them: that very importance which is the caufe of the dittinslion ought to be a reafon for guarding againt the independence to which it is naturally prone, and by which an object, which ought to be a part of the whole, is reduccel to a mere individual. An elevated is generally a noble lituation. When it is a point or a pimacle, the thucture may be a continuation of the afcent; and on many occafions, fom parts of the building may defeend lower then other, and multiply the appearances of connesion: but an edifice in the midat of an extended ridge, commenly feems naked alone, and impofel upon the brow, nut joined to it. If wood, to accompany it, will not grow there, it had better be brought a little wily duws the declivity; and then all behan 1 , at ove, athe about it, are fo many points of contat, by which it is incorporated into landicale.

Accompaniments are important to a buiding; Lut they be much of their effert when tiney do wot aty pear to be catual. A litele mount juit large enougts for it; a limall picce of water betore, of wo uther , it

Sumbiras that to reacet i. ; ...n a plantation clofe behind, eviLom dently placed there only to give it relicf; are as artificial as the Atrueure iticlf, and alienate it from the feene of mature into which it is intwodeced, and to which it ought to be reconciled. Thele aryendages therefore ihould be fo difpofed, ind fo comerted witis the adjacent parts, as to aniwer other purpofes, though applicable to this: that they may be bonds of union, not marks of cifference; and that the fituation may appear to have been cholen at the moik, not made, for the building.

In the choiee of a fituation, that which hows the building beft ought generally to be preferred: eminence, rclief, and every other advantage which can be, ought to be given to an object of to much confideration : they are for the mofl part defirable; fometimes neceliary ; and exceptionable only when, initead of rifing out of the fenc, they are forced into it, and a contrivance to procure them at any rate is avowed without any difguife. There are, however, occafions, in which the moft tempting advantages of fituation nunt be waved; the general compofition may forbid a building in onc ppot, or require it in another; at other times, the interelt of the particular group it belongs to may exact a facrifice of the opportunities to exhibit its beauties and importance; and at all times, the pretenfions of every individual object muft give way to the greater effect of the whole.
2. The fame itructure which adorns as an object, may alfo be expreffive as a charatfer. Where the former is not wanted, the latter may be defirable : or it may be weak for one purpofe, and ftrong for the other; it may be grave, or gay ; magnificent, or fimple : and according to its ftyle, may or may not be agreeable to the place it is applied to. But mere confiftency is not all the merit which buildings can claim : their characters are fometimes ftrong enough to dctermine, improve, or correit, that of the feene : and they are fo confpicuous, and fo diftinguilhed, that whatever forec they have is immediately and fenfibly felt. They are fit therefore to make a firit impreffion; and when a fcene is but faintly charaterized, they give at once a catt which fpreads over the whole, and which the weaker parts concur to fupport, though perhaps they were not able to produce it.

Nor do they ftop at fixing an uncertainty, or removing a doubt; they raife and enforce a character already marked : a temple adds dignity to the noblett, ${ }^{4}$ cottage fimplicity to the moft rural, fienes; the lightnefs of a fifire, the airinefs of an open rotunda, the fplendour of a continued colonnade, are lefs ornamental than expreffive; others improve cheerfulnefs into gaiety, gloom into folemnity, and richnefs into profufion: a retired fpot, which might have been paffed unobferved, is noticed for its tranquillity, as foon as it is appropriated by fome Atructure to retreat; and the moft unfrequented place feems lefs folitary than one which appears to bave been the haunt of a fingle individual, or even of a fequeftered family, and is marked by a lonely dwelling, or the remains of a deforted habitation.

The means are the fame, the application of them only is different, when buildings are ufed to correct the charatter of the fcene; to enliven its dulnefs, mitigate its gloom, or to check its cxtravaguce ; and, on
a varicty of oceafiors, to foften, to aggravate, or to Buildings. counteract, particular circumflances attending it. But $\underbrace{\text { B }}$ care mult be taken that they do not contradict too flrongly the prevailing idea: they may leffen the drecrinets of a wafte, but they cannot give it amenity ; they maty abate horrors, but they will never convert them into graces ; they may make a tame feene agrecable, and even intereting, not romantic; or turn folemnity into cheerfulnels, but not into gaiety. In thefe, and in many other inftances, they correct the character, by giving it an inclination towards a better which is not very different; but they can hardly alter it entirely: when they are totally inconfiftent with it, they are at the beft nigatory.

The great effects which have Been afcribed to buildings do not depend upon thofe trivial ornaments and appendages which are often too much relied on ; fuch as the furniture of a hermitage, painted glafs in a Gothic ehureh, and feulpture about a Grecian tenıple; grotefque or bacchanalian figures to denote gaiety, and death's heads to fignify melancholy. Such devices are only defcriptive, not expreflive, of character; and muft not be fubflituted in the flead of thofe fuperior properties, the want of which they acknowledge, but do not fupply. They befides often require time to trace their meaning, and to fee their application; but the peculiar excellence of buildings is, that their effects are intantaneous, and therefore the impreffions they make are forcible. In order to produce fuch effects, the general flyle of the ftructure, and its pofition, are the principal confiderations: either of them will fometimes be ftrongly characterittic alone; united, their powers are very great ; and both are fo important, that if they do not concur, at leaft they muft not contradict one another.

Every branch of architecture furnihes, on different Species 2nd occafions, objects proper for a garden; and there is no fituation 3 reftraint on our felcetion, provided it be conformable to of buildthe ftyle of the fcene, proportioned to its extent, and ${ }^{\text {ings. }}$ agreeable to its character.
The choice of fituations is alfo very free. A hermitage, indeed, mult not be clofe to a road; but whether it be expofed to view on the fide of a mountain, or concealed in the depth of a wood, is almoft a matter of indifference ; that it is at a diftance from public refort is fufficient. A caftle muft not be funk in a bottom; but that it fhould fland on the utmoft pinnacle of a hill, is not neceflary : on a lower knoll, and backed $\mathrm{b}_{j}$ the rife, it may appear to greater advantage as an object, and be much more important to the general compofition. Many buildings, which from their fplendour beft become an open expofure, will yet be fometimes not ill beflowed on a more fequeftered fpot, either to characterize or adorn it ; and others, for which a folitary would in general be preferred to an eminent fituation, may occafionally be objects in very confpicuous pofitions. A Grecian temple, from its peculiar tafte and dignity, deferves every dillinction; it may, however, in the depth of a wood, be fo circumitanced, that the want of thofe advantages to which it feems entitled will not be regretted. A happier fituation cannot be devifed, than that of the temple of Pan on the fouth lodge on Eufield Chafe. It is of the ufual oblong form, encompaffed by a colonnade; in dimenfions, and in flyle, it is equal to a moft extenfive landfcape : and yet by the

Temyt, thof thourie and mof cofl! obeets in gardens, too gencully merit cenfure for their inutility, their peotuice, or the impropric: Whether they be dedicated to Bacchas, Venus, Pria!e, or any other demon of dehauchery, they are in ta are. enlightened with regard $t$, theological and fiemtic knonledge, equally abfurd. Architecture, in this pirt of its fphere, may more nobly, and with z.tater benuty and effect, be evercifed upon a chapel, a manieum, a m nument, jadiciouly dilpoled anong Iaido sos the natural crnments. The late Sir Willam Harhorid has geve an a model, of the firit hind, at G.mton, in Norfu't ; tie patill church Randing in his ratk, and being an old unfightly building, be had it taken down, and a beautiful temple, under the diretion of the Adans crected upon its fite for the fame facred purpofe:- The manoleum at Calle-Howard, in Yorhikire, the fent of the earl of Carlifle, is a noble ftructure : - And as an imtance of the latt fort, may be mertioned the Semple of Cuncom and Victory at Stove, crected to the memory of the great Lord Chatham and his glorions wat; a beautiful monumental building, fuited to the grentnef of the accafion."

To the great varimy abme mentioned mull le added, Mr Wheatley obferve, the many ciangen which may be made by the means of tuins. They are a clafo by themelve, teaut:fun of jech, ca;rotlice as charaters, and peculiarly calculated to connect with appendages intn elegant graups. '1lny mav be accommonded with eafe to irreculnite $u$ : grount, and their dhoder i improved hy it. They may be intimately beoded whth trees and thiclets; and the interra tion is an an!vantage : for impercition and obfurity are $t$ t is properties, and to carry the imftimation to fomething greater than is Ceen, is their eftoct. They may for any ot theie purperes be feparated into detached piecer; contiguity is not neceffary, nor cen the appearance of it, if the relation lue mefirved; hut ftraculing ruins have a had effect, when the feveral phts are equally confideralle. There gould he one lirge mafe to raife an idea of greatnef, to attract the others about it, and on be a common centre of union to all the fmaller Vol. IX. Part II.
piece then mark : we wi
live houciure: : at molon wi Coual litle benhitis.
 of the ellifice, ased tiv the mind in a wores. tis of the ufo it was applisel:u; lefifer tion in at oc. prefled by their ityic and positun, the? sate ide. which would :nt anif. fom the laniting it entise. The purpoter of may hane coated:
 inys the memory of the times, and wi we enveres to whifer they ate adaptel, in prefora omly it lintos $y$, and ia ruins and certmin fortet is of escre of vereration, or compafion, attend tim reablection. Nor are thete contined to the romains of buirlins which are in difate; tione of an old mmann raite ralections on the donekic comiurts once mopde and tise dricient hoipititity which reizned these. Whatever indiling, we fee in duay, we natually contrat its prefent with its former itase, and delisht to raminate on the compaiton. It is trae that fuch efoct, properly beions to real mian; they aze however ;ouduced in a certain dergee by thote which ate intitious: the imprethons are not fo lirong, bat they are extely fimilar; and the reprefentation, thoush it dow not prefent faets to the memory, yet fuggeit, hidiects in the imagination. But, in order to afect the fancy, the luppofed original detign thould be clear, the we obvious, and the form ealy to be traced: no frasments hould be hazardeal whout precife meaning, and an evident comexion ; none thould be perpleacd in their combruction, or uncertain as to their ifytias... tion. Conjeclures about the form ratie douts doout the cxiftence of the ancient fructure : the mind mat not be allowed to hehtate ; it mal be hurried away from examining into the reatlity by the conctac; and the firce of the retemblance.

In the ruins of Tintern abbey \& the origint conftrution of the church is perfectiy marhed; and it is principally from this circumfance that they are ctebrated as a fubject of curiofity and contemanan. The walls are alnoft entire ; the root only in tina in, but moft of the coltmons which divided the fals, are fill flandiag : of thole which have drop ead down, the baten remain, every one castly in in phace and in the midlle of the nove four luty arker, when onec cos ported tise ftecple, rile hish is the at atove ati the rell, each reduced now to a narrow rim of thom, hat completely preferving its form. The thape acta of the windows are litule aftered. hut fine of them are quite ubfored, others pantilly thaded, by thin a ivy; and thole which are noul cles a.e ed, witw it flember tembits, and lighes toliase, wrembine about the lider and the divifion: it wind: sumd the pillars; it clings to the wallv; and in otic of the aitles ('ulfers at the t in in branche, fo thecia an! in lave an to durhen the fine belo:s. The wher aibe, wh the bleat mase, ate expoled to the Il.y; the dlow is cutire. !y werfine with turf; and to keep it clear from weedsath haher, is now it, bighell pretionation. Monhinh tomb thones and the monuments of benefictor long fince fingotten, apow above the seat foand; the bate of the pillars whinh hase fallem. tife out of it ; and mamed efligies, and feutpthe worn with age and weather, Gothic capital, ciric. 3 E
comicis, and raricas fragments, are foattered about, or lice in hewis filed up together. Other thattered picce, though dijointed and mouldering, fill occupy their original places; and a maircale much inpuired, which led to a tower now no more, is fufyctaded at a great height, uncovered and inaccellible: nothing is perfect ; but memorials of every part itill fubift; all certain, but all in decay; and fuggelling at once every idea which can occur in a feat of devotion. folitude, and defolation. Upon fuch models fictituos ruins hlould be formed : and if any parts are e:stity lont, they hould be fuch as the imagination can ealis fapply from thole which are fill semaining. Diltiact traces of the building which is fuppoied : have exifted, are lefs liab'e to the difpicion of atticie, than an ummeaning heap oi confufion. Precifon is always fatisfactory, but in the reality it is uniy agreable ; in the copy it is chential to the imii:tion.

A matcrial circumfance to the truth of the imitation is, that the ruins appear to be very old. The idea is behbes interefting in itielf: a momment of antiquity is never feen with indiference; and a femblance of age may be given to the reprefentation by the hue of the materials, the growth of ivy and other plants, and - ruchs and fragments feemingly occafioned rather by decay than by deftruction. An appendage evidently more modern than the principal aructure will fometime, corroborate the effect : the thed of a cottager amidt the remains of a temple, is a contrait both to the former and to the prefent ilate of the building; and a tree flourthing among rains, hows the length of time they have lain neglected. Nocircumftance fo forcibly marks the defolarion of a fpot once inhabited, as the pacvalince of nature over it :
Campos ubi Trgia fuit,
is a fentence witich conveys a flronger idea of a city : .....' y overth:own, than a defeription of its remains; At in a reprefentation to the cye, fome remains mult Pear: and then the perverfion of them to an ordiary ufe, or an intermisture of a vigorous vegetation, :intimates a leitied defpar of their reltoration.

Sect. II. Principles of Selaion and Arrangement in
the Siobjeats of Gardening.
I. $\mathrm{Or}^{-} A \mathrm{R}^{\prime} \mathrm{T}$. In the lower clafies of rural improvemiente, art thould be feen as little as may be; and in the more neglizent fcenes of nature, every tling ourgh to appear as if it had been done by the general laws of
on every occafion, to endeavour to avoid labour ; or, P if indif enfably liecellary, to conceal it. No trace thould be left to lead back the mind to the expenfive twil. A mound raifed, a motntain levelled, or a ufehif temple built, convey to the mind feelings equally difgutang.
II. PICTURESQUE BEAUTY. Though the Oi Scenery, ails of art are as eflential to gardening, as edecation is to manners; yet art may do too much: fhe ought to be confidered as the handmaid, not as the mittrefs, of nature ; and whether the be employed in carving a tree into the figure of an animal, or in thaping a view intu the form of a picture, the is equally culpable. The nature of the place is facred. Shou!d this tend to landicape, from tome principal point of view, affift nature and perfect it ; provided this can be done without injuring the views from other points. But do not disfigure the natu:al features of the place :-do not facrifice its natice beauties, to the arbitrary laws of landfcape painting.

> Great Nature fooms controul ; fhe will not beaz
> One beauty foreign to the fpet or foil
> She gives thee to adorn: 'Tis thine alone

To mend, not change, her features. Mison.
Nature fcarcely knows the thing mankind call a landfcape. The landicape painter feldom, if ever, finds it perfected to his hands; fome addition or alteration is almolt always wanted. Every man who has made his obfervations upon natural fcenery, knows that the miletue of the oak occurs almof as otten as a perfect natural landfcape; and to attempt to make up artificial landicape upon every occation is unnatural and abfurd.

If, indeed, the eye were fixed in one point, the trees could be raifed to their full height at command, and the fun be made to ftand finl, the rural artift might work by the rules of light and thade, and compoie his landfcape by the painter"s law. But, whilf the fun continues to pour forth its light impartially, and the trees to rife with llow progreffion, it would be ridiculcus to attempt it. Let him rather leek out, imitate, and aflociate, fuch friking paflages in nature as are immediately applicable to the place to be improved, with regard to rules of landicape, merely human; -and let him,
_in this and all
Be varions, wild, and free, as Nature's felf. Mason.
Inllead of facrificing the natural beauties of the place to one formal landicape, let every ftep difclofe freth charms unfought for.
III. Of CHARACTER. Character is very reconcilable with beauty; and, even when independent of it, has attracted fo much regard, as to occation feve- Wheotley's ral frivolous attempts to produce it: fatues, infcrip- Otfroations, and even paintings, hifiory and mythology, and ${ }^{\text {tions. }}$ a variety of devices, have been introduced for this purpofe. The heathen deitics and heroes have therefore had their feveral places alfigned to them in the of ent. weods and lanns of a garden; natural cafcades have matual been disfigured $n$ ith river gods, and columns erected on- characters.
ly to receive quotations; the compartiments of a fum- nuture, or had grown out of a feries of fortuitous circumitances. But in the higher departments, art connot be hid; and the afparance of denign ought not to be excluded. A human production cannot be made perfectly natural; and held out as fuch it becomes an impotition. Our art lies in endeavouring to adapt the productions of nature to human tatte and perceptions; and if much art be ufed, do not atiemp: to hide it. Art feldom fails to pleaie when executed in a materly manner : nay, it is frequently thic defign and execution, more than the production itfelf, that Itrikes us. It is the artivice, not the delign, which ought to be avcid. ed. It is the labour and not the art which ought to be conccaled. The rural artift ought, therefore, up-

## Part 1.

$\underbrace{\text { Character }}$
$\rightarrow$ mer houfe have beea fillew: with piatures of ganhols and revels, as fignificant of gaiets; the cyprefs, iecaale it was onee ufed in fenerai-, has been thourght peculiarly adapted to melancholy; and the decerations, the furniture, and the environs of a building, have been crowded with puerilities under pretence of propriety. All the fe devices are rather cmblematical than evprefive: they may be ingenious contrivances, and recal abtent ideas to the recollection; but they make no immediate imprettion: for they mult be examined, compared, perhaps explained, before the whole defign of the in well undertood. And though an allufion to a farmurite of well known fubject of hitory, of poetry, or of tradition, iray now and then animate or di nify a feene; yet as the fubject does not naturally belong to a garden, the alliufion flould not be prancipal: it fhould feem to have been fuggelted by the fcene; a tranfitory image, which irrefiftibly occurred ; not fought for, not laooured : and have the force of a metaphor, free from the detail of an allegory.

Another fipecies of character arifes from direct imitaiion; when a fcene or an object, which has been celebrated in defcription, or is familiar in idea, is reprefented in a garden. Artificial ruins, lakes, and rivers, fall under this denomination. The air of a feat extended to a diftance, and feenes calculated to raife ideas of Arcadian elegance or of rural fimplicity, with many more which have been occafionally mentioned, or will obvioully occur, may be ranked in this clafs. They are all reprefentations. But the materials, the dimenfions, and other circumftances, being the fame in the copy and the original, their effects are timilar in both: and if not equally ftrong, the defeet is not in the refemblance; but the confcioufnefs of an imitation checks that train of thouyht which the appearance naturally fuggefts. Yet an over-ansious folicitude to difguife the fallacy is cften the means of expofing it : too many points of likenefs fometimes hurt the deception; they feem ftudied and forced; and the affectation of refemblance deltroys the fuppofition of a reality. A hermitage is the habitation of a reclufe; it thould be diffinguined by its folitude, and its fimplicity : but if it is filied with crucifixes, hour glaffes, beads, and every other trinket which can be thought of, the attention is diverted from enjoying the retreat to examining the particulars : all the collateral circumftances which agree with a character feldom meet in one fubject; and when they are induftrioully brought together, though each be natural, the collection is ar tificial.
charcters Bat the art of gardenin ₹ appires to more than mitiafions to the create ariginal characters, and give expresceive from allufions. Certain properties, and certain di'poittions, of the oljects of nature, are adapted to excite par icular ideas and feafations: many of them have been occafionally mentioned, and all are very well known. They require no difcernmert, examination, or difcuffion; but are obvious at a glance, and inflantancoully ditinguifhed by our feclings. Beauty alone is not fo e waing as this fuecies of claractos: the impretioni: moknare more tranfient and lefo moterc.ing ; for it sins only at delighting the eye, bat the other alfict, our fontioility. An affenblage of the mote elo 5 me oran in the liapric.l fitua fons i. to a dagree indiferini-
nate, if they lwive lue I:, :
 niticcucc, or of simplicity, wi chaten , $\because: 1 \quad$ in or fome wher general character, 1 . at th 1 .
whole; and objects pleafing in thencolse, if $t$ ' $\gamma$ or tradict that charaster, fhated there inse he eveinded. thofe which are only indifferent mun formetimo make foom for fach an are more digniticunt ; many vall often be introduced for no other m-rit thas whir extrolion; and fome, which are in gencral ruther th : tes. .t.a.n. occafionally be recominended by it, B asemen i, is may be an accoptable circumance in a fipt dedic.... 1 to folitude and melancholy.

The power of fuch characters is not confined to the ideas which the objects immediately fuggetl ; for the e are connected with others, which intenfibly lead to fubjects far difant perhaps from the originsi thought, and related to it only by a fimilitude in the fenation they excite. In a profpect enriched and enlivened with inhabitants and cultivation, the attention is caught :s firit by the circumilances which are gavelt in their ic: fon, the bloom of an orchard, the feitivity of a hay field, and the carols of harvelt home; but the cheerfi! nefs which thefe infufe into the mind, expands afterwarls to other wbiects than thofe immediately prefented to $01=$ eye; and we are thereby dipoled to receive, and de. lighted to purfue, a variety of pleafing ideas, and ever: benevolent feeling. At the fight of a ruin, rellection: on the change, the decay, and the defolation betore u, naturally occur; and they introduce a long fuccefiion of others all tinclured with that me?anchuly which theit bave infpired; or if the monument revive the memorv of former times, we do not fop at the fimple fact which it records, but recollect many more coesal circumpas. ces, which we fee, not perhaps as they were, but asthe; are come down to us, venerable with age, and masnified by famc. Even without the allilance of building: or other adventitious circumftances, nature alone furnithes materials for feenes which may be auapted to a: molt every kind of expreffion : their operation is general, and their confequences are infinite: the mind is clevated, deprefied, or compofed, as gaicty, glonm, or tranquillity, prevails in the foene; and we foon lote fight of the means by which the character is furmed; we furcet the particular objeets it prefent ; and giving way to their effeels, without recurring to the caate, we follow the track they lave begun, to any extent which the difpofition they accord with will allow: In futices that the feese of mature have a poser to affect cur imagination and our feafibility; for fuch is the conslation of the human minel, that if once it in agitoted, thic emotion freads far beyond the occation: When the pafions are roufed, their counfe is unedtrained; when the fancy is on the wing, its flight is unbounde 1 : and. Initting the inanimate object which fint gave them their fping, we may be led by thought above
 fyonding in charater, till we rise from familiar fuhjest up to the fodment conceptions, and are wreat ia the con* mplation of whatever is great or heautisl, which se lee in natare, feel in m:n, or atribute to divinit.

ought not to be facrificed to the manfion; -the houfe mull ever be allowed to be a principal in the compofition. It ought to be confidered as the centre of thic fyifem; and the rays of art, like thofe of the fun, thould grow fainter as they recede from the centre. The houle itficlf being entirely a work of art, its immediate environs thould be highly finithed; but as the didrance increafes, the appearance of defign thould gradually diminith, until nature and fortuitoufnefs have full pofiefion of the licenc.

In general, the approach thould be to the back front, which, in fuitable fituations, ought to lie open to the paflure grounds. On the fides more highly ornamented, a well kept gravel walk may embrdee the walls; to this the thaven lawn and fhrubbery fucceed: next, the grounds clofely paitured; and dally, the furrounding country, which ought not to be comidered as out of the artin's reach: for his art confilts nut more in decorating particular fipots, than in endeavouring to render the whole face of nature delightful.

Another reaton for this mode of arrangement is, obteis immediately under the eye are feen more diftinetiy than thate at a diftance, and ought to be fuch as are tieafing in the detail. The beauties of a flower can be ditcerned on a near view only; whillt at a ditance a roughet of coppice wood, and the molt clegant ar. pangenent of flowering lhrubs, have the fame eifect. The moll hational entertainnent the human mind is
flowers, and the maturation of fruit, are amoang the Ornamentmof delightful fubjects that a conten.plative mind can ed Lottage. be employed in. Thefe proceffes of nature are fluw; and except the object fall fpontaneoully under the cye of the obferver, the inconveniences of vifiting it in a remote part, fo far interfere with the more importa : employments of life, as to blunt, if not deitroy, the enjoyment. This is a flrong argument in iavou: of hirubs and flowers being planted under or near our windows, efpecially thote from whence they may be viewed during the hours of leifure and tranquiility.

Further, the vegetable creation being fubject to the animal, the fhrub may be cropt, or the flower trodden down in its day of beauty. If therefore we wilh to converie with nature in private, intruders mult be kept off,-the fhrubbery be fevered from the ground;-yet not in fuch a mamer as to drive away the paturing slock from our fight. Fur this reafon, the flaven lawia ought not to be ton extenive, and the fence which inclofes it thould be fuch as will not interrnyt the view : but whether it be feen or unfeen, fufpected or unfufpected, is a matter of no great import: its utility in protecting the thrubs and flowers,-in keeping the homs of the cattle from the window, and the feet of the theec: from the gravel and broken ground, -in preferving that neatnels on the outtide, which ought to currolipond with the finihings and furniture within,-mender it of fufficient importance to become cren a part of the ortament.

## PART II. EXECUTION OT THE GENERAL SUBJECTS.

IMPROVEMENTS in general may be claffed under the foilowing heads: The Hunting-Bor, the Ornamen*ed Cottass, the $V_{i / i}$, and the Principal Refidence.

Bu: before any itep can be taken towards the exccution of the deing, be it large or fmall, a map or plan of the place, waclly as it hies in its unimproved ftate, thould be made; with a corref fouding deetch, to mark the intended improvements upon. Not a hovel nor a twig thould be touched, until the artilt has ftudied maturety the natural abilities of the place, and has decidedly fixed in his mind, and finally fettled on his plan, the propofed alterations: and even then, let him "dare "ith caution."

## 1. Of Inprovements adapted to a Huxtisg-Box.

Hlere art has little to do. Hunting may be called the amukement of nature; and the place appropriated to it ought to be no farther altesed from its natural ftate than decency and conveniency require:-With men whu live in the prefent age of refinement, " a want of decency is a want of fenfe."
The llyle throughout thould be mafculine. If thrubs - be rec,uired, they hould be of the hardier forts: the brox, the holly, the laurultinus. The trees flowuld be the vik and the beech, which give in autumn an agreeabie saricty of foliage, and anticipate as it were the feaion of diverforn. A fuite of paddocks thould be feen from the houfe; and if a view of ditant covers rin be raugh, the bach ground will be complete. The fable, the Vencle, a d the leaping lar, are the
facitious accompaniments; in the conflrustion of which fimplicity, fubtantialnef, and conveniency, thould prevail.

## 2. Of the Sigles of an Ornamented Cottage.

Neatnefs and fimplieity ought to mark the flyle of this rational retreat. Oitentation and how hould be cautionily avoided; ceen elegance fhould not be attempted; though it may not be hid, if it ofier itfelf fontaneoutly.

Nothing, bowever, fhould appear vulgar, nor fhould fimplicity be pared down to baldnefs; every thing whimfical or expenfive ought to be ftudioufly avoided ;-chailenefs and frugality hoould appear in every part.

Near the houfe a fludied neatnefs may take place; but at a diftance, negligence fhould rather be the characteriftic.

If a tafte for botany lead to a collection of native fhrubs and flowers, a ihrubbery will be requifite; but in this every thing fhould be native. A gaudy exotic ought not to be almitted; nor thould the lawn be kept clole ilaven; its tlowers thould be permitted to blow; and the herbage, when mown, ought to be carried off, and applied to fome wifful purpole.

In the artificial acconpaniments, ormament muft be fubordinate ; utility mult prcfide. The buildings, if any appear, ilhould be thofe in actual ufe in rural economics. If the hovel he wanted, let it appear; and, as a fidefereen, the bum and rick-yard are admimble; whilt
t'e dowe-limutind noutiy yad may enter more feely at. the con wition.

 the rarst lice agterde to a cutcivatud mind, the atl tha.i: dhould be amm at.
2. Ofta Rombtat mens of a Vuti.

This demazas a ale very ätert from the paced. ins. I: usit to he clegain, ioh, or grath ${ }^{1}$, wewd. ing to the fyle of the houle itver, and the thete of the forrounding counsry ; the principal bufmels of the artit being to conacet t. e: two in fuch a mavner, that the
 dol..te and in hotitale.

It itse houle to itarely, and the adjacent country rich .. : unhiy cultisiteえ, a thrubbere may intervene, in a Sich art may tao: her utmos ikill. Here the artilt may even be permited to play at landlape: for a place af tin kind icing fuppoied to be finall, the purpole princanliy ornamotal, and the point of siew prolmbly confined fimply so the hout, file icrecns may be formed, and a fore-ground laid out fuitable to the beft diftance that can be canght.

If buildings or other artibial ornaments abound in the oficane, is as to mark it itrongly, they ought alio to appear more or lefs in the fore-gtound: if the diftance abound with wood, the fore-ground thould be thickened, leti baldnefs hould offend; if open and nolied, elegance rather than richuefs ought to be litudied, let heavinefs hlould arpear.

It is far from baing any part of our plan to cavis unnecelailly at artiti, whetiaer living or dead; we cannot, howevr, refrem from exprelling a concem for tie almoft total $n$ glect of the principles here in ornimentin the vicinajes of vills. It is to be regretied, that in the prefont practice thele principles teem *, be fenerally lut ight of. Without any regard to ". iting the houle with the adjacent country, and, indeed, icerinurly without any regard whate;er to the r.ficape, one ibratithe phan of embelithment provails; ramely, that of tixipping the foreground entircly maked, or nearly fo, and furrounding it with a wavy border of formh, and a gravel waik; having the drea, wincther large or fmall, ote naked theet of yreen timard.

Ia inall confued foots, this plan may be eligible. But a limgle border rund a large unbroken lawn on!y ferves to thor what mose is wanted. Simplicity in feneral is pleafing; but even fimplicity may be carricd in an extrume, fo as to consey no other idea than that of pover:y atd baldneis. Bendec, how often do we Cee i: hatural icenery, the holly, and the fox-glove Aouriling at the foot of an oak, and the primole and We campion adding charms to the hawthom fattered ner the pathured lawn ? And we conccive that fingle wees footed with evergreens and native fowers, and dumps as well as borders of thrube, ate admifible in orsamental as woll as in natural fochery.

The frecies of thrub will sary with the purpofe. If O. ar.al insention be a ninter retrat, everereens
and the corly-hlonimer thru'sin ald predominate ; But
 ducition alimes ondot chicíy to be 1 'med.

In the front of the buafe iv a alie able la

Procipal to the wates beyond which are two clegant Dotic pa-Refien-r vilons, placed in the boundary of the garden, but not
narking it, though they correffond to each other ; for Aiill further back, on the brow of fome rifing grounds whout the inclofare, flands a noble Conithtian arch, ly which the principal approach is conducted, and from which all the gardens are feen, reclining back againft their hills; they are rich with plantations; full of objects; and lying on both fides of the houfe almoft equally, every part is uithin a moder.te diftance, notwithftanding the eatert of the whole.

On the right of the lawn, but concealed from the l:nufe, is a perfeet garden fcene, called the queen's n"mblithatre, where art is avowed, though formality is ivoided. The fore-ground is fcooped into a gentle l:ollow. The plantations on the fides, though but jult afoued from regularity, yet in ftyle are contrafted to each other: they are, on one hand, chielly thickets, landing out from a wood; on the other, they are open groves, through which a glimple of the water is viible. At the end of the ho!low on a little knoll, quite detached from all appendages, is placed an open ionic rotunda: bevond it, a large lawn flopes acrofs the liew ; a pyramid itands on the brow; the queen's pillar, in a recefs on the defcent; and a!l the three build. ings, being evidently intended for ornament alone, are peculiarly adapted to a garden-fcene. Yet their number does not render it gay : the duky hue of the pyramid, the retired hituation of the quecn's pillar, and the lolitary appearance of the rotunda, give it an air of gravity; it is encompafied with wood; and all the external views are excluded; esen the opening into the lawn is but an opening into an inclofure.

At the king's pillar, very near to this, is another lovely fot ; which is fmall, but not confmed ; for no termination appears; the ground one way, the water thother, retire under the trees out of light, but nowhere meet with a boundary. The view is firlt over fone very broken ground, thinly and irregularly flanted; then between two beautiful clumps, which father down to the bottom; and afterwards acrofs a glade, and through a little grove beyond it, to that part of the lake where the thicket, clate upon the brink, fpread a tranquillity over the furface, in which their hadows are reflected. Nothing is admitted to diffurb that quiet: no building obtrudes; for objects to fix the eye are needlefs in a fcene which may be comprehended at a glance; and none would fuit the paftoral idea it infpires, of elcoance too refined for a cottage, and of fimplicity too pure for any other editice.

The fituation of the rotunda promifes a profect more enlarged; and in fact molt of the objects un this fide of the garden are there viible: but they want both connexion and contralt ; each belongs pecultarly to fome other fpot they are all blended tugether in this, without meaning; and are rather hown on a map, than formed into a pieture. The water oniy is capit. 1; a brodd expanfe of it is fo near is to be feen under the little group, on the bonk without intersuption, Eyond it is a wood, which in one place leaves the lahe, ' 1 run up bchi: d a boautiful building, of three pasilions joined by atcades, all of the lonic wher: $\mathrm{i}^{\text {i }}$ is called Kent's Bmblins. And never was a Selicen mot happily conceived: it feens to he chase:
terifically proper for a garden ; ic is co elegant, fo va- Ptincipal ried, and fo purely ormamental : it directly fionts the Refidence. rotunda, and a narrow rim of the country appears above -rthe trees beyond it. Bat the efect even of this nothe ubject is fairter here than at other points: its pofition is not the moft adrontrgeous; and it is but one amons many other buildings, none of which are priacipai.

The frene at the temple of Dacchus is in character direetly the reverle of that about the rotunda, though the fpace and the obiect, are nearly the fame in both: but in this, all the parts concur to form one whole. The ground from every fide fhelves gradually towards the lake; the plantations on the further bank open to fhow Kent's building, rife from the water's edge towards the knoll on which it ftands, and clofe again behind it. That elcgant tiructure, inclined a littie from a front riew, becomes more beautiful by being thrown into peripective; and though at a greater ditance, is more important than before, becaufe it is alone in the view : for the queen's pillar and the rotunda are removed far afide; and every other circumitance refers to this interefling object: the water attracts, the ground and the plantations direct, the eye thither: and the country does not juft glimmer in the offscape, but is clofe and eminent above the wood, and connected by clumps with the garden. The icene altogether is a noft animated landfcape; and the fplendor of the building; the reflection in the lake; the tranfparency of the water, and picturefque beauty of its form, diverfified by little groups on the brink, while on the broadeft expanfe no more trces caft their hadows than are fufficient to vary the tints of the furface; all thefe circumftances, vying in luitre with each other, and uniting in the point to which every part of the fcene is related, diffule a peculiar brilliancy over the whole compofition.

The view from Kent's building is very different from thole which have been hitherto defcribed. They are all directed down the declivity of the lawn. This rifes up the afcent: the eminence being crowned with lofy wond, becomes thereby more confiderable; and the hillocks into which the general fall is broken, foping further out this way than any other, they alfo acquire an importance which they had not before; that, particularly, on which the rotunda is placed, feems here to be a profound fituation; and the itructure appears to be properly adapted to fo open an expofure. The temple of Bacchus, on the contrary, which commands fuch an illultrous view, is itfelf a retired obiect, cloie under the covert. The wood riling on the brow, and defeending down one fide of the hill, is thown to be deep; is high, and feems to be higher than it is. The lawn too is extenfive; and part the boumdary being concealed, it fugsedts the idea of a mill greatcr exacnt. A fmall portion only of the lake indeed is vifible; but it is not here an object: it is a part of the fpot; and neither termination being in fight, it has no diminutive appearance: if more water had been admitted, it might have hurt the character of the place, which i- fober and temperate; neither folemn nor gay ; great and fimple, but clegant; above rulticity, yet tree from vitentation.

1月 are the principal fienes on one fide of the garden. fon the other, clofe to the lawn before the houle.

 d ly a lowely nitulet; are vety hithiome, and very arm, fo thinly are the the feate-es at unt them ; are
 the reh of the :ommen if fiequmtity brokea to lat in obichs a wo w, whith apqust dill more dilant from thie mamer vi howing them. The ereance is celler a Dric arch, which coincius, with an opening among the tiece, and forms a him of vita, throwh which a Pombrahe bridge gint !elun, and a lodre built like a conte i: the park, are ien ina beentifal perfientwe That
 filiar is at another, yet beth are wible from the lime aration in the Elyfian filds: and all thefe exernal as. ject are unffecte3ly introducel, diveted of their nown appurtenarcee, and cond ived with othery which blowg to the foot. The tomple of Friend! ip is whin in fight. jut without the fuce, and within it :re the temples nt ancient Vistue, and of the Bitith woithes ; the one in an elevated fifution, the other low down in the valle, and near to the water : both are decorated :.ith the effies of thofe who have been molt ditinçume 1 tor mihitary, ciish, or literary merit; and near to the former ftands a roliral columa, larred is the memory of Cas tain Getenvilt, aho fell in an action at feat: by phin cian here the meed of valure, and by flang thefe feld with the repreartiuns of thofe whan decived beit of mankim, the charatue intended to be girea to the fout is jutly and pretically exprefed; ard the number of the images which are prefented or eacied, perfectly correiponds with it. Sulitude was never rechoned among the charms of Elyfum; it has been atways pictured as the manton of del? and in this imitation, ensy circumitance accoods with that eftablinhed idea. The vivacity of the itram which flows through the vale; the glimples of anotlice approaching to foin it ; the ferightly verdure of the green frard, and every but of the Britih worthies rellecled in the water; the waniety of the teen; the 12 htnefs of the greens; their difpofition; all of them dininat objects, and difperfed oser gentle inequalities of the ground; together with the maltiplicity of ob jects both within and withunt, which em eillih and enliven the fcere; give it a qaiety, which the imagination can bardly conceine, or the heart whit to be exceeded.

Clofe by this fpot, and a nereat contraft to it, is the alder grove; a deep receis ia the midht of a thade, which the blaze of noon cannot bigiten. The wate feems to be a flagnated poul, eatios into its banks; and of a peculiar colour, not dirty Lit ciouled, and dimly reflecting the dun hue of the horecrleffotio and alders which prefo upon the brink: the thems of the latier, rifing in cluter from the fame root, har on arother down, and flaut over the water. Mathanen elm, and ragzed firs are frequesit in the wood which encompantes the hollow; the trunks of dead trees are Ift Itanding amon if thein: and the uncouth fumach, and the ye:s, with elder, nut, and hully, compofe the underwond: fome linces and laurels are intermixed; bua they are not many; the wood is in general of the darkell grens; and the follage is thickened with i:y, which not only twines up ti.e tice:, but cree 5 alfo over the falls of the ground: thele are Deep and

Inreditaly above the alder-grove is the principal minence in the gardens. It is divided by a great dip into tho pimales; uno 0 e of which is a lirge G . t.inc buidid. The face before this Itructure is an wienive han the fround on one fille foll, imme Untly into the dip; aid the trecs which bordse the lawn, in lins with the ground, the houle rife aloove them, and bils the interval : the rall pike feems to be will herer then it :s; for it is thrown into peripective, and brewcen and above the heads of the trees, the up1.f fory, the porticoce, the turzet, and ballullrades, :. I all the hated rouf, afyear in a noble corifulion. Oatle other tide of the Gothic building, the ground thes down a lo, es continued dellivity into a bottom, which feems to be perfectly irriguous. Divers ltreame Wamer al, ut it in feveral drections: the contux of that which rums from the Elyira field, with another below it, is full in iight; and a plan wooden bridge then ove: the latter, and evidentily de.igned for a paldace, imperis an air of really on the river. Beyond it is ce.e of the Doric porticoes which front the Loule ; bat now it is alone ; it Atands on a little bank above the water, and is feen under lome trees at a diAlance before it : thas grouped, and thas accompanied, it is a happy incileat, concursing with many other circumitances to ditinguilh this landicape by a chazaster of cheerfaluefs and amen: y .

From the Gothic building a broad waik lends to the Grecian valley, which is a feene of more grandecu: than any in the gardens. It enters them from the puk, fyreadiag at firft to a coniderable breadth ; thea rind' ; grows varrower, but deeper; and lofes ittelf at latt in a thicket, bchind fome lofty elms, which interrupt the fight of the termination. Lovely wood and grove hang all the way on the declivities: and the open fpace is broken by detached trees; which, near the park, are cauiouly and faringly introducen, le. $\begin{gathered}\text { the bread!h thould be contracted hy them; but as }\end{gathered}$ the valley imks, they advance more bllly down the fides, heetch acrofs or along the bottom, and cluiter at tims iato group and forms, which multiply the v.rities of the langer plantations. Thoic i.re fometimes clofe covert, and fometimes onen gro:es: the tress ifte in one unon hish teme, and feather dusu to the botom in another; and between them are hox: conangs into the purk or the garlens. In the midt of the fene, jult :at he bend of the walley, and con:mamling it on both fiJes, upen a harse, e"fy, natural affo, in laced the temble of Concord and Vitory: at cac piare its mageflic front of six Ionic columns, iupputian a pedimens: filled with bas relicf, and the points If it cromned with daturs, face the view; at another, the beatiful colomato, oa t'o dide, of to lofy pilliar, retices in perfjective. It $i$ - fuan from every part; and impetfing it, own character of cismity on all around, it fureals an awe over the whole: but no glom, no reflaycholy, atteuds it : the fenlations it excites are ra-
 : to chrich the vew ; tho parts of the fone are 1.1 - ce, the idea of it fublime, and the execution happy ; it is imdependent of all adrentitions circumitancos, now re i.es on itfels for its areatnefs.

The foenes which have been deforibed are fioch an are mond remarkable for heauty or characler; but the 2.edens contain many mure; and even the oifedo in iace, by their leveral com'inations, produce very differnt effects, within the dilance fometimes of a few f:ce, from the unevemel, of the ground, ti:e variety of the flantations, and the number of the baildimgs The nolltiplicity of the laft hav indetd teen often urged as an objection to Stowe ; and certainly, when all are teen by a itranger in two or thace lours, twenty or thinv capital ftructures, nived with whers of inferior note, do feem too many. But the growth of the wood every day weakens the objestion, by concealing them one from the other: each belongs to a diflinct feene; and if they we considered feparacely, at different times, and at leilure, it may be difficult to determine thich of take away. Set ftill it muft be acknowled ed that their frentency deftroy* all ideas of filence and retire. metit. Magnifence and Iplendor are the characteriftics of Stowe: it is like one of thofe places celebrited in antiquity, which were de:nted to the purpues of religion, ard filled with facred groves, hallowed funtain, and temples dolicat-d to feveral daities; the reiort of diftant nations, and the ubject of venera*ion tw balf the heathen wold: this ponp ic, at Stuwe, tionded with beauty : and the place is equaily disionguinhed 1 y its pnenity and ith grandeur.

In the mitit of fo much embellimment is may be intraduced into this foccio of garden, a plain field, or a theep-walk, is fometime an ayreable relief, and even wilder fenes may occafionally be admitted. Tl.ele indeed are not properly parts of a garder, but they nay be comprehended within the serge of $i t$; and the arsimity to the more cmanmuted forucs is at leatt a warenience, that the trmition from the one to th.e "ther miy be calf, and the clarge almgs in eur option. Fur though a fret in the higheit date of in: wovement be a leccflary a:puldace to a feat; yet, in - Pace wilich is perfect, other characters will not ke wanting : if the: canonot be nad on a large fcale, they reacceptaile en a fanaller: and fo many cincomtuscos ate common to all, that they may ofton be inter anded ; the: mu alway suder on eath otier."

Fut on this bead it would be in win to attempt to lay comar particular mule: differnt 1 laces are marked by fet of teatures as difterent fiom each other as are the'e in men' fucts, Muc's nouf be left to the fhill a.d the of the artift : and It: thole he what they may, nuthing but mature iftuly of the matuma abilities of the p.raser place to be img roved can render him equal to the eaccution. lio as to rabe the moit of the naterime that are placed before him .
ome tew general ruks maty nevertleled le laid (ant. Wl\%approach onght to be conducted in fuch a marner, that the Afriliseg features of ti:e fiace thall bur!'2 upon the view at once: no trick hosever hould lew mate uit of: all thould aje car to fill in maturally. In he.fin townards the lowte, its direction fhould not be fully in front, nor exactly at an angle, but thould
pas obliquely unon the houfe and ns .ecommanments; Io that their potition with refpect to each othen, as well at the perfective appearance of the houle itelf, mat wory at every tep: and having thown the frons and the princinal wing, or other accompaniment, to advont ale, the anpronch hould wind to the back tuont, which, as hav been alrealy oblerved, ought to lie ones to the pa or paliured grounds.

The improvement and the roors form which they are to be leen hould be in uniton. Thuc, tie view from the draving-room thould be highly embellihed, to crefrefond with the beauty and eregance withis: evory thing here hould be feminine, elegant, berutiful, fuch as attunes the mind to foliteneis and lively crnverfation. The breakfaling room thould have more mafculine ofgeens in riew: wood, water, and an extendedcuntry for the eye to rom over; fuch as allure us imperceptibly to the ride or the chate. The eating and bar:queting rooms need no extcrior allurements.

There is a harmony in talte as in mulic: varicty, and even wilduefs upon fome oceafions, may be admitted ; but dicord cannot be allowed. If, therefore, a place be fo circumitanced as to confift of properties totally irreconcileable, the parts ought, if polide, to be feparated in fuch a maner, that, Whe the $i$ ir and the recitative, the adagio and the allegro, in mutir, they may fet off each other's charms by the contratl.Thele obfervations, in the elegant performance whence Defaiption they are extracted, the author illuthates by the follow-of Perteing defcription and propofed improvement of Perfe-fichl, ioid. hicid, the feat of Mr Morric, near Chentow in Mon-? 6i6, Ne. moutlithire ; a place upon which nature has been peculiarly lavith of her favours, and which has teen fonken by Mr Wheatley, Mr Gilpin, and other writers, in the noft flattering terms.
"Porlesield is lituated upon the banks of the river Wre, which divides Glouceflerfhire and Monmouthhlire, and which was formerly the boundary between En:land and Wales. The general tendency of the river is from north to foutn; but about Periefield it deferibes by it winding courfe the letter $S$, fomewhat comprefied, to as to reduce it in length and increafe its width. The grounds of Perifield are lifted high above the bed of the river, thelving, and form the brink of a lofty and Iteep precipice, towards the fouthwell.
" The lower limb of the letter is filled with Perfewood, which makes a part of Perfficid ; but is at prefent an impenetrable thicket of coppice-wood. This dipe to the fouth-cant down to the water's edge; and, feen from the top of the oppolite rock, has a yood etfeet.
" The upper limb rectives the farms of Llancot, rich and highly cultivated, broken into infotures, and featered with groups and lingle trees; two well looking farm-houles in the centre, and a neat white chapel on vise fide: altogether a losely little pacalitacal fipot. The loshinefs of its fituation ilamps it with an air of meeknes and lamility ; and the natural barrien which furround it add that of peacefuhef and lecurity. The jicturedque farme do not form a low that battom, fubject to be overllowed by the river; but take the form of a gorget, rifing fulleft in the middle, and falling on every fide gently to the brink of the Wye;

## Part II.

G A R D E N i N Ci.

Refidene. lans in an ealy manner againt a range of perpendieujar rock; as if to llow its ditk with advantuge to the walks of Periefied.
" This roch ftretches acrols what may he called the I"ntr, leaving only a marow pats down into the fiedds of Lian and joins the principal sange of roch at the lover bend of the river.
" '1u the north, at the head of the latter, itands an inmenie ro-k (or rather a pile of immenk rocks heapd d one ahove another) called IIFdidf; the top of which is levated as much above the sround of Perfeneld as thole are above the fields of Llancot.
" 'T:ere leveral rocks, with the inooded precipices on the inle of Perlefies, form a circular inclolure, abont a mile in diameter, including Perie-nood, Llancot, the Wy, and a matl meadow lying at the foot of Winlcota
" ithe curnds are divided into the upper and lower lawn, ty the approach to the houle a finall irreLs': ; we. but framg iown the lower lawn, a beautiful anco d, atily - precipitately every way into a valley $\therefore$ ainh ileties domn in the middle, and is fattered wi.h grour and lingle trees in an excellent ilyle.
" The view trom the houle is foft, rich, and beautifisty picturetine; the lawn and woods of Perfefield in it the opposite banks of the river ; the Wye, near i! : atuth, wisding through' meatows green as emerad," is. a manact peculiarly graceful; the Severn, hare vers Sorad, hacked by the wooded and highly
Atimates hith of Gloucettimire, Bilthire, and Suwetethine. It ore rock enters into the compofithon. The whole vien comtits of an elegant arrangement of lawn, rand, and water.
"The wepe lawa is a le's beatifal ground, and the view trom i: thoust: it command the " cultiveted 'ills and ticin wile - of Mumontithire,' bounded by the Sovenn and brined by the Mendij-hille, is much merior to that from the houle.
"1 o give varicty to the views from Puffefeld, to uncluie the native grandtar which fursounds it, and to fet cif its more ftriking fetiures to adsantage, walks have been cut through the woods and on the face of the precipice which border the grounds to the fouth and ealt. The viewer enters thele walhs at the lower corner of the lower lann.
"The firt point of view is marked by an alcove, from which are feen the bridge 'and the town of Chepftow, with its cattle fituated in a remakable maner on the very baish of a perpendicular rock, wathed by the Dye; ated beyond the the Severth hows a fimall portion ot its filvery faffece.
" Poceedins a littie farthor along the walk, a :icu i caught whicl the painter might call a comphete bandSeape: The catle, with the ferpoutine part of the Wye thow Cheptow, intermiacd in a peculiar mamen with the broad watus of the Siverr, forms the fore-ground; which in baeked i, ditant hiils: the rocke, consoned with wut, lying hetween the alcove and the callie, to tiu right, and Coitlehill farm, elevated won the opPrive banl:s si the river, to the left, form the tho ficeforechs. Lhis point is not marked, and mat fre's antily lie lont to the ftranger.
" The grotio, fituated at the head of Derfe-wood, TinL. 1X. PertI.
 nificent bevond detcription 1 he intleme ut hana in .". art was never placed in a mose humblatisis prin or -...
 pared with thefe nitural bulwarh, a nete in efo ni card.
"A hove the zroten, apon the ithems of :he P-4. field tide, is a thubbery; ftrangely nithlaced! unpardonable intrution apon the native grade ur at this feene. Mr Gilpin? oldersations uport tias, upon every other occation, are very juit. Me hov,
It is a pity the ingenious emberlinher of thete fee: $n$, could not have been fatified with the great beautir. of nature which be commanded. 'the itrubberies $\mathrm{t}:-$ has introduced in this part of his improvements I te, will rather be efteemed paltry. "—— It is wot the thas', which olfonds: it is the formal introduction of is Wild underwood may be an appendage of the gratueit feene; it is a beautiful appendige. A bed of violet. or of lilies may enamel the ground with propriety a the foot of an oak; but if you introduce them artificiat. ly in a border, you introduce a triding formality, ai a difsrace the noble object you milh to adorn,'
" The walk now leaves the wood, and onens upw the lower lawn, until coming near the houle it entthe darming frecipice facing Llancot; winding alor the face of it in a munner which does great honour $t$, the artith. Sometime, the fragments of rock which fall in its way are avoided, at other times partially removed, fo as to conduct the path along a ledge carsed out of the rock; and in one intance, a huge fras ment, of a fomewhat conical thape and many yari high, is perforated; the path leading through is bak. $T$ his is a thought which will hand down to future tines the greatnels of Mr Morris's tatte; the demign and the execution are equally great; not a marb of a tool to be feen; all appears perfectly natural. Iho arch-way is made winding, fo that on the approach it appears to be the mouth of a cave; and, on a neater view, the idea is ftrengthened by an allowable deception : a black dark hole on the file nest the cliff, which, feen from the entrance hefore the pertoration is difovered, appears to be the darktome intet i:so the body of the cave.
"From this point, that valt incloinie of rucks atod precipices which marks the peculiar magnifirence of Perferield is leen to adventage. The area, contanis ing in thi point of view the ficlds of Llancot and the lover niargin of Perie-wood, is broken in a manas peculiariy picturefque by the graccul winding of the Wye; here wathing a low granfy thore, and there fivec:ing at the feet of the rocks, which rife in fome place perpendicular from the water; but in gencral they have a wooded offset at the bale; above which they rife to one, two, or perhaps three or four hundred feet high; c\poling one full face, filvered by ace, ant beardec? with isy, growing out of the wriskle-like fams and fintures. If one mivert be allowed to comprase the paltry performances of art with the magniticent "ork of nature, we thould fay, that this inclofure refembles a prodigious fortrefs which has lain long in ruins. It is in reality one of nature's trong-holds; and as fuch h.is probably been frequently made uik of. Acrofs the ithmus on the Glonceterlhire fide there are the remains of a deep intenchment, called to this day this

"From thee tranche he woud enter the forel? part. IIere the idea of Nature in her pimitive taic would be trengthened: the roukhorfe, atd deer to the ri,ht, ard the rocks in all their mative widdects to the le:t. Even If noct might be flout cut from the view by the artural intubbery of the cliff. The Lover's Letp, honeven (s tremendou reep), night remain ; but to cend!e, nor other mork of art, himuld hare be leen. A naturnt path, devintirg near the brink of the proripice, would bring the viuner conn to the lower cormer of the park; where bethches thould be placed in a happy peint, for as to give a foll view of the rocks and lative vildetiles, and at the fime time bide the farm houles, fichis, and other acquitud beanties of Llane ct.
"H ving lati tod himfif with this favare foeve, he wouk be led. by a llill ralic fath, throug the lathyri th- uiten the mubery, the lann, with ail it ap' Fendiges, the staceral W!e, and the broudthior Severn, would brekk tanon the eye with evry advanade of irmanental mature : the thatfition could not fail to Atrike.
"From this forit feene he would be drown to the top of Windc.iif, where in one valt vew he sould anite th.e fubime and beautiful of Perfeneld."

On? one particular remains now to be noticed. A phee which is the refidence of a fonily all the year is very defective, if fr me potion cit it be not itt epart for the enjo ment of a tine day, for air, and exercile, in wi:nter. Wo fuch a lpot metier in aufolutely effential; and evergreets being the thichcit covert, are theretore the bett: their verdure allo in then agrecable to the eye; and they may bearranged to as to produce beautitul mixture of ;reens, with mosecertainy than deciduous trees, ami with ahmon equal varicty : they may be coilerical into a nood; and through that woed graiclen tiks naty be led along openings of a curnderable Lredth, free frem large trecs which woud inturcept the ran of the fin, and winding in fueh a maner os to avoid any draft of wind, from whatever quarter it may blow. But when a retreat at all times is thus fecured, cother ¢ ${ }^{1}$ ots may be adaped only to occaional fropoles; and be flellerad townels the nerth or the cail in one hand, while they are open to the fun on the other. The fow hours of checrfulnels atd warm:h which its beams afford are io valuble as to pullify the ine rifice cven of the principles of benty to the enjerment of then; and therefore no

Trmeipa！objeさんions of iamenefs or formality can prevail again！t Refidence the ples＇antacfs of a ftraight walk，under a thick iedge －or a fouth wall．The eve my，however，be diserted from the fkrew by a border betore it，where the aco－ nite and the fnowdrop，the crocus and hematica，brought forward by the warmth of the fituation，will be well－ come harbineers of fering ；and on the oppolite iise of the walk littie tufts of lauruftines，and of wariegated evergecens，may be planted．The fot thus enivened by a variety of colours，and even a degree of bloom， may be thill further improved by a green－houfe．The entertamment which exotics afford peculiarly belongs to this part of the year ；and if amongtt them be intur－ ficetied fome of uar earlient flowers，they will there

## Part ill．PRaCTICAL Gardening．

WE now proceed to treat of horticulture or practi－ cal gardening．And although it may not appear to be the mon perfect arrangement；yet as it is probably the moft contenient and ufeful in the directions to be given for the practical management of the garden，we thall comider the work to be done for each month of the year in the kitchen garden，the fruit garden，the flower garden and the nuriery，under fo many feparate fec－ tions．

## JANUARY．

## Sect．I．Kitchen Garden．

ever the weather is nild，by ranng the ghafo，or re－ moving them altogether during warm diss．If wath－ ed very early，recourle mult be had to a flight hot－ bed．

At any time in this month，when the wother is mild Catsot： and dry，let a foot of ground in a warm liturtion be prepared for fowing a few early carrot，by digeing the ground a full foade deep，and breaking tice earth well； and when the feed is fown，let it be raked in．When carruts are wanted very ear＇y，they may be reared in a night hot－bed．

About the beginning，or any time in the month，Spinach． when the weather is mild，you mav fow fome finach； but if the weather will permit，fome ought to be lown，both in the beginning and towards the end of the month．The fonooth－leeded or rourd－leaved finach thould chietly be fown now．It is preterred，on ac－ count of its leaves being thicker，larger，and more fuc－ culent than the prickly－feeded；though fome of the lat－ ter ought alto to be form，becaule it is hardier，anl better able to fuftain the leverity of the weather．They may be fown either broadcaft and raked in，or in thal－ low drills about an inch deep，and nine or ten inches afunder．It is a frequent practice to fow fpanach in drills between the rows of carly beans and cablatises．

You may fow fome leed of cref，mullard，radih，Smath rape，\＆ic．and likewie fome lap lettuce in a worm fitua－ist tion expoled to the fun．They form an arrecable latad when cut foute．The gromid on which they are to be fown in int to be doped to the foulh，and covered with a common hut－bed frane，which hould be funk in the gromd，to far as to allow the gla．．．s to ap－ proach to aidhan fix or eight inches of the Lusia fur face．

But finall falad will fucceed beh in a hlitht hot－ bed of wam dang formed to the depth ef is or 20 inchos；air mat be admitted ficely，whenever the weatine will permit，by raikig or removing the glate．

Ahent the nathlie，on towad the litter end of the Pawer month，fow parlley feed in any dry fituation，in hallow drills nine inches alunder，and cover it in with carth to fle depth of a quarter of an ioch，or in hingle rous alone the nonders of the hitehen garden．Here are tuv hirts，the ghin－leaved and curd deaved ；the later is prefined as grathing on account of it haso buthy
leaves, but both are equally good as pot herbs. This Seed lies very long in the ground before it vegetates.
Sow fome early peas in a warm fituation, to fucceed thofe fown in November and December. The principal early peas are the Charlton hotfpur, golden hotfpur, Reading hotfpur, Mafters hotipur, \&ic. the two firit of which are rechoned the earliell. Sow them in rows two feet and a half afunder, but when they are to be fupported by fticks they ought to be three feet afunder. Some marrowfat peas thould likewife be fown at this feafon for a firft crop of late peas: the dwarf marrowfat is the moft proper, but any other late pea will fucceed very well, fuch as the Spanilh moratto, tall marrowfat, Pruflian prolific, fugar pea, dwarf fugar, egg pea, pearl pea, \&ic. Thete dould be fown in rows three feet afunder ; but when it is intended that they hould be fupported by ficks, the rows fhould be three feet and a half apart.
Any time in the courfe of the month, if the weather be mild, a main crop of tems may be lown. The Sandwich bean, toher, Wincior, broad Spanih, broad long-pod, \&c. are the kinds moll commonly ufed. Ather the gromed has been well dug, put in the beans to the depth of about two inches, with a dibble, in rows three feet apart, and at the ditance of fuur or five inches from each other in the rows: or they may be fown in drills to the fame depth and dirance. It no early beans were fown in November or December, they ought to be fown the earlieit opportunity this month. the early Mazagan and Lillon beans are the bett. They ought to be planted in a warm border; if at the foot of a fouth wall, they will come on carlier. Thefe may be planted clofer than the larger beans, two feet, or two feet and a half, between the rows, being fufficient. When peas or beans are wanted very early, they may be fown in hot-beds or floves, and when fomewhat advanced, they may either be planted out into other hot-beds, into peacli and vine-houfes, or into any warm fituation in the oper air.

In the beginning, and again towards the erid of the month, you may fow fome lettuce. The kinds commonly ufed are the green and white cos, brown Dutch, Cilicia, and common cabbage lettuce. Prepare a jiece of ground in a warm fituation; fow the feeds moderately thick, and rake them in as evenly as poffible. They may alfo be fown under hand glaffes or in common hot-bed frames, to be occafionally covered :rith glaffes or mats: but in cither cafe, air mult be ircely admitted, whenever the weather will permit. When withed for very carly, they may be fown in a flight hot-bed, and planted out in the open air in March or April.

Take care of lettuce phants which bave ftood the winter.-If you have lettuce plants in frames or under hoops, covered with mats, give them plenty of air when the weather is moderate. Remove all decayed leaves, and deltroy fnails which frequently infell them; and when the froll is fevere, tahe care to protect them well with mats.

The caulitherer plants raifd lat autumn, which have acod during the winter in frames, thould be looked over in open weather. If any decayed leaves appear, pick the m off; fitir up the carth hetween the plants, and remove all weeds. In mild weather, give them plenty
of air during the day, by pufling down, or removing January. the glaffes altogether: but cover them during the night, unlefs when the weather is particularly mild : when it is frofly, or rains much, they ought to be covered during the day. But if the froft is very feverc, the frames thould be protected at night with a covering of mats, and even during the day, thould the froit be intemfe, without funthine; and fome ftraw, dried leaves, or fomething of that nature, thould likewife be laid alt round the outide of the frame, to prevent the frolt from penetrating its fides.

Canlifiowers under bell and hand glafies require the fame attention: during mild weather, the covers thould either be taken off altogether, or raifed (or tilted) on the fouth fide, fo as to admit the air frecly during the day and that again at night, melefs the weather fhould be very mild, in which cafe they may remain a little tilted on one fide ; but hould intenfe froft prevail, they fhould be kept but, and covered with firaw or lomething of that nature. The free admilion of the air will prevent the plants from becoming weak, and make them lefs apt to run up to Hower before they have acquired futlicient fize. In nuild winters, flugs very frequently injure caulilower plants; they ought, therefore, to be carefully looked for and deftroyed. Kitchen Garden. About the end of the month, if the weather is mild, Plant cat ${ }^{26}$ plant out a few early cabbages, on a fpot of ground bages. well dug and manured with rotten dung, at the diftance of a foot and a half from each other, or even clofer, as they ate to be cut early, and before they acquire a great ifze. The early York, Batterfea, and fu-gar-loaf, are the kinds which hould be planted at this feafon.

Tranfplant fome full grown cabbages and favoys, for Tranfplant feed, about the beginning of the month; though the ear-cabboges, ly part of winter is the moft proper time for doing fo. \&e. for Sce Notember.
In open dry weather, earth up fuch celery as has ad- 28 vanced much above ground; let the earth be well bro- Ecitery. ken, and laid up almoft to the tops of the plants, but care mult be taken not to bruife them. This will afford them protection againt frolt, which might prove very injurious to them at this feafon.
Where celery is wanted daily, a quantity of llraw er formething of that nature, fhould be laid over the rows on the approach of froft, which will prevent the frout from penetrating the ground, and on the removal of the covering, the cclery may be dug up: or when fevere weather threatens to let in, a quantity of celery may be taken up, placed in fome fituation theltered from the weather, and covered as far as the blanched part extends with fand.

In open dry weather prepare fome full grown en-Btanch dive for blanching. When the plants are perfecily dry endive. tie uf their leaves clofe together, and they will be conipletely blanched in about a fortnight. As endive is very apt to rot in wht weather at this feafon, when blanched in the open air, a quantity of it ought to be tranfplanted into a ridge of dry earth, in fome fituation where it may be fheltcred from rain.

In open dry weather, the earth thonid be drawn up Earth up about fuch peas and beans as may have advanced an inch peas and or two above ground, which will both flrengthen thers ${ }^{\text {beans. }}$ protect them againlt frolt.

If artichokes have not been earthed up before this, that work inould now be dune the firt opportunity. Sce Nuvesiber. the rain thould at any time have penetated nearly thoo: h it, it outh: to be removed, and a covering of dry liraw put in is place; for if the bed thould get wet, the liawn would be injured, and the future coop detroyed.

Sumctimes it is defirable to have fome of the ordinary kitchen garden crops, at anearlier period, than that at which they are produced in the open air. For this purpole recourle is had to hot-beds; there are likewite fome things reared in the kitchen garden, fuch as cucumbers and melons, which cannot be obtained in this country without their ail. The principal crops, befides cucumbers and melon, for which hot-beds may be prepared in this month, are alparagus, fmall fatad, mint, tanley, peas, and beans for traniplanting; radihes, early cariots, early potatoes, and kidney beans. Hotbeds are formed either of freih horfe dung, or of tamers bark; the hot-beds ufed this month, as leed-beds for early cucumbers and melons, are almolt always formed of horfe dung. Procure a lufficient quantity of frefh horfe dang, according to the lize and number of the hot-beds you mem to form, lay it up in a heap to ferment for ten or twelve days, longer or thorter accoading to the condition of the dung or the flate of the weather, during which time it ought to be turned over once or twice with a fork, that it may be thoroughly mixed and equally fermented. After the violent fermentation is over, and the rank iteam hat efcaped, it will be in proper condition to form a hot-bed. Dung that is very much mixed with fraw, or is too dry, ought to be rejected. About a cart-load may be fufficient for a tomnon hot-bed frame of one light, and fo on in profortion for one of two or three lights. Hot-beds fhould i, eformed in a ftaation theltered from the wind, and espoled to the morning and mid-day fun. Some dig a tench about a foot decp, and a few inches longer and wider than the frame with which thiny mean to cover the bed; o:hers form hor-bcls on the furface of the sround. At this fewine the scar the latt mode is to ise preferred, becausic it affad an opportunity of lining the bed with freth hot dung quite duwn to the bottom, to augment the heat when it declines; in this way water is likewne pervented from fetting :.bout the buttom of whe bed, which is often the cale, when the bud is formed in a trencr, which would inevitably check the fermentation, and cunfequently deftroy the hea: of the bed. Mark ont a face on the ground, a few inches longer and wicer tian the frame which you intend to put on the bed. Spread the dung when in proper condition, regularly with a fork, beatin, it down gently from time to time with the fork; when the dung is trodden down, it is ajp to heat too violently, and dues not fucceed fo well ts when the dung is allowed to fettle gradually. The dung ougit to be raifed to three feet and an half, or thereabuets. In this wey bot-bed may be formed, : hhich will preterve their heat for a condiderable time; When ilighter hot-beds are required, the dung may be taifed to cine foot and an half, or two feet: thefe flight bou thels anciner ery well for tafe g early crups.

Having propared a l. Ablu a aconling to of direction foft given for a lut si oz imatior frame in propostion to the quatity of racd sor isfead :/tow, fur a onc as may be coveru! vi:h a trane
 ordinary crop. Let the fame and liphte lo. fot on, w and hept clofe, will the he..t icein tw i.. , time rite
 days after the bed has been donned, it may be consered with earth prepared for that purpole, to the depth of about three inches; before the carth in put cor, it the: dung thall have fettled unequally, the furiace of the bed ought to be made perfecily level. Rich light dry earth is betk adapted to this purpofe: that it may be dry enough, it ought to have been protected from the rai:s by fone thade during the winter; for, thould it Le wet, it is apt to prevent the feeds from germinating, of to injure the young plants. Fill two or three fmall nowerpots with fome of the fame earth, and place them in the hot-bed till the eath in them be warmed, and then fow the feeds.

Sow the feeds, and cover them about half an inch: deep; the bottom of the pots ought to be plunged a little way into the earth with which the bed is covered ${ }_{2}$ fome of which ought to be drawn up round the pot:A few days after fowing the feeds in the pots, fome leed, may be lown in the earth of the bed. By fowing in pots, if the bed mould overheat (wnich is fometimes the cafe) you have it in your power to withdraw and remove the pots out of danger.

After fowing the feed, put on the lights; when the fteam riles copioully, give the hot-bed air by raiing the glafies a little. The hot-bed ought to be covered every evening about funfet with mats, which flould be takt:? off again in the norning about nine o'clock, fooner or later according to the ftate of the weather. A fingle mat will be fufficient at firft, as the warmth of the bed will be ftrong. The ends of the mats ought not to hang down over the fides of the frame, becaufe the rank fteam proceeding from the bed would be confined, and might injure the plants. The plants will appear, i. two or three days after the feeds have been fown, whe: care mult be taken to raike the glafies a little to admi. fieth air, and to allow the theam of the bed to cicape: if this be not properly atterided to, and if the bed be hept too clofe, the plants will cither be dellroyed altogether, or become weak and yellowith. Abuat the time the firt fown feeds appear above ground, a few morought to be fown in the earth of the bed. As thote tender plants are liable to fatior fom varions eatues at this fafon, it would be proper to fow a little feed at three difiesent periods, at thort intervals, that if one toxing fhould mifarry, another may fucceed. '1 free or four dave after the jumts have conie up, they ought to be planted out into tinall pots.

The day before the plants are to be tranfplanted, pots filled with light rich dry eath thould be put ints the bed, that the carth which they contanin may brought to a proper temperatac. Tahe the phatits carefully up, railing them with gour finger and tinumb, with all the roots as entire as pollible, and with as mas' of the earth as will readidy adhere about the forePlant three cucumbers and two melons in each put, and draw the carth well up ahout the lleme. It the

 Iit: $\because 3, \therefore$ in be fanged cote to on: mother in sise ........ the fen, ind all the fore hetween them $x$ he a) be carctuly f:la with cart', to peveat the rank - a.m of the dow fom raing u', which would cotanly $\therefore$ a the flante. The bed of sit to be corculy examiraderery dy to the that ehe roots of the planth do mont receive too mathent. I wething like that appear,
 to the rimafer : on arer. When the plants are fulty root ' ....its anears dry, give them a little water in t:e uamed time of the day; let the watcring be occalimatio he ted very mulerately, acconding as the carth in the ents becomes dry. All the vater fiven to the phants $\therefore$ : this faton ought to ltand fors a fen hours within the 'oc, that it moy acquire the firse temperature with the ranh in which the plants aron, as vey cold water wodld cilill the plonts to much. In order to preferve a proper beat in the bed as long as pollible, the fides of it ought to be covered with ftraw or dry leaves, which will defend the bed from cold piecring winds, heasy rains, and fnow. Should the bed be unproticied when any of thete prevail, the heat would be diminith d, and the plants receive a check. It a lively heat be kept up, you may admit air to the the plants every dar, by railing the glafes in proportion to the heat of the bed and temperature of the externa! air. If the air be very cod, it will be neceflury to fix a piece of mat or fome fuch thing to the edge of the fath, which may hang down over the openibr, and prevent the cold air from runing too frecly into the bed. About a fortnight after the had has been formed, it ought to be examined carefully, 10 difcover whether the heat of the bed itill continues firong cnough : if not, the dry leaves and Atraw ought :o be removed from the front and back of the bed if any had been placed there, and a quantity of froh horte dung thould be fupplied. The lining thus applied thould not exceed 15 or 18 inches in thickneds, and thould be raifed a fer inches higher than the bed. When toe thick a lining is applied, it is apt to throw in too great it heat, and injure the ptants. A guantity of earth fhould be laid on the top of the dung thus applied to the depth of two incler, to keep down the ramk lleam. The lining will foon increate the heat of the bed, and maistain it for ten days or a formicht longer. At the expiration of that time, when the heit begins to fail, the two fides of the bed hould receive a lining of the fame thicknef, which will again augment the heat of the bed, and preferve it in good condition for upwards of a fortniplet longer. By lining firt the one fide and then the other at the interval of about a weck or ten dors, the heat of the bed may l.e made to haf longer thin when both linings are applied at the fame time. Either :ncthod may be followed, according to tbe degree of csternal cold which may prevait, or arcording to the degree of warmth required to be maintained in the bed. After perforning the lining, if very coll, wet, or howy weather perall, it may be proper to ley a quantity of lone dry utter all round the general lining, which will pronce 'low whe of the beif, an! hecp it in a proper tempentase. Ky the proper monament of this feedherd, at !! the dal applitetion of liniage, the growth of young flant may be penaced till they are fit to be
flented on: into other hot-bed, where they are to remain and produce frut. Where there is penty of hot dunk and exory other consenience, a fecond bed may 10 jramed, into which the young plants may be transfern al and nurled til! they become periecty tit for final tuma', mition. Dece atiention mut be paid to have the the and anrlety-ie i 10 proper condition for the reCthion of the pois contaming the young plants. It is the formet, earthed over, and takn core of, according t: the - "ndion given for manasemont of the fied 1ra'. Whelt the flat: hate got their two firit rough heres, two thece inclecs hroad, and have puhed out thair tou fitl moning buds, they are in a proper Whe tor $1^{1}$ hatines out into larger hot beds. For the firther maurgement of cactmbers and incions, fee FsERU ER :

It is proper that none but fuch feets, buth of cu . cumbers and melon, as have been kept for fome time, thould be fown ; thole which have been l.ept for tiwo or thee years are to be prefered, becaule the plants which proced from them are thought to be, not only more fruit $u l$, but to produce their fruit looner. Plants which are produced from recent feeds commonly puth vigoroully, and their iboots grow to a great length before they thow a fingle fruit. The beft fort of cucumbers for producing an early crop, are the carly fhort prickly and long green prickly; the former of thefe is the earlier, the otber produces the beit crop and the largett fruit. There are feveral forts of melons fown for an tarly crop, viz. the romana, cantaloupe, polignac, \&ic. The romana is a very good. bearer, and produces early, and is a very well-favoured, though fmall fruit. The cantaloune is a very well-davoured melon, acquines a good fize, and ripens early. The pulignac is allo a very good melon. It is better, however, to fow two or three kinds, if they are eanly to be had, for the fake of gaining greater variety.

Hot-beds may be formed any time this month for forcing atparagus: they are to be formed in the fame way as hot beds for cucumbers and melons; the dung, however, need not be raifed to the fame height, from two and an half to three fect will be fullicient. After a bed has been formed, it thould be covered with einth to the depth of fix or feven inches, and the af paragus plants immediately put in; hut the frame and glafles are not io be put on till after the violent heat of the bed thall have fubfided, and the rank itcan efcaped. A fulficient quantity of afparagus plants, proper for forcing, raut be provided; vic. fuch as have been raifed from feed and planted out in the open ground for two or tirce years, as directed elfewhare; fix hundred will be fatlicient for a frame of three light, and fo on in proportion, for a larger or imaller trame. The ifrongett and molt vigorons plants ouglat to be cholen, and thould be flanted very cloie to ecther, that the quantity produccd may repay the troubic anl cxpence of forcing. Hitving marked the fire of the frame on the furfice of the bed, raile a ridge of carth a few inches high, as ainlt whicb place the firlt row of plants, and diaw a litte earth over the ronts of each; nevt to them another row may be planted as clofe as puffible, and to on till the whole face is corcrad, fome moint earth thould lie applied :ill rumat the outhde of the fpace, orcupied by tize plante, an I riticd an inch or two above their tups. Then the whole houtd be covered with a

E. . their infortiou; if $m$ the flumn that is lefo fine stoots will be ptalide wht the folluwing faton, the bedt of whi h may be retaincel, to dupply the place of tle branch removed. Ail the leading branhes cuglit to be looked over, ald the fupertar wis fore ricit and mifflacel thoot of tal years srowth which whil not eafly apply to the wat, ouglit to be cut of Cic $=$ to their infertios into her main brame ; the mes? vigrous and beft placel thont, 1howh be thaned at fuid length to the wall or ethation at the diftarce of from: fur to fix inches frum one motler. When there happens to be any vacant $i_{\text {ane }}$ on the "all or efpalier. fome of the laft year's Ahoots may be llontened, ax iifrected in the pruning of young tiees.

In louking over the leading branches, all the frurs which produce tlower buds ought to be carefully ictained; and aty flumps which may have been left, after former pruning, ought to be cut asay quite clole to the banch from which they procced, for they conftantly produce a redundancy of branches which create confofion, fhade the fruit from the fun, and rob it of it, proper nouribment.

This is a proper feafon to prune plum and cherry trecs either on walls or elpaliers: the fame dircetions which have been given for pruning apple, and pears will apply to the pruning of plums and cherries, as they likewite produce their fruit on Purs, fulied ont from, nearly the extremity of the thoots, which are two or three years old. It is improper in pruning to thorten the bram hes, beraufe the very part would be removed from which the iruit buds hiould proceed next or fubfequent feafon.

1 hefe trees produce their fruit on the young branches of laft year. A plentiful fupnly of laft year's hoots muft therefore be retained to be nailed to the wall, at
the diftance of from three inches to half a foot from one another; the molt rigorous and bett placed thoots are to be felected for this purpole, and shl fore-right, weakIy or fuperthous thoots are to be remored, likewife fome of the latt year's bearers. That the proning knife way be wfed more freely, it would be proper not only to unaail the thoots whith lad been laid in latt year, dut even tome of the principal branches. In felecting the branclies, attention mult be pand not only to their pofition and froper diflance, but likewife to the quantity ut :lower buds they contain. I hede buds are ditti: guinable from thoie which produce branches by their manduefs; and ward, guring when the buds begin to - cll, by thris fise: thote whie h protuce branches be0 acmeralic hoal!, that and pointed. It frequently I. prest: that one of eech in roduced at the fame eye

- it is termed), or fometimes two flower bude, with a 'anch bud between them. All very ftrons thick srancho are to be rejected, as well as thofe that are - mog, fanal', and fechle, becaute the very vigorous wowhen are much more apt to run to wood, than to produre fiust. Thole branches which are ielected as the fitest to be rotained, ought to be morte:ed (dise -egard being paid to their vigur, and to the number sud fituation of the fioser buds they contain, which will m-ke them puht ont two or three lirames the - nking fummer, the beat of which may be retaine for next year' bearers.
la weah tree that ase not dipoted to puth vigoroufly, the im ller houts may be thortenel to the length of $f x$ or cight inches; the atore vigorous fhoots may be
lefi from ten to niteen inches long, or therety. In trees of moderate guvth the branches ought to be left proportiomally longcr, the limaller ones from half a foot to ien inche, the note vigorous from one foot to a foot at an, in.lt. In very vigotous trees, the branches cugt to Le tl.ortened but littie, and fome of them nct It ail, tiee imaller thoots may be fhortencd to the tength ut a foot or fifteen inches; the more vigorovs thouts h.ouid have only about a third or fucth fart of their length cut off; and the mon vigorous thatd not We horteted at all, for the more they are dhortened, the more they are dipoled to puin vigorouly and iun to weni. and on that account produce icw trunt. As the Hower buds are fometimes fituated near the extrenity, at other times near the bottom of the branch, this ciscumflance in a certain degree mult regulate the thertening the branch, as care mult be taken to leave a futficient quantity of nower tuds, where fiuit is the oh. ject. Care mutt likewife be taken to have a bud which is expected to produce a branch, at the eye which is wext the cut extremity ; it is of no noment whetber it be alone or in company with one of two flower buda. but it is abtolutely neceilary to have one to preduce a leading brameh, without which the fruit will not thive. When three or four laft year': thoots are found on a branch of the preceding year, the one at the upper and lower extremities is frequently preferved; in that catio the intermediate ones ought to be cht away clote to the branch: but thould any of the intermediate ones be felected as the molt froper to be retained, the branch of the preceding year theculd be cut off chole by ti.e up. permoft of the thoot, which has been fixed on, and all thofe thoots which are to be removed ithouki be cut away clofe to the branch from which they proceed. Aiter each tree has been gone over, it eught to be carefully nailed to the wall or fixed to the efpalice.

Vines if cut when in a growing flate are apt to bleed vine ${ }^{4 \mathrm{r}}$ very copioutiy. This bleeding is detrimental to them, $\mathrm{h}_{\mathrm{e}}$ s. and is fopt with gett dificuity. It vines are pruned a fhont time before the rife of the fap, they are hilewif liable to oleed at the recently cut extremities; it would therefore be improper any time this month to prune vines which grow in the hot-hou'e or int a vinery Which is to be early forced; but fuch as grow on open walls or in vineyard, may be fafely cut any time this month. 'Though it would certanly be advifable to prune as foon after the fall of the leaf as may be, as in that cale the cut extremitics would have futficient time to heal, and all danger of bleeding would be removed.

Fig trees may be pruned any time this month, though perbaps it would he as well to defer it till neat or follossing month. For the nethod, fee Fi BKiARy.

Goofeberries and currants may itill be punied. Sce Novlmple.

Goofeberrics and currants may be planted if the fe- Plant ${ }^{42}$ verity of the froit does not reader the ground too hard; noieberras indecd they may be planted any time from the fall of and curthe leat in autumn tild the funting ont ot their buds in rants. fprines. It $i$ ulual to plant them in rows along the borders, or to divide the plats in the kithen garden; in whirh cale they aught to be planted two or three yards apart, and the dintance between the rows malt depend on the size of the plots they are to feparate ( 10 , 15 or 18 yards). They ought to be traned up with 2

Fruit
Garden.

Fruat Tiarden. allow the litchen crop that may be planted near them to grow freely, and will render the operations of hoeing, weeding, and raking under the buthe esty. They are frequently phanted out in comparment by themfelves, in which afe the bole ought to thant at the dillance of from five to eight feet in the rows, and the rows ought to be eight or nime fet apart.

When plenty of rom is athoned between the buthes, they grow ireely, and produce larger inuit; free admotion is likevvie afforded to the fun and air, without Which, the rruit would not acquire its proper flavour: hoeing, and digginss Letween the buthes, is more eanly ferformed, and crops of differet kinds of hitchen gardea prodution may be reared in the internals. Currants are very frequently planted againt wall, and rails to which they are regularly trained. Guofeberrits alfo are iometimes planted againt walls and rail, thoic againt wall yieht early and well thavoured fruit. the vaicty of gouleberics is very great, and every featur abls new vartetics to thofe already khown. The principdi kinds are the early routh green, fmall enty red. fimooth geeen, large Dutch icd, common haily red, fmooth tlack, rough white, white cryital, large yellow, rutgh yellow, large amber, large tawny, \&ic.

The differeat kinds of currants are the blach, common hite, large Dutch white or grape currant, common sed and champaigne.

Ralpberries may be pruned or planted during this ut ant of the winter monhs; they produce their fruit on imall branches which proreed from the thoots of the fommer year. Every year they puhh up a number of thoos from the root, which bear iruit the fublequent fimmer, and then die. In drefing rafperries, all the o.d dood thaiks muft be cut away clofe by the ground, and all the young ones cicept four or five of the ifrongeit, which mould be thortezed a iftle. All thele thoots kecome fmall ian .rds : iteir extremity and bend a little; it is the common pracrice to cut offi the hent part, but fome horten then ole-third, others one-fourth. After the foows have been fhortened, they ought to be interiwined or furrounded by a bandage of fonse hind to keep them together, for the fake of mutual fupport, becaule when they are allowed to ttond fingle they are apt to be weighed down in funmer by the weight of their onn leaves and fruit, particularly when loaded with rain, or to be beaten down by the wind; in which cafe they may frequently lie one over the other, cieate confufion, and exclude the 1 n and air from thofe that are undermo.t, or may lie fo cloie to the ground as to have their truit dentroves. After the plants ane pruned, the ground between them uught to be dug, and atll fraggling hoots which whance to a difance from the main plinis oaght to be taken up.

Rafpucries may be planted any time thi montin when the weather is moderate: when new pantation of them are wantet, they ought to be formed in open fituations, if high flavoured tiait be wibed fon; int rafps will thrive very well and produce good crops in fladowy fituations. The ground in which they are to be planied ought to be weil dug, and if a little rutten dung be added, the plants will fucceed the better. Whey ought to be planted at the diftance of thace feet from each other, in rows four or five fect apant. The offers which are dug up from between the rows of

Voz. IX. Part II.

 are well rovich and ther bly vigoroun will antuer ped. acolly well. Theme widh two or thee bud, formed on the ruol-, irom w: $1 \cdot$ : nums thents are to proced the following fommer, se serersiy the yetere to thote which have fewer hom equally veow it I hev ouglit to be iakem op cernlly with all theit routs, an!
 thisd) they may be fiorecd at the datacocsateculy mentioned. Pintations formed now will y eld fome fruit the erfuing fimmer, and a peatitit ctop the folloning featon. The kinds of tatherri-r commonly uled are the white, double bearing, (shill bears two crops, one in fummer the other in mamn), tie imooth falk, the Anwerp (vary large).

If the weather be mald, all kind of foit trees may Prepute ior be planted any tirse this month: bet if it mouid be planting detmed more advitable to defor planting till next frut thes. month, the ground ing be prepared for themr reception aty time during open weather. The borders on which finut trees are to be planted, which are to be trained againt wallo or etpaliers, thould be tenched or dug two fpades deep. Fur planting and prepartog grourd for fruit trees, fee Oluber.

The routs of the more tender form of frent tree , viz. Protect the peaches, nectarines, apricots, and indeed of all forts of roots, \& itoned truit, which may have been planted any time i:a the courfe of the winter, will require to be procected during frolt by a covering of ftraw, or litter mixed with dung, or fomething of that nature, applitd to a confiderable ditance round the fem, fo as to cover the ground completely, and prevent the frot irom penetrat ing.

Protect fig trees during frolty weather with a covering of mats, or forething of that nature, becaule their thoots being fucculent, particularly towards their čtremities, are apt to be deftroyed by the frotl. This is of the more confequence as the fruit is produced from the young thouts only, and chiety from their extremities, the parts molt hable to dufier.

Where there are vineries, ycach, cherry-houfts, \&c. Forcettia the glaries ought to be put on a out the beginaing ofteces. the month when it is intended to force carly, ithd fires outht to be applied about the middle or tuwat the end of it. See Forcins, Februity.

Fowards the beginning, widdle, or end of the monis, and itraw. hot-beds may be made for forcing trawberri s, which, berrec. if pronerly managed, will produce ripe fruit in . 1 arch or Aprit. The hot-beds are to be formed according to the dircetions given under the article M\%/on, w. d Cuctomler. See Kitchen Garden, Javuarz. Tire dung thould be railed at leath to the height of three fict, and the frame and ghafies put ou as foon as the b: 1 i made, which will both protect it from rain or fnow, an 1 l draw up the lheam fooner. As foon as the volent heat is uver, the furface of the bed thould be covered to the depth of four or five inches with dry earti, or with a quantity of decayed tamers bark taken from an old tan-bed. The pots conteining the plants thould be plunged up to the rims into the carth or tan with which the bed is covered. They thould be placed as clite together as polfible, and care taken to fill up all the interitices with earth or tam. When all the pots are plunged, put on the glaffes and keep them clole till 3 G

## G A R D E N I N G.

Jamuary. regular rambling flroots of flrubs, and reduce them to a Green- regular neat form. This work may be executed any Hout-hunde time this month, even during frol, when little elfe can $\underbrace{\text { Hothonfe, }}$ le done. All kinds of hardy deciduous thrubs, fruit, and foreft trees may be tranfplanted during open weather.

Dig ground in open weather, and wheel out dung in froft.

Vacant compartments of ground may be dug any time during open weather; and likewile after the necellary pruning has been given to the trees and thrubs, the ground between the rows may be dug, and all weeds
6o carefully buried.

## 62 VEMBER.

Bycuttings. Put in cuttings of honeyfuckles, goofberries, currants, \&c. indeed molt kinds of trees and firubs may be propagated by cuttings. For this purpofe felect the ftraight thoots of latt year's growth; take them off by a clean cut with a fharp knife, and reduce them to the length of ten, twelve, or fifteen inches, by cutting off part of their fmaller estremities. Plant them in rows a foot apart, and at the ditance of four or five imehes from one another in the rows, taking care to infert one third or one half of their length into the ground. Though cuttings will grow when their fmaller extremities are put into the ground, they never fucceed fo well in this inverted pofition, therefore in planting, attention thould be paid to place them in their natural polition. Older and longer branches of fome trees and thrubs, viz. willow, elder, \&c. may be employed as cuttings.

Gooberries, currants, roles, lilachs, and many other flurubs and trees, may be propagated by fuckers or offfets from the roots: thefe may be taken off any time this month, and planted in rows. Previous to their being planted it would be proper to trim off part of their extremities.

## Sect. V. Grcen-HIafe and Hot-Houfe.

Derisg frof, keep the glaffes fhut, But whenever the reather is mild give the green-houfe air by opening the glafles more or lefs according to the tlate of the weather : even in the brighteft nild day during this month the glaffes fhould not be opened until about ten o'clock in the morning, and ought to be thut agsin about three in the afternoon. In dull forgoty days, cven though the weather be mild, they thoukd te opened but little, and that for a fhort time, ant in very damp wa:her, not at all. When very fevere froll prevail,
fires mull le put on, and tic flacs zertio $10^{\circ}$ ien; ; it .
 than merely to keep off the ene eh of the es emand fiolt. A little fare hond likewife be put on datios tere wet weather to baridh the damp". W:are alookd te given to luch plants a: require it, but farmel. . Sumbert plants, fuch an alow, \&ec. reraire little of no water :n this feafon. All dead and decesyed leaves thond be earefully picked ofr, and the greendate kept reman.

Particular attention mull be paid to the pine applep: of
 as many of them in the courfe of this month ! an thite flew dowers. If due attention be not now 1 aid to hee up a proper heat, both in the tamed bei and in the sir of the hot-houfe, the plants may receive furn at che F . as will confiderably affect the fize of the future fruit. The bark bed mult be carefully examined; and if the bark be much decayed and the heat found on the scline, a quantity of frefh tamers bark thould be prepared to be added as a refreihment to the otd. The pots containing the pine apple plants thould then be taken out of the tan pits, and a quantity of the decoysul tan removed from the furface and fides of the pite, tw make room for the frefh tan which is to be adjed. The old tan mult likewife be turned u? from the lenttom, and well mixed with the new, after which the pots mult be again plunged into the tan. But if, on examination, the heat of the ton pit be fourd good, and the tan not much decayed, it will be fufticient to turn the old tan, and to mix it well torgether without making any addition of new. This operation will revive the heat of the bed, and preferve it in good condition for fome time to come. The heat of the air in the houfe muft likewife be attended to, and regulated by the thermometer and by due att"ntion to the fires. Moderate watering muft be given once a week or ten days, according as the pine-apple plants may feem to require it ; and care mult be taken not to pour any of the water into their hearts or among their leaves.

The other plants in the bot-houfe mut be resularly watered; but thofe of a fucculent mature, fuch as the different precies of aloe, cuphorbia, metimbryanthemum, \&c. require very little water at a time, and that but feldom.

Kidney beans, fown in pots or in narrow boves of 8 ens about two or three feet long, may he reared in the hot-iemat. houfe. Thofe fown this month will produce fruit in April or Nach. When fown in pots, two or three may be put into each, and covercd about an inch deep: When in boxes they may be planted to the dey th of an inch along the middie, at the diatance of two or three inches fiom one another. The pots or boases may be placed on the crib of the lark bed, on flelses, or any convenitnt fituation, within the houfe, where they may not encumber the other plants. After the plants have come up, they flould be regularly and frequently watered. The hinds commonly ufd for this purpuife are the early fecekled dwaif, negro dwarf, and dun-coloured dwaif.

Cucumbers may be raifed with tolerable furcefs in casumbers the hot houfe, which will profuce finit early in fpring. If the piants have been raited in fmall pote, plunged in the tan of the bark leed, or in Fot-bels made of horfe dur:g, they hould be tranthlanted into larger pots or boecs, in which they may remain and produce fruit;

Fchruary or the iceds r: : y be fom at once in the pots where
Kitchen they are to icmain. In this cafe fix or eight feeds
Gardin. may be fown in each pot, or patches containing that number may be fuwn at proper interwh in long narrow boses. When the plants have come ap, only two or three of the ftrongett lloold be left in each put or patch. The prots or boxes may be phaced in any convenient fituativa in the hot-hotic, but will facceed bett no a thelf fixed noar the tup of the honle, within a hort tifidace of the glaik. The plants raut be frequent! watered, and have fone fmall rods fixd near them, to which twomer may be fatened.

- cauli-
f. wers. dint.t

Tril culallower plame, which are under frames, fhe ald hase plenty of air. Indeed, wheneser the weather will permit, the glaffes ought to be tahen of cistisely.

At out the tai of the month, if the weather be mid, fon: ut the . the firmtions witese they are to remain. They ought to be phated in good well-manured grourd, in a warm fitantion, .t the dinance of two feet and a half exch 1 af frumbie aruther. The fame atteration naft be faid to cambluwers ur der bell or hand-glafie. When nocre than two plants happen to he uader one glafs, the weaheft of theni thoald le planted cat about the end of the morth, if the wather be mild, and anly one or two hould be left under each glafs: Eut if the weather is unfettled or fevere, traliflanting ought to be deitrred till nest month. Some cauliflower feed may be fown any time this month to produce plants to facceed thofe that have been preferved during uinter under frames or band-glaffes, or io fupply the place of thofe which may bave been cut off by the feverity of the weather.

For thi, rurpcie make a dight hot-bed of horfe dung, so the leinght of 20 itrhes or two fect; cover it with a light rich carth to the depth of frour or five inchec, on the furface of which fuw the feed, and cover them to the clepth of a quarter of an inch with carth of the farre celeription. Aiter the feed las been fown, a frame and clatiss iliould be put on, if one can be fpared for this burpofe; and when the plants begin to appear above :roumb, they thould have plenty of air, whenever the intior will permit, wherwile they will be drown up and lecome weak. The glafies, therefore, (onlefs in very cevere weather) hould be raifed every day, and in mild ones taken off entirely. When there arc bo glaffo to parc, the bift may be coveed during the nighit, and in icvere weather, with mats propert fed over it. The flants thould be frinkled with water from tinue to time, if nodesate floweso lhould net render this unnecelary.

Cabioge flatic. it tolerahly Arong, floond be tranfplanted in the courie of this momh." See Planiing cut Callegei, Javiary.

Alcut the riddle, or towards the ed of the morth, fow feme cablage and favoy feed to raite phants fer late
or if the plants raifed then have been cut of by the feverity of the winter, a quantity of both early and late thould be fown the firf opportunity this month. That the plants may fooner acquire foricient itrength ior planting out, it would be proter to fow them in a lilight hot-bed.

Where fmall falad is required, let fome fecds of mall ${ }^{2}$. ${ }^{2}$. mutard, cref, radih, rape, \&c. be fown regularly every tad. eight or ten days during the courfe of the month. See Javerr.

Earth up celery in open dry weather if the plants eelery. have advanced much above ground. Sow fome upright celery feed for an early crop about the middle or towards the ond of the month in a finall bed of rich light earth in a wann fituation. There are three ways in which this may be performed. ift, The earth of the bed hould be well broken with the fpade; the leed fown on the rough furface and raked in. zuly, The farface of the bed may be made imooth; the feed fown and covered to the depth of a quarter of an inch withe light rich cart). 3 uil. 1 quantity of earih, to the depth of about half an inch, ihould be removed with the back of a rake from the furface of the bed into the alieys, which, atuer the feed has been fown, flould be gently replaced with the rake. Thufe who are very anxious to have early celery, hoold fow fome in a fligh: hot-bed. The plants railed now will be fit for uic in June or July ; but it woud be adrifeable to fow few at this feafon, ss they will be very apt to pipe or run up to feed beiure they acquire futlicient fize : there are two kinds of celery, the Ithlian, and turnip-rooted or celeriac.

About the beginaing of this month fow fome fhort-Radifies. topped radihes to fucceed thofe fown laft month, and fome talmon and ltalian radithes at any time during the morth. See Janvary.

Sume tound-leaved ipinach may be fown any time in Sy:inah. the courfie of the month, to fuccced that which was fown lat month. See Javerix.

Some carly peas may be foun this mon:h. This is Pes like:nife a proper fcafon for fowing a fall crop oi late peas, fuch as marrowfats, rumcivals, Carolina, and fugar pea, \&ic. For the dilances at which they are so be crops in funmer and autumn. Both the carly and late hirds of cubtage may be forn :ow, but it is better to fow them in Agent; bu: if: an ?
foma, fee Jasuary.

This is the proper time to plant beans. For the me- Eeans. thod and ditances, fee Jivuary.
Such peas and beans as are fufficiently advanced in Earth up growth thould now be earthed up.
In mild open weather for fome feeds of green and beans. white cos lettuce, likewife fome Sicilian, imperial, brown Sow and Dutch, and common calbesge lettuce. Sce Jax ary tranfpar:
If young littuce plant, are wanted for tran'planting lettuee ea:ly, they flowid be fowin in a night hot-bed or in fome warm fhectered fituation; and when they have adsunced to the height of about two inches, they may be planted rut in the open ground. Leituces that have flood the winter in fiames, under hand-glafies or in warm borders, houad be thinned and left Manding, at the diftance of one foot from cacls other, and thofe that are drawa cat flocald be planted in fome proper fituation.

About the middle or end of this month fow fome car-Sow carre: rots and parfuips. They facceed beit in light deep foil, and parfin? and in an opern fituation. The ground ihon?d be dug, $\therefore$ :ent one ifade thep or twu, if the depth of the foil

pathey, S. for their roots ; the fallaty for its roots and tope. The The Hamburgh pariley and fcorzonera are cultivated
paike, \&u for their roots; the falafy for its roots and tops. The roves of all of them, if fown now or ary time in fpring, will be fit for ufing in autumn, and comtinue good all winter. The Hamburgh parley rocts are not only ufed fur culinary purpofer, but recommended in medicine. They are fid to be ufeful in the gravel. The feeds my be fown in drills, fix inches apart, and covered
with earth to the depth of half an inch. The plants thay ec fown in drills, fix inclics apart, and covered ihould be thinned in May or June, and left ftanding
at the dikance of fix inclics irum cach otler in the ihould be thinned in May or June, and left fanding
at the ditance of fix inclics irum cach otler in the eit only fhould be leit.
Some of lat year's carrots, parfinips, and beets, hould be planted out in rovs, tivo feet apart and one foot dif. tant from each other in the row, to itand and produce feed.

Some onions and leeks may be fown in mild dry weather, any time after the middle of this month. The ground thould be weil dug, and the feeds fown when the furface is dry, and then raked in. The beft mode is to divide the groand into beds of about four feet wide, for the convenience of thinning, weeding, \&ic.; but they may alto be form in plots, without being divided i:ito beds, in "hich cale, if the foil be light, the feed may be gently trodden in, before the furface is raked. The leeks will be fit for tranfplanting in June and July, and the onions for draxing in Auguff. Sometimes a finall quantity of leek-feed is form along with the onion; and when the onions are drawn in Augut, the lecks are allowed to remain to acquire a proper lize; but it is better to fow each feparately. The principal kinds of ovions are the Straburg, Deptford, Spanilh Portugal, long keeping, and red. row.

About the middle of the month you may fow feeds of burnet, lovage, angelica, narigold, fernel, dill, forsel, chervil, and clary. Each lind thould be fown teparatcly, either in the place where they are to remain, or they may be tranfplanted in fummer. See Je:ce.

A buat the middle or end of the month fow marjoram, thyme, throry, and hy gop. The plants may either remain where foun, or be platitel ont in the begianing of fummer. Sue Juxe.

Toward the ead of tie month plant fluider, sarlic, and

Sow fome feeds of ral. w!ire, and grewn beet, likewit of mangel wurzel of (iertum thet. The the :ed root of the ririt is uled as a pichl, eco : the le an of the white and green are mate uff of in tiup, sco. and the large leases of the mangel wazel are buited and ufed ar ipinach. The fortialks of is leaves are likewife uifel an afyazaus. Each kind thould be fown teperately, either broadcat or in drills, an inch dees, and about a foot apart: Fat the mangel wurzel requires more room than the other kinds, becaule it is of larger growth. After the phants have come up, they fhould be thimed out, to the difance of f or eight inches from each other. The iecd may likewife be dibbled in rows, about a foot apart, an at the diftance of fix or eight inches from caci, ther in the ruws. Two or more feeds may be put into cach hole; and when the plants appar above ground, one of the itrong-

divide and piant them in rows ninc inches apart and fis: February. inches dilant from each vether in the row. They my Fi.ellen. be put in th the defth of two inchers with tlie dible, or fir! pla ed ia drill, :wo inches dece, drawn with a hoe.
 See Javaki.

A tew phetane my be rated ane a mille orp... end of thin mo th for ant carly crop; teat if war: 1 wry early, fome early duar: itatues thould be phen in a ile h: hur-jed. Fos the method of phatin, to Mikea.
Horie ratih is proparated by ofets or cartan aif.: the routs, about thre incine, huns, which tway be po is: ed either with the dibble or fade, at the dintance of $1:$. or eig't inch:s irm each other, in rows two fet ana. When they are planted with the dibbie, the hoisoon to be made 10 or 12 inche deep; when with the tip uie a treach hould be male a full inade deep, in the be: tom of which the offets or cuttin,s thould be phaced erect, and covered with earth from the next trencis. A they will not appear above ground till the month o: Nay, a crop of fpinach, radifies, or fmall folad, may be got from the groumd, and cle:ted off befure the hor: radih appears. After the plomts have come abow ground, they ought to be kept clear of weed.

About the middle or towards the end of the month, sur tu:. fow forme feed of the early Datch turnip in a borde: of light earth, in a warm intuation. See March.

If no preparations were made laft month for raing farume or early cucumbers and melons, they may be commenced, win wh any time this month, with better profect of fuccefs. For the method of forming and managing the fecd-bed. fee Jantary. - lf the cucumbers and melons, fown lat: month and tranfplanted into fimall pots, be fit fur ridg. ing out, a hot-bed for one or more frames thould be got ready for their reception, which ihould be railed to the height of threc feet and a half, and covered with a frame and glaffec. About a week afterwards, if the: hot-bed his lettled unevenly, the frame and glafico chould be removed; and after the furface of the bed has been made perfectly level, replaced. A. fion av the siolent heat has fubfided, the rank iteam cicupech, and all danger of burning apparently over, cover the bed to the depth of two inches with dry light rich earth, and raife a conical heap of the fame earih, to the height of about 10 inches, immediately under the centre of each light. By the following day the earth will have acquired a proper warmth, and the bed will be fit for the reception of the young plan:s. The earth, laid over the furface of the beed, to the depth of two inches, will prevent the rark lleam of the dung, on the one hand, from rifing up freely, and yet not keep it dowa altogether: were muln of the fariace of the dung expofid, and the Heam :allowed to ciane fieely, the young plant, would be deltroyed; and, in the other hand, were it prevented from efiaping alogether, by laying on earth to a fudicient depth at once, the bed would becone ovclleated, and the 1oots of thas plants might be bunnt.

The pots containing the young cucumber and melon it no, $n^{2}$ phats, which were tranflamen! lat month (iee J went : Nohry), hould be well watered the day previous t, "ra? theirir being ridted out, to make the ball of e.rth adlicre, and come out of the po: cuntic. Aher the tops of the hivecke of earth. which loul bern raifet th the

Februar - height of io inches under each light, have been fattenal by reducing their height ahout wo inches, make a hove in the ce:are of each, capable of containing one of the lalls of eath, which is to be turned out of the rot. Sciect fome pots containing the itrongel plants; flace your hand on the furlace of the prot, allowing the plaws to pals between your tincers; invert is, and itvike the che of it gently againt the frame till the ball of eart? comes out, which ihould be put into one of the holes in the hillock jut! nentioned; clo:e the earth round the ball, and mane it rife about an inch over its fuface. Alter the has been thes ridged out, they hould reetive a gentle watering, ma be covered with the glatfes till the fleam begin to rite much, when air hould be fiven by railing the glutes. Therie hot-beds, into wlich the cucumbers and melons have been tinaliy tranfplanted, muft be managed in the fame mamer as the nurfery bels, mentioned tait month. A covering of Ara:x, or fomething of that mature, hould be !aid all round the dung ; limings of frefh dung thould be applied to the fides of the bed when the heat begins to decline, air admitted under the fame circumitances and with the lame prccautions as there ftated. If three cucumhers ur two melons have been planted in the poti, as butore directed, one of the weakelt of either fhould be removed immediately before, or after they are ridged o:it. Should any fymptoms of burning appear foon aftor the plants har e been ridged ont, part of the earth, clofe to the batum of the hillucks, mut be removed; and as foon as the violent heat has fubiled, be replaced with frelis earth. When the heat of the bed begins to decline a little, efpecially if any of the rots of the plants thew themfelves through the fides of the hillocks, a quantity of frefh earth ilould be appiied all round them, which ihould be kept within the frame for one niight previoufly, that it may acquire a proper temperature, for thould it be applied cold, it might injure the young roots. Two or three days after this an additional quantity of freih earth fhould be applied to the fides of the hiif: ; and in two or three more the whole furface of the bed may be earthed over as high as the tops of the hills.

When the plants have got two rough leaves, and when the fecond is about an inch broad, the bud, which is fituated at the axilla (or bate) of the fecond rough leaf, muft be removed either with the finger, a pair of iciffars, or a penknife, or, when the bud is very fmall, with a needle or pin, being careful not to in.jure the joint. After the plants are thus topped or flopped, they foon acquire ftrength; and in about 10 or 12 days, each of them will throw out two or three runners, which will hew tlowers fometimes at the fecond or third joint. Were the plants not to be topped, the principal thoots would probably advance to the length of about two feet, withont iending off any rannets to fill up the frame, and without hewing a fingle thower. If none of the rumners, which are puhed out at:er the firl opping, hew flowers at the third or fourth joint, they fhould be topped likewife, which will caule each of them to puth out two or three rumners, all of which raay perhaps prove ?ruitful. As thele runners advance in frouth they ought to be trained regularly along the furface of the bes, and all very weak or redunelant thoots removed. The cucumbers, it well masarged, will be fit for the t.ible about the end of this or
b:zinning of next month; but the melons will not be rime before May or June.

Cucumbers and nelow have male and female lowers ot the fame plant, which are eanily ditinguiked from 97
one another. The male flowers, in the centre of whichtmpregn
hbratry. une anther. The male flowers, in the centre of which tmpregnathe :nthere are fituated that contain the farim (or thon the (ievandaing powder), have fralks of an equal thickneis, towers, withou: any fwell immediately under the futwers; whereas a fielling is perceptible immediately uncer the female Howers which contain the female organ of generation, as foon as they are puhed out from the falks of the plant, which is the germen or future fruit. If none of the farina of the male be conveyed into the female flower, the germen decays, becomes yellowih, and drops off. It becomes therefore necelary, particularly at this early period, to impregnate the female flowers by fulpending male tlowers over them, and thaking fome of the farina i to the pittillum (or female organ); fur after the plants have continued fome time in flower, the air of the hot-hed in which they grow becomes loaded with the farina, by which means it is wafted into the female flowers. Infects likewite, paticularly bees, at a more advanced period of the year, ferve to convey it from flower to tower. As foon as the female flowers have opened, pinch off a newly blown male flower, together with a portion of its foot itaik, remove the greateft part of its corolla or Hower leaf, introduce it into the female nower, and either touch the piftillum of the female gently with the antherie of the male fo as to make fome of the farina adhere, or thake the male flower over the piftillum of the female in order to make fome of the farina fall on it. In a day or two after impregnation the germen or future fruit begins to fwell, and in about a fortnight, if the weather be favourable and the heat of the bed good, the young cucumbers may be broucht to table. This operation may be employed to produce new varitties, not only of cucumbers and melons, but of many other vegetables. Were the female of one variety of melon to be impregnated nith the farina of another, a kind would be produced partaking fomewtat of the properties of both; thus a large melon, not poffeffed of much flavour, might be improved by intermisture with one fuperior in ? favour but inferior in Gize. In hermaphrodite flowers this operation of impregnating, or crolling, as it is called by cattle breeders, is performed by removing the anthere from a flower of one feccies, and impregnating it with the farina of another of the fame natural family. The plants proceeding from fuch a commixture partake more of the properties of the male than the female parent. We have feen a hybrid produced from the papaver fomnife um impregnated with the farma of the papazer orientale, fo like the male parent as with difficulty to be diflinguilhed from it.

The papaver orientale produces only one fower on a flalk; fome of this hybrid however carried more than one, and in this particular alone it refembled the fapaser fimniferum, which hranches very much. Mi K right has made fome curious and interelting experiments on this fubject, which he has detailed in the follosing letter to Sir Joieph Banhs, publinhed in the 05 Trambeions of the Royal Society. "The refult of It:Kight's fome experiments wlich I have amufed mytelf with obiervaluns making on plauts, appearing to me to be interelling to on thas lubthe mituralil, by proving the exiflence of furerfectation

## Fart III!

Eennery in the vegtable worid, and lang likely tacombe to Kut hen tome improvemont, in sgri ulture, 1 have than the liGarien.
 animels have wory long entertained an on in that confiderable aduatioges are obtsined ! g beodiay from rraies and femaler rebed to enth other. Thou h this opinion han lately been controusted, the number of its oppofers has gridually diminihod, and I can lipeak from my own oberwation and experience, that animals degenerate in fize, at lewt on the lame pafture, and in other refeects under the fance managernent, when this procis of crulling the breed is negiected. I he elole analcgy between the anima! and vecetable word, ard the fexual fyitem equally pervading both, induced me to fuppole that fimila means might te produgte of fimiIar effects in each; and the event has, lihink, fully jultifed this onimion. The primipal object i had in vien, was to obtain rets an 1 improved varietits of the app'e, to fupply the plure f thofe which have become difeaied and unproductive by having been cultivated bevond the period which nature appears to have anfigned to their exitence, But a I fuw that fereral yeas muth efofe before the feccels or failure of this procefs could powity be afcertained, I silhed in the interval to lee what weeld be its efiects in anmual clants. Anongit thefe none aypeared to well calculated io anf:er my purpoie as the common pe, not only becaule I couif obtain many varietie of this plant, of different form, fizes, and cisluurs, but aho becaule the itructure of its bloilom, ly preventing the ingr fo of infects and adventitious farina, has rendered its varie ies remarkahly permanent. I had a kind growing in my garken. which, having been long cultivated in the fame foil, had cealed to be productive, and did not appear to recuver the whole of its former vigour when removed to a bil nf a bmewhat difierent quality : cn this my firt experment in 1787 , was mode. Heving opened a dozen of its immature blotoms, I defroved the male part:, taling great care not to injure the temale ones; and a fetw days, after:ards when the bionoms appeared meture, I introcuced the farina of a very larec and lusuriant gray pea into one half of the blofoms, leaving the other balt as they were. The pods of each grew equally well, but I foon perceived that in thefe in'o wiofe blumos the farina had not been introduced, the fee is remained neariy as they were before the blofoms expanced. and in that thate they withered. Thofe in the other pods attained muturity, but were not in any femble degree difierent from thofe aiforcied by other plants of the fame variety ; owing, I imagine, to the external covering of the fed fas 1 have found in other plant-) being tame hed entirely by the female. In the fucceeding fpring the diference however became eitremely obvious, fur the pitnt, frow, them rofe with evc-估位e luvuriance, and the colour of their leaves and thems ciearly indicated that they hat all exchanged their whitentis for the colour of the male parent. The feds prohuced in autumn were dark gray.
"By intoducing the farina of another vhite variety, (or in fome inilances by finple culture), I found this colour nas eafly dilcharged, and a mumenc:. 5 variety of new rind, producel. many of whirh were in penist of bize and in every other repect much funerior to the original white kind, and grew with cacetlive luxariance, some of them attaining the keight of mure than twelve
fect. I had frequent occafive to phere in this an a $F_{i}$ ir fect. I had frequent occafon to obferve in this piata a $F_{i}$ ir...r).
ifronger tendency to produce purple blofinath and co- Kith at loured feed than white ones: for when 1 introcuced Giader. the farina of a purple blolion into a white cae, the Whote feed in the fuc cedires yoar became coloured; but when 1 endeavourd to didinarpe thi col ur by reverfing the proref, a part only of the m aftoried plants with white blofonse; this part fometimes occupyine one end o. the ood, and being at other times irregularly intermise? with thele which, when fown, retained their colour. It ni ht perhaps be fippoted that fomethine might depend on $t$ ' quantity of farina employed ; but I bever coald dilcover, in this or any other experiment in which fup.rfacation did not ake plice, that the lirgett or fmallett quantivy of futina afinted any dit: ferenice in the rinet roduced.

The dimmilarity 1 oberved in the offoring afforded by different kinds of fatim in theie eypriments, pointed out to me an ealy method of afcertaining whether farerfictation, (the exutence of which has been arl. mitted amongt animal, cond alto take place in the vegetable work. Fur as the offepring of a white peat is alrays white, unlef the farina of a columed hind be introduced into the blofom; and as the colour of the gray one is awaystransfored to it offssing though the female be white, it redily occurred to me, that is the farina of both were mingled or applied at the fame moment, the offspring of each could be cafily ditinguithed.

* Miy firl experiment was not altogether fucceffitul, for the offinsing of fise pols (the whole which eicaped the bird) received their colour from the coloured male. There was, however, a ftrong reiemblance to the other male in the growth and character of more than one of the plants, and the feeds of icveral in the autumn very clolely refembled it in every thing but cubur. In this experment, 1 ufed the farina of a vlite pea, which poletied the remarkable property of fisivelling escefbively when ripe, and in the fecond yar I obtained white leeds from the gray ones above-mentioned, perfeely himilar to it. 1 am itrongly dilpoled to believe, that the feed; were here of common pare:trge; but I do not conceive myfelf to be in polfiffion of facts fus: ficient to enable me to fpeak with decifon cat this quedtion.
" If, however, the female afford th- foll romital atom, and the farinz act only as a lima'ta, it appears to me by no means impolible, that the eaplonion of two velickes of farina at the fame moment talen from different plants) may afford feeds (as I have fopooed) of common parentate and as 1 am unnble tu dircuse. any furce of inaccuracy in this experiment, I muit bee lie e this to have happened.
"Another fpecies of fiperfoctation, if I bave juitly applied the tem to a proceli in which nate dical ap pears to have been the offyring of two maice), has oicurred to me fo often as to remove all pobbily of doubt an to its exillence. In 1-9?, that yoar ater 1 had feen the refult of the lan! montioned "xperimert, having prepard a great mony wite blobioms, I introdued the farma of a white pea, and, tine of a arey pea neasly at the fame moment into ecth, nat as in the late yor, the charater of the coleured male had prevaited. I ufd it, farima more faringly than that of the white onc, and now almolt every pud aflorded plate of dis.

F-bruty. 1.1.at colours. The najority bowever ware white, but $K$ it. tan the characters of the two kinds were not fulficiently diftinct to allow me to judge with prection whether any
of the feeds produced were of cummon parentige or nt. In the laft year I was more fortunate, having prepared bloflums of the little early ir me pea, I introduced its own farina, and inmediately afeewatds, that of a very large and late gray kind; and I towed the feeds thus obtained in the end of the latt dummer. Many of them retained the coloter and character of the fimali: eally per not in the fighent degree altered. and bloffimed kefore they were 18 inches hisl, whill others (taken from the fame pods) whole colour was changed, grew to the height of more than four feet, and were killed by the froft before any blofoms appeated.
" It is evident that in thofe instances, fuperfetation took place, and it is equally evident that the lecds were not all of common pareatage. Should fubfeguent experience evince that a dingle plant may be the offispring of two males, the analogy between animal and vegetable nature may induce iome curious conjectures relative to the procels of generation in the animal world.
" In the courfe of the preceding experiments, I could never obferve that the character either of the male or female in this plant at all preponderated in the offepring, but as this point appeared interelting, I made a few trials to afcertain it. And as the foregoing obfervations had occurred in experiments made principally to obtain new atd improved varicties of the pea for sarden culture ; I chole for a fimilar purpofe the more laady varieties ufually fown in the fields. By introducing the farina of the largeft and moft luxuriant kinos into the blofioms of the mot diminutive, and by reverfing this procefs, I found that the powers of the male and female in their effecto on the ofispring are exactly equal. The vigour of the growth, the fize of the feeds produced, and the feafon of matusity, were the fame, though the one was a very early, and the other a late variety. I had in this experiment a ftriking inftance of the ftimulative effects of crolling the breeds; for the fmalleft variety whofe height rarely exceeded two fett, was increafed to fix feet, whilit the height of the large and Iuxuriant kind nas very little diminimed. By this procefs, it is crident that any number of new varieties may be obteined; and it is highly probable, that many of thefe will be found better calculated to correct the defect of diferent loils and fituations, than any we have et prefent ; for 1 imagine that all we now puffets have in a great meafure been the produce of accident, ad it will rarely happen in thi, or any other cale, that accident has doaie all that art will be found able to accomplih.
" The fuccef of my endeavours to produce improve 1 varieties of the pea, induced me to try fome experiaents on wheat, but thofe did not fucceed to my expeetations. I readily obtained as many varitties as I wihed, by merely fowing the different kinds together, f., the ftructure of the bloffoms of this plant, (unlike that of pea), frecly admits the ingrefs of adventitions Frime, ithd is thence very liable to fort in varieties. Some of thefe I obtained were excellent, others very bad; and hone of them permanent. By fogarating the beit varietic, a moft aboudant crop was froduced, wut it quality was not quite equal to the quantity, and all the difiarded varieties again made their appear-
ance. It appeared to me an extraodinary circum Feiruary. Atance, that in the yedrs 1795 and 1796 , when almont ri:e whole crop of com in this illand was blighted, the varieties thes whined, and thete only, efeaped in this neighbourhood, though fuma in leseral difficrent foils and iituations.
"Mis fucctis in the apple (as fir a: long experience and attention have erabled me to jutue trom the cultivated appearance of trees, whic? have tot yet Lome fruit) has been fully equal to: iopien. Su, as the improvement of this fruit was the inst dobet of my attention, no probable mesns of improvamot cither from foil or afpect were regiccicil. The plats, however, which I obtained from my thorts to :anie the good qualities of two hinds of apple ferm to polles the greateft health and Juvuriance of grow:h, a- well as the moit pronining appearance in other refpects. In fome of theic, the character of the male thereas to pre will; in others, that of the femsic: and in cthers both appear blended, or neither is dilinguibuble. Thafe variations which uare often eblervable in the feeds taken from the fincle apple, evitently arite son the want of permanence in the characes of this freit when railed from feed.
"The refults of imilar experiments on another fuit, the grape, were neariy the fame at of thole on the apple, except that by mingling the f..isia of a black and a white grape, juft as the bloflons of the latter were expanding, I fometimes obtained plants from the fume berry to diflimilar that I had good reaton to believe them the produce of fuperfoctation. fiy taling of the cups and deftroying the inmature male pats (as in the pea), I perfectly fucceeded in combining the characters of different varieties of this fruit, $a, ~ f a r$ as the changes of form and autumnal tints in the leaves of the offspring will allow me to judge.

Many experiments of the jame kind were tried on other plant: : but it is lufficient to fay that all tended to evince, that improved varieties of every fruit and elculent plant may be obtained by this procefs, and that nature intended that a fexual intercourfe thould take place between neighbouring plants of the fame fecies. The probability of this will, I think, be apparent, when we take a view of the varicty of methods which nature has taken to difperfe the farina, even of thefe platsts in which it has placed the male and female parts within the fame empalement. It is often fattered by an elallic exertion of the flaments which fupport it in the firft opening of the blofom, and its excellive light. nets renders it capable of being carried to a great diflance by the wind. Its pofition within the blofom is generally well adapted to place it on the bodies of infects, and the villous coat of the numerous family of bees is not lefs well calculated to c:rry it. I have frequently obferved with great pleafure the diperion of the farina of come of the sraffes, when the fun had juit rifen in a deny morning. It feemed to be impelled from the plant witl condiderable force, and being blue was eadily vifible, and very ftrongly refembled in appeatance the explotion of a grain of gunpowder. An examination of the ftructure of the bloffoms of many plants, will immediately point out that nature has fomething more in view than that its own proper males hhould fecundate each bloffom, for the means it employs are always belt calculated to anfwer the intended pur-

 Garden. meats; and many trint lave convond men it has
no action on any mether patt of it. In promotins thes fosat intercoure he:wen reighboning plans of the fate fecics, nature appers to me to hive an imon-
 powne, this intercomate ceranly tend to comfin with. i: more :arrow limit, thofe veriation, wind acciden:al richnef or poverty of tril ulually produce. It may be oujected by thoie who admit the exikence of vegetalle mules, that wider this extenive incercourfe the mut have been more tumerons; but my total want of fis. ccs in many endeavors to profuce a fingle mole plant, makes me much dianded to batiese that haseid plants have beea railakea for muler, and to duate with all the deference I feel for the o inion of hamen and I. Ahatrious bellowers) whether nature ever dit or cter wiit perait the production of fuch a montr. The ewtince of numerous mules in the anmal world betwara hadred feevies is allowed, but netture has here yrarted againt their production, by impeiling evely Amimal to :eck is proper mate; and smong the fedweted tribe, whea from perverion of appetite, lexual Cherenaric twhes place between thofe of dittinct get.era ( $A$ ). it has in fome intances at leatt rendered the Geath of the female the inevitable conequence. But in the vege:able work there is not any thing to direct the maie to its proper female, its farina carried by winds ard iniect to parats of every different genus and feccies, and it thereiore appears to me (as vegetable males certainly are nut common) that nature has not permitied then to exilt nt all.
"I cannot dimil, this fubject, without exprefing my regret, that thote wion have made the fcience of botany their sludy thould have conlidered the improvement of thole vegetabion, whin ha in their cultivated llate aftord the largen peation of fushitence to manhind and other mimals, as little connected with the ouject of their purtuit. Hence it has happened, that whillt much attontion has been paid to the improvement of every feecies of uicful animal, the moil valuable efculent plants kave been almoll whoily neglecien. But when the extent of the benefit wheh would arile to the ayricul. ture of the country. fiom the ponienion of varieties of plants, which with the fime extent oi fiol and labuar would aford even a mall increale of produce, is contidered, this fubject appears of no incomaderable importance. The improvement of animals is attended with nach experice, and the improved kinds neceflarily extend themflven insly, but a fingle buithel of improved wheat (ir peas may in ten years be made to worl feed enowh $\therefore$ fupply the whole illand, and a tingle apple or other Thit tree may withia th. fame time be extended to - very garden in it. Thefe confiderations have been the - aule of my addrefling the foregoing obiervations to Sue at thi time; for it "as much my wih to have alcerInimed before I wrote to you, waterher in any intance a Singic phent can be the offipring of two male parent. ## Surt. II. Furit Garin.

Whare peaches, neilarine, and upricots, have not P\% bern fruned before ties, that wark ought to be fone withut delay, becaufe the flower hod ather they have begun to fucil (which they do at this feaforn) ane eaffy nubbed of. Plums, cherrics, spples, pears, goofeberries, currants, and rafuberrios, \&c. may likewite be prund during this month if neglected till now.

Aoout the end of the month you may prune fig Figs. ${ }^{\text {y/ }}$ thees, as by that time all danger of the gans, thoots being hilled by the frolt will be over. A the young thoots of lank feafon alone produce figs the miluins, ? fufficient fungly of them mut be left to nail on to the wall; and fupethons, ill-placed, very ilron long-jointed ihoots, and fimall weak ones, ought to he cut away ciote to the branch of the former year's growth. The branches which are retained ought to be laid in and nailed to the wall at full length, at the diltance of about hali a foot from each other. They ought nut to be flate ened, becaufe the figs are generally produced from that part of the branch near to the extremity: on this ac. count likewife care mult be tahen, in choofing thoie which are to be retained, not only to prefer the thonts of moderately vigorous growth, but likewife thyt: which have had leatt e their extrenities killed by th. froft, for it frequently harpens that the froll kills the fucculent extremitics of branches, and fometimer eom the whole ihoot.

Shortening the branches has another bad effet be fides remoring the part from which the fruit is to fre ceed. it makes them throw ont a crond of lateral hlaot which create confufion and thade the fruit. All worn out old branches which are not furnithed with a turit cient number of young lateral ihoots, ought to be cut away, either clofe to the man branch from which they proced, or clofe to fome thoot placed near thit tower end. Young fig trees may be planted alfo any tine thi month. See October.

Strawberry beds thould now receive a dreffing. Lat fintr, sic vear's rumers thould be cut away, weeds and decayed titawbeeleave, removed, the ground between the rows duy or ries. loolened with the hoe, and fome earth drawn up ahout the ronts of the plants. Strawberries may be planted toward the end of the month: for the method fee June and Seftevbir.

Any time this month you may begin to force the Fore tree in hot walls, in vine, peach, and cherry houlce, eariy irhe 3 H
※c.
(4) This is foid to be the cafe with the drake and the hen.
 1) ante ctinie prestios to the application of fee-heat, and if the
 But-bely of tamien bark or horie dung, a quantity of either thould be got read. If tanacis bark is to be wied. it wugh to be fread out and expoied to the air, thas it mey diey, fur if it be put in too teet it will cither
 froperly drich, the then will be modeate and latt for a jone time. Whan leste dung it to be ufed, it ought to be furked ap into a heap and allowed to remin for a few days, daing whid tine it thoold be turned two or three times with a fork that it may be thoroughly mived. Shight fires hoond be applied for two or three days o: inut, which may be gradually increaled. They caght to be kindled about fanfet, and fupplied with fuel frim time to time till about ten oclock, which will keep the houre in a proper heat until morning, whas the fires :hould again be fet a going, if the lieat has declined, but it will feldom be neceliary at this featon to keep the fires burning all day. The fucl employed may te tither coal, woud, peat, or turf: of theie coal in heft, becante it makes the ftrongeft, the moft duraHe, and mort eatily manged fire. The heat of each houte thould be regulated by a thermometer. The degree of warmth heit up at this feafon, honld not much exces the $60^{\circ}$ of Fahrenkeit. When the fun bines bright the heat muf be regulated by opening the glaffes more or lefs, and admitting the external air. Befides the trees that may be trained to the wall or front of the houle, pots or boxes containing cherry or peach trees may be introduced; likewile pots of kidney beans, itrawberries, \&ic. rofes, and a variety of other flowers. The trees and plants within the houfe mult be duly watered, and have plenty of air admitted to them whenever the weather will permit. When the fruit opproach to maturity a greater heat dhould be maintainAl within the houfe, which may be effected during the day by the rays of the fun, and fparing admiffion of mexernal air, and daring the night (if the weather te cu'd by tire.

## Sect. III. The Pleafure or Flower Garditn.

Towards the end of the month, you may fou fime tender ennuals, furh as balfans, cockscombs, globe amaranthus, ice plants, egy plants, \&ic. They mult be fom in a hot-ied, which is to be formed and earth-- Aover in the fame way as feed beds for cucumbers and melons. See Janvary. The feeds may either be lown in the earth of the red, or in pots plinged into the parth. Or a few may be fown in pots, and introduced into a cucumber or melon bed. When the plants have acquired fufficient flrens th to admit of being tranflauted, they thonld be put into feparate pots and trarsferred to other hot-beds. See April.
Hardy an. About the end of the month, you may fow fome mual. feed of mignionet, ten weeks iteck, larkfpur, flos Adoais, convolvulus, lupines, fcarlet, fiweet-fcented, and Thayier pea, candytutt, dwarf lychnis, Venus's looking ylaf, Loncl's catchtly, Venus's navel-wort, dwarf poppy, annual fanflower, oriental mallow, lavatera, hawkweed, and sany cthers. They muft be fown in
place where they are to remain, for sone of thefe plants lebwary. fucced to well when they are tranlplanted.
Dig fmall patches with a trowel in the Hower borders, break the earth well, remove part of it from the fuiface with the edge of the trowel, and fow the feeds, which thould be covered with the carth which had been moved alide from the furface of the patches. The fimaller Rets foch as mignionet, ten walis tock, larkipur, © c. ihould be covered to the depth of about a quarter of an inch; the larger ones, fuch as lupines, painted and fwect peas, annuai funflower, \&ic. may be covered to the depth of an inch. After the plants have advanced a litite in growt:l, they thould be thinned out in proportion to their fire, viz. one funtlower thould be left in a place, two plants of lavatera and oriental mallow, four or five of the larger, and fix or eight of the fmal. ler lupincs, and fo on in proportion.

Mon kinds of hardy perenniais and biennials may Plant hardy be planted out this month, viz. polyanthufes, prim-perennizis. rofes, London pride, violets, double daileys, duable chamomite, faxifrage, rofe campion, rockets, campanula, catchily, fearlet lychuis, double feverfew, batchelor's button, carnations, pinks, fiweetwilliam, colusnbines, monkihood, tree primrofe, foxglove, goldenrod, perenuial afters, pereumial fun-tower, holyhocks, French honeyfuckles, wallflowers, and many others.

Where auricula plants are much valued, and where Deff and there are many of the finer varietics, they are common- wow aurily kept in pott. During mild weather any time this calas, \& ${ }^{\text {en }}$ month, it would be proper to give them fome freh earth. Clear away all dead leaves from the plants, remove fome of the old earth from the fides of the pot all around, fo far as you can do it withont injuring the roots, and fill the pots with frefh earth prepared for the purpofe. See Seftember.

Auricula and polyanthus feed may be fown any time this month, either in the open ground or in pots. When fown in pots or boxes they are more eafily moved to proper fituations during different feafons. Sow them in light rich earth, and cover them to the depth of about a quarter of an inch. The pots or boxes fhould be placed in a iftuation fheltered from the north, and expofed to the morning and midday fun, from which they ought to be removed in-April to a more thady place. They will be fit for tranfplanting in the month of June. See Juxe.

About the end of the month plant out the carna-Tramplant tions which were raifed laft year by cattings or layers, camations. into pots or borders where they are to remain to produce tlowers the enfuing fummer.

Any time this month you may tranfiplant evergreen Evergreens. trees, and flirubs; fuch as pires, firs, evergreen oaks, hollies, yews, cyprefles, cedars, phillyreas, arbutufes, laurels, laurmhinus, \&ic.

The finer forts of tulips, hyacinths, anemones, ranun- Protect tuculufes, \&ic. hould be protecied during fevere weather, lips, \&ic. as they begin to appear above ground. For the method of heitering them fee January.

Grafs walhs and lawns ought to be kept clean, poled and rolled at lealt once a week if the weather permit it. After being rolled with a wooden roller to take off the worm-cals, a heavy itone or iron one thould be paffed over them to render them firm. Their edges ought likewife to be cut with an edging iron about the

## Part III.

Fermasy end of the month, which will give them a neat ap$\underbrace{\text { Nuriety. pearance. }}$
Gravel and grafs walks may be made during this
Walks and month: for the latter fee J.avisu, and the former odings. March.

Edgings of boswood, thrift, daifes, thyme, hyllop, \&c. may be planted this month. Boxwood forms the neateft, moit durable, and mott eafily kept edging, and if planted now it will fucceed very well. Fur the method fee October. Where my of the old bowwood edgings have become irregular, they ought to be taken up and replanted.

Thrift is frequently emploved as an edging, and well kept makes a very neat one. The plants may be either put in with the dibble fo clofe as to touch, or at the diflance of two or three inches from each other, or planted as boxwood, fee October. Dalies are fometimes whed, and form a very pretty eduing; they may be planted in the fame manner as the thrift.

A great variety of flowers, fuch as hyacinthe, jonquils, and rofes, \&c. may be placed in the hot-houe, vinery, or peach-houfe; and when they have come into flower they may be placed in a green-houfe, or in apartments of a divelling houfe.

## Sect. IV. Nurfery.

Mavy things mentioned under the article work to to be done in the nurfery for fanuary may likewile be done this month; fuch as pruning young trees and firubs, digging between the rows, propagating by cuttings, fuckers, and layers, \&c. See Javuary.
Such layers of laft year, as appear well rooted, hould be removed from the parent plant (or ftool), and planted in rows of from one to two feet afurider, according to the fize of the plant, and at the dittance of a foot or foot and a half from each other in the row.

If feeds or itones of apples, pears, cherries, and plums, were not fown latt autumn to raife flocks for budding and ingratting, they thould be fown about the besin- ning of this month. They thould be fown in light foil, and covered to ahout the depth of an inch. The plants raifed from this fowing will be fit for tranflatating in the heginning of next winter or fpring. The feeds of berries and nuts of thru's and forelt trees may likewife be fown any time this month in narrow beds, and covered in proportion to their fize, viz. the fmall feeds to the depth of about half an inch, the larger to the depth of an inch or an inch and a half, and fome of the nuts even to a greater depth.

Trees and thrubs may be removed from the feed-bed or from where they ftand too thick, and phanted out in rows at proper difiances, or tranflanted into the places where they are to remain.

Young trees that were budded fuccefffuily lant firmmer thould be cut down to within about four inches of the bud. See Juse and July.

Fears, plums, and cherries may be ingrafted towards the end of the month, if the weather is mild: apples likewife may be ingrafted at the fame time, or in the courfe of the following month.

Grafting or engrafting, in gardening, is the taking a floot from one tret, and inferting it into another, in fuch a manner, that both may unite clofely and become ane tre?.

By the ancient witers on humary and adeng $\mathrm{F}_{1} \%$ this operation is called incifon, to dilling it from ann inoculation or buddin, which they call artan" :if Gaiting has been pratifel from the moll remote anti-nitury if quity, but itsorigin and invention ate difomaty related engrath by naturaliks. Theophratus telle o-, that a bird hasing fwallowed a fruit whole, cat it forth mo a clett or cavity of a roten tre, where, mising with fone of the putrefied pats of the tree, and being wathed with he rainc, it germinated, and proluced within this tree a tree of a different kind. This led the !!u!andman $t$, cert.an retlections, from which afterwands arve the art of engratiug.

Pliny gives a differem account of the ori, in of graiting : he fayc, a hubandman willing to make a pallifade in his ground, that it night eadure the louger. and with a view to fill up and itrengthen the hottom of the pallifade, wattled it with the tivigs of ivy. Tho effect of this sas, that the tlakes of the pallifiles taking root, became engrafted into the t :igs, and prodsced large trees, which fuggelted to the hutbandman the art of engrafting.

The ule of grafting is to propagate any deinoble fort, of fruit fo as to be certain of the varicty: for as all good varieties of fruit have been accidentally obtainec: from feeds, fo the feed of theic, whea form, will many of them degenerate, and produce fuch truit an in net worth cultivatung ; but when grafts are taken frem fuch trees as produce good fruit, thicie will never alte: from their hind, whatever be the flock or tree on which they are grafted. Many have fuppofed that fruit underones a change, by being engrated; but this is not the cail. MI. Du Hancl tried it on different trees, and fors fear of error repeated every experiment feveral times. He grafed the peach on the almond, the pium on the apricot, the pear upon the apple, the quince on the white thorn, one fpecies of plum on another, and the almond and apricot on the peach. All thefe lucceeded alike; the fruit was never altered; the leaves, the wool, the flowers, were perfectly the lame with thoie of the tree from which the grafts were taken.

Some authors have made mention of engrafting trecs of ditinct genera on one another; fich a, the apple on the oak, the elm, the mapple, and the plum. AI. D.: Hamel tied a number of thefe experiments, none of which proved fuccelsful. Engrating feems nevar to fucceed but when trees of the fame natural family are grafted on one another. Some trees a:c fuppoied to five longer, and grow more vicorouly when engraties than when growing in a natural itte. It is fiil. that this is the cafe with the peach, when engratited on the plum. But it is commonly alledyed, that clograted tree do not live folong as they would have dune in their natural ilate. The reatun why enyrafted trees are thort hed, perhays proceds from another canfe than merely fron the circumbance of being orated, viz. the age of the thec from which the fions were originally ther.

the receptin- of the srafis. 3. A flat grafting chiled and fimall matht in cleaving large focks, in cleft grating, for the reception of the graft. . 4. A quantity of new bafontring for bandages for ting the grasted pars clofe together, to fecure the gratts, and promute thaiz tacedy maion with the fock. Iad ヶ. A quamtity cf grating clay for claving cloiely round the grats atter tiver infertion aud binding to defend the parts from being died by the fun and winds, for theic parts onght tw oe ceclily furr unded with a coat of clay in fuch a manner as effectually to guad them from ail weathers, which would preve ingurious to the young gratte, and prewent their junction with the tlock.

For thi purpofe fome argillaceous loam or pure clay mult be procurcd, to which thould be added one fourtin nart of freh berte durg :and a fmall portion of cut hay. The what mall be well moilteried with water, and thoroughly hicat with a thich after the manner of mortar.

The kions or graft (which thould be hoots of lat - evr) cu hit to be felected and cut of foze time about the beakining ar middle of the month. Each hind rught wh the up feparately in little bundies, which thould be infurtud into the earth of a dry border, and A.ould be protected during fevere weather by a cover...g of it ...w or fometning of that natule. The reaton wor taking them off at the time mentioned, is that their groxth my be cheched, and that they may be preferved in a coiditimu for grating; for were they to remain wi the trees, their buds would becin to fivell, and would foon advance fo far as to be unfit for ufing with any jrofpect of fuccels. The ftock intended to be grafted, medt, previous to the infertion of the graft, be cut down ; thuie intended for davif trees, to be tramed on walls or efpliers, mull be cut over five or fix incies above the ground; thole intended for flandards thould be cut uver at the height of five or fix feet.

The fiock: mult vary according to the kinds of fruit to te çafted on them, and to the lize of the tree to be prociuct. Apples are grafted on apple ilocks raifed from feed, cutinge, or layers; for dwarfs, paradile pip. in or Siberian crab flock, are ufed; for half dwarls, codlin tocks raifed from fuck-rs, cuttings or layers; and tur full flandards, liocks railed by fowing the feed of rrabs or any comnion apple. Pears are engrafied upon pear ftochs obtained from feed or fuckers, on quinces, and on white thorn. Whan they are engratted on thince itochs, they become dwarf, and are fit for efpaliers, Ne.

Cherrics are engrated upon cherry ftochs obtained by fowing the tones of red or black cherriee, and plums Ae ceqrafted upun plum thocks raifed from leed or fuckCrs (B).

There are difierent methods of grating, termed whipgaturg, cleft-grafting, crown-grating, cleckgraitinc, lide grating, root-grating, atd grafting by ayprach or inarehing; but whip-grating and cleftgeains are the mot commonly ufed, and vhip-grafting moit of all.

Whip-grafting being the mon expeditious and fuc- February. ce:Sful method of grafting, is the mott commonly prac- Nariery. tiled in all the nurferies; it is always performed upon -116 imall tlochs, from about the fize of a goofe-çuill to haif Whip. an inch or a little more or lefi in diameter, but the near-gr.itung. or the llock and graft approach in tize, the better; and is called whip-grafting, becaule the grafts and itock being nearly of a fize, are tloped on one fide fo as to fir each other, and tied together in the manmer of whips or juints of angling rods, sc.; and the method is as follows. Having the ficions or grafts, hnife, bandages, and clay ready, begin the work by cutting off the head of the dlock at fome finooth part; this done, cut one dide iloping upwards, about an inch and a halt or near two inches in length, and makin ${ }_{f}$ a notch or fimall filt near the upper part of the flope downwards, about half an inch long, to receive the tongue of the fcion ; then prepare the ficion, cutting it to five or fix. inches in length, forming the lower end allo in a thoping mamer, fo a exactly to fit the floped part of the Rock, as if cut from the fanac place, that the bark of both may join evenly in every part, and mahe a lit fo as to forin a tongue to fit the ilit made in the flope of the took; then piace the graff, inituting the tongue of it into the ilit of the itock, applying the parts as everily and clufe as poffible, and immediately tie the parts cloie together with a tlring of bafi, paffing clofely ieveral times roand the flock and graft; then clay the whole over near an inch thick all round, from about half an inch or more below the bottom of the gratt, to an inch above the top of the flock, finithing the whole coat of clay in a kind of oval form, cloling it effectually about the ficion, fo that neither air nor water may penetrate. The clay mult be examined foom time to time, for fhould it crack much, or fall off, a quantity of freth clay ought to be applied immediately. This fort of grafting may alfo be performed upon the young fhoots of any bearing tree, if you wih to alter the kind of fruit or to have more kinds than one on the fame tree. By the middle or latter end of May the graft will be well united with the tlock, as will be evident from the ihooting of the buds of the gratt, when the clay ilhould be removed; but the bafs bandage thould remain until the united parts feem to fivell, and be too much confined, then the bandage fhould be taken off entirely.
Cleft-grafting is fo called becaufe the ftock being too clett-grafilarge for whip-grafting, is cleft or tlit down the siddle ing. for the reception of the graft, and is performed in flocks from one to two inches diameter or upward. Firt, with a tirong knife take off the head of the tlock with a floping cut about an inch and a balf long, then cleave the flock with a frong knife or chiel and matliet acrofs the flope to the depth of about two inches, or long enough to admit the graft, leaving the inftrument in to keep the cleft open. Prepare the fcion by cuting it to fuch length as to leave four or tive eyes, floping the lower part of it on each fide, wedge fathion, to the length of an inch and a half or two inclue, making one edge very thiia, and leaving the other much thicker with the bark on; then piace it in the cleft at the back

[^15] tirys or layers, and on that :ccount are calied iree flocks.

be firaken and loofened from the flock. If the head of the llock were not removed previous to inarching, it thould now be cut off clofe to the infertion of the graft, and all the old clay and bandages fhould te taken away and replaced with new, which fhould be allowed to remain a few weeks lorger. If the graft and ilock do not feem perfectly united the firlt autumn after they have becn inarched, they th uld be allowed to fland till nest autumn : for were the branch to be cut off from the parent plant before a complete union was formed between it and the flock, the operation would
h wew me- An anonymous author has given, in a treatife puolihthod. ed at Hamburgh under the title Amranitates Horten/es Nete a new method of grafting trees, fo as to have very beautiful pramids of frut upon then, which will exceed in llavour, beauty, and quantity, all that can otherwife be produced. This he fays be had long experienced, and gives the following method of doing it. The trees are to be tranfplanted in autumn, and all their branches cut off: early in the following fummer the young hoots are to be puilled off, and the buds are then to he engrafted into them in an inverted pofition. This he fays, not only adds to the beauty of the pyramids, but alfo makes the branches more fruitful. Thefe are to be clofely comnected to the trunk, and are to be faftened with the common ligature; they are to be placed circularly round the tree, three buds in each circle, and thefe circles at fix inches diftance from each other. The old trees may be grafted in this manner, the fuccefs having been found very good in thofe of twenty years Itanding; but the mof eligible trees are thofe which are young, vigorous, and full of juice, and are not above an inch or two thick. When thefe young trees are tranfplanted, they mult be fenced round with pales to defend them from the violence of the wind. The buds engrafted muft be fimall, that the wound made in the bark to receive them, not being very large, may heal the fooner; and if the buds do not fucceed, which will be perceived in a fortnight, there muf be others put in their place. The wound made to receive thefe buds mult be a ftraight cut, parallel to the horizon, and the fiece of bark taken out, muft be downwards that the rain may not get in at the wound. In the autumn of the fame year this will be a green flourilling pyramid, and the next fummer it will flower, and ripen its fruit in autumn.

Mr Fairman, of Kent, gives an account of a method of renewing decayed trees, by what be calls extreme branch-grafting, which has been publifhed in the Memoirs of the Society of Arts for 1802. It is addrefied to the Secretary.

## * SIR,

" From much converfation with Mr Bucknall, on the idea of improving flandard fruit trees, we could not but semark that in apple orchards, even in fuch as are mott valuable, fome were to be feen that were flinted and barren, which not only occafioned a lofs in the production, but made a hreak in the rows, and fpoiled the beauty and uniformity of the plantation.

N I N G.
" To bring thefe trees into an equal itate of bearing, February. inze, and appearance, in a hort time, is an object of the Nurfery. greateft importance in the fyitem of orcharding, and aino for the recovery of old barren trees, which are fallen into decay, not fo much from age as from the forts of their fruits being of the worn out, and deemed nearly loit, varieties.
" Haviag long entertained thefe thoughts, and been by no means inattentive to the accompifiliment of the delign, I attempted to change their fruits by a new mode of engrafting, and am bold enough to affert that I have mott fortunately fucceeded in my experiments; working, if I am to be allowed to fay it, from the errors of other praclitioners, as alfo from thofe of my owa habits.
" My name having feveral times appeared in the Tranfactions of the Society for the encouragement of Arts, \&c.; and having the honour of being a member of that Society, I thought no pains or expence would be two much for the completion of fo deirable an improvemert. Under thcfe impreflions, and having many trees of this defription, I made an experiment on three of them in March 1799, each being nearly a hundred years old. They were not decayed in their bodies, and but little in their branches. Two of thefe were golden pippins, and the other was a golden remnet : each had likewife been pait a bearing ftate for feveral years. I alto followed up the practice on many more the fucceeding fpring, and that of the laft year, to the number of forty at leaff, in my different plantations (c).
" The attempt has gone fo far beyond my utmoft expestation, that I beg of you, Sir, to introduce the fyltem to the fociety for their approbation; and I hope it will deferve the honour of a place in their valuable Tranfactions.
" I directed the procefs to be conducted as follows: cut out all the fpray wood, and make the tree a perfect fkeleton, leaving all the healthy limbs; then clean the branches, and cut the top of each branch off, where it would meafure from an inch to two inches in diameter. Some of the branches mult of courfe be taken off, where it is a little larger, and fome fmaller, to preferve a head or canopy of the tree; and it will be neceflary to take out the branches which crofs others, and obferve the arms are left to fork off; fo that no confiderable opening is to be perceived when you fland under the tree, but that they may reprefent a uniform head. I mult here remark to the practitioner, when he is preparing the tree as I directed, that he fhould leave the branches fufficiently long to allow of two or three inches to be taken off by the faw, that all the flintered parts may b: removed.
" The trees being thus prepared, put in one or two grafts at the extremity of each branch; and from this circumitance I wilh to have the method called extreme branch grafiing. A cement, hereafter defribed, mult be uted inflead of clay, and the gratts tied with bafs or iff firing. As there was a conlderable quantity of mofs on the bodies and branches of the trees, I ordered my gardener to fcrape it off, which is effectually done when they are wet, by a itubbed birch broom. I then ordered
(c) The average cxpence I calculated at 2 , 6d. each tree.

Felrowiry. oflered him to bruh them ower with coanfe oil, whin ha Numb: invigorated the grosth of the tree, afod as a mernate
to the barl., and made it expand very evidently ; the old eracks wese foon, by this operation, renderid invitiole.
" All wounds thould be perfeelly cleanet out, and the medication applied, as defubed in the Orchardit, p. 14. By the beginning of July the bandages were cut, and the thoots from the graft; hinrtened, to prevent them from blowing out. 1 muft here, too, obferve, that all the itionts, or fuckers from the tree, mult enjoy the full liberty of erowth till the fucceeding fpring, when the greater part mult be taxien out, and fow but the grafts fuffered to reman, except on a branch where the graft have not taken; in that cafe leave one or two of the fucher, which will tare a grati the fecond year, and makc good the deficiency. This was the whole of the procets (D).
" By obferving what is here itated, it will appear that the tree remains nearly as large when the operation is finihed, as it was before the bufnefs began; and this is a molt effential circumftance, as no part of the former regetation is loft, which is in health fit to continue for forming the new tree. It is worthy of natice, that when the vivifying rays of the lun have caufed the fap to flow, thefe graft, inducing the duid through the pores to every part of the tree, will oceation innumerable fuckers or fcions to thart throurh the bark, which, together with the graits, give fuch energy to vegetation, that, in the courfe of the fummer, the tree will be actually coveredover by a thick foliage, which enforces and quickens the due circulation of fap. Thefe, when combined, fully compel thie roots to work for the general benetit of the tree.
"In thefe experiments. I judged it proper to make choice of grafts from the forts of fruits which were the moit luxumant in their grouth, or any new variety, as defcribed in the 1 rth and a Sth volumes of the buciety's Tranfaction=, by which means a greater vigour was excited; and it this owfervation is attended to, the practitioner will clearly perceive, from the firft vear's growth, that the gratis would foon ftarve the fuckers which fhoot forth below them, if they were fuffered to remain. With a view to accomplih this grand object of improvement, I gave much attention, as I have obferved before, to the general pracitice of invigorating oid trees; and I happily difcuvered the error of the common mode of engrafting but a thort diltance from the trunk or body. There the circumference of the wound is as large as to require feveral graft, which cannot firmly unite and clalp over the ftumps, and conlequently thete wounds lay a foundation for after decay. If that were not the eafe, yet it fo reduces the fize of the tree, that it could not recover its former ftate in many years, and if is dubious if it ever would; whereas, by the nethed of extreme grafting, the tree will be larger in three or four years, than before the operation was performed. For all the large branches remaining, the tree has notling to make but fruit-bearing wood; and from the very beautifal verdure it foon acquire, and the fymme.
try of the tree, no argumait, neceffary to enforce the $F$ bruary. practice. Some of the trece, done in this way, yielded Greencach two buthels of aptles from tl:e third year", wood.
horne and Hut-houle.
Coment fir Ronsafins:

One pound of pitch,
One pound of rolin,
Half a pound of beeswas, A quarter of a pous d of hos's lard,
A quarter of a pound of turpentine;
to be boiled up togcther, but not to be ufed till you can bear your finger in it."
Secr. V. Giren-konje and Hot-houfe.

Th: fame care of the green-houie is required during this month which was recommented in January. If fevere frot, or very wet weather prevails, the glafles muit be tiept clole during the day to exclude the froit and ditne, or light fires may be had recourfe to for this purpote.

In mild weather the glattes muft be opened during tir to be the day to admit air, and water notult be given to the admittedpiants regularly, though Inaringly. Towards the end of the month it will be proper to remove a little of the earth from the furface and fides of the boxes or pots, and to replace it with fone freih compolt. If any of the orange trees, myrtles, or plants of that nature, have irregular heads, they may be cut fo as to caufe them to throw out a number of new branches to fill up any vacant places, or form an entirely new head. If they require to be much pruned, or to be cut over altogether, it would be proper to thift them at the lame time, i. e. to remore them from the box or pot in which they have ftood with the ball of earth about their roots, part of which, together with any matied roots, thould be pared off from the fides and bottom, and replaced in the boses and pots, with a proper addition of freh earth. Any of the plants which are to undergo this operation, that are very fickly, fhould have almot the whole of the earth removed from their roots, and ought, for lome time after thifting, to ftand in a bark-bed.

If the bark-bed in the pine ftove received no freth Pine ftova, tan or turning lait month, it fhould be examined as early as consenicnt ; and if the hent fhould have at all declined, it ourht immediately to be turned or have an addition of frefl tan, as directed laft month. See J.iaUARy.

If a lively heat be not kept up in the bark bed now, when the plants thew flower, the fize of the future fruit will be coniderably affected. A proper cegrec of warmith, apticd to the rost of the plant, will make them grow visorouly and produce large fruit. The heat of the air of the hoate mult be kept at a proper temperature, by due attention to the fires every night and morning, and even during the day in frofty weather, or when cold winds prewail. The barn hed, in which the fuccetion pinceapple plants graw, thould be examined ; and if the heat in it begirs to decline, it

## IIIRCH.

## Sect. I. Kiflion Garaco.

Ut need not here sive a detailed account of the methods of periommany man the things mentioned under this lees, in the two preceding monthe, though mon of them might be performed now with better profpect of fuccets, at this is the princinal month in the year for frwing and planting sill crops of the greater part of hichen-garden verctables. We hall, therefore, mereI. enumerate them. Make hot beds. Sow cacumbers and melurs. Tranfplant and furw cauliflower. Tranfflont and fow cabbage. Traniphant and fow lettuce. Sow finach, onions, lecks, radihes, carrots, parfnins, beets, beant, peas, turnip', celery, fmall falad, parilcy, faffy. and Ilamburgh pariky. Plant thatlot, garlic, fcorzonera, and rockambole.

Same feed of the carly puple and cauliflower brocoli foould he fown, both about the beginning and towards the end of the month, in a bed of rich earth, in an open fituation, to raife ptani, in le fit for the table the following autumn. For li.e fultequent management, fee Arpil., Min, Juxe, and duis.

The feeds of the fea cabbage (crambenarituo) may Le fown any time this menth, in narrow hods of light earth, about four feet wide, for the convenience of weeding. They may eithor be fown all over the furface of the bed, tolerably thich, when they are to be trandpanted, or in drills a foct and a hali or two teet abre, whe:e they are to wmain. Thofe plantware petemial, and eveiy year puh up thick fucculent thoots. They thould be covered tome time during the courie of the winter, with dry earth, to the depth of a few inch?. ly which the young mosite, as they come up in $1_{1}$ tines, are klanched and become fit for whe. They thould be cat af foon is they appear atove ground, or
bevere. ine mancor datagu.
Ans tire in, the courfe 0 the month fome feeds of browa and green cole (kale may be fown in an open fi:wation, for uhon they are finaded they are apt to grow up tall and week. The plant, ratied now will be fit for Wanting out in fummer, and may be cut for wfe any time from autumn to fpring.

Ahout the beqiming of thi nonth afparagus feed may be fow in arrow bed of sond earth in an ofen Atuetion. The feed mas be fentered regularly all over the furface of the hed, raked in, and then receive a ligh: coverimf of earth from the alleys, or in drills, sbue: an inch deel, at the diftance of fix inches from
one another. The plants will afpear abure gound in fine or five wack; when they onght to be kent chear of WEこl, and wateied occafonally daring üy wentiner. The plants rail d now will be fit for tranflating next $1_{\mathrm{j}}$ ring into bed, where they are to remain and protuce crup, or into pluts, to remain for a zear or tho till tiacy be fit fur forciag.

Mlis is a proper ie ion for making y fantatiots of ai- Aiparagus faragus, for which purpole young plats of one on two t, be planta years o!d are commonty wid. Whey lucceed bet in a ed d.ep Ir hat foil, and in an expetel litatione The grourd thould be well manured, dus to the depth of 12 or 1 ; inclies, and divided into beds of the bicadth of tuur tect and a half, in which the alparagus may be plated in rosis, 13 or 12 inches apat, and aboat the fame ditance fiom each other in the row. The utual mode of planting them is to itretch a garden line along the !ed, and to form a driil with a fpade, to the derth of about fix inches, in which the alparagus roots are placed with their cronns or bu's uplemont.

A crop of urions may be fown ia beds when it is an object to make the mott of the ground.

The faface of afparagus beds thould be lookened or arefied turned over with a fork, in the courle of this month. The inftument commonly made ule of for this purpole, is a fork with three flat blunt prongs. Care muth be taken not to dig too deep, left the tops of the aiparagus roots floould receive injury. Immediately ater the furfaces of the beds have been lootened, thes hoold be raked over: for if the raking were to be deferred for fome time till the buds of the afparagus approach the furface of the ground, they might be broken by the teeth of the rake. Atparagus beds will continue to produce good crops for 10 or 12 years, if properly managed. They ought not to be cut till the third ur fourth year after they have been panted in rich foils; however, a few of the frongelt hoots may be cut even in the fecond, but it thould be done fpaningly. When alparagus has aswanced to the height of three or four inches above ground, it fhould be collected for the table; but as the thoots are commonly cut about three inches under the furface of the ground, care mut be taken not to injure the riling buds for feveral buds nite in fucceifien from the lume root), tor this reafon, it is commonly cut with an infrement made on perpuie. called an a/paragus lofifc, which fhould be introduced cloe by the thoot to the requifite depth, and directed to as to cit it off ubliqualy.

Artichoke plants, that were earthed up during win- Attichoke" ter to protect them from froll, flould now be exa-dreffed, nined; and if their alems appear to puth up viguroulle, atd the earth ought to le removed and levelled. The toil thould tikewite be looinad from the fhath, and it matny fhoots procied from the fame root, they fhould all be taisen away except three of the thongeth. The redut.dant hoots, if carefully detached from the main roots, may be emplosel to form nes plantations: the carth, therefore, hould be lo far removed as to alluw the hand to be introduced to ilip them clole to thair infertion.

Plantations of young artichukes are mace towards the end of this or in the courle of next mometh, as foom, indeed, as the offets (the onls way in which this plant is propagated) c:n be froe stect. For this purpofe choofe a plot of good ground, dig in a good quantity

March. of rotten dung, and plant the wifct, with a dible after Gatechen their tons an! roots have been trimmed a little (if it ap$\underbrace{\text { Garaca }}$
${ }^{13} 3$
Pot-hebs Slips or cuttings of fage, rue, rofemary, hyffop, propagated. thyme, and favory, may be planted any time this month. They thould be planted about fix inches apart, and to the depth of nearly two-thirds of their length. By next autumn they will be fit for tranfplanting.

## Sow ikir

Some feeds of ikirrets may be fown in narrow beds, in an open fituation, either in drills fix inches afunder, or regularly over the furface of the bed. After the plants have come above ground, they thould be thimed out to the dittance of about $\mathrm{S}_{\mathrm{i}} \mathrm{i}$ isches from one another, and allowed to remain in the place uhere fown. This plant is frequently propagated by offsets taken from old roots, which thould be planted at the diftance of din or

About the end of the month, if the weather be mild and dry, a few early kidney-beans may be fown in a well heltered fituation, at the foot of a wall, having a fouth expofure. See Aprif. But as thefe lants are tender, they are liable to be injured by cold weather, therefore a fmall quantity only fhould be lown now.

About the middle or latter end of the month fome cardoons may be fown for tranfplaning. For this purpofe a piece of light cround thould be well dug, the feed fown thin'y, and raked in erenly; a few weeks atter the plants have come up, they thould te thinved out to the difance of about fix inches from one another, to allow them room to grow till they are itrong enough to be planted out, which will be in June. See Jove. They may be fowr likenife in rows five feet afunder, and at the dilance of four feet from each other in the row, and allowed to remain where fown. They are biennin', grow to the height of three or four feet, and are cultivated for the fase of the footitalis of their leave, which are blunched ly being earthed up fomewhat in the manner of celery, on which account they require a goot deal of room.

This is a proper time to plant chives, a fmall frecies of onion, which is ufd in fring is a fubtitute for young onions. They grow in large tufts, and we propagated by parting the root, into frall tufts containing eight or ten bulbs, which may be planted with the dibble in beds o- rows at the diltance of fix or tight inches frem one another.

You may now plant Jerufalem artichokes, a fpecies of fandower (keliantus tuberofa) the runts of which pear nceellary), in rows abont four fect and a half atunder, and at the ditance of from two to three feet in the rows. I crep of finach, lettuce, radihes, \&ic. may be got from the ground the firt yrat, without injafing the artichckes. This plantation will produce heands in September and Oiober, and will cominue to produce plentiful crops for in or feven years, Whencer artichukes are requircd late in the feafon, young plantations ought to be furmed every year, as it is from them alone that heads may be expected late in autumn; fur the old piantations generally produce them in June, July, and Augur. There are two forts, the large globe, and the French or green oval artichoke; tl:e formee is commonly preferred, on account of the fize of the head and the quantity of eatable matter they af- fome that reicmbie the potato, and are to be planted Vol. IX. Part II.
much in the fame manncr to the depth of about four inches, in row three feet apart, and tout haif that diltance from each other in the rov. Tis; ar for for the table in Uatober, and continue good an wiater and Spin\%.

144 wards the end of this monti, in ay of the belsalre.dy aphoyed; or one may be formed on purpofe to raife plints to be reared under hell or hand glavies. Thofe form now will be fe fur ridgiag out in the beyming of May. Sec Min.

$$
3!\quad \text { Spert }
$$

A the crop of the may be planted a $y$ time to. Cuttings of maderate-ficul pitars of the varity intended to be plated, each containgre ore or tho eve; at leatl, my be put in with a blunt dibhte, to tie drawh of about four inches, in rows two fent apare, at at the diftance of about a foot from erch oher in the row, or in trenches or holes made with the fpad. In the filld, they are planted either with the dibble or in furow, made by the plough. See Asimetitrr. They fuccoed beit in light foil, which flould be well manured. After they have come above gromad, they ought to be kept clear of weeds, and have a quantity of carth drawn up about their ftems. There are many virieties of this regetable, which are obtained from feed: the pincipal are, early dwaff, champion, large round white, oblong red and white kidney, common kidney, imall white kidney, round red, large round dark red, 心e.

Any time in the courle of this month new planta-and must. tions of mint may be formed. This plant is propagated by parting the roots or by cuttings of the young Italks; the former is practifed this month, the litter in next and following month. Procure a quantity of the root; from an old plantation of mint; part and plant them in rows fix inches afinder, and about the fame ditance from each other in the row, either with the dibble, or in drills about an inch deep, diawn ty the hoe. Thefe plants fucceed very well in any toil, but prefer a moint one. The hinds commonly cultivated are f pearnint, peppermint, orangemint, \&c.

The leares and flowers of Indan creffes are frequent- Sow 1 I. ${ }^{1 / 2}$ ly ufed in flads, and their feeds for pickling. The criles. fueds may be fown about the beginning of the month, at the diftance of two or three inches from each other, in drills, about an inch decp. If they are not fown along fide of a hedge or other fupport, they may have fticks placed befide them like peas aiter they have come above ground. There are tio kinds, the large, and dwarf; the former is generall. prefered.

147
Seeds of bail, tow apple (or smatee), and caphicum, hafil, 心s. may be fown any time this month. They are tender annuls, and mut be fom in a lye-bed, to be afterwards planted out in the onen ground in M. y ; they mult be manased like other tencer annuals. See Fower Garatn. Bafil is ufed in foup, and falad, and muit be fown in very dry earth, otherwife the leeds will rot. Love applec are uled in foap and for pickling. The caplicum, of which there is great variety, is uled a a pickic, and for feaforing. The principal kinds are the long-Fud hed, heart-haped, bell-thaped, angular-podded, round thort-podded, cherry-hape!, \&c.

Sow curmbers and melonc, to be hlanted oat under cucumber, hand or be 11 -glaffes.
Sume cucumber and melun feed may be fown to.

$\qquad$HE MCLUDE

Fruit trees on hot walls, in peach, cherry, and vine-
houfes, muft be duly attended to, mull receive air and water regularly, and have the fires put on every evening and cold morning.

## Si.ct. III. Flower Garden and Piafure Ground.

Sila. II. Frut: Gar,čiz.

Ans. kirds of fruit trees mentioned under this head lan mont'h may be puned now, though it ought to be performed as nas the beginning of the month as poldible: for if the weather has been mild during the preceding month, many of the trecs will have adsanced too far to be in a thate proper for pruning. Figs, howcrer, on account of the late period at which they begin tu puth, may be fifely pruned; indeed this is the belt It flon for pruning them.
Truit trees may will ho phanted, theurd the earlier in the menth the better; for it mild weather presails, the Luds of the trees will have adranced fo far before the end of the month, as to render tanfplanting lefs fafe. Fur the method, lee Grobsk. The duration of the plating feation depends more on the mildnefs and feserity of the weather than the time of the year.

When apticot, nectarine, and peach trees are in Aoner, they thould be protected during frof with large garden-mats fixed to the top of the walls oy hooks, and finlened at the hottom to prevent them from being agitated by the wind fo as to dain off the bloifoms. Thefe mats mult be removed during the mildelt part of the day, unlefs when the weather is very fevere, and without funhine. Inflead of mats, old tifh-nets douoled may be ufed for this purpofe, and need not be removed during the day; a number of fmail branches of evergreens (weli clad with leave:) fixed among the branches of the trees in flower, will alfo afford thelter to the bioflom and fating fruit.

Drefs trawberry beds, if not done laft month. See Febreary.

If any early amnals, fuch as balfums, cockscomb; \&c. nere fowin lall month, they will be fit for planting out into fmall pots or a hot-bed prepared for the purpofe. This hot-bed thould be railed to the height of two feet; and when the violent heat has fublided, covered over to the depth of fis inches with rich dry earth. The plants may be put in at the dilance of three or four inches from one another, or rather in fmall pots, becaule from thefe they can be more eally removed into larger ones at a fubiequent period. Due attention munt be paid to give then water and air when requinte ; and liangs of freth dung null be apl ied to the bed whenever the heat begins to decline. If properly taken carc of, they will be fit for final trantplantation in May or Iane.

If no tender annuals were fown in February, fome may be form any time this month.

S w ich tender or halfhardy anmal, fuch as China after, Indian pink, capticum, French and African marithialde hollyliocios.
Form a llight hot-bed any time this montl, which wed not be raifed hivher than t.no feet, and earth it wer to the depth of abuut ix inches. The fecd may
be foum in marrow drilis, at the dinarce of two or

Mark h. three inches from one another, and each lind, ieparately or in pots, plunged in the earth of the bed. After the plants have come up, they will require flenty of free air and moderate watering; and when they have acquired the height of two or three inches, they muft be gradually hardened to bear the open air, by taking the lights entirely of in mild warm days. Inflead of hotbed frames and lights, oil-paper frames, or handglañes, may be made ule of. The plants raifed now will be fit for tranfplanting into the flower border in May. If hardy annuals were not fown lait month, they may be fown any time during the prefent.

Cuttings of double chry fanthemums which were plarted laft autumn in pots or boxes, fhould be planted out into pots or flower borders if mild weather prevails. Auricula plants in pots thould be protected from rain and froft, and thould till be kept covered with hooped arches, over which mats may be occalionally thrown, for thould they be expofed to much rain or fevere weather now when their tlower-ftalks begin to advance, the future bloom might be injured. Keep the pots clear of weeds, and give thern a little water in dry weather, or expofe them to a gentle ftower. If the pots received no freth earth lan month, let them receive fome now.

Let the hoops mentioned the two preceding months hysciaths. ftill continue over the beds of tulips, hyacinths, ranun- $\& \circ$. culus, \&c. for if fevere weather occurs, the beds mutt be protected by a covering of mats, as already mentioned. See Jhnuary. When the flalks of hyacinths, particularly double ones, have advanced almolt to their full height, they are apt to be borne down by the weight of their own flowers, therefore a neat fmali tick ought to be fised in the ground clofe to every plant, to which the flowerftalks thould be faflened by a piece of bafs or other foft ligature.

## 157

Ranunculules and anemones may ftill be planted; ranunculus, they will fucceed the early ones, and flower in June mond ane. and July.

Towards the end of the month, feeds of biennial and sow bienperemial tlowers may be fown, fuch as carnations, niass, \&cc. pinks, fweetwilliams, wallfowers, and fock julytowers of all forts, alfo tofe campion, catchify, fearlet lychnis, columbines, Greek valerian, polyanthus, auriculas, fcabioufes, and Canterbury bells; likewife hollyhocks, French boneyfuckles, rockets, honefly or fatin tlower, tree primrote, ihrubby mallow, broad-leaved campanula, foxglove, fnapdragon or frogfmouth, \&c.

Biemial and perennial plants may likewife be tranf-
planted at this feaion.

150
Pum trees fill be planted; but that work thould be failied before and huts the end of the month.

## Sect. IV. Aurfery.

Fru'it trees, cims, \&c. may be engratied; and the Ingrating floots of trees engrafted laft year thould be fo fhort- and treatened about the cinac their bud begin to finell, as to leave mon of four or five buls, which will :unh out branches to form ded laft a head. The floots of laft year's growth of trees bud-ecar. ded the preceding fummer thould likewie be thore ned, and the beads of trees budded laft fummer thould be cut off about four iaches abowe the bud, which will

March. caufe it io puh out vigorounly. The part of the flock Nurlery. which is left will terve is a fupport, to which the young branch may be fined in the courle of the fummer to prevent it from being hlown out by the wind.

Seeds of hardy trees and thrubs may be fown

Sow feeds of tree., sic. any time this month, in beds three or four feet wide, which thould be well duy, and thoroughly pulveriled. The leed may be fown either regularly over the furface of the bed or in drills, and covered in proportion to their fize; the acorns and other large leeds to the depth of from an iuch and a half to two inches, and the finaller ones from about half an inch to an inch. Some of the more delicate thrubs, fuch as the arbutus, \&c. mav be fown in pots or boses, by which means they will be more caflly protected from the feverity of the

Morl hind of trees and thrubs may be propagated by cuttings this month, particuarly vines.

The vine cuttings mut be hoots of laf year's growth, about ten or twelive inches long, and each furnithed with three buds. If cut from the vines during the wimter, before the fap begins to rife, and preferved in dry earth, they will fucceed the better. Some leave about an inch of the former year's wood attached to each cutting, but this is unneceffry. They may be planted in rows a foot and a half afunder, and at the diltance of eight or ten inches from each other in rows, and fo deep as to leave only their uppermoit bud abose ground; they fhould afterwards be occafonally watered, and kept clear of weeds. Though cuttings of vines may be railed in the open air, much better plants may be obtained by thriking them in a hot-bed or tan-pit in a hot-houfe. At pruning feafon felet fome well-ripened thoot, cut them into pieces of a convenient length, and infert them a little way into pots filled with dry earth, where they may remain till wanted for planting. Protect theu in fevere, but in mild weather, expofe them to the free air. About the beginning of this month, if there is no room in the hot-beds already made, prepare one on purpofe, which may be formed and earthed over exactly lihe a feed bed for melons. See Jonuary. Fill a number of pots, about four inches deep, correfponding to the cuttings you mean to plant, with light rich earth. Take the cutting, you have preferved during the winter; felect the roundelt and fullelt buds; cut the branch about a quarter of an inch above, and about three inches below the bud, with a tharp knife, fo as to make a fmooth cut, and infert each clofe by the lide of the por, fo deep, that the bud may be covered about a quarter of an inch by the earth of the pot; for it is alleged, that a cutting itrikes with greater freedom when placed clofe to the fide than in the middle of the pot. When plants are raifed in this manner from a fingle bud, they feem as if reared from feed. As foon as the cuttings are planted, plange the pots into the earth of the bed, give them a gentle watering, and put on the glaffe. Attention muif be paid to the bed, to fee that the heat be not too flrong, for a moderate bottom heat is a!l that is neceffrry. Air thould be frecly admitted during the day, and even during the night, in mild weather ; but when the weather is cold, the beds flould be covered with mats daring the niglit, to protect them fiom froft. The cuttings fhould likewife be fladed when the fun thines very bright, with mat, and thould receive occahomal vateriars. When the plants are about fin or cight
inches hi, h, they will repuire to be lifted into lager pot, which mult be donc chasiouly tor foar of injuring their roots. Take pots of anout is inche deep, and about the fan widh; put a lathe gorl earth lino the bottom of each, and tuan the cuttins out et the tmall pot intu it with the ball ot enth is entire as pollible, and fill it ep with eath. The tramer of the toeds dhould be raikal in propotion as the plant, inereate in height, and the heat of the bed renewed by linims, of frelh dung when on the decline. Support the thoots when they are about ten or twelve inches high, and pinch off the tendrils and lateral thoots as foon as they. appear. They will be bit for planting out ia the end of June or begianing of July.

When Ury weather prevails, give gentle waterings Water ${ }^{1 / 63}$ to feeding trees and hlrubs, and keep them free fromttowngi. weeds.

## SLct. V. Grecn-hufe and Hothoufe.

Tue plants in the green-houfe dhould receive air dir ${ }^{164}$ be freely, unlels during wet or frolly weather, and more ireeiy at. frequent and plentiful waterings than in the too fornere ${ }^{\text {mitelt }}$ montl:s. Dead branches or decayed leaves haoald be removed, and any of the larger leaved plames that aypear foul thould have their leases cleaned with a wet fponge. Thote alfo which require thifting or prouing may be managed as direcied lait month. Sus feeds and plant cutting, of green-houfe plants; for which purpofe a hot-bed or tan-pit of a hot-houfe will be necelliary at this feafom.

Pine apple plants will require a good deal of warmth, Tr antment particularly in the tan-pit; as their fruit will now be of confiderasily advanced, they mult therefore be kept in a ip's vigorous tase of growth, to fecure lar ge fruit. If the heat of the tan-bed be not very great, at leat one-third of new tan ought to be added. After the tan has beca procured, it cught to be fpread out and diced a little, and then laid $u_{p}$ in a heap, in fome thade adjacent to the hot-houfe, till it begin to ferment. The plants thould then be taken from the tan-bed, and a quantity of the decayed tan removed from its furface and fides, to make room for the new, which mult be thoroughty mixed with the old; and, as this operation ought to be completed in the courfe of one day, a fulficient number of hands hould be empluyed to effect it. Both pine apples and other plants in the hut-houle thould be regularly watered, and have freth air admitted in bright calm days, from about two hours before till two or three after noon.

## APR1L.

## Sbeci. I. Kitction Gardent.

If the heat begin to de line in the cucun'rer and $3 n_{n}^{165}$ gemelon bed, they hould receive linings an directed in .n it in cu. the former months; for thefe phant, will not yield fine cametr fruit, or a plentiful crop, if the bed ore dellitute of a and me..: :prope heat. Sir mutt be admitted every day, and a moderate waterithe given cery four or five days, particularly to cucumbern; but melons Bhould reccive it iparinkly, offecilly when their fiuit, are fetting, as much "uta at that lime would prave injurion, and math the fruit dop off. love: and secayed male fowens. When the fun fhines fo briglt as to caule the leaves of cucumbers and melons to hias, it will be proper to thade thent for two or three hours, during its greatelt heat, with a thin mat or a little loofe hay, ftrewed thinly over the glaffs.

Pitie hot-beds on whicl: to ridge out cucumbers or melons under hand glafes or oiled paper frames. See M1:.

Sow fome cabbage, Cilicia, imperial, and large admirable cabbage lettuces any time this month; indeed, fome ought to be fown about the beginning, midule, and towards the end of the month, to lecure a regular lucce:hion. Should the lettuces that were fown lat month or in February fland too thick, they may be thinned out and tranfplanted at the diftance of about ten inches from each other, and watered occaionally till they take root.

Some early hidncy beans, viz, the Batterfea, fpeckied, dun-coloured, and Canterbury dwarfs, may be planted towards the end of the month, in a well-fheltered fituation, expefed to the fouth, in drills two feet or two feet and a half ahuner, and about two inches from each other in the drills. The tall rumning kinds frould not

160 Iranfiant (at)bages, \& C. be plamed till next month.
Some of the cabbage and favoy plants, which were fown in February and March, fhould be thinned and tranfplanted, when their leaves are about two inches broad, into beds, to gain itrength before their final tranfplantation; and thofe which have ftood the winter may be planted out for good.

Cauliflower plants under bell or hand glaffes fhould have fome earth drawn up about their items, and fhould be expofed to the open air during the day in good weather. Thofe fown latt month thould be planted out into beds in the open air, or into flight hot-beds, to forward their growth. Some of the flrongelt of the plants raifed in the early part of fpring may be planted out at the end of the month, at the diftance of two or two feet and a half each way from one another, and thould be occafionally watered till they are well rooted.

Young plants of brocoli, which were fown laft month, may be planted out at the dittance of two or three inches from one another, to acquire ftrength for final tramflantation; and fome feed of the early purple, late purple, and cauliflower brocoli, may be fown to raife phants for tranfplanting in June. Some plants of laft year's fowing, which produced heads this fpring, fhould be allowed to remain for feed, which will ripen in Augul.

## Sect. II. Fruit Garden.

$\begin{array}{r}272 \\ \hline\end{array}$
Is late feafons, pear, plum, and cherry trees may ftill be planted, and even apricot, peach, and nectarine; but it flould be done as early in the month as poffible, for if any of thefe have advanced much in growth before they are tranfplanted, they will not puifh freely in the courfe of the fummer, and will be liable to be injured by drought. Where prusing has been neglected, it may fill be done, but the fooner the better, for many fruit trees will now be in thower.
${ }^{273}{ }^{27}$ prote? Fruit trees in flower thould ftill be protected in cold fiuteres. ivecther. See March. All ill-placed thoots fhould
be rubbed off, and the young fruit on apricot trees where fet too thick thould be thimed.

Look over the vines trained on walis about the end of the month, and rub off the young fhoots which proceed from the old wood, unlefs they happen to be fituated Dref vines, where a fupply of young wood is wanted; likewite where two thoots proceed from the fame eye on branches of of laft year's growth, let the weakeit be rubbed off. Stakes hould be placed belide the vines in the vineyard, to which they hould be tied, and the ground between the rows fhould be kept perfectly free from weed.

The vine was introduced by the Romans into Britain, Hiftory of and appears formerly to have been very common. From the vine. the name of vineyard yet adhering to the ruinous fites of our caitles and monalteries there feem to have been few in the country but what had a vineyard. The county of Gloucefter is particularly commended by Malmftury in the twelfth century, as excelling all the relt of the kingdom in the number and goodneis of its vineyards. In the earlier periods of our hiltory the ille of Ely was exprefsly denominated the I/le of Vines by the Normans. Vineyards are frequently noticed in the defcriptive accounts of Doomfday; and thofe of England are even mentioned by Bede as early as the commencement of the eighth century.

Doomiday book exhibits to us a particular proof that wine was made in England during the period preceding the conqueit. And after the conquefl, the bilhop of Ely appears to have received at leaft thrce or four tuns annually, as tythes from the produce of the vineyards in his diocefe, and to have made frequent refervations in his leafes of a certain quantity of wine for rent. Dr Thomas, the late dean of Ely, gives the following extracts from the archives of that church.

No wine but verjuice made, 9 th Edward IV.
From thefe extracts it appears that Ely grapes would fometimes ripen, and the convent made wine of them; and fometimes not, and then they converted them into verjuice. Maddocks in his hiftory of the Exchequer, i. 36 , fays that the theriffs of Northamptonhire and Leicelterihire, were allowed their account, for the livery of the king's vinedreffer at Rockingham, and for neceflaries for the vineyard. A piece of land in London, now forming Eaft Smithfield and fome adjoining flreets, was withheld from the religious houfe within Aldgate by four fucceflive conttables of the Tower, in the reigns of Rufus, Henry, and Stephen, and made by them into a vineyard, to their great emolument. In the old accounts of rectorial and vicarial revenues, and in the old regilters of eccleflaflical fuits concerning them,

Garden.
the uthe of wire is an article that frequently occurs in Kent, Sursy, and oher countios. And the wines of Gluactierihice whthin a centu:y after the concueft were litie inferior to the French in fiveetnefs. It is alleged that a black irape very fimilar to the black mulcadine was introhuced from Gaul into Britain, about the middle of the third century. To thele proofs of the antiquity of vineyards in Britain, we thall add the following account of the vincyard at Painshill, Surry, (the molt extenfive one at prefent in England), given by the original propritor, the honourable Charies Hamilton, to Sir Edvard Barry, and publithed in his treatife on wines, p. +68 .
"The vineyard at Pains-hill is fituated on the fouth fide of a gentle hill, the foil a gravelly fand: it is planted entirely with two kinds of Burgundy grapes, the Auvernat, which is the molt delicate, but the tenderelt ; and the Miller grape, commonly called the black clulter, which is more hardy. The firit year I attempted to make red wine in the ufual way, by treading the grapes, then letting them ferment in a vat, till all the butks and impurities formed a thick crast at the top: the boiling confed, and clear wine was drawn off from the bottom. This effiy did not anfwer; the wine was fo very harth and anllere, that I defpaired of ever making red wine fit to drink; but throush that barthnefs 1 perceived a tlavour fomething line that of fome fmall French white wine, which made me hope 1 fhould fucceed better with white wine. That experiment fuccecded far beyond $m y$ molt fanguine expectation; for the very firt year I made white wine, it nearly refembled the flavour of Champagne ; and in two or three years more, as the vines grew ftronger, to my great amazement my wine had a finer flavour than the beit Champagne I ever tafted. The firlt rumning was as clear as fipirts; the fecond was cil de perdrix; and both of them fparkled and creamed in the glafs like Champagne. It would be endlefs to mention how many great judges of wine were deceived by my wine, and thought it fupenior to any Champagne they ever drank: but fuch is the prejudice of molt people againt any thind of Englith growth, I generally found it most prudent not to declare where it grew, till after they hat patfed their verdict upon it. The furelt moof 1 can give of its excellence is, that I have fold it to wine merchants for lifty gumeas a hogthead; and one wine merchant to whom I fold five hundred pounds worth at one time affured me, he fold fome of the beit of it from -5.6 d . to 10 c .6 d . per bottle. After many years experience, the belt method 1 found of making and managing it was this: 1 let the grapes hang till they had got all the maturity the leafon wouk sive them; then they were carefully cut off with fiftur, and brought hone to the wine barn, in lmall quantities, to prevent their heating, or prefling une amother; then they were all picked off the falks, and all the mouldy or green ones were difardec!, butore they were put upon the pref; where they were all pref: fed in a few homrsafter they were gathered: mach would run from them, before the prof fipecect them, from their own weight o: e whon atwither. This ruming uas as clear as water, and facet an fyrup; and all this of the firit prefling, and part of the
fecond continued white ; the other preffings grew reddihh, and were not mixd with the heat. Is fath as the wiae run from the prefs into a harge receiver, it was put into the hogtheads, and clolely bunged up. In a fow hours one would hear the fermentation leegin, which would foon burlt the cath, if not guarded againdl, by hooping them dirongly with inn, and fecuring them in flrong wooden framies, and the heads with wedges. In the lieight of fermentation, I have frequently feen the wine oozing through the fore of the taves. 'The hogthe deds were left all the depth of winter in the cold barn, to reap the bencfit of the froits. When the fermentation was over, which wav eatily dil. covered by the cellation of noife and oozing, lut to be more certain, by pegging the calk, when it would be quite clear, then it was racked off into clean hogiheads, and carried to the valts, betore any warmth of weather could raife a fecond fermentation. In March, the hogineads were examined : if any wese not quite fine, they were fined down with common fith glue in the ufual manner; thole that were fine of thembelves were not fined down, and all were bottled about the end of March; and in about fix weeks mote would be in perfect order for drinking, and would be in their prime for above one year ; but the fecond ycar the tlavour and fweetnefs would abate, and would gradually decline, till at laft it lolt all Havour and fweetnels; and fome that I kept fisteen years became fo like old hock, that it might pafs for fuch to one who was nut a perfect connointur. The only art I cver ufed to it, was putting three pounds of white fugarcandy to tome of the hogfleads, when the wine was firt tumed from the prefs, in order to conform to a rage that prevailed, to drink none but very fweet Champagne. I am convin. ced much good wine might be made in raany parts of the fouth of England. Many parts are fouth of Jainshill ; many foils may be yet fitter for it; and many fituations mult be fo: for mine was much evoled to the fouth welt wind (the worft of all for vince), and the declivity was rather too dreep; yet with thefe difadvantages it fucceeded many years. In lead the uncertainty of our climate is arginit it, and mony fine crops have been fpoiled by $\mathrm{M}_{\mathrm{y}}$ frolts and wit lam. mers; but one good year balances many dilappoint. ments."

In a differtation on the gronth of whe in Enviand by F. X. Viiper, printed at Bath 1786 , there in a m tosd of traning vines along the farface of the grou:d propofed, which leems well adapted to the northolly ctimate of Britah, for which the Rer. M. L. Brosir oh. tained a patent. Mr Vifper uchnowledges, that he touk the firf hint from the following palige, from Lod Chancellor Bacon: " The lownels of the fint troughs mates the fruit geater, and camion it to ripen beteer for we always lee in apricos, peaches, and mello cot:-ns upura watl, the larged fruit is toward the lentem; and in Fiance, the grapes tion mabe the wine mou upon low vines bound to fin th flake, while the wided vines in arbours make veriuice." He add. " 1 . reported, that in forne place vines are futtered :- : like herbs, freading ntom the gromal, and the grow ot thede vime are very batec it were prese to try
 large lases and friat it laid atong the gromel."

Sec 1. 111. The Flower Garden, or Piedíure Ground.
Sow and trenfpant tender ammals. Se Febrliary and March. l'rotect hyacinths, rantaculutes, and anemone, flonted in beds, from leavy rain and frott, as diected in Janary and February ; likewife, when they are in flower, from very bright funline, from about two hours before till two or three after noon; but in this cafe the covering thould be railed a confiderable height, to admit air, and allow them to be viewed.

Plant tuberofes in a hot-bed or hot-houfe, and give them but little water till they have come above 177 groand.
F'ant ever- Eierseen farubs and trees may fill be planted, but grens. the earlier in the month the better.

1-9 Grats walks and lawn thould be poled, rolled, and Walk,
dreficu. monn. Gravel walks may be broken up and turned.

## Sect. IV. Niurfiry.

Look over newly engrafted trees, and fee if the

Eramine new: ir.yratied trees. clay heep clufe about the grafts, as it is apt to crack and fall off; when you find it any way defective to as Edmit the air and rain to the graft, then remove it and apily fich clay in its head. All hoots which rife from the tlaik below the grait muft be taken off whenever they are produced; for if permitted to remain, they would rob the graft of nourilament, and prevent it flooting freely.
Thove hud. Trecs that were budded laft year, will now begin to puh out their firt thoets. Should they be infefted with intechs, fo as to caufe any of their leaves to curl, thefe Grould be picked off, and pains taken to deftroy the vermin. Shouts that proceed from the flock under the bud mula be rubbed off as fuon as they appear.
Asidranf- The fowing and tranfplanting of young trees and Dhat yourghrubs from the feed bed, or where they fand too thick, -ucs. theuld be finifhed early in the month, and if very dry weather fremail, water ihould be given to feed-beds, cuttings, and lately tranfplanted trees and firubs.

Sict. V. Grean-hufe and Mot-loufe.
Ari may be admitted, and water given more frecly than in the furmer months, becato the plats will begin now to advance in grouth; but in general the manarement mull be nearly the fane as recommended latl month.

A proper degree of wamth, both in the bark bed and in the air of the bot-houfe, is requite for fuluting pine apple plants. Water may be more frequently given, and air almitted more free's, becaule the weather will be milder; and in other refipects they mult be manmed :- directed in March. The fuccetion pine apple fants, or fuch as are to fromt hest year hould Le thifed into lurger pers, (viz. 24*.) the fize commosily made whe of. Viben the plests are heathy, thery ilould be tumed out of the pois with the ball it (rith foum their ront as entize as pollitle, and put them in'w hareer once with an atdition tuantity of freile cortl: ; but thould the 1 lants be diekly, infeited with inac:A, r atntate the hase lad root, the whole wi the e ath himen ide dothen oft, atd the roots tam-

and the plants then put into pots filled entirely with May. freth earth.

After the plants have been thus flifted, they fhould
Kitchen.
Garden. have a moderate quantity of water given them frequently, which will promote their growth. The young pine apple plants which were railed from fuckers or crown lat feafon hould likewife be thifted into larger puts, if their roots appear to have filled thole in which they have flood during the winter: if healthy, they thould be turned out of the pots with the ball of earth entire ; if otherwife, they muft be treated like the fucceffion plants as above.

This is a proper feafon for propagating hot-houfe Propagate plants by cuttings, layers, \&c. or for fowing their feeds. hot-houle Cuttings of green-houfe plants may likewife be ftruck ${ }^{\text {plasts. }}$ in the bark bed of the hot-houfe, and kept there till fit for tranfplanting.

## MAY.

## Sect. I. Kïcken Garden.

Melons require attention, particularly when their ${ }_{\text {reatmen }}^{18_{4}}$ fruit are fetting. The heat of the hot-beds muft be of melons, kept up by proper linings; water muft be given \& c. moderately, and air admitted regularly. In warm weather when the fun thines bright, the plants fhould be thaded from its rays for an hour or two about mid-day, by a covering of mats or fomething of that nature. A piece of tile or tlate thould be placed under each fruit after it is fet, to prevent it from coming into contact with the moift earth of the bed, which would injure it, and caufe it to drop off. Ridges may be formed for the reception of the melon and cucumber plants, which were fown laft or preceding month, to be railed under hand or bell glaffes. Thefe ridges thould be about four feet wide, and are to be conftructed in the lame manner as hot-beds. See JanUARY. The dung thould be railed to the height of two feet and half, and covered with fix or eight inches of rich light earth, and may be made either in trenches about a foot deep or on the furface of the ground. When more than one ridge is to be conftructed, they fhould be placed parallel to one another at the diftance of about four feet, which interval fhould afterwards be filed up with frelh horfe dung when the heat in the ridges begins to decline; this will both revive the heat, and when earthed over, will afford room to extend the advancing runners of the plants. As toon as the ridges are earthed over, the hand or bell glafles may be put on along the middle of the bed, at the diftance of four feet, when intended for melons, and three feet when for cucumbers ; and the following day, or as foon after as the earth under the glaffes has become warm, a hole thould be made under each, into which two melon or three cucumber phants areto be put with the ball of earth about their roots; the earth floould then be well clokel about the ball and ftem of the plant, a little water given, and the glafes put on. Shade them for a day or two, and give air during the day by raining the glaffes. When the plants have filled the ghation, the runners mult be tratied out from under them, tut this thould mot take place till the end of the month, or fome time in Juse. Oil praper frames ate tometian wiod for covining the ridges. Thete frames

## Part III.

May. frames are mo:le of thin Nips of woud co:ered with
Truit paper, rendered tranforent and water foul by weans $\underbrace{\text { Garten. }}$ of oil. Melons reated in this way will jrahlue e ple" tifully in Augut and September, and cucumben from the middle of June, till the culd weation in antumn fet in. If no cucumber plants were railed in Narch or April for this purporic, fome feeds may be form in the ridges. Sornc mas likewife be fown about the end of the manth is the open ground, to produre a crop for pickling ; but thould cold weather prevail at that time, it thould be defersed till lune. Gourds and pumpkins may be fown in the open ground in a warm fituation, or in a hot-bed, to be afterwards tranfplanted.
185
Piant kidney beans.

A full crop of kidney beans may be planted both of the dwarf and tall running forts: the former, viz. black fpeckled, Batterica and Canterbury white, ihould be planted in drills about an inch deep, and tho feet and a half afunder, at the diftance of two or three inches from each other; the latter, wiz. the fcarlet and large Dutch white, thould be fown in diills, about an inch and a haii deep, and three feet and a half or four afunder. Thefe rumning kinds muit have tall 15s fticks, or fome fupport of that nature.
Capficurn, The capficum and love apples which wete raifed hat \&ce. planted or the preceding month in hot-beds, may be planted out out. into well nieltered inctations expofed to the fouth.
Sow $1 \varsigma 7 . \quad S$ pi-me fpinach plants, both of the fmooth and prickly nuch. feeded, hould be allowed to run up for feed; and fome of the different kinds of radihes thould be tranfplanted $15 s$ for the fome purpofe.
Weed and The different crops flould be kept clear of weeds, thin crops. and thinned with the hee. Turnifs may be left at the ditance of feven or eight inches from each other ; carrots, fix or eight; parfrips, eight to ten or twelve ; onions, four or five; Hamburgh parlley, foorzonera, and falfafy, fix or Seven; and cardoons, five or hix; that they 159 may acquire ftrength for final tranfilantation.
mant cut Plant out cabbages, favoys, caulthower, brocoli, and rabbages, bore cole.
\&:c.

## Sect. II. Fru:t Gardin.

Wall-trees As wall trees will now have made vigorous ithoots, a rainted. fufficient quantity of the belf placed lateral, and all the terminal ones, fhould be trained to the wall, and all foreright, ill placed, fuperfluous, and very lusuriant fhoots, fhould be removed. None of the young branches fhould be fhortened, unlefs where a fupply of new wond is wanted to fill up fome vacant face. When the fruit ftands too thick on wall trees, they ihould be thinned. When wall trees are infelted with infects, means should be made ufe of to deftroy them; the curied leaves thould be picked of with a view to check their propagation: robacco duilt may be fometimes employed with advantage; but water forinkled plentifully over the branches with an engine conilructed on purpofe, is the mote eif. cacious remedy.

Let vines both on walls and in vinceard be lockeciove:; and let all fuperfluous branches, which procee! from the old wood or lateral hoots, which are puhed out by the young branches, be rubbed off; ind.ced this mult be done conitantly during the fumrar.

Ticyor armals forld be tranplanted into newl forme thoris. , when they are willied to thoner cary' rearount and in full perfection, particularly baltan, whd cockfowhancanb.
L. the auricula planti in pote, which are pant ilow. ho thed. er, be placed in fome litantion where they may wioy Preatme.
 morning.
las.
Some wallhower and fork gillifower feed may be son ${ }^{104}$ fown about the beginning of the monh; cuting alfo of son war, c double wall-flowers and flocks may be planted under bell and hand glafice, or in a thady border.

Peremial and biemsial plants that were fown lar Tr man March, will be fit for tramplanting about the end of hientia:the month into beds, where ti. -y nay remain to acquire $\mathrm{is}^{2}$. fltength.

## Sect.IV. X.for.

Towarns the end of the momth, the clay hould be vew ${ }^{1}$ ith removed from newly grated trees, and the bandages :nitu looiened, becau'e they mifht chech the growth of the :recs. grath, which will now thout ficely, and ath buds under the graft thould be carefully removed.

## Sect. V. Green-houfe and Itst-hunfe.

Aboct the end of the month, if the weather hould ple is? ${ }^{15}$ to be tavourable, the greater part of the phants may berawd removed from the green-bunte, and placed in fome well- ape a thectered fituation in the open air. The ${ }_{j}$ lants in the ar. hot-houie thould receive water and air freels, partick. lar!y in bright weather.

## JUNE.

## Sect. I. İ̈̈chen Garcien.

Tine fame care of cucumbers and meloms which wai welle, recom:nended for laft month, is necollary now ; the cu- K cumbers fown in the open ground laft month dould be thinned, when they begin to puh out their lifit rough leaves, and a few more feeds may be fown for th: fame purpof, but the earlice in the monta the better. Tranflant celery for blanching. For this parpof, form trenches, about a fyade deep and three feet aprert; lay the earth which cor co out ot the trenches regulatIy along each tide; lay into each trench tome well rotten dung, and dig it in: put the plants in a row along the middle of the trench at the diftance of four or five iacher from one another. Ahout a menth or fix we:ch after they have been planted, when they have acguired the beight of fix or eifht inches, a pamtity of contr flould be ladd aluest their fien., wh thanch them and prepare then for the whble; thi thand be dome dusin dry weather, and repeated once a fontuigh, or accordii. y as the plants advoue in growth, till they are blancled to the height of a foot or fifecon metion. The earlic: fowa celery wiil be fit for tanfyntime about the begisaing of the month; the haer twon, whos the end.

S.O turN: ${ }^{5}$.

Abuat tice midele of this month is the bet feafon for fowing a principal crop of tumips; the diferent hinds common!y fown, are the yllow, white Dutch, round white, hone-tumit, S edif., blach Rufian, imall Irenchamad. The large white Nrikit, green iupped, and rel topyed, are clielly uted tor field culture.
liant nut leeks in roits nine inches afunder, and about tix inches from one anoher in the row: it is an utul practice to trim of the extremitits of their leaves and of their roots before they are planted.

Plant cat pot-herbs, fuch as thyme, favory, fweetmarjoran and hyfop; likewite angelica, marygolds, clary, Sc. A ruiny or dull day hould be chofen, and the plants put in at the dilance of fix inches from one another; occafonal watering will be neceliary, till they have taken root. Cuttings or the of tage, hyllop, rue, tifemary, lavender, \&c. may be planted in a ihady fituation, and occafionally watered.

## Secr. II. Fruit Gardin.

Watr trees, and vines in the vineyard, require the
$2=4$ plants pre partd. fome attention this month that was recommended latt. When plautations of firawberries are wanted, the young flant, that are produced at the joints of the rumers, that are furtinled with good roots, hoould te taken up about the end of this nienth, and planted in a thady border at the ditance of about fix inches from one another, by september they will be f.t to be planted out it the diatance of a fout or fifteen inches from tach other.

## Sect. III. Fiower Garden, or Plafure Graznd.

The roots of hyacinthe, jonquils, ranunculufec. \&c. now be taken up after their ftalks be in to decay, dried and preferved till planting feafon; the roct of narcillis, crocu;, fnow-dror, \&c may likewile be taken up and te parated, and either planted ayain immediately or kept till autumn.

The up alfo autumnal tlowering bulbs, fuch as col hicum, autumnal crocufes and narcifur, Guern'y and belladona lities, cyclamenc, \&e: : take oft the mit tet, and phant them xgain inmediately, or heep them till nest month.

Peremial plants, fur has double frarlet lychnis. doubie ruchet, Sce. naay be propagated by cuttinges of their :Anlks; each cutting huould contith or three of four if it, twon which, (or more than ore lalf the lengh of the curing), thould be inferted inte the eround; they may Le iflher planted (th) a thary border, three
or four inches apart, or more clofely together, and covered with bell or hatd glafies.

Propayate carnations, pink, and double fiveet-williams, by layers. Select young floots about five or fix inches long for this purpofe; ittip of the leaves from the lower annations, part of the italls, and trim ofl the tops of thofe placed $\times \mathrm{c}$. at its cxtremity ; make a tlanting cut with a darar knife on the under part of the ftalk, which thould commence at a joint near the middle of the fhoot, and extend upwatds almont half way to the nest; make a hole in the earth aiout an inch or an inch and a hatf deep, immediately under the thoot, for its reception; $f \mathrm{fx}$ it down with a fmall tooked fick, and cover it with earth, except an inch or two a: its extremity. A little water fiould be given in dry weather, which will make the layers Atcihe root more reacily. Piaks and carnations may lihewife be propagated by cuttings or pifings. Thefe pipincs are furmed of the estremities of the young fhoots, taken off immedately under the third joint, which fhou'd be inferted into light earth almott to their tops, (the extremities of their leaves being previoully trinimed ofti.) They flould receive a little water to make the earth fettle clofely about them, and thould be covered with a beil or hand glafs. The earth is fometimes rendered quite wet, and reduced to a btate referabling mortar, betore the pipings are introduced.

About the end of the montin hedges thould receive their firlt clipping.

## Sect. IV. Narfiry.

Aboct the end of the month you may inoculate $\underset{F}{ } \stackrel{10}{05}$ peaches, neetarines, apricots, and roles: for the method, inocutated, fee July.

If any of the trees that were budded laff fummer, or encrafted latt ipring, have made very vigorous thoots, ftakes thould be fixed into the gromed clofe to the fiocks, to which both the ltocks and thoots mult be fixed.

Propagate both deciduots and evergreen flurubs by 1 yer., particulariy fuch as do not puth out roots freely excert from the new wod.

## Sect. V. Green-houfe and Hothoufe.

If the green-houle plants were not placed in the open Exotics ${ }^{209}$ air latt month, on account of the coldneis of the wea-picp.gated. ther, they may be fafely trutted out now. Thefe plents may be propagated this month by cuttings, layer, inarching, \&c.

Hot-hurufe flants may likewife be propagated now, and thould reteive a fenticul allowance of air and water; fine apple jlants which are approaching to maturity fhould be faringly watered, becaute toe much water would injure the flavour of the finit.

## SEct. V. Green-houfe and Hothule.

GRVEX Hoise plants require a plentiful fupply of water at this feafon. If the fruit have fet too thich on Thin thy orange or lemon trees, they thould be thinned, other-truit of wife they will not acquire a proper fize.

Is many of the pine will ripen their fruit in the courfe of this month, it is a proper time to becrin to Popagart propagate thefe plants, which is done by planting the pine afite crowns that are produced at the top of the fruit, and the fuckers which procced fom the root of the plants, about the time the fruit is ripe, or fiom after they are cut.

Thele fuckers of crowns, if nrepely managed, wi:! produce fruit in two years, and then decay. Vach fruit is furmounted by at leat one cronn, which frequently

[^21]Tu'y. Gre"9--:Hut-1ume.
lume of the Plitofophical Traniactions. His neconnt of this method is as follows:
"In the front part of the loouk, and indeed anywhere is the lowelt parts of it, the pine-apple plants will not thrive wall in water. The way in which I treat them is as follows:-1 place a thell near the ligh--it part of the back wall, fo that the pine apples may Iand without abstutely touching, but as near it as can be; on this thelf I place pons full of watcr, about feven or ei, ht inches deep; and in the fe pans I put the pineapple plant, crowing in the fame pots of earth as they are generally ghaned in, to be plunged into the barkbed in the common way; that is, I put the pot of earth, with the pine plant in it, ia the pan full of wa:ct, ad as the water decreales 1 conflantly fill up the pan. I place either plants in fruit, or young plants, is foon as they are well rooted, in thele pans of water, and find they thrise equally well : the fruit reared this way is always much larger, as well as better flavoured, than when ripened in the bark-bed. I have more than once put only the plants thamfives without any earth, I mean after they had roots, into thefe pans of water, with only water futhicient to keep the roots always co:exd, and found them tlourith beyond expectation. In my houfe the thelf I mention is fupported by irons from the top; and there is an intervening fpace of about is inches between the hack wall and the ihelt. A neighbour of mine has placed a leaden ciltern upon the top of the back the, in which, as it is in contack with the Atue, the water is always warm when there is fire in the houfe, and finds his fruit excellent and large. 3ly fhelf does not touch the back fiue, but is about a foot above it ; and, confequently, the water is only warmed Ls the air in the howle. Both thefe methods do wall. The way I account for this fuccef' is, that the warm air, always afcending to the $\mathrm{p}^{-1}$ there the thelf is placed, as being the highen part of the houfe, keeps it much hotter than in any other part. The temperature at that place is, I believe, feldom lefs than what is indicated by the $73^{\circ}$ of Fahrenheit's thermometer, and when the fun hines it is often above $100^{\circ}$ : the water the plants grow in feems to enable them to bear the Greatell heat, if futicient air be allowed; and I often fee the roots of plants growing out of the holes in the bot:om of the pot of earth, and flooting vigoroully in the water.
"My hot-houfe, the dimenfions of which it may be proper to know, is 60 feet long, and in feet wide, the dlues incluted; fiv feet high in the front, and in feet at the back of the invide of the houtc. It is warmed by tho fires. A leaden trough or cillern on the top of the back tlue is preferable to my thelf; as in it the pine plants grow much fatter in the winter, the water being ahas marmed by the the. Of this 1 bave feen great bencits thefe latt two months in any neighbourhood.
"It is not forein to this purpole to mention, that as a perfon was moving a large pine plant from the hot-bed in my houfe latt fummer, which plant was jult thening iruit, by lome accident he broke of the plant jut above the earth in which it grew, and there was no root whatever lefi to it. By way of eaperiment, I took the plant, and fixed it upright in a pan of water, without any carth whatever, in the the lf; it there foon threw out rost, and bure a pine apple that weighed upwards of tho !ounds."

1. The bromelia anana., of which there are fix varieties: 1. Ovatus, or oval-thaped pine apple. 2. Pyranuidalis (pyramidal), or lugar-loaf pine. 3. Glatior, with fncoth leaves. 4. Lucidus, with hining green leavis. 5. Serotinus, with a yellowifh-coloured ilelh. 6. Viridis, or green pine apple.

Auguft. Kitehen Gâden. of the pros. and but the fecond fort is much priferable to it, the fruit of this being larger and much better flavoured : the juice of this fort is not fo aftringent as that of the firit; fo that this fiuit may be eaten in greater quantity, with leis danger. This fort frequently produces luchers immediately under the fiuit, whereby it may be inc:eafed much better than the common fort; fo that in a few years it may be the beft common fort in Britain.

The thrd fort is preferved for curiofity by way of variety ; but the fruit is not worth any thing.

The fort with very fmooth green leaves, was raifed from leeds taken out of a rotten fruit, which came from the Weft Indies to the late Henry Heathcote, Efq. from whom Mr Millar rectived one plant, which produced large fruit: this is what the people of America call the king pine.

## AUGUST.

## Sect. I. Kïchen Garden.

Sow fome prickly-feeded, or triangular-leaved fpi- Sow winter nach, for a winter and fpring crop; for though the rops of round-ieeded produces larger and more fucculent leaves, ipmach. the prickly-feeded is to be preferred now, becaufe it is by much the hardier of the two. After the plants have got their fint leaves about an inch broad, they thould be thinned to the diflance of four inches from one another, and kept free from weeds.

Sow fome cabbage feed both of the early and late cabbage. kinds, to produce plants for next year.

Sow fome onions, to be ufed when young in winter Onions. ${ }^{223}$ or fpring, or to produce a crop of early onions this fummer. The Strathurg or any other kind may be fown now, but the Welh onion is very hardy, and flands the winter well; for though their tops ghould be dellroyed by the fererity of the weather, they will puth up again from the root in the fpring : this onion, however, does not produce bulbs.

Towards the end of the month fow fome caulitlower 224 feed to produce plants for an early crop next fummer, which may be protected during the winter, either under hot-bed frames, bell or hand-ghafies, or in a well-hieltered border expofed to the fouth. Between the 18 th and $24^{\text {th }}$ of this month is, perhaps, the befl time to fow thefe feeds. The London gardeners, who fow great quantities, are accullomed to fow them on a particular day, riz. the 211 lt of this month. If they be fown too carly, they are apt to button, as the gadeners tem it, i. e. run up to feed without producing heads ot a proper iize; and if they be fown too late, the plants do mit acquire fufficiont ftrength, before winter, to cnable them to fupport the feverity of the weather.

Sow fome tettuce fecd about the middle of the month, Lettuce. both to fupply the table late in the autumn, or begin. ning of winter, and to plant out into well-hheltered borders, or under hot-bed frames, to fand during winter.

Augut.
Plant out brocoli, favoys, bore-cole, and celery, for Fruit the ufe of winter and fpring.
Garden.
The eardoons which were planted in June thould
226
Pant out brocoli, \&e. accomplithed the more eanily, tie up the leaves of each plant, with a piece of bafs mat or finall fraw rope, and apply fome earth clofe round the ftem, which earthing muit be repeated at intervals, till it rife to the height of two feet.
Time of The principal crops of onions will be fit for taking the us up up in the courfe of this month. Choofe a dry day for oniuns. taking them up; take off the flalks within two or three inches of the bulb; fpread them in fome dry place, expofed to the funthine, for 10 or 12 days, that they may be thoroughly dried.

## Sect. II. Fruit Garden.

22 S
Drefo the
vines, Sxc.

Look over vines, figs, and other wall trees; remove all foreright and fuperfluous branches, and nail the others clole into the wall, that the rays of the fun may have free accefs to the fruit.

Vines in the vineyard likewife fould be fised to the fakes, and cleared of all fupertluous ihoots.

## Sect. III. Flower Garden or Plafiure Ground.

Propagate About the end of the month, you may propagate , horous-rooted peremial plants, fach as dotble rofe campion, catchtly, double fearlet lychnis, double rocket, double ragged robin, bachelors button, gentiarella, polyanthufes, auriculas, double daifies, Nc. is thefe plants frequently grow in tuft; they may be taken up and divided, taking care that every thip be provided with fome roots.

Auricula plants in pots fhould receive frefh earth.
Auricula and polyanthus feed may be fown any time this month, but will not come up till foring.

Layers of carnations, double fweetwilliams, and pinks, that are properiy rooted, may be leparated from the parent plant, and planied into borders or pots. Cuttings and pipings of pinks and carnations, may be

Towards the end of the month the feeds of bulbousrooted tlowers, fuch as tulips, hyarinths, marcifus, itis, crocus, fritillaria, crown imperial, liies, and fnowdrops; likewile. the feeds of anemone, ranuaculus, and cyclainen, may be fown in beds or boxes, to obtain lew varieties. Ihey mutt be protected during winter from the froit; and when they appear above ground in fring, they mutt be kept clear of weeds.

Plant out leedling biennials and perennials.
233
Ciphedzes.
About the end of this month hedges thould receive their lecond clipping.
SECT. IV. Nu•氿ry.

234
Evimine
thec budded
trees.

BUDDING may thill be performed about the heginning of the month, and thofe trees whirh were budted three weeks or a month aro, flould be evmined. If the buds reman plump and iredh, there in reatua to believe that they have furceeded: in that cate the bandage mut be loofened.

$$
\text { SEct. V. Gren-h:ufe and } H \text { i-hove }
$$

Greendiouse plants, in the open air, muld be manutoed as already directed.

The plants in the hot-heufe muit receive a plentiful allowance of air and water.

Succellion pine-apple plants, that are to produce fruit next year, thould be thifted into larger pots, viz twent -fours or fixteen, about the beginning of the month. The phants thould be turned out of the old pots ant placed in the new ones, a quantity of light rich eatil being previoully put into the botiom of each. Fach pot thould then be tilled with fome of the fame earth, watered, and plunged into the tan, which, at the fame time, thould be turned over and receive an addition of about one-third of freth tan.

## SEPTEMBER.

## Sect. I. Kitcher Garden.

Plast fome brown Dutch, cos, and common cab-Plant ${ }^{2,3}$ bage lettuce, in a well-fheltered hituation, expoled to totuse. the mid-day fun, to be covered with hot-bed frames and glatles, which thould not be put over them till fome time next month.

Plant out from the feed-bed the caulitiowers that fins $^{236}$ were fown latt month, into well-iheltered burders, at flusers the dittance of three or four inches from one another, taking care not to plant them fo deep as to cover their hearts with earth. Thele plants may be either planted out again next month under garden frames, be 11 or handglafles, to itand during the winter, or may remain where planted.

Plant brocoli, favoys, bore-cole, celery, and endive. Brocoii, Sic.
Earth up celery and cardoons.
Tie up the leaves of endive with a picce of bats mat, or fomething of that nature, to blanch them, and prepare them for the table.

Mulhroom beds may be formed any time this month, pleparition as Ipawn will very eafily be procured during Augut, of mufhSeptember, or October. The fpawn has the appear-roum bethe ance of a white mould thooting out in llrings, which, when bruifed, finells like mulhrooms. It may be obtained either from old multiroom beds, old hot-beds, or dung hills that are principally compoled of horte dung, and from pallure fields, indeed in any place where horfe or theep's dung has lain for fome time unditturbed and not expoled to much moiture ; and may be preferved for a confiderable length of time, in a proper ftate for ufing. If fawn is not otherwile to be procured, fome may be produced by laying a quantity of horie dung and rich earth in alternate layer, and covered with fraw to exclude the rain and air; for the more thete are excluded, the koner the fipaw will appear, which commonly happens in about two months after the duser and earth have been lade together. Muthroom bed flu suld be form of dang that has been fyreal ont for fone tim, whout having been fermented, and miy be male two or three tect brodu, and of ally lew th. A stratum of durg about a fuot thich., dhumb be laid fist, which flosid be covered with rich canh to the $A+1$ b of about four inele, then ann-

greens, \&c.
Both evergreen and deciduous trees and dhrubs may be propagated by layers or cuttings about the end of the month.

## Sect. V. Grcen-houfe and Hot-honfi.

A bout the end of the month, if the weather be Tender cold, orange and lemon trecs, and many of the ten plants derer kinds of green-loufe plants, flould be removed in taken into derer hinds of geen-houre plants, hould be remored in- the houte. to the houfe.
${ }^{2}+5$
About the end of this month or begiming of next, Tan-bed the tan-bed in the hot-houfe fhould be refrefled with a renewed, quantity of new tan, one half or two thirds according as the old tan may be more or lefs decayed.

## OCTOBER.

## Set. I. Kïtchen Gardion.

Plant out fome of the lettuces that were raifed in Plant out Auguff, into a well fheltered border or into a hot-bed letuces. frame to fupply the table during winter and fpring. 247 Cauliflowers that were planted out latl month from the feed-bed, may now be planted under hot-bed frames, at the diltance of about four inches from one another, or under bell or hand glaffes. Four or five plants may be put under each hand glafs, all of which (thould they furvive the winter) may again be planted out in the fpring, except one, or at moft two, of the flrongeft, which flould be allowed to remain and produce heads. Sec Frbruary.

Propagate aromatic vegetables by flips, fuch as thyme, fhould be difengaged, that each may have the benefit of the fun and air.
planittraw. Strawberries may be planted any time this month Plan ittraw- when the weather is thowery. If rain fhould not fall to-
berries. wards the begimning of the month, the tranfplanting thould be deferred, otherwife they mutt be watered occationally, for lome time after they are planted. If any were planted into beds in June, they will be in excellent condition for planting out now; but if none were planted out then, the bell rooted plants produced at the joints of the rumners, or offsets from the old plants, ihould be chofen, and planted at the ditance of a foot or 15 inches from one another, either in beds, about fuur feet wide, or in rows along the borders. Hoit kinds of ftrawberries fucceed beft in an open fituation, but the wood flrawberry may be planted under the thade of trees or bufhes.
The principal kinds of ftrawberries, are, the fcarlet or Virginian, white wood, green wood, red wood, large white wood, hautboy itrawberry, large globe hautboy, oblong hautboy, royal hautboy, green hautJuy, Chili Atrawberry, globe Chili, fugar-loaf Chili, pine-apple Chili, Bath Chili, Carolina Chili, white Carolina Chili, Devonflire Chili, Royal Chili, Dutch Chili, Alpine or prolific, which produces fruit from $\therefore$ ane to November, red Alpine, white Alpine, fcarlet Alpine, pine-apple ftrawberry, red, white, and sreen.

Alout the end of the month, moft of the late pears anl apples will he fit for tiking dewa, to be l.id up for ketping. See October.
mint, balm, fage, \&c.

Afparagus beds flould receive their winter drefling, ${ }^{248}$ i. e. their ttalks flould be cut down, and the alleys be-ragus. tween the beds fhould be dug, and a little of the earth from the alleys fread over the furface of each besl. Afparagus beds require fome dung once every two years, which ihould be applied at this feafon. Before the alleys are dug, a little well rotten dung thould be fipead over the furface of the bed, dug in with a fork, and covered with a little of the earth from the alleys. Where forced afparagus is required early in winter, a hot-bect may be made any time this morth. See January.

Plant fome carly Mazagan beans, and hotfyur peas about the end of the month, to tand the winter, and produce a crop early in fummer.

## Sect. II. Fruit Garden.

Winter pears and apples fhould in general be ga- $\frac{2+9}{2}+9$ thered this monh. Sume will be fit to take down the wirter apbegiming ples.

## Part III.

## G $\begin{array}{lllllllll}\mathrm{A} & \mathrm{R} & \mathrm{D} & \mathrm{E} & \mathrm{N} & \mathrm{I} & \mathrm{N} & \mathrm{G}\end{array}$

Octer. becinning of the month, others will not be really before Frut the middle, or towarde the end. To know when the Gifien. Auis have hat their full grewth, fome of the m thould be trie in differnt parts of the tree, by tursing them sentio upuard ; if they quit tive tree eaty, it is a forn onatioit:, an time to gather them. B.it mone at the rame whinate citing pars ihould be permittud to taig Wexer of sat the than the midule of the month, ctrecta!ly it the niglte prove fooly ; for it they are wace a celled ath the froit, it will ucotionmany of them in sce iclare they are fit for the table: and therefore, Oqueral, let betibier apples an peas remain jonger on the t:ees than the inidale or tace end of thi, munth, for they will not improve by henging on the trees after that time. 'The teit apples and pear, which are intaded for long ketping, thould be taken down one by whe, on a dry day, and carefully put into bakets, to be canied to the ronitery, or place where they are to be fored up. The fruit themitlves hould be dry when taken down from the trees, thereire thould not be gathesel too early in the morninz, ivtore the dew on their furface has evaporated. They honld be laid in a heap for ten days or a furtnight, that their watery juices may trantpire; each thould then be thoroughly dried with a rloth, and laid on the fhetees of the fruitery, or in boaes or hampers well covered with dry ftraw or hay.

Guderi, clater nut, Byzantine nut.
Goofeberrice, currants, and rafpherries, may likewife be plamed about the end of this month. See J.axusey.

## Seet. IlI. Flower Garden, or Plafiure Ground.

Buibius Bulbous-rooted plants, fuch as tulips, hyacinths, toot) pint-narciflus, junguils, crocus, dens-canis, crown imperial, 1. fiword lily, ixia, Perfian and Englihh iris, ranuaculus, and anemone, may be planted any time this month, either in beds by themfelves, or in flower borders, together with other flowers; but the finer forts of tulip, hyacinths, ranunculus, and anemone, are commonly $p^{\text {i.anted in beds, fix or eight inches dillant, and two or }}$ three deep.

Plant out deciduous and evergreen trees and flrubs. The method of planting all thefe is to open a circular hoie, wide enough to receive the roots, and about a fpade deep, more or lefs, according to the length of the root:.

Thorn and other hedges may be planted towards the end of this month, or any time in the courfe of the next.

> Sect. IV. Nurfory.

Sow haws, holly berries, hips, barberries, yew-berries, acotns, heech-matts, maple and alh-feed, cherry and plam flones, in a bed about four feet wide. It is a common practice to keep haws and hips, in heaps covered over with earth for twelve months; for thole which are form without this preparation frequently lie a whole year in the feed-bed, without coming above ground. Plant cuttings of laurels and evergreens.

## Sect. V. Grcen houfe and Hot-houfe.

The hardier kinds of green-houfe plants fhould be all - cmoved into the green-houle, when they thould have plenty of air, except in very cold or wet weather.

The fuccefion pine-apple plants thould be removed into the fruiting houfe, which hould previoully receive a quantity of new tan, as directed lat month. The younger fuccefion plants likewife thould be moved into the place of thofe that have been transferred into the fruiting houfe, air thould be given freely in mild weather, and water very moderately.

## NOVEMBER.

## Sect. I. Kïthen Garden.

Ttre up endive for blanching, continus to earth-up cardon', and drefs the plantations of artichohes, i. e. cut down their larger leaves, and lay fome earth a.sout t'ry phat, to proiea them during winter.

Courcts and partheps may be talo a up, and preferved is I the faring the winter.
 -are the "cie fown lat month, or to lupply their , A...it and be cot ath by tererity of the

TuE beft time for pruning vines is immediately after November. Fruit Garden. the fall of the leaf, becaufe the greateit pollible time in mrune vines that way is allowed for healing the wounds. Vines that are cut about the time of the rife of the fap in the fuing, are apt to bleed profufely; this happens fometimes even to thofe that are pruned in the courfe of the winter. It is a common error, in pruning vines, to allow the branches to grow too cloie together, particularly in thofe varictics which grow vigoroully, and have very large leaves; for, in fummer, when the leaves are fully expanded, they are fo much crowded together as to exclude the rays of the fun from the fruit. When pruning is properly performed, the young branches thould be left at the diflance of from one foot or two feet, and even upwards from ome another; but this in a great mealure muft be regulated by the fize of their leaves. The Syrian grape has leaves about a foot and a half broad, with foot-flalks fix inches long. The black Hamburgh has leaves twelve or thirteen inches broad, with footit:lks feven inches long. The black clufter on the contrary has leaves five inches broad, with foot-ftalks three inches long. Blue frontignac and claret grape have leaves fix inches broad, with foot-1talks about four inches long. When vines are weakly, each thoot fhould be fhortened fo as to leave only three or four eyes; when they are moderately vigorous, each thould be left about a foot long. Whea very vigorous, fome of the thoots may be left three or four feet long or more ; the thoots of vines, however, that are trained to the rafters of a vinery or pine-ftove may be left eighteen or twenty feet long. It has been obferved, that both the largett grapcs and fineft clufters are produced on thoots of a confiderable length. When vines have been allowed to run into confufion, much time and pains are requifite to reduce them to regularity; but when they have been trained regularly from the begiming, pruning is eafily and expeditioully performed.

If the following directions for training vines in a Directions vinery be obferved, they will eafily be kept in order, for traiming and plentiful crops of good fruit may be expected. vines.

Vines may be planted both on the back wall and front of a vinery; thofe on the back wall thould be planted fron fix to twelve feet afuidier, according to the vigour of growth of the particular fort, and in fuch a polition that the two uppermof buds may point eaft and weft; thefe on the front thould te planted fo as onc may be trained to each rafter. When the vines begin to grow, all the buds excent the two uppermofl mult be rubbed off from thofe on the back wall, and all except the uppernooft from thofe on the fiont wall. If auy of the plants thew fruit the firit year, the cluiters thould be rubbed off, :as well as the tendrils and literal thoots and the principal thoots fhould be trained regularly to the trellis as they advance in growth. Fires thould be fut in the rinery during the fring, to encourage an carly growth in the wincs, that they may have full time to ripen the ir wood. In the month of lune the glafere may be taken off :ltogether, but thould be put on as ain in September, and continued till the foll of the leaf. when the vines flowh be pruned. The two thoot, which each vine on the buck-wall was permitted to pulh, hinoud te cut doyn to ther this! or fourth bur',

November according as cither of them appears fullelt and Aronge．t，
Frut and then bent down as near as poltisle to a horizonts
G．aden． podition，forming a figure sefembling the letter T．

Plants in front that are trained to the raiters，hould be cut down almont to the bottom，and wo more leit than is mercly duticient to traia them to the ratter． Only two thouts hould ugais be permitted to grow on each plant on the back wall，and one on thole of the front，and thele may be allowes to run the whole height of the honde before they are fopped．After the vine fhoot，are flopped（which is done by pinching off their tops），they witl in general puih out laterals at three or fuur eyes，on the upper part of the hoot．Thele iate－ rals hould not eatirely be taken ofl，as it would caufe more eyes lower upon the thoots to puh out．It would therefore be prudent to permit the firit laterals to grow twelve or feurteen inches，and then to pinch off their tops．Thele lacrals，in their turn，will puih out lecun－ dary laterals，which thould be pinched ott at the fecond or third joint，and in that way the lap may be diverted till the end of the featon．

The thoots of the plants on the back wall mult be brought down to a horizontal pofition，and cut fo that the branches of each plant may reach within a foot of the other．IF all the vincs on the rafters have pulhed vigoroully，it will be proper to prume every other plats down to threc or sur eyes，and the rett to from twenty to twenty－five eyes each，the latter being intended to ro－ duce fruit，and the former to make bearing wood againft anotheryear．When the vines begin to $\mathfrak{u f h}$ in the fering of the third year，the thoots of thole on the back wall thould not be allowed to tiand nearer one another than a foot or fifteen inches，all the intermediate buds being carefully rubbed off．The thoots ought to be trained tap perpendicularly，and however vigurous they mav be，no more than one clutter hoold be allowed to remain on any of them ：all of them may run up to the height of five or fix feet before they are itomped．The thoots on the rafters，that were pruned to twenty or thenty－five eves each，will probably puak at all of them； but not more than five or feven thoots thould be per－ mitted to remain，even on the ftrongen；viz．a leading floot，and two or three on each fide．Care being taken to leave one thoot as near the britom as polible，as the whole branch will require to be pruned down to this moot next winter．Oisly one thoot thould be left upon thofe vines that were pruned down to three or four eyes， at every other rafter；and this mult be trained up the rafter as in the proceding year．At next pruning feafon all the fhoots proceeding from the horizontal branches of the vines in the back wall thould be pruned down to three or four eyes．The vines on the front which pro－ duced fruit thould be pruned to their lowelt hoost，which foould be thortened，fo as to leave fiur or fise eyes． Thofe at every other ratier which were thortened the preceding year，and which were allowed to puht one fhoot，thould now＇．e promed tike the bearets of the former year；i．c．twenty or t．acnty－five eves fhombl be loft on each．Ia the followine and all fucceeding lenfons，thefe vincs on the front will require a fimiar management，with this difference，that，as they acquire
more ftrength，they may permitied to puh more fhouts，and mone clutten may be allowed to remain on each tho $t$ ；firs，as the tims adoance in age，they will eentanly be enabied to prodace every year for a certain period，a layer crop of frait．The lipurs of the vines on the bacl．－a all，i．e．the th．vots that were thortened to three or four eyec，floould be allowed to puh up one Ghoot：thefe thonts at neat fruning featon mull be cu：fo as to leave a long one，viz．about four fiet，and a shost onc，altemately．The long ons hasald be alloved to puik five thoots（all the other buds being rubbed off）， the four lateral of which thould be cut down to two er three eyes each，at nest pruning feafon，and the terminal one chould be left about a foot and a half long．The fhort thoots between the long ones mut comitantly be pruned down to two or threc eyes cach，in order to ficep up a jroper fuccelion of hottom wood．The proming follosing leaton mutt be the fame，with thi difference， that the upright hoote，as they have acquired a foot and a haif adntional length，may be allowed to puilh feven thoot，inilead of five．

The princiqal hinds of vines（E）are，＊the white Diffiene muicat of Alexandia，＊blach damafcus，＊golden galli－grapes． cian，＊w whte frontinac，${ }^{*}+$ grilly frontinac，＊+ black or purple frontinac，$+\ddagger$ blue or siult frontinac，$\ddagger \ddagger$ red frontinac，＊white frect water，＊black Himburgh， ${ }^{*}$ red Hamtargh，of Giltraltar grape，＊white H：m－ hurgh，＊i mabucike or blue tokay，＊＋genuine tokay， ＊+ tame－coloured tukay，$+\ddagger$ brick graye，${ }^{*}+$ white mut－ cadine or challelas，＂t royal mutcadine or d＇arboyce， ＊＋Malmle＇y grape，＊claret grape，＊Syrian，$+\ddagger$ Bur－ gundy or Munier graje，t＋fmall blick clater，+ large black clutter，$+\ddagger$ early black July grape or morillon， noir nati, ＋white parll－leaved．

Goubtrities and currants may be pruned any time prume gooin from the fall of the leaf，till their buds begin to grow berree and in the fring．If theie buthes be not well proned，the currants． fruit will neither be large nor well－favoured．The principat thing to be attended to is，to keep them open； for they are very apt to become cver－crowded with branches：all fuckers therefore which arife from the root，or thoots which proceed from the main flem， mould be removed，becaufe they would only create con－ fulion，by growing up into the heart of the buth．When latt fummer＇s thoons fland too thicl：，on the mair branches，which is frequently the cafe，particularly with goobberries，they thould be thimed，and fow either of them or of the $m$ in branches Howh be thort－ ened，becaute the more they are hortencel the more liable they are to run to wood．They who make ufe of garden－heats，for luke of exjedition，which is too frequatly the cafe，may fove time，and make wet－lunk－ ine lubles，hut witi be difappointed with refpee to the quantity and cualit：of their fant．

Decin.... now or any time during the winter when the Kit'reu wo 'Ar is open. Gortion

## Sect. IV. The Nurfery.

Trivsplant young trees and thrubs, and protect tender feedlings during fevere weather.

Sect. V. Green-IIufe and Hot-Houfe.

The plants in the green-houfe fhould have air during the day, whenever the weather will permit, and thould receive but little water. The plants in the hot-houfe thould likewife receive air during the day in favourable weather, and fires mult be put on every evening, but feldom need to be continued during the day, except the weather is very fevere.

## DECEMBER.

## Sect. I. Kitclen Garden.

Tue cauliflower plants and lettuces planted under hot-bed frames, or under bell or band-glafes, thould be expofed to the air during the mild days, and protected during fevere :seather with a covering of mats or ltraw. In dry weather celery and cardonns thould be earthed up, and endive tied up for blanching.
In this month there is nothing to be done either in the fruit garden, nurlery, green-houfe, or hot-houfe, that has not already been taken notice of in the proceding months.

Here we fall add fome obfervations on the conflruction of green-houfes and hot-houfes.

A green-houfe confructed for the protection of fuch vegetables as camot fland in the open air during winter, may vary in form at dimentions according to the fancy of the proprietor, and the number of plants it is intended to contain. When the front only is of glafs, which formerly was the only, and even niil is the prevalent, mode of conflructing green-houfes, the pillars hetween the fathes ought to be as arrow as the weight they have to fupport will adnit of, and formed fo as to give the leat poffible obtruction to the light; they may the either of thone, brick, wood, or caft iron. The height of the fithes thould equal if not exceed the widh of the houfe, that a fullicient quantity of light may be thrown on the plants which ftand near the back wail, otherwife they will lofe culour, become unhealthy and de formed ; for not only the colour, but the vigour, and even the form of vegetable, depends on the hight. When one half or the whole of the roof is of glafs, which ought to be the cafe, there is no necelfity for Attending to the proportion the height oucht to bear to the width of the houfe. The end of the houlc flould alfo be of glafs, unlefs whe: it is connected with a ferics of other buildings. The pots containing the plants are commonly fet on benchec, which gradually increafe in heichit as they recerle from the front; howexer, when the roof is of glaf, the arrangement my be different. livery green-houfe ought to be furnihed with thes; for though many winter may occur in which the application of fire-heat may not be neceffary, jet luch interife frofs at times prevail as would infalli-
bly kill a great many of the plants: external cowangs,
it is true, are frequently made ufe of as a proteation it is true, are frequently made ufe of as a protection againt the feverity of the weather, but they do not anfiwer the purpofe equally well, for when the froft continues lone they camot be applied day and night with. out doing injury, by excluding air and light; the application of fire-heat is likewite neceflary tor banithing the damp, which very much injures and frequently deItroys the plants, during long-continued, dull, rainy weather. The flues in green-houfes are frequently cornfincd to the back wall, but they ought to pafs in front of the houfe likewife, becaufe the plants fituated are moft liable to be injured by the feverity of the weather.

As fires are feldom required, and thofe but very flight ones, merely to banilh frolt and damp, it will not be necefiary from economical motives to conflruct the flues, fo as to throw off the greatelt pofiible quantity of heat, they may therefore be concealed that they may not affect the appearance of the houfe.

Hot-houfes for rearing plants which grow in warmer climates, or for forcing at an early period fuch vegetables as grow in the open air, vary confiderably according to the different purpofes for which they are intended. Ift, Coniervatories, or dry foves, fo called becaufe they are confructed without pits for containing tamers bark, oak leaves, or other fermentable fubftances, and in which the plants grow in the earth which forms the floor of the houfe, and not in pots. Thofe are commonly of a confiderable width and height, and are either covered entirely, or at leaft on the fiont, roof, and ends, with glafs. 2dly, Hot-houfes for rearing exotic plants, furnifhed with a pit containing tanners bark, oak leaves, heated fand, \&c. in which pots containing the plants are plunged: thefe likewife are of confiderable breadth and height, and have their front, roof, and ends, covered with glats. 3 dly, Pine-houfes which are furnifhed with a pit, as above: thefe are low, the roof being within a few feet of the furface of the pit, that the pine plants may be as near the light as poffible, and the roof and part of the front only need be of glafs.

Vine-houfes are commonly conftructed without pits, and are generally about 12 or 14 feet high, fometimes very narrow, at other times of confiderable breadth; the former anfwer beit for forcing at a very early period, and in both houles the vines are commonly trained both to the back and front.

Peach-houfes are almoft always confructed without pits, are of a moderate height, and vary in breadth. The pcaches are traincd either to the front or back, or to both; and fometimes they are planted in the middle of the houle, and allowed to grow like flandard fruit trees, in which cafe the houfe chould be capacious:

Cherry and fig-houfes are confructed nearly in the fame way as peach houfes. The tlues for warming all the fe ought to pafs round the front as well as the back of the houfe, and ought to bave as much of their furface expofed as pollible; for the more of the furface of the tlue cemes in contact with the air of the houfe, the more readily the houle will be warmed : therefore they ought not to be built in contact with the front or back walls when that can be avoided, but ought to be fupportel on pillars of brick, to keep them from reiling on the ground.

The furnaces for containing the fuel are placed fome-

CreenSintes, 8 en

Conitruc- times in front, fometimes at the end, but molt frequenttion of ly behind the houfe. They ought to be fituated fo far Greenhoufes, Sec. below the level of the flue, as is neceffary to caufe a $\underbrace{\text { fuffer.sec. fulf draught ; if this be not attended to, the linoke }}$ will not pafs through the flues to warm the houfes, but efcape fome other way. When the furnaces are about 18 inches high (a common fize), they ought to be placed about two feet below the level of the flue, that the heated air may have an afcent of about fix or eight inches, which will be fufficient to give the requifite draught.

When the hot-houfe is of confiderable extent, it is better to employ feveral moderate, than a finaller number of flrong fires, for violent fires are apt to crack the flues, in which cafe the fmoke efcapes into the houfe, and injures the plants. Some are partial to large fires, from an idea that they confume lefs fuel in proportion; but this is a miftake, for two moderate fires are found to heat the fame extent of hot-houfe to an equal degree, and more equably, with a lefs expenditure of fuel than one large one. One moderate fire will be fufficient for an extent of 500 or 600 fquare feet of glafs, but if the houfe is protected with coverings du-
ring the night, it will be fufficient for 700 or 800 : Conftructhus the number of fquare feet of glafs being known, tion of the requifite number of fires may be eatily afcertained. The fires employed for warming hot-houles may at the fame time be converted to other ufeful purpofes. At Billing in Northamptonhire, the feat of Lord John Cavendifh, the furnaces are contructed to burn lime at the fame time that they heat the hot-houfe. One furnace can burn four buthels of lime, and confume abou* three-fouths of a hundred weight of coal, when lighted ouly at night and in the morning.

Hot-houles are formetimes protected during the winter nights by external coverings of wood or canvafs, \&c. This renders lefs fire neceffary ; but the faving in point of fuel is more than overbalanced by the originat expence of the covering, by the trouble of taking it off and putting it on morning and evening, and by the quantity of glafs broken, particularly when the covering is made of canvafs, which is apt to be dafhed againft the glafs by the wind. When light covering, of cloth are applied internally they are not liable to the laft-mentioned objection, but there are few hot-houfes where they can be fo applied.

Gardiner

GARDINER, STEPHEN, bilhop of Wincheiter, and lord chancellor of England, born at Bury St Edmunds in Suffulk, natural fon to Richard Woodville, brother to Queen Elizabetl wife to Edward IV. was learned in the canon and civil laws, ard in divinity. He ingned the divorce of Henry VIlI. from Katharine of Spain ; abjured the pope's fupremacy ; and writ De veia er folfa obedicntia, in behalf of the king; yet in Edvard's reign he oppofed the reformation, and was putithed with imprifonment; but Queen Mary coming to the throne, fhe enlarged him. He drew up the articles of marriage between the queen and Philip of Spain, which were very advantageous to England. He was violent agninft the reformers; but on his death-bed *:as difintisfied with his life, and often repeated thefe words: Erravicum Petro, fed non flevi cum Petro. He died in 1555 .

GARGARISNI (from zopereg? $\omega$, "to wafh the moutl ;") a gargle. Its ufe is for wahing the mouth and throat with, when inflammations, ulcerations, \&c. are there. A fmall quantity may be taken into the mouth, and moved brifkly about, and then fpit out; or if the patient cannot do this to any advantage, the iquor may be injected by a fyringe. When gargles are required, their ule thould be more frequently repeated than is done in common practice.

GARGET, a difeafe of cattle, confifing in a fwelling of the throat and the neighbouring parts; to prevent which bleeding in the fpring is recommended.

GARG1L, a diftemper in geefe, which by fopping the head frequently proves mortal. Three or four cloves of garlic, beaten in a mortar with fweet butter, and made into little balls, and given the creature faltmg, are the ordinary cure.
G.IRIDELLA, a genus of plants belonging to the decandria clafs, and in the natural method ranking ander the 26th order, Multiziliquic. See Botany Index.

GAR17.IM, Girizim, of Gcribon, in Ancient Geokraphy, a mountain of Samaria, at the foo of which food Sichem; fo near, that Jotham could be heard by the Sichemites from its top, (Judges, ix. $\sim$.) Famous for the temple buils $\mathrm{c} a$ it by samballet, in favour of his

## G A R

fon-in-law Manaffeh, by the permifion of Alexander Garland the Great, and 200 years after deftroyed by John Hyrcanus, fon of Simon, the fourth in fucceffion of the Afmoneans (Jofephus).

GARLAND, a fort of chaplet made of flowers, feathers, and fometimes precious ftones, worn on the head in manner of a crown.-The word is formed of the French guirlande, and that of the barbarous Latin sarlanda, or Italian ghirlanda. Menage traces its origin from gyrus through gyrulus, to gyrulare, gyrlandum, ghurlandum; and at length ghirlanda and guirlande; fo that guirlande and garland are defended in the fixth or feventh degree from gyrus.-Hicks rejects this derivation, and brings the word from gardel handa, which in the northern languages fignify a nofegay ort fully wrought with the hand.

Garland alfo denotes ornaments of flowers, fruits, and leaves, intermixed; anciently much ufed at the gates of temples, where feats and folemn rejoicings were held; or at any other place where marks of public joy or gaiety were required, as at triumphal arches, tournaments, \&ic.

GARLIC. See Aldum, Botany Index.
GARMENT, that wherewith any perion is clothed. See Dress and Habit.

GARNET, in Natural Hifory, a very beautiful gem, of a red colour, with an admixture of blue. See MINeralogy Inder.

When pure and free from blemifhes, it is little inferior in appearance to the oriental ruby, though only of a middle degree of hardnefs between the fapphire and common cryital. It is found of various fizes, from that of a pin's head to an inch in diameter.

Among lapidaries and jewellers, genuine garnets are known by diferent names according to their difforent degrees of colour. 1. The garnet, fimply fo called, is the finett and mott valuable kind, being of a very deep blood-red with a faint admisture of blue. 2. The reck-ruby ; a name very improperly given to the gannei when it is of a very frong but not deepred, and has a fuirer calt of the blue; this is a very beaut:ful gem. 3. The forme or ferain garnet; that of a yot brighter red, apreveting is the culetw of native

Garnet cinndbar, with a faint blue tinge. is The ahmandine,

## Garnet-C lour. See Colouring of Glass.

To imitate G.arnsis. The making the counterfeit garnet in patte is done as follow.-Take prepared cry fitl two ounces, common red-lead lix ounces, manganefe 16 grains, zaffer three grains; mix all well, put them into a crucible, cover it with lute, and fet it in a poiter's kiln for 24 hours. Or take cryital two ounces, minium five ounces and a balf, manganefe 15 grains, zaffre four grains: mix them well together; and let all be baked, in a pot well luted, in a potter's kiln 24 hours.

GARONNE, a large river of France, which taking its rife in the P yrenean mountains, runs northweit by the city of Tholoufe, divides the provinces of Guienne and Gafcony, and, viliting the city of Bourdeaux, falls into the bay of Bifcay, about 60 miles below that city. It has alfo a communication with the Mediterranean, by means of the royal canal of Louis XIV. The tide flows up this river 25 miles above Bourdeaux.

GARRICK, David, Efq. the great Rofcius of his age and country, who for near 40 years thone the brighteit luminary in the hemifphere of the ftage, was born at the Angel Inn at Hereord, in the year 1716. His father, Captain Peter Garrich, was a French refugee, and had a troop of horfe which were then quartered in that city. This rank be maintained in the army for feveral years, and had a majority at the time of his death; that event, however, prevented him from ever enjoying it. Mr Garrick received the firf rudiments of his education at the free-fchool at Litchfield; which he afterwards completed at Rochelter, under the celebrated Mr Colfon, ince mathematical profelfor at Cambridge. Di Johnton and he were fellow-ftudents at the fame fchool; and it is a curious fact, that thefe two celebrated geniufes came up to London, with the intention of pufhing themifles into active life, in the fame coach. On the 9 th of March 1736, be was entered at the bonourable fociety of Lincoln's Inn. The fudy of the law, however, he foon quitted; and followed for fome time the employment of a wine merchant: but that too difguting him, he gave way at laft to the irrefifible bias of his mind, and joined a travelling company of comedians at lplivich in Suffolk, where he went by the name of Lydtlle. Having in this poor fchool of Apollo got fome acquaintance with the theatric art, he burlt at once upon the world, in the year ${ }^{3} 7+0-1$, in ail the lin tre of perfection, at the little theatre in Goodmat's Fields, then under the direction of Henry Giffard.

The chardeter he firit performed was Ri.hard IIl. in which, like the fun burding ro a behinl a cloul, he difplayed in the eutiet dian ewen more than rocridian brightnefs. His excellence discled and a lonithed every one; and tise feein r a yrung, man, in no more than his 24 ch yerr, and a novice in reality $t 0$ the itage, reaching at one bingie atep to that height of perfecton which maturty of yars and long practical experience hed not been ande to ectw on the thea capial perforncrs of the Eurli:h flase wata a plum.... menon that coald not but become the whjest of uriverfal feralation and of as nuiventa admistion. Thace
theatres at th: we.t end of the town were deferted; Goodman's Fields, from being the renderous of citizens and citizens wives alone, became tie retiort of all ranks of men; and Mr Garricl: continued to act till the clofe of the leafon.

Having very advantageous terms ofiered cim for the petforming in Dablin Juring fome part of the fommer $(17+1)$, he went over thither, whele he found the lame jut homage paid to his merit which he had reccived from his own countrymen. To the fervice of the lat:er, however, he efleemed himich more immediately bound; and therefore in the enfuins winter, cngaged himlelf to Mr Fleetwood, then mannger of Drury Lane; in which theatre he continued till the year 1745 , when lie again went over to Ireland, and continued there the whole fealion, joint manazer with Mr Sheridan in the direction and profits of the theatre royal in Sinock Alley. From thence he returned to England, and was engaged for the feafon of $17+4^{6}$ with Mr Rich at Covent Garden. This was his laft per. formance as a bired actor: for is the clufe of that feafon, Mr Fleetwood's patent for the management of Drury Lane being expired, and that gentleman having no inclination further to purfue a defign by which, from his want of acquaintance with the proper conduct of it, or fome other caufe, he had contiderably impaired his furtune; Ar Garrick, in conjunction with Mr Lacy, purchafed the property of that theatre, tagether with the renavation of the patent; and in the winter of $17+7$, opened it with the greatelt part of Mr Fleetwoot's company, and with the great additional frength of Mr Barry, Mrs Pritchard, and Mrs Cibber, from Covent Garden.

Were we to trace Mr Garrick through the feveral occurrences of his life, -a life fo active, fo bufy, and fo full of occurrences as his, we fhould fwell this accoun: to many pages. Sufice it to tay, he continued in the uamoletted enjoyment of his fame and urrivalled čcellence to the moment of his retirement. His univer. fality of excellence was never once attacked by competition. Trasedy, comeds, and farce, the lover and the hero, the jealous huband who fupeds his wile without caule, and the thoughtlef lively rake who attacks her without delign, were all alike his ows. Rage and ridicule. doabt and defair, tranfort and tendernef, compafion and coitemy, ; love, jealoufy, fear, fury, and fimplicity; all :obt in tum potellon of hi features, while each of them in turn appeared to be the fole poffefor of his heart. In the foveral characters of Lear and Hamlet, Richard, D, rilas, Romee, and Lulignane; in his Ronger, Baye, Duster, Kitely, Brute, and Benedict, you fis the nuitalar conformations that your ide is attictied to them all. 1) thurt, Natare, the miltrefs from whom alone this great performer bonosad all his lefors, beves in leerfett inexhautible, ilis her darling for, marked out for her trud regrefentitive, fourd an whimitel icy e for change and diverity in his manner of copyong from hior variou, prodetion: Tleese is one part of theatrical conduct which oeght unquelionably to be recorded to Mr Garick: lionmar, fince : be catie of virtue and mora'ity, and the fimation of public mamers, are confistraly d pendeat u ion it and that is, the seal wis'? whel he amed to hatih from the flage all thofe plos which cary with $t^{\text {thein }}$ in immoral tendency,

## ( A R [ 4.2 ] G A R

Tartok, and to jrune from thofe which do not abfulutely, on the whole, promote the interefls of vice, fuch feenes of licentivafnels and liberty, as a redundancy of wit and too great livelinefs of imagination have induced fome of our comic writers to indulge themfelves in, and to which the fynpathetic difpoition of our age of galiantry and intrigue has given fanction. The purity of the Englith ftage has certanly been much more fully eflablidied during the adnainitration of this theatrical minitter, than it had ever been during preceding managements. He fems to bave carried his modelt, moan, chalte, and pious prisciples with him into the very management of the theatre itfelf, and refcued perfurmers from that oblogny which ftuck on the profeffion. Of thofe who were accounted blackgnards, unworthy the aflociation of the world, he made gentlemen, united them with fociety, and introduced them to all the domeftic comforts of life. The theatre was ro longer efteemed the receptacle of all vice; and the moral, the ferions, the religious part of mankind, did rot hefitate to partake of the rational entertainment of a play, and pars a cheerful evening nndifgufted with the licentioufnefs, and uncorrupted by the immorality, of the cxhibition.

Notwithtanding the numberlefs and laborious avocations attendant on his profeffion as an actor, and his fation as a manager ; yet till his active genius was perpetually buriting forth in various little productions in the dramatic and poetical way, whofe merit cannot but make us regret his want of time for the purfuance of more extenfive and important works. It is certain that his merit as an author is not of the firf ragnitude : but his great knowledge of men and manners, of flage effeet, and his happy turn for lively and ftriking latire, made him generally fuccelffu!; and his prologues and epilogues in particnlar, which are almoft inrumerable, poffets fuch a degree of happinefs, both in the conception and execution, as to ftand unequalled. If Ode on the death of Mr Pelham ran through four editions in lefs than fix weeks. His Ode on Shakefpeare is a matherly piece of poetry ; and when delivered by himfelf, was a moft capital exhibition. His alterations of Shakefpeare and other authors have been at times fuccesful, and at times exploded. The cutting out the gravediggers icene from $\mathbf{H}$ mlet will never be forgoten to him by the inhabitants of the gallery at Drury. Though noceffary to the chattenefs of the fene, they cannot bear to loie fo much true fterling wit and humour ; and it muft be owned, that exuberances of that kind, though they hurt the uniformity, yet increafe the luxuriance of the tree. Among his alterations the folloning are part : Every Man in his Humour, akered from Ben Johifun ; Romeo and $\mathrm{J}_{11}$ liet, Winter"s Tale, Catherine and Petruchio, Cymbeline, Hamlet, \&c. altered and nale up from Shakepeare; Gameikers, a comedy, from Shir!ey ; liabella, from Southerne. Io thele we add, as original productions, 'Tlee Famen's Retum, and Linco's Travel, interludes; Geardin, Lethe, Jying V let, Nifs in her Teetis, S. Conuct, Irih Widow, and other comedies in tus avt; Enchanter, a mu:"cal entertainment ; Liliiput: the Cheitmas l'se is afribed to him, and mainy oti cre.

We row bing ath to the pertod of his retirement in the furing of $177^{6}$; whon, full of $5 \mathrm{am}{ }^{\prime}$, with the 20 .
quirement of a fplendid fortune, and growing i.ato G.nifon years, he thought proper to feek the vale of life, to enjoy that dignified and honourable eale which was

Giffer
Gatter. compatible with his public fituation, and which he had fo well earned by the activity and the merits of his dramatic reign. But very hort indeed was the period allotted to him for this precious enjoyment : for on the 22th of January 1779, he departed this life; leaving no one rival in excellence upon earth to compenfate for his lofs, or a hope of our ever mecting with his like again.

GARRISON, in the art of war, a body of forces, difpofed in a furtrets, to defend it againtt the enemy, or to keep the inhabitants in fubjection; or even to be fubfifted during the winter feafon: hence garrifon and w.ver quartors are fometumes ufed indifierently for the fame thing; and fometimes they denote different thing . In the latter cale, a garrifon is a place wherein forces are maintained to fecure it, and where they keep regular guard, as a frontier town, a citadel, caltle, tower, \&c. The garrifon thould be always itronger than the townfmen.

Du Cange dcrives the word from the corrupt Latin garni/io, which the latter writers ufe to fignify all manner of munition, arms, victuals, \&c. necellary for the defence of a place, and fuftaining of a fiege.

Winter quarters fignify a place where a number of forces are laid up in the winter feafon, without keeping the regular guard.

GARSTANG, a town in Lancafhire, 223 miles from London. It is a large populous place, near a mile in length, but built in a very irregular manner, with dirty ftreets, and very indifferent houfes. The church is a Itately Gothic ftructure. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Aron, \&c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Weftmorland, Cheiter, Stafford, Warwick, Leeicefter, Oxford, Worcefter, \&c.

GARTER, a ligature for tying up the flocking; but particularly ufed for the badge of a noble order oi knights, hence denominated the

Order of the Garqer, a military order of knighthood, the moft noble and ancient of any lay order in the world, inftituted by Edward III. The knights companions are generally princes and peers; and the king of England is the fovereign or chief of the order. The number of knights was originally 26 ; but fix were added in 1786 , on account of the increafe of the royal family. They are a college or corporation, having a great and little fea!.

Their officers are a prelate, chancellor, regiter, king at arms, and uther of the black rod. They have allo a dean, with 12 canons and petty canons, vergers, and 26 penfioners or poor hnights. The prelate is the head. This office is vefted in the bilhop of Winchefter, and has ever been fo. Next to the prelate is the chan cellor; which oftice is vefted in the bilhop of Salifbury, who keeps the feals, \&c. The nest is the regifter, who by his oath is to enter upon the regitry, the felutinics, electimes, penalties, and other acts of the order, with all fidelity: I he dean of Windfor is aluays regit ter or officin. The tourth othicer is Garter and king 2:-ancs, being two ditinct oftices united in one perfon.

Garter
 George, the protestor of this order, whea the hoee: in is predent. He notiic, the clections of mes kni ins, attends the folmuity of their intaltetions, carrice the gater to forign puinces, \&e. $H$ : is the mincipal ollicer wihin the college of anms, and chicf of the heralds. Sec Angece itmr.

All the? olficers except the prelate have fees and penfion: The college of the order is featel ia the catle of Windfor, within the chapel of St Gzorge, and the charter houfe, created by the founder for that purpofe. The habit and enfign of the order are, a garter, mantle, cape, george, and collar. The three fint were affigned the knights companions by the founder ; and, the george and collar by Henry Vilil.

The garter challenges pre-eminence over all the other parts of the dref, by rcafon that from it the noble order is denominated; that it is the fint past of the habit preiented to forcign priaces and ablent knights, who, and all other knights-clet, are therewith firl adorned; and it is of to great honour and grandeur, that by the bare inveffiture with this moble enfign, the knights are efteemed companions of the greatell military order in the world. It is worn on the left leg between the knee and calf, and is chemelled with this moto, Honi soit out mid. y pense; i. e. Shane to him that think evil hereof: The meaning of which is, that King Edward hasing laid claim to the kingdom of France, retorted thame and defiance upon him that flould dare to think amifs of the juff enterprile he had undertaken, for recovering his lasful right to that crown; and that the bravery of thofe knights whom he had elected into this order, was fuch as would enable him to maintain the quarrel againt thofe that thought ill of it.

The mantle is the chisf of thefe veltments made ufe of upon all folemn oceations. The colour of the mantle is by the flatutes appointed to be blue. The length of the train of the mantle only diftinguithes the fovereign from the knights corapanions. To the collar of the mantle is fised a pair of long ftrings, anciently woven with blue filk only, but now twifted round, and made of Venice gold and filk, of the colour of the robes, with knobs or buttons, and tafiels at the end. The left ihoulder of the mantle has from the inftitution been adorned with a large garter, with the device, Hons sort, \&ic. Within this is the crofs of the ordet, which was ordained to be worn at all times by Fing Charles I. At length the itar was introduced, being a fort of crofs irradiated with beams of filver.

The collar is appointed to be compored of pieces of gold in fahion of garters, the ground enamelled blue, and the motto gold.
When the knights wear not their robes, they are to Lave a filver flar on the left fide; and they commonly tear the piaure of St George, emamelled on gold, and befet with dimmonds, at the end of a blac ribbon, croffing the body from the left thoulder. They are not to appear abroad without the garter, on penality of 6s. 8d. paid to the regiller.

The manner of eleaing a knight companion into this mort noble order, and the ceremonict of inveftiture, are as follow. When the fovereiga defigns to -lest a cumplun vit the garter, the chancullor belong-

 at ame ; at ase in this mannee, or to the fime ffoce "We, whith the companiu:s of our roult inble arter of the garter, afiembled in chapter, haden this paint dyy at our calle at Windor, comilaing the virtuous fullity you have thown, and the homourable coploite you have done in our fervice, by vindicating and main. taining our right, \&er. have clected ant choco you one of the companions af our order. Therctise, we re quire you to make your fipeedy repair unto $u$, to receivthe enigus thereof, and be readiy for your mallan, tion upon the - day of this prefent morth, "Si."

The garter, which is of blue velvet bordered wit, fine gold wire, laving commonly the letters of the motto of the fame, is, at the time of election, bucklei upon the leit leg, by two of the fenior companions, who receive it from the fovereign, to whom it was prefented upoa a velvet cuhhon, by Garter king as arms, with the ufual reverence, whith the chancello reads the following admorition, enjoined by the 1 : tutes: "To the honour of God omnipoten, and an memorial of the bleficd martyr St George, tie abou* thy leg, for thy reasw, this noble garier; wear it a: the fymol of the mot illutrious order, nevar to bforgotten or laid afde; that thereby thou majeft be adinonihed to be courageous; and having undertaken a jult war, in which thon thait be engaged, thon mayell itand firm, valiantly fight, and fuccefiully conquer." The princely garter being then buckled on, and the word of its fignification pronou:cel, the knigi:t elect is brought before the forereign, who puts about hi, neck, hneeling, a dar's blue ribbon, wheecurto is appendant, wrow he in gold within the garter, the imge of St George oa horieback, with his fword dram, encountering with the dragon. In the raenn time, the chancellor reads the following admonition: "Weaz this ribbon about thy neck, adorned with the image of the blefed martyr and foldier of Chritt, St George, by whofe imitation prowoked, thou mayelt io overpats both profperous and adverfe adventures, that having ntoutly vanquilhed thy enemies both of body and foul, thou mayeft not only receive the praile of this tranfient combat, but be crowned with the palm of cternal victory." Then the knight elected kifies the fovereign's hand; thanks his majefty for the great honour done him ; rifes up, and falutes all the companions feverally, who return their congratulations. See a reprefentation of the abore imfignia, among others, on the piate belonging to Orders of Ǩnghthoon.

Since the intitution of this order, the te hove been eight emperors and twenty-eight king:, befides numerous foveregn princes enrolied as comparion thereof. Its origin is fomewhet difierentiy al :ed. The common account is, that the counte S.listury at a ball happoming to drop her garter, the kis, too's it up and prefented it to her with thate wal. " $H$. ni foil qual mpala i. c. Evil to :on evil thinks. This accident, it is fail, gave wat to the orde: and the moten; it beine the firit of the tianes to mix love and wir together: but as in the criginal flatute of this order thicese is nut the leal cosigettere to coun tnance fuch a teminine inflimation, credi: canaot $\mathrm{F}_{\mathrm{E}}$

## Ci A R $[454] \quad$ G A R

Gaiter, tulave Leen infituted on occafion of the victory ob. Girth. tained by Edward over the French at the battle of Creily ; that prince, fay fome hiftoriars, ordered his garter to be dilplayed, as a ligmal of battle: in comniemoration whereof, he made a garter the principal ornament of the ordcr, erected in memory of this fignal victory, and a fymbol of the indifuluble union of the huights.

It appears frem Raffel's Chronicle, lib, vi. quanted by Granger in the fupplement to his Biographical Hitory, that this order was devifed by Richard 1. at the liege of the city of Acre, when be cauled twenty-hix knights, who firmly itood by him, to wear thongs of blue leather about their less, and that it was perfected in the nineleenth vear of Edward III.

I: 15 ;i, Edward VI. made fome alterations in the ritail of this order: that prince compofed it in Latin, the original whereof is itill extant in his oon Fadd writing. He there ordained, that the order thould no longer be called the order of St George, but that of the Garter; and, initead of the george, hung at the collar, he fubftituted a cavalier, bearing a book on the point of his fword, with the word prosectio graven on the fword, and verbum Dei on the book: with a buckle in the left hand, and the word files thercon. Larrey.
G.sirfex, principal King at Arms. This ofice was inftituted by Henry V.
Garter, and principal king at arms, are two diftinct ofices united in one perfon: Garter's employment is to attend the fervice of the order of the garter; for which he is allowed a mantle and badge, a houfe in Windiot cafte, and penfions both from the fovereign and knights, and laftly, fees. He allo carries the rod and ficeptre at every feat of St George, when the lovereig. is prefent, and notifies the election of fuch as are new choien; attends the folemnity of their intallatio:s, takes care of placing their arms over their feats; and carries the garter to foreign kings and princes, for which fervice it has been ufual to join him in commifion with fome peer, or other perfon of diItinction.

G:arter's oath relates only to fervices being performed within the order, and is taken in chapter before the fovereign and knights. His oath, as king at arms, is taken before the earl mathal.

Girter is allo a term in heraldry, figeifying the moicty or liall of a bend.

GARTH is wfed in lome parts of England for a little backfide or clofe. It is an ancient Britith word. Gardd, in that language, fignifies garten, and is pronounced and written garih. This word is alfo ufed for 3 dam or wear, \&ic.

Gakth Men is ufed in our flatutes for thofe who catch fill by means of fih garths, or wears. By fatute it is ordinined, that no filher, nor garth man, fhall ufe any net, or engines to deftroy the fry of this, \&c. ${ }_{17}$ Ric. 11. cap. 9. The word is fuppofed by fome to be derived from the Scotch word gart, wheh fignifies forced or compolied; becaufe fith are forced by the wear to pafs in a loop, where they are taken.

Girth, Sir Sanuel, an excelient Engli.h poct and phylician, was defcended from a g od family in Yortthire. H: was admitted into the college of phyficians
it London in 1693 . He at that time zealounty promoted and encouraged the erecting of the difpenlary for the relief of the rick poor, by giving them advice gratis, and medicines at low rates. This work of charity having expoled hini and many other plyficians to the ensy and refcument of leveral perfons of the tame faculty as well as apothecaries, he ridicuied them, with a pecuiliar firitt and vivacity, in a poem called the Diperiary, in fix cantos, highly eftecmed. He was one of the molt eminent members of the famous fociety called the Kit Kat Club, which conifited of noblemen and gentlemen ditinguihed by their excellent parts and affection to the houle of Hanover. Upon the acceffion of George 1 . he was knighted, and made phytician in ordinary to his majefly, and phyfician general to the army. Nor were theie more than jutt rewards even of his phylical merit. He had gone through the office of centor of the college in 1702; and had practifed always with great reputation, and a flrict regard to the honour and interelt of the faculty, never, flooping to prollitute the dignity of his profefiion, through mean and fordid views of felfintereft, to any, even the moft popular and wealthy apothecaries. In a fieady adherence to this noble principle, he concurred with the much celebrated Dr Radcliffe, with whom he was allo often joined in phyfical confultations. He had a very extenfive practice, but was very moderate in his views of advancing his own fortune; his humanity and good nature inclining him more to make ufe of the great interelt he had with perfons in power, for the fupport and encouragement of other men of letters. He chofe to live with the great in that degree of independency and freedom which became a man poffeffed of a fuperior genius, whereof he was daily giving freh proofs to the public. O:re of his laft performances in polite letters, was his tranlation of the whole fourteenth hook, and the flory of Cinnus in the fifteenth book, of Ovid's Mietamorphofes. Thefe, together with an Englifh verfion of the reft, were publilhed in $17^{17}$; and the has prefixed an excellent preface to the whole, wherein he not only gives an idea of the work, and points ou: its principal beauties, but fhows the uies of the poem, and how it may be read to moft profit. The diliemper which feized him the enfuing year, and ended not but with his life, caufed a general concern; which was particularly tellified by Lord Lanflowne, a brother poct, thouch of a difieren: party, in fome admirabic verfes written on the uccalion. He dicd, after a thort illnefs, which he bore with great patience, in January 1719.

GARUMNA, a nobie and navigathe river of Gaul, which rifing from the Pyrenees, formerly bounded A puitain on the north (Cedar); but ly the new regulation of Augullus divided it in the midde, cmptying itleif to the north of Burdegala, in the Aquitanic ocean. Now the Garonne. Mela obferves cuncert:ing it, that unieff it is fwelled by winter rains, or the m - th , , of the liow, it is for a great part of the year thooly and farace navipable; lut when facreated by the meeting tide, wherty irs waters are impelled, it is fum what fuller; and the farther the river advances, it i, broader, till at leneth it refembles a large frith or arin of the fea, not on'y hearing large vefliele, but at-
fo fweiling like a racing fea，tofles them extremely， efpecially it the direcion of the uind be one way and that of the current another．

GAS，in Chemiflry，a general name for all perma－ nently elaftic tluids，which are obtained by chenical procellea，as avotic gas，maniats acid zas，nitrous sas． See Cheutstry Indev．It is derived trom the German gach or $s^{i / f}$ ，fignifying an eruption of wind，or the ebullition attending the expulion of elaflic thids from fubllances in a fate of fermentation or effervelcence． It was firlt emnloyed by Van Helmont．

GASCOIGNE，Sir Villiam，chief juttice of the court of king＇s bench under Henry IV．A moft learned and upright judge：who being infulted on the bench by the then prince of Wales，afterwards $H \in n$－ ry V ．with equal intrepidity and coolnefs committed the the prince to prifon；and by this feafonable fortitude laid the foundation of the future glory of that great monarch，who from this event dated his reformation from the licentioufnefs of his youth．It is not well authenticated that the prince fruck Sir William ，as recorded by Shakefpeare；but all authors agree，that he interrupted the courfe of jutlice to fcreen a lewd fervant．Sir William died in i413．

Gascotine，George，an Englifh poet of fome fame in the early part of the reign of Queen Elizabeth，was born at Walthamitow in Effex，of an ancient family， and educated at both univerfities，but principally at Cambridge．From thence he removed to Gray＇s Inn， and commenced ttudent of the law ；but having a ge－ nius too volatile for that ftudy，he travelled abroad，and for fome time ferved in the army in the Low Countries． He afterwards went to France；where he became ena－ moured of a Scottilh lady，and married her．Being at length，fays Wood，weary of thofe sanities，he re－ turned to England；and fettled once more in Gray＇s Inn，where he wote molt of his dramatic and other poems．The latter part of his life he fpent in his na－ tive village of Walthamfow，where he died in the year $5^{5}$ ． 8 ．He had the charncter of a polite gentleman， an eloquent and witty companion，of wir inter poetar fui lecul proflantifimus．His plays，firit psianed feparately， were afterwards，with feveral other poens，\＆ic．re－ printed in two volumes $4^{\text {to }}$ ；the firll volume in $\mathbf{1 5 7 7}$ ， the fecond in 1587 ．

GASCOIN，or Giscoig＊，denrtes the hinder thigh of a horfe，which begins at the fille，and seaches to the ply or bending of the ham．

GASCONADE，a boalt of vaunt of fomething wery improbable．The term has it sife from the Gaf－ conc，or people of Gafcony in France，who it feems have been ditinguified for bragging and modumon－ tade．

GASCONY，ther fouth－weft province of France， is bounded by G iir on the north，by Languedoc on the eat，by the－yrences which feparate it from Spain on the fouth，and by the bay of Bifeay on the well．It had its rame from the ancient inhathita ts， called fafounse，or Vafeonts；by the moderns Bafques， or I＇aliguis．After thele vere fubdued by the Iranks， the：had for func time duhes of their osin，who were fubiect to the dal：es of Aq it tiae ；but beth were at $12 i$ difphetred by the kings of Fronce．The erountry produce corn，wine，fruts，tolacio，homp，bandy， pruncs，Sic．The inhabitants are noted fur a corrupt
and vicions pronunciation of the French tongue，as well as their vain－glorious boalting．

GASSENDI，Priter，one of the moll celebrated phitofophers Fance has produced，was born at Chan－ terier，about three mile，from Digne in Provence，in 1502．When：ashin，he towk paticular velight in gazing at the moon and alars as often as they appeaza！ in clear unclouded weather．This pleafure frequantly drew him into bye places，in order to featl his cye free＇y and undifturbed；by which means his parents had him often to feck，not without many anxions tears and apprehentions．They therefore put him to fchool at Digne；where，in a thort time，he made fuch an extraordinary progrefs in learning，that fome perions， who had feen fpecimens of his geniu，refulsed to have him removed to Aix，in order to tludy philofophy under Fefay，a learned minor friar．This propofal was fo difagreeable to his father，who intended to breed him up in his own way to country bufinefs，as being more profi：able than that of a fcholar，that he would confent to it only upon condition that he thould return home in two years at fartheit．Accordingly young Gaffendi，at the end of the appointed time，repaired to Chanterfier；but he had not been lony there whea he was invited to be profeffor of rhetoric at Digne，be－ fore he was quite 16 years of age；and he had been engaged in that oflice but three year：，when his mafter Fefay dying，he was made profatior in his roon at Aix． When he had been there a fos years，he compoled his Paradosical Exercitations；which，coming to the hands of Nicholas Peirefc，that great patron of learning foined with Jofeph Walter prior of Valette in promot－ ing hin ；and he having entered into holy orders，was firit made canon of the church of Digne and doctor of divinity，and then obtained the warlenthip or rector－ thip of that church．Gaffendi＇s fondnets for altrono－ my grew up with his years；and his reputation datiy increafing，he was in 1645 appointed royal profelfor of mathematics at Paris．This inititution being chiesty defigned for aitronmy，our author read lectare；on that fience to a crowded audience．However，he did not hold this place long；for a dangeroun courla and inflamnation of the lungs oblig d h m，in 16\％7， to return to Digne for the benefit of his move air．－ Gatfendi wrote ayaint the netaphylical metitation of Detcartes；and divided with that great man the phi－ lolophers of his time，almott all of whom were Carte－ fians or Gatiendians．He joined to his knowledge of philofophy and the mathematics an acquantance with the languages and a profound erulition．He wrote， 1．Three volumes on Fepicurus＇s Philudiphy ；and tix other，which costain his o on plishoulh．2．－hero－ nomical Works．3．The Lives of Nicholas de Peiruic， Epicurus，Copernicus，Tycho Bahe，Pwobobiv， and Regiomontanu．4．Fp：alles，and othor the tilice All his works were chicriad torethor，an i ptimed at Lyons in 1658 ，in fix volume folio．Ife cied at Fa－ ris in 1658 ，an a！ 63.

Gaft are from certain glands in the fomach, foe the dilution, mius II Gate. \&c. of the food. Sce Anatomy.

GASTROCNEMIUS, in Anatomy. See AnatoMY, Table of the Mufcles.

GASTROMANCY, or ? istromantsa, a kind of
 rords coming or feeming to come out of the belly.

The word is Gretk, $\gamma \approx s \xi \mu \boldsymbol{\mu}$ delly, and menitix, divination.

There is another kind of disination called by the fame name gaflroniancy, which is performed by means of glafles or other round tranfparent vefiels, within which certain figures appear by magic art. It is thus called, becaufe the figures appear as in the belly of the veffels.

GASTRORAPHY, in Surgery, the operation of fewing up wounds of the abdomen. See Surgery.

GAS'TROTOMY (of jacns, and $\tau \notin \mu, I c u t$ ), the operation of cutting open the belly; otherwife called the Cafarianfection. See Midwifery.

GATAKER, Thomas, a learned critic and divine, was born at London in 1574 , and ftudied at St John's collecge, Cambridge. He was afterwards chofen preacher at Lincoln's inn; which he quitted in 1611 , for the rectory of Rotherhithe in Surry. In 1620 , he made a tour through the Low Countries; and in 1624, publifhed at London a book, entitled, Tranfubitantiation declated by the confefion of the Popifh Writers to have no necelfaty foundation in God's Word: he wrote likewife a defence of this difcourfe. In 1642, lee was appointed one of the affembly of divines, and was engeged with them in writing annotations upon the Bible. He died in July 1654 , in the 80th year of lis age. Befides the above works, he publifhed, 1. A Dinertation uyon the Style of the New Teftament. 2. De Nomine Totragrammata. 3. De Diphit.ngis, fee Braccalitur. 4. An Edition and Tranlation of the Emperor Marcus Antoninus's Meditations. 5. A Cuilection of Sermons, in folio; and many other works. His picty and charity were very exemplary; and lis modefy fo great, that he declined all eccleflallical diznity and court preferments. His extenfive learning was admired by Salmafius and other great men abroad; his houfe was a private feminary for soung gentiomen of this ration, and many foreigners refurted to him to receive advice in their itudies.

GATE, in Arclitecture, a large door, leading or giving entralice into a city, town, caftle, palace, or other comfiderable building. See Architecture.

Thelts, in Egypt, was anciently known by the apwhatin suis a tianare! ates. In ancient Rome there $\because$ av stionshal gate, pur:a triumphalis. In modern Rome tinere is the jatice gate, which is unly opened in the seas at a mand jutilee.

Nhe gree if lordon were many of them converted intu abob or 1 rilis.s, as I.udgate, Newgate, \&c. but they that removed. The lefler or by gates are ratied pa゙tne. Gatcs, through which coaches, \&c.
 we tian 12 ; the heigit to be $1 \frac{1}{2}$ the breadth.
G:!, Ciar, in the narege, called in Fiench rain, is uled for the going os pace of a horfe.
G.ins, in a military fenfe, is made of ftrong planks, mith its. rars, to citolc an enemy. Thty are genc-
rally made in the middie of the curtain, from whence they are feen, and defended by the two flanks of the baftions. They fhould be covered with a good ravelin, that they may not be feen or enfladed by the enemy. Thefe gates, belonging to a fortified place, are paflages through the rampart, which may be fhut and opened by means of doors and a pertcullis. They are either private or public.

Private gates are thofe paffages by which the troops can go out of the town unfeen by the enemy, when they pafs to and from the relief of the duty in the outworks, or from any other occafion which is to be concealed from the befiegers.

Public gates are thofe paffages through the middle of fuch curtains, to which the great roads of public ways lead. The dimenfions of thefe are ufually about 13 or 14 feet high, and 9 or 10 feet wide, continued through the rampart, with proper receffes for foot paffengers to ftand in out of the way of wheel carriages.

GaqEs of Hell. This expreffion is ufed in Scripture, to denote figuratively either the grave or the powers of darknefs, i. e. the devil and his angels.

The Mahometans ufe the expreffion literally, and fuppofe that hell has feven gates. The firf is that where Muffulmans, who incur the guilt of fin, will be tormented. The fecond is for the Chriftians. The third is for the Jews. The fourth is for the Sabians. The fifth for the Magians or worfhippers of fire. The fixth for Pagans and idolaters. And the feventh for hypocrites, who make an outward fhow of religion, but have none.

GATESHEAD, in the county of Durham, is as it were the fuburbs of Newcaftle, though it lies in another county, being divided by the river Tyne; over which there is a fine fone bridge, with an iron gate in the middle, having the arms of Durham on one fide, and thofe of Newcaftle on the other, which is the boundary between the bifhopric and Northumberland. The church is a fine building, with a very high tower, feen at a great diltance; and in the churchyard are feveral ancient monuments. There are few traces left of its ancient monaitery, except a ftone gateway, or rather a modern erection. The houfe covered two acres and a half of land.

GATH, or Geth, in Ancient Geograply, a celebrated city of the Philiftines, and one of their five principalities. It is famous for having given birth to Goliath. David made a conqueft of it in the beginning of his reign over all Ifrael; and it continued fubject to the kings his fucceffors till the declenfion and decay of the kingdom of Judah. Rehoboam rebuilt or fortified it; King U'zziah retook it, and Hczekiah once mone reduced it under his fubjection.

Gath food about five or fix miles from Jamnia, about 14 fouth of Joppa, and 32 weft of Jerufalem. Hence fome authors (among whom is F. Calmet) have conmitted an egregious miltake in making Gath the moll fouthern, and Ekron the moft northern, of the Phlifline cities; as if thefe two had been the two boundaries of their domianos, whereas thefe two cities are not above five miles sfunder; and Caza is the lat of the five fatrapies fouth. And Jofephus (in the place already quoted) expreffes himfelf plainly enough, when he hays, that Hezekiah took all the Philittine

cities from Gaza to Geth; there being mavy nore cities of that name, which dignifes in the 15eve a wine prefs. Seversl more of the name of Geth or Gath are mentioned in Eulebios and st Jerone, whole fituation, according to them, phin'y how, them in have beea dioberent nacen fom thes, and from each other; befides thofe which had an stifunct to diftioguth them.

This city recovered its liberty and luthe in the time of the prophets Amos and Wicah; but was ateetwan demolihed by Hazael king of Syria, after which it became of but little conficertion tit the tipe of the holy war, when Fulk hing of Jerwhem buit a catle on its ruins.

Gath Opter, Gath $E_{p h}$,r, or Goth, in the canton of Opher, in Gatilee, was the bith-itare of the prophet Jonah. Johua makes this city to to part of the tribe of Zebulun; and St Jerone, in his prefice upua Jonah, fay", that it was tevo miles from Sephoris, otherwile called D: c.xfaren.
G.ith Kimnon, a city belonging to the tribe of Dan. St jerome places it ten miles from Dionolis on the way from Eleutheropolis. It was given to the Levites of Kuhath's family.
G.sth Rimin,n, was allo a city in the half tribe of Manafleh, on this fide Jordan, atid was alfo given for a I iace of abode to the Levites of Kohath's family.

Gath Kimmon, was !ikewice a city in the tribe of Ephraim, given to the Kohathites.

GATION, a borough in the county of Surrs, 19 miles from London. It lies under the fide of a hill roing to Reygate ; and is fappofed to have been known to the Komans, by realun of their coins and othes antiquities that have been found here. It is a borough by prefcription; and has fent members to parliament ever tince the 29 th of Henry VI. It was formerly a large town; but is now a mean village, with a frall church, and without either fair or market. The members are returned by its contable, who is annually chofen at the lord of the manor's court.

GAUBIUS, Jeromr-David, M. D. profelfor of medicine at Leyden, and afterwards fellow of the Royal Socety of Londun, was born at Heidelberg in the year t70\%. From the lelints he received the rudiments of his educatim, and was nuch efteemed by them on account of his abilities; but his father afterwards fent him to the orphan houle of Halle, lelt he thould be obliged to abiure his religion. The nature of the diciplise, ho:vever, he here found to be nuch too fevere, which induced him to requet his father to remuve him from it, which was accordisgity complied with. His teacher at this holpital attributing the ditlike of young Gautius to the wast of genise, urged him to give his fon forme mechanical emoloyment ; but the father thought profer to indulge his ardent defire atier kinotedge, and accordinely: fent him to Amfterdem to ftudy under his uncle John, who was an eminent phyfician. After profecting his medical iludies for iome tinue at Hordizyl, he refolved to vifit Leyden, where the immortal Boerhaave was an eminent profeffor, and whofe penctrating eye foon difoovered that Gaubitas was poffeled of talents above mediocrity. He sonoured him with unlimited accefs to his houle, delighted in imparting inftruction to him, and gradually tus warded the cultivation of his mind. He took the Vol. IX. Part II.

 indefatigate hobour :ate him anvine w ro.en in chair, Gabits on his re-omandetion $\cdot$ ts aromine. 1 to acceed him. Hi rus) ing Recipes in the year $1-38$, by whin he acquired gras and bukty mented approbation, she weduced the art from a mere mechanical to a fintentinc form. His Princiaies of Nofolozy is pequns his moti materly performance, as it evinced that be wa: highly worthy of luch a preceptor. Hi= nest pullication, which appenrcd in iz, 1 , was his " Adveriatia varii Atcumenti," a work which was farticuiariy i:terefing to chemifs; and his eration on the 200th amnerfary of the cademy of Leycen attracted comiderabie notice, as in it he traced out, with his accultomed acumen, the chief epochs of the arts and fciences is Holland.

Ile was hilewife the author of numstrots and vatuable papers in the Tradactions of the Socicty of Ilaer'em, and was editor of many excellent performances, among which we may rank Cramer's Elementa aritis docimafice; Albinus de prefagiend'a vita e: morte, and Sxammerdam's Book of Nature, which he partly tranlated. His literary merit fpread his fame fo far beyond the bound; of his native country, that pupi's repaired to Leyden from every quarter of Europe. In addition to his widely extended reputation, he was bleflied with the enjoyment of good health till he was 70 years of age, and died on the 29 th of November 1782 , in his feventyfifth year.

O:c work of his, entitled " Intitutiones Pathologie Medicinalis," was deemed fo valuable by Protetior Ackerman, and of fuch dimeular adiantage in acale mical lectures, that he gave the world a fourth edtition of it, publihed at Nuremberg in 1787.

GAUDEN, Dr loseph, fon of lohn Gauden vicar of Maytield in Effex, wav born there in 1 ozs. At the commencement of the civil war, he was chaplain to Robert earl of Warwick; who taking part wi:h the parliment againt the hing, was followed by his chaplain. Upon the efablifhment of the Pretbyterian mom del of church government, he complied with the minizy powers, and was nominated one of the allembly of dirimes who met at Weltminiter in $1+3$, and truk the covenant ; yet having offered fome leruples and whe tions to it, his name was afterwards flruck out of the lini. Nor did he efpoufe the parliament caufe any longer than they athered to their firil avowed principles of reforming ouly, imted of dettroying, monarchy and epiropacy. In this fpirit he was one of thole disises who di 子aed a protettation to the army agnind the viount proceedings that affeeted the life of the Ling: and a few days after his execution publilled the famoun Eixav Baridixn, A Portraiture of his Sacred Majefty in his Sulitude and Sufferings; which ran through 50 editions in the courfe of a year. Upon the recurn of Charles I1. he was promoted to the fee of Eveter; and in 1662 was removed to Worcelter, much to his 3 M
regret,
reget, havin: Anttered himfelf with the hopes of a trandition to Wincheler; and his death haprened the f.me vear. He wrote many controverfial pieces fuited to the ciscumtances of the times, and to his own ve:s frum them. The Ekon Barilike above-mentioned he prblified as the king's private meditations: though on this paint there has been a long controverfy. Aiter the bihne's death, his wibow. in a letter to one of her Wonce call's it The fiewel; and faid, her hufband had foped to make a fortune by it; and that the had a letier of a vere great man's, which would clear up that he writ it. This afertion, as the earl of Clarendon had predieted, was caccrly efpoufed by the anti-royaluts, in the view of difparaging Charles 1 . But it has ieen ubferved, that Gauden had too luxuriant an imagination, which betrayed him into a ranknefs of hyle ia the Aflatic way; and from thence, as Biihop Burnet argues with others, it may be certainly concluded, that no: he, but the king himielf, was the true author 1. The Eixwv Buata,xn; in which there is a noblenefs and ivfnefs of thought, with a greatnefs of Ryle, that made it be looked on as the beit written book in the Englifh l.ngulage.

Givel, or Gibel, among builders. See Gabel.
G.ivel, in La:r, tribute, toll, cuftom, or yearly re: snue; of which we had in old time feveral kinds. See GIDEL.
G.ivFL Kind, a tenure or cuftom belonging to lands in the county of Kent. The word is laid by Lambard to te compounded of three Sazon words, gyfe, eal, kyn, " muthus cognatione proximis data." Veritegan calls it $\therefore$ "rikint, quat " give all kind," that is, to each clisld lis part: and Taylor, in his hiftory of gavelkind, debises it from the Britifh garel, i. e. a hold or tenure, and cithned, " gencratio aut famiïa;" and fo gavel cenved might fignify tentiore generationis.-It is univerfally , nown what targgles the Kentilh men made to preseve their ancient literties, and with how much fucref thofe ftuggles were attended. And as it is prinadly here that we meet with the cuftom of gavelkind (though it was and is to be found in fome other parts of the kingdom). we may fairly conclude, that this was a part of thefe liberties: agrecable to Mr Selden's opinion, that gavelkind, before the Norman con'Leef, was the general cuffom of the realm. The dittinguilhed properties of this tenure are various: fome of the priacipal are thefe: 1 . The tenant is of age Cufficient to alienate his eftate by feofiment, at the age of 15.2 The eftate does not efcheat in cafe of an attainder and execution for felony; their maxim being, "the f.ther to the bough, the fon to the plough." 2. In moft places he had the power of devifing lands by will, before the ttatute for that purpofe was made. 4. The lard's defcend, not to the eldelt, youngef, or any one fur only, but to all the fons together; which was indeed anciently the moft ufual courle of defeent, 511 ove: England, though in particular places particular cultoms prevailed.
G.IVELET, in Law, an ancient and fpecial ceflavit ufed in Kent, where the cultom of gavelkind continuce, by which the tenant, if he withdraws his rent and fervices due to the lord, forfeits his land and tenements.
' The procefs of the gavelet is thus. The lord is firft to feek by the fteward of his court, from three weeks so three watks, to find fome ditrefs upon the tene-
ment, till the fourth court; and if at that time he find none, at this fourth court it is awarded, that he take the tenement in his hand in name of a dittrefs, and keep it a year and a day without manuring ; within which time, if the tenant pay his arrears, and make reatonable amends for the withholding, he thall have and enjoy his tencment as before : if he come not before the year and day be palt, the lord is to go to the nest county court with witnefles of what had pafled at his own court, and pronounce there his procets, to have further witnelles; and then by the award of his own ccurt, he fhall enter and marure the tenement as his own: fo that if the tenant defired afterwards to have and hold it as before, he mult agree with the lord; according to this old faying: "Has lie not lince any thing given, or any thing paid, then let him pay five pound for his were, e'er he become healder again." Other copies have the firtt part with fome variation; " Let him nine times pay, and nine times repay."

Gaveiet, in London, is a writ ufed in the hatings, given to lords of rents in the city of London. Here the parties, tenant and demandant, appear by foire facias, to how caule why the one hould not have his tenement again on payment of his rent, or the other recover the lands on default thereof.

GAUGAMELA, in Ancient Geograplay, a village of Aturia, lying between the rivers Lycus and Tigris; famous for Alexander's victory over Darius. It is faid to have been allowed to Darius Hyltafpes for the maintenance of a camel; and hence the name. It was not far from a more coniderable place called Arbela; whence the latter gave the name to the victory. See Arbelia.

GAUGE-Ponint of a folid meafure, the diameter of a circle whole area is equal to the folid content of the fame meafure.

GAUGER, a king's officer, who is appointed to examine all tons, pipes, hogitheads, and barrels, of wine, beer, ale, oil, honey, \&c. and give them a mark of allowance, before they are fold in any place within the extent of his office.

## GAUGING. See Geonetry.

Gavging-Rod, an inftrument ufed in gauging or meafuring the contents of any veffel. That ufually employed is the four-foot gauging rod. It is commonly made of bos, and confilts of four rules, cach a foot long and about three-eighths of an inch fquare, joined together by three brals joints; by which means the rod is rendered four feet long when the four rules are quite opened, and but one foot when they are all folded together. On the firit face of this rod, marked 4, are placed two diagonal lines; one for beer and the other for wine: by means of which the content of any common veffel in beer or wine gallons may be readily found, by putting the rod in at the bung hole of the veffel till it meets the interfection of the head of the vallel with the flaves oppolite to the bung hole. For diftinction of this line, there is written thereon, beer and wine gallons. On the fecond face, 5, are a line of inches and the gauge-line; which is a line exprefling the areas of circles, whofe diameters are the correfpondent inches in ale gallons. At the begianing is written, ale area. On the third face, 6, are three fcales of lines; the firft, at the end of which is written hog/lead, is for finding how many gallons there are in

Plate
CXXVIIT.

Gavelet
I! Gutging. R d.

Gaugng- a hogftead when it is not full, lying with it: axis paRor. rallel to the hurizon. The fecond line, at the end of
:hich is written E. L. fignifying a butt lying is for the fime ute as that for the hogthead. The third line is to find how much liquor is wanting to fill up a butt when it is fanding: at the end of it is written $B . S$. fignifying a butt fanding. In the half of the fourth tace of the gauging rod, 7 , there are the thiee fcales of tines, to find the wants in a firkin, kilderkin, and bareel, lying with their areas parallel to the borizon. They are ditinguilhed by letters $F . K$. B. fignifing a frkin, kilderkin, and barril.

I/fe of the diagonal lines on this rod. To find the content of a velfel in beer or winc gallons, put the brafed end of the gauging rod into the bung hole of the caft, with the diagonal lines upwards, and thruft tnis brafed end to the meeting of the head and flaves; then with chalk make a mark at the middle of the bung hole of the veffel, and alfo on the diagonal lines of the rod, right againit, over one another, when the Lsafed end is thruft home to the head and ftaves: then turn the gauging rod to the other end of the veffel, and thrutt the brafed end home to the end, as before. Laftly, See if the mark made on the gauging rod come even with the mark made on the bung hole, when the rod was thruft to the other end; which if it be, the mark made on the diagonal lines will, on the fame lines, thow the whole content of the cakk in beer or wine gallons.

If the mark made on the bung hole be not right againft that made on the rod when you put it the r,ther way, then right againft the mark made on the bung hole make another on the diagonal line; and the divifion on the diagonal line between the two chalks will fhow the reffel's whole contents in beer or wine gallons. Thus, e. gr. if the diagonal line of the veffel be 28 inches four-tenths, its contents in beer gallons will be near 51 , and in wine gallons 62 .

If a veifel be open, as a half barrel, tun, or copper, and the meafure from the middle of one fide to the head and ftaves be $3^{8}$ inches, the diagonal line gives 122 beer crallons; half of which, viz. 61, is the content of the open half tub.

If you have a large veffel, as a tun or copper, and the dagonal line taken by a long rule proves 70 inches; the content of that vellel may be found thus: Every inch at the beginning end of the diagonal line call ten inches. Thus ten inches becomes 100 inches; and every tenth of a gallon call 100 gallons; and every whole gallon call 1000 gallons.

Example. At 44.8 inches on the diagonal beer line is 200 gallons; fo that 4 inches 48 paits, now ralled 44 inches 8 -tenths, ts jut two tenthe of a gallon, now called 200 gallons; fo alfo it the diagonal line be -6 inches and 7 -tenths, a clofe cafk of fuch diagonal will hold icoo beer gallons; but an open calk but half fo much, viz. $j 0=$ beer gallons.

I/e of the Guge Line. To find the content of any cylindrical veftel in ale gallons; feek the diameter of the veflel in inches, and jult againit it on the gauge iine is the quantity of ale allons contained in cue inch decp: this multiptied by the length of the eylinder will give its content in ale gallons.

For example, fuppofe the length of the vefiel 32.06, and the diameter of its bale 25 inches; to find what
 on the gauge lim is one fallom :an! . 75 of a callon; which multiplied by 32.06 , the len, h, give, 55.91 .7 gallons for the content of the veflel.

The tung diamseor of a hogh, ad hein"; 25 incita, the head diameter 22 im-Hes, an's the luarn $\because 2 .=6$ inches, to find tioe quantity of ale gallori contailed is it - Sech. 22, the bung diameter, on the liate efincher; and night again? it on the guage fine you will find 1.745: take one third of it, which is $.5^{2} 2$, and fet it down twice; feek 22 inches in the had diumetco, and againt it you will find on the ganse line 1.355 ; onethitd of which aded to twice .530 gives 1.0006 ; which multiplied by the length 32.06 , the product in!! be 51.6037 .6 , the content in ale gallons. Note, thin operation fuppoles, that the alurctaid hogthesed is in the figure of the middle fruttum of a !pheroid.

The ufe of the lines on the two other faces of the rod is very ealy; you need only put it domaright intu the bung hole (if the vellel you defire :s know the quantity of ale galions contained therein be lying. is the oppofite ftaves; and then where the lurface of $t$ l, liquor cuts any one of the lines appropriated to that veffel, will be the number of gallo:s contained in that veffel.

GAUL, the name given by the Romans to the country that nor forms the kingdom of France. - The original inhabitants were defeended from the Celtes o: Gomerians, by whom the greated part of Europe was peopled ; the name of Gal/, or Gaul's, being probably given them long after their fettlement in that country. See Galeia.

The ancient hitlory of the Gauls is entirely wrapped up in obfcurity and darknefs; all we know concerning them for a long time is, that they multiplied fo fait. that, their country being unable to contain them, they poured forth in valt multitudes into other conntries, which they generally fubdued, and fottled themielves in. It often happened, however, that thefe colonics were fo moletted by their neighbours, that they were obliged to fend for affiftance to their native country. This was always very eafily obtained: The Gauls were upon every occafion, ready to fend torth great numbers of new adventurers; and as thefe foread defolation wherever they came, the very name of Gauls proved terrible to moit of the neighbouring nations.-The Acenunt cariieft excurfion of thefe people, of which we have any the G..nat dilinct account, was into lialy, under a famed leader, incurfing. named Bellovefie, about 622 years before Chrift. He crolfed the Rhone and the $A / p$, till then unattempted; defeated the Hetrurians; and fcized upon that part of their country, fince known by the names of I.cmbardy and Picamont.-The fecond grand expedition was made by the Conomani, a people dueling between the rivers Seine and Loire, under a general named Elitonis. They fettled in thofe parts of Italy, now known by the names of Brofium, the Cromoncfi, the Mantuar, Carmisa, and the linetian.-In a third exeurtion, eso other Gaulith nations lettled on both files of the rive: Po; and in a fourth, the Lonii and lingones lettled in the country tetween Ravcma and Bologna. I'he time of thefe thrice laft expeditions is uncertain.

The third expedition of the Gruls was more remarkable than any of the former, and hampened about 202 years after that of Dellos fus. The Semones fettied

Ga:\%. betwein $P$ ant and Meaty, were invited into Italy by a Hornim 1ad, sud fetted themedver in Umbris. Dran an their hing laid fiege to Cluium, a city in alF.nce with Rome; and this producd a was what the Ih man, in which the later were at fint defenten, an than cliy takein and bumt; but at lansth the whole army uas cut of. I.y Camillus, infonion, that not a hayk pertom cicured.

SHene wher cepectition the Gat's undertook againt Ruma.r. . in whel, bhough they always prowed unfacceifal, by reaiun of ther wath of mifitaly difciWhe; yot ther fincue. and colinge made them fo fomidable to the repuillic, that, on the fint news of this march, extraurdinary lesics of troops were made, facrifices and pullic fupplications offered to the gods, and the law which granich m innunity fom miliaty fervice to pricts and cid man, was, for the time, abobithed.

A were very litite more fucceftul tha again the Romane. The firt of thale we hear of anas about 279 yars Lece Clah, in the year after Pyrious had inGaded Iedy. At this time, the Gaub fording themLeina frezay oventoched at home, font out three great - olonice to cutquer new countries for thenfelvec. One ,i thefe armies was commanded by Bremmer, anotleer iy Cocikriz, and the third by Boigius. The rirt entered Pamonia or Hungary; the feeond Thrace; and the third marlud into Hyricum and Macedonia. Here Belgias at firt mat with great fucceris; and enriched himelf by plunder to fowh a degree, that Brenuss emving him, raluived to entier thie fafue countries, in order to ihare the fooil. In a flort time, however, 3ughis mut with fuch a total defeat, that his army usios :Imont catitely deftroyed; upon which Erennus hatened to the fame place. His army at firf confittod of 150,000 foot and 15,000 horfe : but two of his priacipal oulicers revolted, and carried offi 20,000 men, with whom they marched into 'Thrace; whers, having foned Cecthriar, they feized on Byzantians and the welema cuant of the Propontis, making the adjacent parts inibutury to them.-To retrieve this lofs, Bremus feat for froh lapplies from Gaul; and lizing increated lis :my to 159,000 foot, and upwards of 60,000 horie, ine intured Macedonid, defeated the general who opputed him, and ravaged the whole country. He nest inurched towards the firaits of Thermopyla, wiha a aefign to insede Grecse; but was itoppel by the -orce iont to defend that pafs agdinn him. He pafied the mountains, however, as Xerxes had formerly dune, upon which the guard retired, to avoid being furrounded. Bremus then having ordered Acichorius, the next to him in command, to fullow at a distance "ith 1.ni of his army, marched with the bulk of the forces to lhiphit, in orler to phonder the rich temple there. This enterprife proved exceedingly unfortente: a grat number of his men were delloyed by a dreadful itorm of hail, thunder, and lightuing ; anther part of his army was deltroyed by aa carthfuat - ; and the remainder, fomehow or other, imagiang themfelvo attacked by the enemy, fought againit earh obher the whole night, fo that in the morning carce one hali of them remained. The Greek force then poureal ia upon them from all pats; and that in fuch nameres, that though Acichutios came
up in due time with his forces, Brennus found himfelf unable to make head againit the Greeks, and was defeated with great laughter. He himifelf was defperately wounded ; and fo dihheartened by his mistortune, that, having aftembled all his chiets, he advifed them to kill ail the wounded and difabled, and to make the beft retreat they could; after which he put an end to his own life. On this occafion, it is faid that $22,:=0$ of thefe unhappy people were executed by their own countrymen. Acichorius then fet out with the remainder for Gaul; but, by being obliged to march through the country of their enemies, the calanitios they met with by the way were fo grierous, that not one of thein reachicd their own country. A jutt judgement, fay the Greek and Roman authors, for their facrilegious intentions againt Delphi.

The Romans having oiten felt the effects of the Guat ${ }^{4}$ mGanlifh ferocity and courage, thought proper at laft, vaded ty in order to humble them, to invade their country mats. Sheir firl fuccenial attempt was about 118 years before Chrit, under the command of Quintus Marcius, furnamed $R_{t} x$. IH cpened a way betwixt the Alps and the Pyrcnces, which laid the foundation for conquering the whole cumery. This was a work of immente labour of ittelf, and rendered fill muse dificicult by the oppoftion of the Gauls, efpecially thofe callied the St.eni, who lived at the foot of the $A l_{\mathrm{F}}$. Thete people, firding themfelves overpowered by the coufular army, fet fire to their houfes, killed their wives and children, and then thres themelves into the Hames. A:ter this Marcius beilt the city of Narbonne, which became the capits of a province. His fucceflor Scaurus alio conquered tome Gaulih nations; and in order to facilitate the fending troops from Italy into that country, he made feveral excellent ronds between them, which before were almolt impallable. Theie furcelles gave rife to the invation of the Cimbri and Teutones : an account of when unfortunate expedition is given under the articles Cimbri, Rome, Teutoses, \&c.

From this time, the Gauls ceaied to be formidable to the Romans, and even feem to have been for lome time on good terms with them. At lati, however, the Helretii hindled a war with the republic, whici brought Ciefar over the Alps, and ended in the total fubjection of the country. Orgetorix was the firlt samenfing caule of it; who had engaged a valt number of his fictefs of countrymen to burn their towns and villares, and to flins ( $x$ go in fearch of new conquefts. Iulius Cefar, to whofe ${ }^{\text {ian }}$. lot the whole country of Gaul had fallen, made fuch hane to come and fupprefs them, that he was got to the Rhone in eight days; broke down the bridge of Genera, and, in a few days more, finithed the famed wall between that city and Mount Jura, now St Claude, which extended feverteen miles in length, was fixteen fect hinh, fortinied with towers and caftles it proper diftances, and a ditch that ran the whole length of it. I lifs own accoun.t of it may be relied upon, he did not fet out till the beginning of Aptil ; and yet this huge work was fininied ly the ides or 13 th of the month: fo that, fubtracting the cight days he was acoming, it mult have been all done in about five days; a prodigious work, condidering he had but one legion these, or even though the whole country had given him :flillance. Whillt this was doing, and the reinfurcements be wanted wese coming, he amufed the

——, Mas took the city of Avaricum, now Buarges, one of ise atrongen in Gaul, and which had a garriton of $7,000 \mathrm{men}$; of whom he made fuch a dreadral thughtis, that hatd'y 800 efcaped. Whill he was betieging Gergovia, the canital of the Arverni, he was informed that the Nitiobriges, or Agenuis, were in arms; and that the Whui were fending to Vercingetorix $10,0=0$ a en, whish they were to have fent to reinforce Cwar. Upon this news, he left Fabius to carry on the fiege, and marched againft the Ædui. Thefe, upon his approach, fubmittel, in appearance, and were pardoned; wat foon atter that whole ation rofe up in arms, and mardered all the Italian troops in their capital. Cafar, at this, was in great ftrains what meafures to take ; but :efolved at length to raile the fiege of Gergovia, and at once attack the enemy's camp, which he did with tome Caccefs; but when he thought to have gone to Noviodunom, or Noyons, where his baggage, military cheft, sic. were left, he heard that the Edui had carried it (ifi, and burnt the place. Labienus, juflly thinking that Cxfar would want his affilance in the condition l.e now was, went to join him, and in his way defeated a Gaulih general named Camulogenus, who eame to oppofe his march; but this did not hinder the revolt from fpreading itfeif all over Celtic Gaul, whither Vercingeterix had fent for freh fupplies, and, in the mean time, attacked Citfar; but was defeated, and forced to retire to Alefia, a ftrong place, now Alife in Burgundy , as is fuppofed. Hither Cafar hattened, and befieged him ; and having drawn a double circumvallation, with a defign to Itarve him in it, as he was likely to have done, upon that account refufed all offers of a furrender from him. At length, the long expected reinfurcement came, confifting of 160,000 men, under four gencrals : thete made feveral fruitles attacks on Cæfar's tienches; but were defeated in three feveral battles, which at length obliged Vercingetoris to furrender at

Gints, Drapes the Senunian, and Luterius the Cadur cean. The place being ftrong and well garrifoned, Cefar was obliged to march thither from the farthe?t part of Belgic Gaul ; and foon after reduced it, for want of water. Here again he caufed the right band; of all that were ft to bear arms to be cut off, to deter the reft from revolting afrefh. Thus was the conqueli of Gaul finibed from the Alps and Pyrenees to the Gat recu Rhine, all which valt tract was now reduced to a Ro- Roman man province under the government of a proctor. Du-proviuce ring his feveral expeditions into Gaul, Ciefar is faid to have taken 800 cities; to have fubdued 300 different nations; and to have defeated, in feveral battles, three millions of men, of whom one million were killed, and another taken prifoners.- The hillory of the country, from the time of its conqueft by the Romans to the prefent, is given under the articles Rome and Frunce.

The Gauls anciently were divided into a great num-Character, ber of different nations, which were continually at war \&c. of the with one another, and at variance among themfelves. ancier t Cefar tells us, that not only all their cities, cantons, Gauls., and diltricts, but even almoit all families, were divided and torn by factions; and this undoubtedly facilitated the conqueft of the whole. The general character of all thefe people was an exceilive ferocity and love of liberty. This laft they carried to fuch an extreme, that either on the appearance of fervitude, or incapacity of action through old age, wounds, or chronic difeafes, they put an end to their own lives, or prevailed upon their friends to kill them. In cities, when they found themfelves fo Atraitly befieged that they could hold out no longer, inftead of thinking how to obtain honourable terms of capitulation, their chief care very often was to put their wives and children to death, and then to kill one another, to avoid being led into llavery. Their exceffive love of liberty and contempt of death, according to Strabo, very much facilitated their conqueit by Cefar; for pouring their numerous forces upon fuch an experienced enemy, as Cafar, their want of conduct very foon proved the ruin of the whole.

The chief diverfion of the Gauls was hunting ; and indeed, confidering the valt forells with which their country abounded, and the multitude of wild bealts which lodged in them, they were under an abfolute neceliity to hunt and delloy them, to prevent the country from being rendered totally uninhabitable. Befides this, however, they had alfo their hippodromes, horfe and chariot races, tilts and tournaments; at all of which the bards affifted with their poems, fongs, and mufical inftruments.-For an account of their religion, fee the article Druid.

The Gau's were exceffively fond of feafting, in which they were very profufe; as, like all other northifn uations, they were great lovers of good eating and drinking. Their chief liquurs were beer and wine. Their tables were very low. They ate but little bread, which was baked Hat and hard, and caflly broken in pieces: but devoured a great deal of tielh, boiled, roafted, or broiled; and this they did in a very flovenly manver, holding the piece in their hands, and tearincs it with their tecth. What they could not part by this way, they cut with a little knife which lung at their gitdle. When the compans was mmeronc, the Cory diferetion. Cafar ufd all his prifoners with great feverity, except the Ædui and Arverni, by whofe means l.e hoped to gain their nations, which were the molt potent of Celtic Gaul : nor was he difinppointed; for both of them fubmitted to him, and the furmer received him into the capital, where he fpent the winter, after he put his army into winter quarters. This campaign, as it proved one of the hardeft he ever had, fo he gained more glory by it than any Roman general had done before : yet could not at all by this procure from the fervile fenate, now wholly dedicated to his rival, a prolungation of his proconfulhip; upon which he is reportrd to have laid his hand upon his fword, and faid, that that Ahould do it.

He was as good as his word; and the Gauls, upon their former ill fuccefs, refolving to have as many feparate armies as provinces, in order to embarrafs him the more, Cixfar, and his generals Labienns and Fahius, were forced to fight them one after another; which they did, however, with fuch fuccefs, that, notwithftanding the hardnefs of the feafun, they lubdued the Bhuriges, Catnutes, Rhcmi, and Belluvaci, with their sencral Correus, by which he at once quieted all the Belgic provinces bordering on Celtic Gaul. The next who followed were the Treviri, the Eburones, aud thie Andes, under their general Dumnacus. The laft place which he!d out againit him was Uvellodunum ; which was defended by the two latt acting generals of the

Ga'unit: fice, or chief of the feall, wi.o was cither cne of the richeil, or noblel, or braveit, fat in the middle, wieh the mafter of the houfe by lis fide: the reit tomk the in places nest aecording to their rank, having their li rvants holding their lhields behind them. Thefe fatis feldom cnde] wi:hout bloodhed; but if by chance the feat proved a peaceable one, it was senerally accomparied not only with mulic and fonge, but likewiee with dances, in which the dancors were amaned cap-a-pee, and beat time with their fwords upon their hields. On certain fetivals they were whit to drefs themfelves in the thins of beatts, and in that accompany the procef. fions in honour of their deities or heroes. Others dref. fed themfelves in mafqueracic habits, tome of them ver: indecent, and played feveral antic ond imm an trich: This lait cutom contirued long after their converion to Chritianity.

GAULANITIS, or GUwosatis (Jopephus); in Ancient $G \times \operatorname{rag}_{f}^{\text {l }} \%$, according to the different mamer of writing the capital, Gouian or Gaulon; the extreme part of Bathan so the fouth, and bordening on the tribe of Gad. It was divided into the Superior, which to the ealt extended to Arabia; and into the Interior, which lay on the lake of Genefareth, (lofephus).

GAULON, or Golan, the canital of the Gaulanitis Superior; a Levitical city and place of refuge, (Mofes, Johua.)

GAULOS, in Ancient Ge jerapli, a fma!l inland of Sicily, in the African 反ea, adjoining to Melite or Mal ta; with commodious harbours; a colony of Phenicians, with a cognominal town. Gaulonits, the people, (Infeription) Now called Guzo, five miles to the wett of Maita.

GAULTHERIA, a genus of plants belonging to the decandria clafs; and in the natural method ranking under the 18 oh order, Bicornes. Sce Botavy Inlex.

GIUNT-Belited, in the manege, is faid of a horfe $w^{11}$ o.e belly $\mathbb{k}$ rinks up towards his tlanks.

GAUNTLET. See Gintlet.
GAUNTLOPE, pronounced Gaunt/et, a military punifhment for felony, or fome other heinots offence.

In weffels of war, it is executed in the folloning manner. The whole thip's crew is difpefed in two rows, tanding face to face on both fides of the deck, fo as to form a line whereby to go forward on one fide, and return aft on the other; each perfon being furnifhed with a fimall twifted cord, called a knittle, haviag two or three knots upon it. The delinquent is then fripped naked above the wait, and ordered to pafs forward between the two rows of men, and aft on the other fide, a certain number of times, rarely eveceding three; during which every perfon cives him a lripe as he runs along. In his paffage through this painful ordeal, he is fometimes tripped up, and very $f$ verely handled while incapable of procecding. This punithment, which is called running the gauntlet, is feldom intlicted, except for fuch crimes as will naturally eveite a gencral antipathy among the feamen: as, of fime occafions, the cularit would pafs without receiving a fingle blow, particularly in cafes of mutiny and fedition, to the punihment of which our failors leen to have a contitutional a verfion.

In the land fervice, when a foldier is fentenced to run the gauntlope, the regiment is drawn nat in two ranks facing each other ; each foldice, having a fwitch in his
hond, lakes the uracim! as he rons aiong nated from the wait upward:. While he runs, the drums beat at c.ech cond of t'e rank: Sometimes be runs three, five, r.ay. or ferer time . accorling to the mature of the offence. The maior is on horiebach, and takes care that cach folline d = i.is athe

GAVILS, or (iwts. Sefiarres.
G.1VOIF 1 , or Cinomat, is a kind of dence, the air of which has tro britk and lively ftrains in coamon time, each of which tirains is twice played over. The firt has ufutly four or eight bars; and the fecond conthins cight, twelve, or mure. The fert hegins with a minim, or two crotcliets, or notes of equal value, ai d the land riling; and ends with the fall of the hatd upon the dominant or mediant of the mode, but never upo:1 the final, unled it be a rondent and the lat becins with the sife of the hand, and ends with the fall upo:t the fiwn! of the mode.

Tempi di Garorta, is when only the time or movement of a gavotte is imitated, without any regard to the meafures or number of bars or firains - Little airs are often found in fonatas, which have this phrafe to regulate their motions.

GALR1, a genus of plants belonging to the oftandria el ifs; and in the natural nethod rinking under the rith order, Calycanthema. See Botasy Index.
G.1UsE, or Giwse, in Commerce, a very thin, Alight, tranfparent kind of ftuff, woven lometimes of filk, and fometimes only of thread.-To warp the filk for making of gaufe, they ufe a peculiar kind ci mill, upon which the filk is wormd: this mill is a wooden machine about fix feet high, having an axis perpendicularly phared in the middle thereof, with fix larse winge, on which the filk is wound from uf the bobbins by the axis tarning round. When all the filk is on the mill, they ufe another inftrument to wind it off again on two beams: this done, the filk is paffer through as many little beads as there are threads nt filk; and thus rolled on another beam to funply thi loom.

The gaufe loom is mucl like that of the commo: weavers, though it has fereral arpendages peculia: to itfelf. See Loov.

There are figured gaties; fome with flowers of gold and filver, on a filk ground: thefe laft are chictly brought from China.

GAY, Jons, a celebrated Englith fact, defeended from an ancient family in Devoalhire, was born at Eveter, and received bis education at the free lchoo! of Barntaple in thit county, under the ca:c of M : William Rayner.-We was beed a mercer in the Strand; but haviag a fmall fortane, independent of butinefs, and confdering the attendance on a thop as a degradation of there talents which he found himfel: poffefied of, he guitted that occupation, and applied himfelf to other views, and to the indulgence of his inclination for the Mufo. Jn 1712 we find him feeretary, or rather domettic llesard, to the duchets of Mormouth, in which fation he contisued till the beginning of the year 1714; at which time he accompanied the earl of Clarendon : Mano:er, whither that nobleman was defpatched $1, \mathrm{~g}$ (ween Anne. In the latter end of the fame year, ia confeguence of the gucen's death, he returned to Enyland, wheic he lived in the bighelt eftimation and intimay of friendllip with

## CA Y [ $46 \neq \mathrm{C} \quad$ G A Z

ma. : $\quad \therefore \quad \therefore$ of tie frrt ditinstion both in ravk and alalites.-Ite was even particularly tahen notice of iy Xuea Casoline, then princefs of Wales, to whom he had tion honour of readine in manulcript his tragedy of the can rios; and in 17-6 dedicated his Frióc, by I" minlin: to the duke of Cumberland.- From this - ..ntenance hown to bim, and numbereis poomics a. de him of preferment, it was reatonable to lippole, t it he would have been exteclly provided for in tome onice fuitable to his inclination and a'jlities. lontead of which, in $\mathbf{1} \boldsymbol{7} \boldsymbol{2}$, he was offered the place of gentleman wher to one of the young princelles; an office Whish, is lie looked on it as rather an indiguity to a :tan whofe talents micht have been fo much better empooved. he thought proper to refule; and fone pretty wam remontiances were made on the occation by his there friends and zealons patron, the duke and duchels of Queenberrv, which terminated in thole two moble pertonages withdrawing from court in difguth. 11. Gay's dependencies on the promiles of the great, and the difappointments he met with, he has figuratively delcribed in his fable of the Hare with many frinds. However, the very extraordinary fuccefs he met with from public encouragement made an ample amends, both with refpect to fatisfaction and emolument, for thofe private difappointments.-For, in the fealion of $1,27-8$, appeared his Bergar's fpera; the valt fuccefs of which was not only unprecedented, but atmolt incredible.-It had an uninterrupted run in London of 63 nighte in the firft feafun, and was renewed in the enfuing one with equal approbation. It fpread into all the great towns of England; was play. ed in many places to the 3 th and qoth time, and at Buth and Brifol 50 ; made its progrefs into Walec, Ecotland, and Ircland, in which laft place it was acted for 24 fuccflive nights; and lat of all it was performed at Minorca. Nur was the fame of it confined to the reading and reprefentation alone, for the card table :nd drawing room thared with the theatre and clofet i: this refpect; the ladies camied about the favourite fonge of it eagraven upon their fan mounts; and fcreens, and other picces of furniture were decorated with the tame. In thort, the fatire of this piece was fo friking, fo apiarent, and to perfeelly adduted to the tatle of all desrees of people, that it orcrthrew the Italtan opera, that Dugen of the nobility and gentry, which had fo long feduced them to idolatry, and which Dennis, by the labours and outcries of a whole life, and many other ariters by the force of reaton and reflection, had in vain endeavoliced to drive from the throne of public talte. The profits of this picce were fo very great, both to the aution and Mr Rih the manarer, that it gave rife to a yuibble, which berame frequent in the mouths of many, viz. Tiat: is lad made Rich gay, and (iay rich; and it has we. aterted, that the author's own advantages from it acie nut lels than $202=1$. In confequence of this ficMr Gay wo. imbuced to write it fecond part to it, which he entitled Polly. But the difguft fubliting besen him sud the court, together with the mifrepre: th: ins.c mane oi lim as hasing been the author of ane dill liwhed libels and fedtious pamphlets, occationa : prohbina and fuppection of it to be fent from the at chmonain, at the very time when every thing W. d i.s remdinels for the relhearfal of it. A sery considerable tum, lowiow, accrued to him from the pub-

Ifcation of it afterwards in quarto.-Mr Gay wrote feveral other pieces in the dramatic way, and may very vifurible ones in verfe. Among the latter, his Irtad, or the Ant of IV alking the Strcets of Lonsu", though his firit poetical attempt, is far from being the lealt conliderable, and is what recommended nim to the enteen and frienthip of Mr Poge: hat as, among his dramdtic work, his Beggar's (thera dici at foth, and perhaps ever will, Itand as an umivalled ramitarpiece, fo, amony his poetical works, his Folks hand the lime rank of eitimation; the latter having, been atmon as univerfally read as the former was reprefented, and beth equally admired. MIr Gay's difpolition was tiveet and altable, his temper generous, and bis converfition agreable and entertaining. But he had one foible, too trequently incident to men of great literary abiliti: and whicit lub. jected him at times to inconseniencies which otherwif: he needed not to hirve experienced, viz. an excels of indolence, without any knowledge of econonr:- So that, though his emoluments were, at fome periods of his lite, very confiderable, he was at others greatly ftraitened in his circumftances; por coull he prevail on himelf to follow the advice of his friend Dean Swift, whom we find in many of his letters endeavouring to perfuade him to the purchafing of an annuity, as a referve ior the exigencies that might attend on old age.-Mr Gay chote rather to throw himfelf on patronage, than fecure to himfelf an independent competency by the means pointed out to him ; fo that, after having undergone many viciflitudes of fortune, and being for fome time chieily fupported by the liberality of the duke and duchefs of Queenberry, he died at their boule in Burlington gardens, in December 1732. He was interred in Wellmintler Abbey, and a monument erected to his memory, at the expence of his aforementioned noble benefactors, with an infeription exprefive of their regards and his own deferts, and an epitaph in verfe by Mr Pope.

GAZA, Theodore, a famous Greek in the 3 sth century, was bon in 1398 . His country being invaded by the Turks, he retired into Italy; where be at firft fupported himfelf by tranfcribing ancient authors, an employment the learned had frequent recourfe to before the invention of printing. His uncommon parts and learning foon recommended him to public notice; and particularly to Cardinal Beflarion, who procured him a benefice in Calabria. He was one of thofe to whom the revival of polite literature in Italy was principally owing. He tranflated from the Greek into Latin, Arilotle's Hillory of Animals, Theophrattus on Plants, and Hippocrates's Aphorifins; and from the Latin into Grcel, Scipio's Dream, and Cicero's 'Treatile on Old Age. He wrote feveral other works in Greek and Latin; and died at Kome in 1475

GAZ1, in Ancient Geasraphy, it principal city and one of the five Catrapies of the Plililities. It was fituared about 100 ftadia from the Mediterrancan, on an $\therefore$ rificial mount, and tlrongly walled round. It was detfroyed by Alexander the Great, and afterwards by Antiochus. In the time of the Maccabees it was a ftrong and thourihing city; but was deftroved a third time by Alcxander Jametus. At preient it has a miferable appearance. The buildings are mean, both as to the form and matter. Some remains of its ancient grandeur

GAZEI, in Z.ologh, a precies of C.apk.s. See Man:u11 IVdix.

GAZETTE, a newfaper, or printed account of $t^{1}$ ee tramfari ins of all the countries in the hnown work, in a loofe flice: or half theet. This name is atith us corkived to that paper of news publilhed by athority. The word is decived trom $\xi$ azain, a Venctian com, which was the ufual price of the frat new fpaper printed there, and which was afterwards given to the paper itfrit.

The firf gazette in Ensland was publithed at Oxford, the court being there, in a folio haif miett, November 7.1665 . On the remoral of the court to hondon, the etille was changed to the London Gavetit. The Oxford gazette was publified on 'I'ucfdays, the London on Saturdays: and theie have continued to be the day of publication ever fince.

GIZNA, a city of Afia, once much ceiebrated, and the capital of a very extenfive empire ; but which is now cither entively ruined, or becone of fo litte conficeration, that it is not taken notice of in our books of geography. The city was anciently mm em pory and fortrefi of sablehan, not far from the confines of India. During the valt and rapid comqueft of the Arabs, all this country had been reduced under their fabjection. On the decline of the prower of the atiph however, the valt empine eflatimbed by Mahomet and his fuccelors was divided into a number of independent principalities, molt of which were but of thort duration. In the sear of the Inegira $3^{8} 4$, anlwering to the 90 oth of the Chritlian era, the city of Gaznst, with fome patt of the adjacent country, was governed by Mahmui Gami ; whobecame a great conqueror, and recinced wider his fubjection a contiderable jat of India :nd fuit of Perlia.

This empire contimed in the family of TH honud Gathi for i:Nowads of $2: 0$ veare. None of his fuce cellors, !maner, wem bonfefied of his atilition ; : mad theatore the estent of the empire, inftem of increatinas, was wry comfiderably diminimet form ater Mahwh ath denth. 'The Seliuhs made themtetie matere of Kher fan, and could toot be diven wat ; sle greated art of lhe berfand dommines alfo kell off; and in the - $4^{-1 h_{2}}$ your of the Hesgira, the race of Gazui fultane Vol.. JX. I'at II.

 for in 1218 , denghic $K$ an hamin smunat that greatelt part of Chim and almont at lant: 1. to turn his arms, elwad; and fi: out ag hat the fultan of Gazma at the hend $7=2,020 \mathrm{~mm}$.

To oppote this formidable arnix, Ahhommed, the reiguing faltan, could multer only 402,250 men ; a 4 , in the firlt battle, $160.0=0$ of his troops are faid to have perthed. Alter this sicto y, dewhiz Khn advanced; Mohammed not daring to rik a fecond battin, the lod. of shich would have been athended with the enire ruin of lis kingdom. He therefore difiributed his amy among the itrongent fortifical tortna he had in his dominions ; all of which Jenghiz khan took onc :Ftur arother. The rapid progres of hi, congueni, i deed, almot exceeds belief, In 1219 and 1220 , he Fad reduced Zamuh, Nur, Bkhara, Otrar, Sus:nk, Uzkant, Ahhah, Jund, Tonkot, Khopent. an ? Samareand. Mohamosed, in the meat ime, ilmi it: to Bukhar. ; but on the approach of Ienghis K:..n arny, quitted that place, and fled to Sumarean ${ }^{\text {: }}$ When this laft city was alfo in duger of being inn..t ed, the fultan did not think proner to tralt himel! is it mone than in the other, though it was garrimet low 110,000 of his bavett troop: ; and therefore $i^{1}, \frac{3}{3}$ through hyways into the prowince of Ghalan in Palis, whese he took refuge in a tlrony fortrefs alled $E$ iara\% Bet boing allo found out in this ritreat, he neal $w$ an inland in the Cafpian fea called ,iosizun; where he ended his dayc, leaving his cmpiee, tuch as it 1 c , : his fon Jholuddin.

The new fultan was a mon of great bravery ant e:perience in war ; but nuthing was able to thop the pro. grefs of the Meguls. In 1220 and 1221 , they mate themfelves maters of all the kingdoms of Kovazim a:. Khoralan, committing creswhere furh matheres: were never heard of hefore or fince that time. $l_{1}$ t?

 Nognt army. This happoned whik Inghiz has was bent ing Bmiva! ; but anfered little other purjoic, than ferving to briag upan that wity the twrible deltrution of which an account is given waler the ar ticie Banuyus. Immediately ater the rebuitur of that city, Ienghiz Khan morched t mard: (Gusa; which wiak very flrongh fortized, and where len expect. ed to have found dablodilit. Bat he lat icet the place 1, day, hefore ; and, as Jenghiz Khon's army sas much redacel, he might perhags lac:e fimel his ground, had it not been for an wident. H. had 'ea lotely juined by three Furkith commondere, each 1:t whom lad a boly of 10,000 men under his rom mond. After his victories uver the Moguis, thele winers demanded the greatell thare of the fupoils: which being refufed, they leparated themferen from the fultan. He wifd his utmolt endearour to mik. them hearken on reafon; and fent feveral mellise. and letters to them, reprefenting the inevitable ruin which mutt attend their leparation, as Jenghiz Khan $3 N$

Gzzna. w.. : Jancing aswifl them with his whole army. At In tiey nese pertuaded to lay adde their animoities: but it was nuw too fate; for Jenchiz Khan, being informed of v:lat nafied, detached 60,000 horfe to prevent their joining the fuitan's army; who, finding himelf deprived of this poweriul ad, retired towirls the rivcr Indus. When ke was arrived there, be hopitd in a flace where the ftream was molt rapid and tire place confned, with a view both to prewht his culliers from piacing a ${ }^{\text {w }}$ hopes of fafety in Hight, and to limder the whole Mogul army from atticking him at orice. Ever fince his departure from Gazia l:e had been tormented wih a colic: yet, at a time when he fufiered molt, hearing that the cnemy's vanguard was arrived at a place in that neighbourhecd called Hirder, he gcitted his litter, and, mounting a borie, marched with lome of his ctolen foldiers in the night; furprifed the Moguls in their camp; and having cut them almon all in pieces, without the lofs of a lingle man on his fide, returned with a confiderable t. oty.

Jeghiz Khan, farding by this that he had a vigilant enemy to deal with, proceeded with great circumluction. When le came near the Indus, he drew out his army in battalia: to Jagatay, one of his fons, he Gue the command of the right wing ; to Oktay, whe:her fon, he gave the cummand of the left: and F:t himfelf in the centre, with 6020 of his guards. ()n the other fide, Jaloloddin prepared for battle like cac who had no relource but in viclery. He firft fent the beats on the Indus farther off; referving only one :o carry over his motler, wie, and children : but unluckily the boat fitit when they were going to cmbark, Io that they were forced to remain in the camp. The filtan took to himfelf the commend of the main body of the army. His left ving, drawn up under thelter of a monnai.: rihich hindered the whole right wing of the Moguls from engaging at once, was commanded by his vizir; and his right by a lord named Amin Anak. This lurd began the fight; and forced the themy's left wing, butwithitanding the great difparity winmbere, to give ground. The right wing of the Moguls likewife wanting room to entetad itfelf, the fultan made whe of his left as a body of referve, detaching from ther.ce fome fiquadrons to the aflitance of the troops whe ftord in need of them. He allo took one fort of them with i,ins when he went at the head of Lis main boody to clarge that of Jenghiz Khan; which iee did with fo much refolution and vigour, that he not moly put it in diforder, but penetrated into the place where Jengliz Khan had origitally taken his ftation: lut thet prince, having had a borle killed under him, was retired from thence, to give orders for all the eromp to engage.

This ditadvantage had like to have loft the Moguls the lattle; for a re;ort being immediately feread that Sice enemy had broken through the main body, the tra. Fi, wore fo moch difcouraged, that they would certhity lave thed, bad not Jenghiz Khan encouraged th. ni hy riding from plece to place in order to how himelt. At latl, lowever, Jatoloddin's men, who vere in :ull but $30,00 c$, having fought a whole day ui he ton times the is number, were leized with fear and thed. ()we pait of them retied to the rochs which were on the hore of the Indus, where the enemy's horle
cond not follow them ; cthers threw thenfelves into Gazna. the river, where many were drowned, though fome had the grood fortune to crofs over in fafety; while the relt fursousding their prince, continued the fight through defpair. The fultan, however, confidering that he had icarce 7000 men left, leyan to think of providing for his own fafety: therefure, having bidden a fual adien to his mother, wife, and children, he mounted a freh horie, and fpurred him into the river, which he crofied in lafety, and even fopped in the middle of it to infult Jengliz Khan, who was now arrived at the bank. His family fell into the hands of the Moguls; who killed all the males, and carried the women into captivity.

Jaloloddin being now fecurely landed in India, got up into a tree in order to preferve himfelf from wild beatts. Next day, as he walked melancholy among the rocks, he perceived a troop of his foldiers, with fome officers, three of whom proved to be his particular friends. Thefe, at the beginning of the defeat, had found a boat in which they had failed all night, with much danger from the rocks, thelves, and rapid current of the river. Soon after, he faw 500 horle coming towards him; who informed him of 4000 more that had efcaped by fiwmming over the river; and thefe alfo foon after joined the reft. In the mean time an officer of his houfehold, named fomalarrazad, knowing that his matter and many of his people were efcaped, ventured to load a very large boat with arms, provifions, money, and ftuff to clothe the foldiers; with which be croffed the river. For this important fervice Jaloloddin made him ftcward of his houfehold, and furnamed him the Chafen or the Glory of the Faith. For fome time after, the fultan's affairs feemed to go on profperoully : he gained fome battles in India; but the princes of that country, envying his profperity, confpired againft him, and obliged him to repals the Indus. Here he again attempted to make head againit the Moguls; but was at laft defeated and killed by them, and a final end put to the once mighty empire of Gazna.

The metropolis was reduced by Otkay; who no fooner entered the country in which it was fituated, than he committed the moft horrid cruelties. I he city was well provided with all things neceflary for fultaining a fiege; had a flrong garrifon, and a brave and rofolute governor. The inhabitants, expecting no mercy from Jenghiz Khan, who they knew had fworn their ruin, were refolved to make a defperate defence. They made frequent fallies on the beliegers, feveral times overthrew their works, and broke above 100 of their battering rams. But one night, after an obitinate fight, part of the city walls fell down; and a great number of Moguls having filled up the ditch, cntered the city fword in hand. The governor perceiving all was loft, at the head of his brave! foldiers rufled into the thickeft of his enemies, where he and his followers wete all dain. Howcver, Gazna was not entirely deffroval, nor were the people all killed; for after the mallacre had continued for four or five hours, Otkay ordered it to ceafe, and taxed thofe who were left alive at a eertain rate, in order to redeem themiclves and the city. It does not, benever, appoar that after this time the city of Gazna tser made any confiderable figuc.-It was taken by the Moguls in the year 1222.

GEBRES. See Gabres.
GECCO, in Vatural H: ,ry, a name given by the Indians to their terrible poitun, which kills when mised with the blood in ever fuch a fmall quantity. They By that this geceo is a venomous froth or humour romited out of the mouths of their moll poibonous ferfents; which they procure in this fatal trenuth, by hanging up the creatures hy the tails, and whipping them to enrage them: they collect this in proper velfels as it falls; and when they would ufe it, they either poifon a weapon with it, or wounding any part of the Hefl introduce the fmalleft quantity imagimable into it ; and this is faid to be immediate death.

Gecko. See Lacerti, Erpetology Index.
GED, Winlian, an ingenious though unfuccefsful artif, who was a goldfmith in Edinburgh, deferves to be recorded for his attempt to introduce an improvement in the art of printing. The invention, firit practifed by Ged in 1725 , was fimply this. From any types of Greek or Roman, or any other character, he formed a plate for every page, or theet, of a book, from which he printed, inftead of ufing a type for every letter, as is done in the common way. This was firlt practifed, but on blocks of wood, by the Chinefe and Japanefe, and purlued in the firlt eflays of Cofter the European inventor of the prefent art. "This improvement (fays James Ged the inventor's fon) is principally confiderable in three moft important articles, viz. expence, correctnefs, beauty and uniformity."

In July 1729 , William Ged entered into partner. Giip with Wilham Fenner, a London ftationer, who was to have half the profits, in confideration of his advancing all the money requifite. To fupply this, Mr John James, then an architect at Greenwich (who built Sir Gregory Page's houfe, Bloombury church, \&ic.) was taken into the fcheme, and afterwards his brother Mr Thomas James, a letter founder, and James Ged the inventor's fon. In $\mathbf{1 7 3}$, thefe partners applied to the univerfity of Cambridge for printing Bibles and common prayer hooks by blocks inllead of tingle types; and, in confequence, a leafe was fealed to them, April 23.173 1. In their attempt they funk a large fum of money, and finilhed only two praver books; fo that it was forced to be relinquighed, ant the leafe was afterwards given up. Ged imputed his difappointment to the villany of the prefumen, and the ill treatment of his partners (which he fpecifies at large), particularly Fenner, whom John James and he were advifed to profecute, but declined it. He returned to Scotland in $173^{6}$, where he gave his friends a ipecimen of his performance, by an edition of Sallult. But being till unfuceefful, and having failed in obtaining redref, from Fenner, who died intolvent, he was preparing again to fet out for London, in order to :um with his fon James as a printer there, when he died October $19.17+9$. Geal's fon attempted unfucecfifully, in 1754 , to revive this invention; Meffrs Tilloch arid Foulf about the year 1 -82 practifed it on a fmall fale at Glations ; and of late years many beauriful editions of the claflies have been - Secprint printed in this way by D Not of Paric. *

 was able to give :n eccome of the hifory, it: f chate he had reached the ele cinth ye of of iiv a e. 1he tar inituctions he receised, ater thofe of his pace:, were communicated hy a fool-mitrels in the vicinie, he: whom he was fo math dittinguilied, thet is becacie: firth me. ntal gratification which, in his owth otion, le ever felt. IIe was nest put unser the tuition of : young man from the city of Aberdeen, who hiod lewn engaged by the laird tor the education of his on:1 chil dren; and afterwards went to a place called Scana, i: the Highland, where thofe were to be trained up who defigned to devote themfelves to the cathulic prienthoe:, and to finith their education at fome foreign unverlit... Here it was, in this obfcure retreat, that Geddes laid the foundation of that intimate acquaintance with the learned languages, by which he was to eninently diftinguiked in the fubleques: part of his lie. He weni to the Scots univerfity at Paris in the year 1759 , and foon after began the ftudy of rhetoric in the college of Navarre. By the ftrength of his genias and his indefatigable attention, he was foon at the head of this clas: although he had to contend with two veterans, and became the faveurite of Vicaire the profeflor, whofe friendthip latted to the clofe of lite.

Inttead of entering into the philofophical clafs at the ufual time, he ftudicd that fubject at home, in order to facilitate his theological itudies, on which he entered under M. M. Bure and de Sauvent, at the college of Navarre, and Lavocat at the Sorbonne was his H s. brew preceptor. So great, or rather aftonithing, was his progrefs, that Profefor Laverat urged him lirnogly to continue at Paris ; but his fiends prevailed with him to return to his native country in 1,64 . His firit charge as a priett was in a eatholic chapel in the county of Angus, from which he removed to $\mathrm{T}_{\text {ra- }}$ quais in 1765 , and became chaplain to the carl of that name, where he remained for about three years. This fituation was moft agreeable to his literary puritit., as he had unlimited accels to a very extewine library, which greatly allifed him in the profecution of his darling ftudies. He left the earl's houre in the year $1-68$, and returned to Paris, where he devoted his time dering the following winter to the perval of books and namuferipts in the king', libraries, making large evtrats from farce copies, particularly fuch as wete in the Hebrew toncue.

In the fpring of 1769 , he returned $t$, lis mosive country, and became pallor of a congregution at Auchinhalrig in Banffiste, where he was for fome tire inwolved in poccuniary dilficulties, out of which he was Atricated by the litera'ity of the then duke of Norik.  r:fium wese "I expert not excelire prufto from cacel. five exertion. I but I thall never want moat, and c.bohes, and fore ; to a philofophical and contented ruind, what more is necelny ${ }^{\prime}$. $\mathrm{H}=$ a is many years em. plowed in preparing this important work for the pref, before he had any profpect of adequate fuccef. In adcretiing the Englinh Catholics on the fubject of his tranf. lation, he has thefe memorable words: "At any rate, I do what I think it my duty to do, and do it fairly and oper!y. In the following pages ye will find neither falli tion nor difguife. I pour out may fentiments with the fame fancerity as if I were before the tribunal of Him who is to judge the living and the dead. Mirtahe I may, but prevaricate I never will." He difoovered this noble fpirit in every action of his life, and in a1l his trumactions and intercourfe with monkind, alWough he did not conciliate the regrard of thofe who - culd have beftowed upon him the molt effectual aliftance.

After fpending much of his life in biblical ftudies, H.e riet with a long and crucl interruption, of which he tus fpeaks: "I had but litile hope of ever living in a lituation to refume them, when Providence threw me into the arms of fuch a patron as Origen timfelf might 'ase been proud to boalt of-a patron, who, for thele en years pafl, has, with a dignity peculiar to hime!f, - fforded me every conveniency that my heart could de. fire towards the carrying on and completing of my ar dunus work."

It is needief to inform the public, that the patron to wiom the learsed Joctor leere alhede was Lard Yetic. For this numiarence contiated through the whele of his !ie, an deven beyond it by liv latter will, Ci riatians of every denomination will fee! fe:timents of gratitude, wher they are qualified to mate a true eftimate of the advantaces of fre and i:3,asti.. enoure.

In the year 1592 , the firt volume of his tranlation was publithed, dedicated to his patron Lord Petre, containing the firit in books of the Old Teitament. Soon after this volume made its appearance, three apoltolic vicars, calling themiclves the bihops of Rama, Acanthos and Cceturix, iffued a paitoral letter, addeeffed to their refpective tlocks over which they prefided, warning them againft the reception of Dr Gedces's tramia. tion. In lis reply to the bihop of Ceaturise we ind thete words: "Perhans, my lord, you with to have another vecation of exerciing your epifcopal authority, and of playine with cenfures as children do with a ne:v ball.-I winh your lordhip much joy of the bauble; but however, my lord, beware of playing too often with it. Read St Chirvoltom on Ecclefialtica! Cenfures, and learn from him a little more moderation. Permit an cid pricit to tell you, that it is a very great ornament in a young lighop. As to mylel, ny lotd, I an not afraid of your threats, and thall laugh at your cenfures as long as I am conicious that I deferve them not.- You cannot hinder me from praying at home; and at home I will pray, in denamee of your conliac, as oiten as I plata. The ciliet Bilhop of our touls is always accemible; and through lim I can, at all times, have free accefs to the Father, who will not leject me, but for soluntary unrepented crimes. In the panoply of conGious innocence, the whole thander of the Vatican would in vain be levelled at my heat."

The fecond volume of his trambation, owing to a variety of intertutions, did not make its appearance till the year 179", to which was prefixed a dedication to her royal highers the duchets of Gloucetter, as an " early, fpontancous, and liberal encourager of the work." In this volume the doctor gives up, and boldly combats, the abfolute infpiration of fcripture, believing that the Hebrew, like all other hiforians, wrote from fuch human documents as they could find, and were of confequence liable to fimilar miftakes. This latitude of thinking naturally led the doctor to give up as fabulous, and wholly unworthy of the divine philanthropy, every commana, precept, and injunction, which appeared unworthy eren of human authority. He denied of confequence, that the command given to deftroy the Camanites could have God for its author. His solume of Critical Remarks was publifhed in $18=0$, in which he enters into an able vindication of his own theory, which rather increafed than diminimed the number of his enemies, for as he wrote to pleafe no party, he forefaw that he would have enemies in every party, and fo it happened.

Dr Geddes was a man of extenfive literature, uncommon liberality of thinking, the friend of all mankind; a man of integrity, honour and benevolence; in the frictef fenfe of the word, a truly genuine Catholic, and whofe love of truth was fo invincible, that neither hopes not fears could induce him to conceal it.

His profpectus of a new tranflation of the Bible in 4 to was publifled in 178.6 , and a letter to the bithop of London on the fame fubject in 1787 . His propofals were printed in 1788 . As a controverial writer, Dr Geddes was eminently ditinguihed by his letter to Dr Prieflley, in clefence of the divinity of Jefus Chrif, and by one to a member of parliament, on the expediency of a general repeal of the penal ita-

 wramost the Cermans. Whea but 13 years of age be difcoresed a poctical gethius; but having none t, cuide his tatte for this kind of compultion, be was led to imitate Gunther, Neukerdh, and Hanke, man of indiferent: abilities. He fludied theolosy at Leipic i: $1-34$, and returned home at the expiration of four years, when he commenced public feaker; but his timid difpoftion prevented him from thining as an orator in the pulpit. The delicacy of his conifitution fortilding him to afpire after extenfive leaming, he confined himfolf to the acquifition of that which might rencier him ufful. He was much refpected for his liret attempts in poetry, called Amufements of Reafon and Wit, which appeared in $17+2$.

The labour which he found requiite for the compoftion of fermons, inclined him to lay afide the clerical profelion, and devote himfelf wholly to the indruction of youth, in which he not only diffufed knosledge through the minds of his pupils, but alfo" inf fired them with the love of religion and virtue. He was made A. M. in 1744 , and publithed the firt volume of his fat les in the emiang year. His " Swedilh Counter", was the firt German romance deferving of notice. He fave the world the fecond part of his fables in 1748 , although two years before this period he was much affilted with hypochondriacal affections. In ${ }_{1751}$, he was folicited to accept the office of extraordinary profefior of philofophy, together with a decent talary, which was augmented on the termination of the war.

Aflailed by unconquerable lownefs of fpirits and confirmod melancholy, he fill erhibited the fame patience, refignation, and univerfal philanthropy as he had ever thewn, and which excited the admiration of the enemy during the war. His fufferings continued to increafe in feverity, and at laft terminated his exifence on the 13th of December 1-69. He contributed much to the improvement of the tanle and morals of his countrymen, and their gratitude for his fervices made them duply lament his lofs. His praie was refounded by every voice, his likenefs was call in gypfum, and moulded in wax ; it was engrated on copper, and reprefented in fculpture and painting.
It is faid of this amiable man and captivating writer, by Futner, who wrote the lives of German authors, that it will prohally be a century before the appearance of another poet, fo fully qualified to excite the love and admiration of his cotemporaties, and obtain fuch a powerful intluence over the tafte and way of thinking if all deferiptions of men. If it would indicate too much partiality to call him a genius of the firtt claf, he certainly was a moit agrecable and fertile writer; the poet to whom religion and sirtue are deeply indebted; an able reformer of public mamers, and fonder of affording confolation, than of plunging into defponden(y. Kutner gives him a mott excellent and enviable (haracter, in thefe words: "A, long as the Germans Alall underiland their prefent language, will the works of Gellent be read; and his character will be honoured whin'. vir ue is known and refpected."

G1:LAL, Som Burtar, an eminent Italian writer, wan bura if man parent at Flowerce, in the year 149 S. II . : . . .ed at :uthr, tme fy a moemaker; but hal Heacasodinery genius, that he nequired feverd
languages, and made an uncommon progrefs in the belles Gell:hrand lettres: and though he continued always to work at his trade, became accquainted with all the wits and learned mon at Florence, and his merit was univerfally lnown. $\mathrm{H}=$ was chofen a member of the academy there, and the city made him a burgefs. He acquired the hishett reputation by his works, which are, 1. I. Caprici dd $B \% a i n$ quarto; which contains ten dialogues. 2 . I. a Circe, oztavo. This, which alto contains ten dialocues, and treats of human mature, has becta tranilated into Latin, French, and Linglith. 3. Differtations in Italian on the poems of Dante and Petrarch. 4. The comedies of La Sporta and La Errore; and other works. He died in 1563 .

GELIIBRAND, Hexry, a laborious aftronomer of the 17th century, was born in 1597. Though he was not without good views in the church, yet he became fo enamoured with mathematical Iludies, that on the death of his father he became a fludent at $\mathrm{Ox}_{\mathrm{x}}$ ford, contented himfelf with his private patrimony, and devoted himfelf folely to them. On the death of Mr Gunter, he was recommended by Mr Briggs to the truttees of Grelham college, for the allronomical profedorihip there; to which he was elected in 1627 . His friend Nr Briggs dying in 1632 , before he had finithed his Trigonometria Britannica, it was finifhed by Gellibrand at his requeit. He wrote feveral other things, chiefly tending to the improvement of navigation; and died in 1636.

GELLIUS, Aulus, a celebrated grammarian who lived in the 2 d century under Marcus Aurelius and fome fucceeding emperors. He wrote a collection of obfervations on authors, for the ufe of his children; and called it Noges Atticu, becaufe compofed in the evenings of a winter he fipent at Athens. The chief value of it is for preferving many facts and monaments of antiquity not to be found elfewhere. Critics and grammarians have beftowed much pains on this writer.

## GELLY. See Jelly.

GELO, or Gelos, a fon of Dinomenes who made himfelf abfolute at Syracufe 48 years before the Chritian era. He conquered the Carthaginians at Himera, and made his oppreftion popular by his great equity and moderation. He reigned feven years, and his death was univerfally lamented at Syracufe. He was called the father of his people, and the patron of liberty, and honoured as a demigod. His brother Hiero fucceeded him. See Syracuse.

GEM, in Vatural Hiffory, a common name for all precious itones; of which there are two clalies, the pellucid and femipellucid.

The bodics compoting the clafs of pellucid gems are bright, elegant, and beautiful folfils, which are found in frall detached mafles, extremely inard, and of great luflre.

The bodies compofing the clafs of femipellucid gems, are ftones naturally cumpound, net inthmmable or foluble in water, found in detached malics, and compofed of cryflalline matter debafed by earth : however, they are bat tlightly debafed ; and are of great beauty and bri herefe, of a moderate degree of tran?parency, and are utually found in fmall mafies.

The linowledge of getus depends principally on obferving their hardnefs and cotur. Their hardnefs is

Gem. commonly allowed to atand in the following order: The diamond the hardelt of all ; then the ruby, fapphire, jaciath, emerald, amethitt, gatnct, carnco!, chalcedony, onys, japer, arate, porathry, and marble. This difference, however, is not rezulir and conitant, but frequent'y varics. Good cryfals may be allowed to fucceed the onys; but the whole family of metaliic glafy ther, feems to be till fofter-In point of colour, the dimond is value 1 for is tranparency, the raty for its purple, the fapphire for its bhee, the emerald for its green, the jaciuth for its orange, the amethyit carneol for is carnation, the onys for its tawny, the jafper, agate, and porphyy, for their vermilion, green, ard varsegated colours, and the garnct for its tranparent blood red.

All thele gems are fometimes found coloural and fpotted, and lometimes quite limpid and colourlef. Ia this cate the diamond cutter or polinuer knows how to ditinguith their diferent feecies by their diferent degrees of hardaefs upon the mill. For the cutting or polihing of gems, the fine powder of the fracments of thofe that ate nest in degree of hardacis is always required to grind anay the fofter; but as nome of them are harder than the diamond, this can onily be polithed by iss own powder.

Cronftedt oblewes of gens in general, that the colour of the ruly and emerald are faid to remain in the fire, while that of the toraz hies ofif: hence it in whal to burn the topaz, and thence fubstitute it for the diamond. "Their colours (hay our author) are commonly fuppoted to depend upon metallic v upurs; but may they not more jully be fuppofed to arife from a phlogifton united with a metallic or fome other earth ? becaule we find that metallic earthe which are pericetly well calcined give no colnur to any glafs: and that the manganefe, on the other hant, gives more colour than can be a.cribed to the fmall quantity of metal which is to be extracted from it." M. Magellan is of opinion, that their colour is owing chielly to the mixtitie of iron which enters their compofition; but approwes the fentiment of Cronftedr, that phlogiton has a llave in their production, it being well known that the calces of iron when dephlosificated produce the red and yellow colours of marble, and when phlogiticated to a certain degree produce the blue or green colours.

With regard to the testure of gems, M. Magellan obferves, that all of them ure foinated or laminated, and of various degrees of hardnefs. Whenever the edges of thefe laminx are ienfible to the ese, they have a fibrous appearance, anl refle $\mathrm{g}_{\mathrm{t}}$ various thades of colour, which change fuccellisely accorling to their angular pofition to the tyc. Thefe are called by the French chat yanter; and what is a blemihn in their tranfparency, often enlances their value on account of their farcity. But when the fubltance of in 8 cm is compofed of a broken tixture, confiling of varions fets of lamine differently inclined to each other, it $\epsilon$ mits at the fame time various irradiations of diffictit colours, which lucceed one another accorditg to their angle of poftion. This hind of gems has ofrained the name of opals, and are valued in proportion to the krillancy, teauty, and varicty of their colours. Their er: thallization, ne doubt devends on the Ga:e confe $u$ ich peoduces that or fat's, c...., and metals, wirh is treated of unet the article Ckrsiabliz.iabs: . The

But later analyfes therw that the component parts are different from the above, particularly the colouring matters which are here afcribed to iron. See Mink. R.abogy.

The chry loprafe from Kofeinitz in Silefla was likewife analyzed by M. Achard; who feund that it contained $45^{6}$ grams of tiliceous eartl, 13 of calcarecus, fix of magnelin, three of copper, and two of iron. " 1 his (iays M. Magellan) feem, to be the on! g gem that contains no argillaceous eath."

Intarian or Countorfining of Gess in Glafr. The art of imitating gems in glats is too condiderable to be pafled without notice: fome of the leading componitions thesein we laall mantion upon the authority of Neri and others.

Theic gems are made of paftes ; and are noway inferior to the native Hone, when carefully made and w.ll polihed, in brightaefs or tranfparence, but want their hardnets.

The gencral rules to be obferved in making the pafte: are thete: 1. That all the ventel in wich they are made be firmiy luted, and the lute left to dry before they are put in:o the fire. 2. That fuch vellels be chofen for the work as will bear the fire well. 3. That the powders be prepard on a porplayy thone; not in a metal mortar, which nould commusicate a tinge to them. 4. That the juft proportion in the quantity of the feveral ingredients be nicely obferved. 5. Ihat the materials be all well mived; and, if not Cufficently bakel the firit time, to be committed to the fire dysin, without breking the pot; for if thi . Le not obierved, they will be foll of thiters and air blad dere. 6. That a fimall vacuity be alway, luft at the tor of the pot, to give rocm to the fiselling of the ingse dients.

… Sem, add higat thom to a perfet fincarts on a y ftone, atd fet thii powder in pots in a glals ite to purify for thruc days: then cafl the whole Etr. and afterwards return it into the furnace, Where let it fand 15 dass, in which time all fualuefs ::c Ulifers will difappear, and the pafte will greatly 1 ... mble the matural jenels. To give this the coluur 1. i. ie emerald, add to it brals thrice calcined; for a tua green, brafs fimply calcined to a rednefs; for a Sopphire, add zaffer, with manganele; and fur a toyaz, manganefe and tartar. All the gems are thus imitated in this, by the fame way of working as the making of coloured glaffes; and this is fo hard, that :hey sery much approach the natural gems.

The colour of all the counterfit gems made of the feveral pattes, may be made deeper or lighter according to the work for which the Hones are defigned; and it is a neceflary general rule, that fmall fones for rings, Eic. requive a deeper colvur, and large ones a paler. Befides the colours made from manganefe, verdigris, and zafier, which are the ingredients commonly ufed, there are other very fine ones which care and ikill may prepare. Very fine red may be made from gold, and one not much inferior to that from iron; a very fine green from brafs or copper; a aky colour from filver, and a much finer one trom the granates of Bohemia.

A very fingular and excellent way of making the patie to imitate the coloured gems is this: Take a quantity of laccharum laturni, or fugat of lead, made with vinegar in the commen way; let it in fand, in a glafs body well luted from the nech downwards; leave the mouth of the glafs open, and continue the fire 24 hours; then take out the falt, and if it te not red but yellowifh, powder it fine, and return it into the veffel, and keep it in the fand heat 24 hours more, till it becomes as red as cimabar. The fire mult not be made fo ftrong as to melt it, for then all the pruceis is fpoilod. Pour dittilled vinegar on this caicined Solt, and feparate the folution from the dregs ; let the decanted liquor ftand fix days in an earthen veficl, to give time for the finer fediment to fublide; fiter this liquor, and evaporate it in a glafs body, and there will remain a mott pure falt of lead ; dry thi well, then diflolve it in fair water; let the folution ftand fis days in a glazed pan; lit it fubfide, then filter the clear folntion, and evaporate it to a yet more pure white and fiweet falt; repeat this operation three times; put the now perfectly pure falt into a glafs velfel, fet it in a fand heat for feveral days, and it will be calcined to a fine impalpable powder of a lively red. This in called the fulphur of lead.

Take all the ingredients as in the common compotition of the paftes of the feveral colums, only initead of rd lead, ufe this powder; and the produce will well ceward the trouble of the operation, as experience has oftcu proved.

A pufle proper for receiving colours may be readily nude by well pounding :nd wising fix pound of white Iod cicanded, three pumads of ied lead, two peunds of puriiced pearl-allec, and use pere of nitre. A fofter rater miny be made in the bace manner, of fix pounds of white fand deenful; sed lead, and furified pearlshise, of each thace pounds; vie peund of nitre, half - pound of borax, and three ounces of arieric. For
common ufe a ound of common fait may be fiblitituted for the borax. This glafs will be very forf, and will not bear much wear if employed for rings, backle, or liuch imitations of fones as are expoted to much rubbing ; lat for ear-ringe, ornaments worn on the bient, and thofe little ufed, it may lat a confiderable ti.ne.
In order to give pate different colours, the procefs is as follows: For
Anethifl. Take ten pounds of cither of the compofitions defcribed under Colouring of Glass, one ounce and a hallf of manganefe, and one drachm of zatfler ; pouder: and fufe them together.

Black. Take ten pounds of either of the compofitions jult referred to, one ounce of zaffer, fix drachms of manganefe, and five drachms of iron, highly calcined; and proceed as before.

Blue. Take of the fame compofition, ten pounds; of zaffer, fix drachins; and of manganefe, two drachms: and proceed as with the foregoing.

Chryfohite. Take of either of the compoitions for pafte above defcribed, prepared without faltpetre, ten pounds, and of calcined iron five drachms ; and purfue the famt procefs as with the rell.

Red Curnelian. Take of the compofitions mentioned under Colouring of GLAss, two pounds ; of glafs of antimony, one pound; of the caicised vitriol called fcarlet oclire, two ounces; and of manganefe, one drachm. Fufe the glafs of antinoony and mangancte with the compolition ; then powder them, and mix them with the other, by grinding them together, and fufe them with a gentle heat.

White Cornelian. Take of the compofition juit referred to, two pound ; of yellow ochre well wahhed, two drachms ; and of calcined bones, one ounce. Mix them, and fufe them with a gentle beat.

Diamond. Take of the white fand, fix pounds; of red lead, four pounds; of pearl athes, purified, three pounds; of nitre two pounds; of arfenic five ounces; and of manganeif, one fcruple. Powder and fute them.

Eagle-marine. Take ten pound of the compoltion under GI.Ass; three ounces of copper highly calcined with fulphur ; and one fcruple of zaffer. Proceed as before.

Emerald. Take of the fame compofition with the laft mine pounds; three ounces of copper precipitated from aquafortis; and two drachms of precipitited iron. See Emirald, Mineraiogy Index.

Garnet. Take two pounds of the compofition undet Glass; two pounds of the glafs of antimony, and two drachms of manganefe. For vinegar garnet, take of the compofition for paite, defcribed in this article, two pounds; one pound of glafs of antimony, and half an ounce of iron, highly calcined: mix the iron with the uncoloured pafte, and fufe them: then add the glafs of antimony powdered, and continue them in the heat till the whole is incorporated.

Gold or full Tcllow. Take of the compofition for patte ten pounds; and one ounce and a half of iron flrongly calcined; proceeding as with the others.

Du,p Plurple. Take of either of the compofitions for pattc, ten pounds; of mangancfe, one ounce; and of zaffer, half an ounce.

Rathy. Take one pound of either of the compofitions

Gem. tions for pare, and two drachms precipitate of gold by tin ; powder the pafte, and grind the calx of gold with it in a glafs, tilint, or agate mortar, and then fufe them together. A cheaper ruby patte may be made with half a pound of cither of the above compoitions, half a Found of glafs of antin:ony, and one drachm and a half of the cals of gold ; proceeding as before.

Sappitire. Take of the compolition for pafte, ten pounds; of zaffer, three draclims and one feruple; and of the ca/r Caffin, one drachm. Powder and fufe them. Or the fame may be done, by mixing with the patte one eighth of its weight of fmalt.

Topaz. Take of the componitions under Glass ten pounds, omitting the faltpetre; and an equal quantity of the Goldcolaured hard Glass. Powder and fufe them. See Topaz, Mineralogy Index.

Turquoife. Take of the compofition for blue pafte already defcribed, ten pounds ; of calcined bone, horn, or ivory, half a pound. Powder and fufe them.

Opaque white. Take of the compoition for pafte ten pounds; and one pound of calcined horn, ivory, or bone; and proceed as before.

Somitranparent whitc, like opal. See Oral, Min. eralogy Index.

To the above we thall add the following receipts and procefies, contained in a memoir by M. Fontanieu of the Royal Academy of Sciences at Paris, and faid to have met with much approbation.

1. Of the Bafes. Although the different calces of lead are all adapted to produce the fame effect in vitrification; yet M. Fontanieu prefers lead in fcales, and next to that minium, as being the mon conitantly pure. It is neceflary to fift through a lilk fieve the preparations of lead one wihhes to make ufe of in the vitrification, in order to feparate the grofer parts, as alfo the lead found in a metallic flate when white lead in icales is employed.

The bafe of factitious gems is calx of lead and rock cryital, or any other ftone vitrifable by the calces already mentioned. Pure fand, fint, and the tianfparent pebbles of rivers, are fubftances equally fit to make glafs : but as it is firft neceflary to break the mafles of cryfal, fones, or pebbles, into fmaller parts; fo by this operation particles of iron or copper are irequently int:oduced, and to thefe duft or grealy matters are alfo apt to adhere. Our author therefore begi:s by putting the pounded cryital or pebbles into a crucible, which he places in a degree of heat capable of making the ma's red hot; he then four, it into a wouden bowl filled with very clear water; and haring the bowl from time to time, the finall portions of coals fartizied by the extraneous bodies iwim on the forface of the water, and the vitrifible earth, with the iron, sxe. reits on the bottom. He then iecants the wates : and having dried the mafs, he pounds it, and in'ts the powder threagh the finelt filk lieve: he then digets the powder during four or five hours with raarine acid, iltaking the mixtare every hoor. After having decanted the marine acid from the vitififable earth, le wathes the latter until the "ater wo lorger reddens the tincture of turnfol. The laid earth being dried, i. pafied timough as filk fieve, and is the: fit for we. Notre, fate of tarsar, and borax. are the there frecies of thit that erter
 ..niu: virrifications.
ro IV. In: I:

Nast ce:chare in the att of making crioned
 diances numb wie of to form the orythe which ferves as a bafe to the factitious lome. A'ur baving tiled a great vaicty of rectiph, our author found the y migit be redined to the following.

1. 'Jake two paris and a lan? of leal in fo bes, one part and a hate of rock cryital or prepared time, hal: a part of nitre, as much borax, and a quarser part of glafs of atfenic. Thefe being well pulverized and mixed together, are to be put into a Helliat crucible, and fubmitted to the fire. When the misture i, well melted, pour it into cold water: then melt it again a fecond and a third time ; taking care, after each melting, to throw it into freih coid water, and to feparate from it the lead that may be revived. The fame crucible flould not be ufed a fecond time, becaufe the glafs of lead is apt to penetrate it in fuch a manner as to run the rifk of lofing the contents. One mum allo be careful to coser the crucible well, to prevent any coals getting into it, which would reduce the calk of lead, and fopoil the compofition.
2. Take two parts and a half of white cerufe, o: . part of prepared hinits, haif a pat: of fait of turtar, and a quarter part of calcized borax : melt the mixture in a Hefian crucille, and then pour it into cold water; it is then to be melted again, and walled a focond and a third time, the fame !recautions being obferved as for the firlt bafe.
3. Take two parts minium, one part rock sry: tal, half a part of nitre, and as much fult of tartar: this nixture being melted, muft be treated as the former.
4. Take three parts of calcined borax, one part of prepared rock crythal, and one part of falt of tartar ; thefe being well mised and melted together, muit be poured into warm water: the water being decanted and the mals dried, in equal quantity of minium muft be added to i: it is then to be melted and w.ined feveral times as diruetud abore.
5. That called by our author the Mayenco la/e, and which he confiders as one of the fineft cryftaline conipofitions hitherto known, is thus compoled: Take three parts of fixed alkali of tartar, one part of rock crytal or flint pulverized: the mixture to be we!! baked together, and then leif to cool. It is afterwards poured into a crucible of bot water to dillolve the frit; the folution of the frit is then received into a Athe ware pan, and aquafortis added gradually to the frution till it no longer effereefor: this water heing decanted, the frit mult be wahed in warm water tiis it has no loneer any tafle: the frit is thend dried, and mised with one purt and a half of fine cerufo or white 1 ad in fales; and this mixare mut be well levigated wha little diffilled water. To one pert and a halt of this powder died add an ounce of calcined bo:ex le: the whule be well mixed in a a arble motar, then raited and poured into coid water as the other liafes wheady defcribed. The e fulions and lection having been referted, and the misure dried and pordered. a 12 th part of nitre malt le adhed to it, and thent ruested for the lati tine; whend very fine orjfal viid De ford in the crurible.
6. A a couplition for furnifhing very fine white Itser. Tix cight: cuncer of serute, three oance o: $\because 0$ sork

## $\mathrm{G} \mathrm{E} \mathrm{M} \quad\left[\begin{array}{ll}474\end{array}\right] \quad \mathrm{G}$ E MI

rock cryntal pulverized, two ounces of borax finely fowdered, and half a grain of manganefe: having melted and wathed this mixture in the manner diretted above, it will produce a very fine white cryfal.
11. Of the Colours. The calces of metail, as already obefed, are the fublances emploved to colour factitious gems; and on the fuparation of thefe calces Stepends the vividnefs of their colours.
a, From Gold.] To obtain the mineral purple known by the name of prociptate of Ca/Fur, M. Fontanie: employs tic following different proceffes.

1. Dinolve fome pure gold in aqua regia, prepared - ith three parts of precipitated nitrous acid and one nart of marine acid ; and to hatten the diffolution, the fattals fhould be placed in a fand bath. Into this islution pour a folution of tin in aqua regia. The sixture becomes turbid, and the gold is precipitated with a portion of the tin, in the form of a reddifh powher; which, after being walhed and dried, is called precipitate of Cafius.-The aqua regia employed to diffolve the tin is compofed of five parts of nitrous acid and one part of marine acid: to eight ounces of this aqua regia, are added fixteen ounces of diftilled water. Some leaves of Malaccatin, about the fize and thicknefs of a fixpence, are then put into this diluted uqua regia, till it will diffolve no more of them : which operation our author obferves, requires commonly twelve or fourteen days; though it might probably be haftened by beating the tin fill thimer, and then rolling it into the form of a hollow cylinder, or turning it round into rpiral convolutions, and thus expofing a greater extent of furface to the action of the menftruum. In order to prepare mere readily the precipitate of Caffius, M. Fontanie: 1 Futs into a large jug eight ounces of folution of tin, to which he adds four pints of diftilled water: he afterwards pours into this metallic lye fome folution of gold, drop by drop, taking care to ifir the whole with a glafs tube: when the mixture becomes of a dcep purple colour, he ceafes dropping the folution of gold; and in order to haiten the precipitation of the mineral purple, pours into the mixture a pint of freh urine. Six or feven hours after, the precipitate is collected at the bottom of the veffel : the fluid is then decanted; and the precipitate, wafted once or twice, is dried till it becomes a brown powder.
2. Pour into a veffel of fine tin with a thick bottom four ounces of the folution of gold ; three minutes ofter add two pints of diftilled water. Let this mixture ftand in the tin veffel during feven hours, taking care to ftir it every hour with a glafs tube ; afterwards pour it into a conical glafs jug, and add to it a pint of new urine: the mineral purple is foon precipitated, and then is to be wathed and dried.
3. Diftil in a glafs retort placed in a bath of anhes, fome gold diffolved in aqua regia, made with threc parts nitrous and one part marine acid; when the acid is paffed over and the gold contained in the retort appears dry, leave the veffit to cool, then pour irso it fome new aqua regia, and proceed to diftil as before. Replace the aqua regia twice upon the gold, and diatil the fame. After thefe four operations, pour by little and little into the retort fome oil of tartar por deliguium, which will occafion a brifk effervefence: when this ceafes, ditil the mixture till it becomes dry, wod then put fome watm water into the retort,

Shate the whole and pour is into a cucurbit, when a precipitate is depofited, the colour of which is fometimes brown and fometimes yellow: After having wafhed this precipitate, dry it. Our author fays, this mineral purple was much fuperior to the foregoing, fince two grains of it only were fufficient to an ounce of the bate, whillt it required of the other two a zoth part of the bafe. And he adds, that be found a means of exalting the colour of the precipitate of Caffins, by putting to it a fixth part of its weight of glafs of antimony finely powdered, and of nitre in the proportion of a drachm to eight ounces of the bafe.
$b$, From Siluer.] The oxide of filver, being vitrified, produces a yellowith gray colour. This oxide enters only into the compofition of the yellow artificial diamond and the opal. M. Fontanieu introduces it into the bafe in the form of luna cornea.

In order to prepare it, he directs to diffolve the filver in precipitated nitrous acid, and afterwards to pour into it a folution of fea falt : a white precipitate is obtained; which, being wafhed and dried, melts very readily in the fire, and is foon volatilized if not mixed uith vitrifiable matters. To make the yellow diamond, 25 grains of this luna cornea are put to an ounce of the fourth bafe: the dofe of filver may be diminifhed according to the fhade of yellow that one wihes to procure.
$c$, From Copper.] The oxide of copper imparts to white glafs the fineft green colour; but if this metal be not exactly in a flate of oxide, it produces a brownith red colour. Mountain blue verdigris, and the refidue of its dillillation, are the different preparations of copper which our author employs to make the artificial eme. ralds.
d, From Iron.]. Although it has been afferted that the oxides of iron introduce a very fine tranfparent red colour into white glafs, M. Fontanicu could only obtain from it a pale red a little opake. The oxide of iron that lie employed was in the proportion of the 20th part of the bafe.

There are fcveral ways of preparing the oxide of iron called crocus Martis, or faffron of Mars. In general, it is neceffary that this metal be fo far oxidated that the magnet ceafes to attract it : thus one may ufe the fcales of iron found upon the bars of the furnaces, which ferve to diftil aquafortis. By digefting filings of theel with diftilled vinegar, then evaporating and replacing the vinegar 10 or 12 times upon thefe flings and drying them alternately, an oxide of iron is obtained, which muft be fifted through a filk fieve, and then calcined. The oxide of iron thus obtained by the vinegar, our author fays, only introduced into his bafes a green colour inclining to a yellow.

By the following procefs a faffron of Mars of the fineft red colour is obtained : Let an ounce of iron filings be diffolved in nitrous acid in a glafs retort, and dillilled over a fand bath to drynefs. After haxing replaced the acid or the dry oxide, and re-diftilled it a fecond and a third time, it is then edulcorated with fpirits of wine, and afterwards wafhed with diftille\} water.
e, From the Magnet.] It is neccifiary to calcine the magnet before it be introduced into the : itrifications Having therefore torrefied the magno duing two houts.

## G E M $\mathbb{\text { G }} 475$ \} G E i1

Ges. hours, it muit be wathed and dried. It is only employed in the compolition of the opal.
$f$, From Cob.ait.] The oxide of cobalt is only proper to iftroduce a blue colour into glafs; but this femimetal is rarely found free from iron and bifnuth, and therefore it is first necelfary to feparate them from it. This is done by calcining the ore of cobalt in order to difengage the arlenic; afterwards the oxide mult be diftilled in a retort with fal ammoniac, and the iton and the bifmuth are found fublined with this falt. The difillation mutt be repeated with the fal ammoniac till this falt is no longer coloured yellow. The eobalt which remains in the comute is then calcined in a potiherd, and becomes a very pure oxide; which being introcuced into the bafe, in the proportion of a goodth part, gives it a very fine blue colour, the intentity of which may be increafed at difcretion by the addition of exide of cobalt. In order to prepare black enamel refembling that which is called black agate of Iceland; melt together a pound and a half of one of the bafes, two ounces of the oxide of cobalt, two ounces of crocus Martis prepared with vinegar, and two ounces of manganefe.
$g$, From Tin.] The oxide of tin, which is of a white colour, renders opake the glafs with which it is melted, and forms white enamel. For this purpofe, calcine the futty of tin; then "aih and dry it, and fift it through a filk fieve. Take fix pounds of the fecond bafe, the fame quantity of the calcined putty of tin, and $4^{8}$ grains of manganefe.
h, From Antimony.] Antimony is only fufceptible of vitrification in a certain flate of oxidation, and then it produces a reddih or hyacinth coloured glafs; but if the antimony be in a flate of abfolute calx, fuch as the diaphoretic antimony, then it is no longer vitrifiable, and may be fubstituted for oxide of tin to make white enamel. M. Fontanieu introduces the glass of antimony in the compofition of artificial topazes. For the oriental topa\%, he takes 24 ounces of the firft bafe, and five drachms of the glafs of antimony. 'To imitate the : opaz of Sarany, he adds to each ounce of the bafe five grains of the glafs of antimony. For the tcpas of Brazil, he takes 24 ounces of the firlt bafe, one ounce 24 grains of glafs of antimony, and 8 grains of the precipitate of Calfius.
$i$, From NIangancfe.] This mineral employed in a Erall quantity, renders the glafs whiter; a larger enantity produces a very fine violet colour, and a still larger dofe of it renders the glafs black and opake.

There are two ways of preparing manganefe. 1. The moft fimple confilts in expofing it to a red heat, and then quenching it with diftilled vinegar; it is afterwards dried and powdered, in order to pafs it through a filk fieve. 2. Haudiquer de Blancour defcribes the fccond manner of preparing the manganefe, proper to furnith a red colour, and names it fufthle man"anefi. 'lake of manganefe of Piedmont one prund ; torrefy Ind pulverize it ; then mix it with a pound of nitre, and calcine the mixture during 24 hours; afterwards wath it repeated'y in warm water, till the water of the Syes laas no longer any tafte; dry the manganefe, and mix with it an equal weight of fal ammoniac ; levigate this mixture on a clab of porphyry with oil of vitriol ciluted with water to the frength of vinegar. Dry the
mixture, an introjuce it into a cornute; antil of a graduated fire, and when the fal ammoniac is fublimed weigh it, and add to the misture an equal quantity. Then dittil an! iublime as before, and tewcat the opere tion fix times, being careful at each time to me the dal ammoniac and the manganets upon the porgyry with diluted oil of citriol.

At Tournhnult is Fohemia, there is flld a fufible glats of a yellow colour, very like that of the topaz of Brazil, which, when expofed to a degree of fire in a cupel fufficient to redden it, becomes of a very fine rub: colour, more or lefs deep accarding to the degree of fire to which it has been cxpofed. Our author allayed this glafs, and found it to contain a.great deal of lead, but was not able to difcover any gold in it.
III. Of the diferent digrees of fire neceffary fur Factirious Gems. Our author obfervery that there are three degrees of heat very different in their energy. The fire kept up in the wind furnaces in the laboratories of cliemilts, is lefs active than that whofe effect is accelerated by the means of bellows; and a fire fupported by wood, and kept up during 60 hours without interruption, produces fingular effects in vitrification, and renders the glafs finer and lefs alterable.

When recourfe is had to the forge, in order to operate a vitrification, it is noceffary to turn about the crucible from time to time, that the mafs may melt equally. Some coal alfo thould be replaced, in proportion as it confumes towards the nozel of the bellows; for without this precaution, we fhould run the rifk of cooling the crucible oppofite to the flame, and probably of craching it, when all the melted mafs running anong the coals would be totally lott. Though this is the readieft way of melting, it llould not be em. ployed out of choice; for the crucible often breaks, $\mathrm{o}_{\text {: }}$ coals get into it, which may rcduce the lead to the metallic flate.

The wind furnace is either fquare or round. A imall cake of baked clay or brick, of the tiachnefs of an inch, is placed upon the grate; and uno:1 this cah: is placed the crucible, lurrounded with coals. The degree of heat produced by this furnace is much let. than that of the forge : but in order to fucceed in the vitrification, M. Funtanicu recommends the ufe of a furnace defcribed by kinnckel, of which, the interio: part is fo difpofed, that we may place crucibles at three different heights; and the name of chambers is given to thofe flens upon which the crucibles are placed.

It is obvious, that the degree of heat camot he equal in the faid three chambers. In the firit or loweft cham ber the heat is greatef, afterwards in the nest, and laftly, in the higheft. We fhould begin by placing the crucibics according to their fize, in thefe different chambers; by which means the beft effect in vitrification is produced.

In order to conduct the fire well, only three billets of white nood fhould be put into the furnace at a time for the firf 20 huurs, four billets at a time for the next 20 hours, and fix biliets for the lalt 20 hours; in all 60 hours. The furnace is then left to cool, care veing taken to flop the air holes with fome lute; and in about 43 hours after, when the kiln is quite cold, the crucible is to be withdrawn.
IV. The Compofitions. 1. For the white dianond 3 )2

Tahe

## $G E M \quad[4 ; 6] \quad G \quad E M$

Gem. Ioke the bate of Mayence. This crytal is very pure, and has no colours.
2. For the yellurs diamond: To an ounce of the fourth bafe, add for colvur 25 grains of luna cornea or 12 grains of glafs of antimeny.
3. For the emerald : 1 . Ho 15 ounces of either of the rates, add tor colour one drachm of mountain blue and fix grains of glafs of antimony ; or, 2 . To an ounce of the fecond bafe, add for colour 20 grains of glafs of antimony and three grains of calx of cobalt.
4. For the fapphire: To 2.4 ounces of the Mayence bate, add for colour two drackms 45 grains of the cals of cotalt.
5. For the amethyt: To 24 ounces of the Mayence bafe, add for colour four drachms of prepared manganefe and four grains of precipitate of Callius.
6. For the beryl: To 24 ounces of the third bafe, add for colour 96 grains of glais of antimony and four grains of cals of cobalt.
7. For the black agate: To 24 ounces of either of the bales, add two ounces of the mixture directed above in par. $f$.
8. For the opal: To an ounce of the third bafe, add for colour 10 grains of luna cornea, two grains of magnet, and 26 grains of ablorbent earth.
9. For the oriental topaz: To 24 ounces of the firit or third bafe, add for colour five drachms of glafs of artimony.
10. For the topaz of Saxony: To 24 of the fame bafe, add for colour fix drachms of the glats of antimony.
11. For the topaz of Brafil: to 2.7 ounces of the fecond or third bafe, add for colour one ounce 24 grains of the glafs of antimony and eight grains of precipitate of Calfi us.
12. For the hyacinth: To 24 ounces of the bafe made with rock cryftal, add for colour two drachms 48 grains of glafs of antimony.
13. For the oriental ruby: 1. To 16 ounces of the Mayence bafe, add for colour a mixture of two drachms 48 grains of the precipitate of Caffius, the fame quantity of crocus Martis prepared in aquafortis, the fame of golden fulplur of antimony and of fulible manganefe, with the addition of two ounces of mineral cryital : or, 2. To 20 ounces of the bafe made with flint, add half an ounce of fufible manganefe and two ounces of mineral cryital.
14. For the balafs rubby: 1. To 16 ounces of the Mayence bate, add the above colouring powder, but diminilhed a fourth part; or, 2. To 20 ounces of the bafe made with Hlints, add the fame colouring powder, but with a fourth lefs of the manganefe.

The fartitious gems are eafly dinlinguided from the natural, by their foftnel's and fufibility; by their folubility in acids; by their caufing only a fingle refraction of the rays of light; and in many cafes, by their $\mathrm{f}_{\mathrm{f}}$ ecific gravity, which exceeds 2.76 in all precious gems of the firlt order, as the diamond, ruby, fapphire, \&c.

Initation of Antique Gems. There bas been at differcrit times a method practifed by particular perfons of taking the impretions and figures of antique gems, with their e gravings, in glats of the culour of the original gem. This has always been eftemed a very va-
luable method, and greatly preferable to the more ordinary ones of doing it on fealing wax or brimftone; but, to the misfortune of the world, this art being a fecret only in the hands of fome particular perions who got their bread by it, died with them, and every new artift was obliged to re-invent the method; till at length Mr Homberg having found it in great perfection, gave the whole procefs to the world to be no more forgotten or loft ; and fince that time it has been very commonly practiled in France, and lometimes in other places.

Mr Homberg was favoured in his attempts with all the engraved gems of the king's cabinet ; and took fuch elegant impreflions, and made fuch exact refemblances of the originals, and that in glafies fo artfully tinged to the colour of tbe gems themielves, that the nicert judges were deceived in them, and often took them for the true antique ftones. The counterfeit gems allo ferve, as well as the original ones, to make more co. pies from afterwards; fo that there is no end of the numbers that may be made from one; and there is this farther advantage, that the copy may be eafily made perfect, though the original thould not be fo, but thould have futtained fome damage from a blow or otherwife.

The great care in the operation is to take the im. preffion of the gem in a very fine earth, and to prefs down upon this a piece of proper glafs, foftened or half melted at the fire, fo that the figures of the impreltion made in the earth may be nicely and perfectly expreffed upon the glats. In general, the whole procefs much refembles that of the common founders. But when it is brought to the trial, there is found a number of difficulties which were not to be forefeen, and which would not at all affect the common works of the founder. For his purpole, every earth will ferve that is fine enough to receive the impreffions, and tough enough not to crack in the drying: thefe all ferve for their ufe, becaufe the metals which they cait are of a nature incapable of mixing with earth, or receiving it into them, even if both are melted togther, fo that the metal always eafily and perfectly feparates itfelf from the mould; but it is very difficult in thefe cafts of glafs. They are compofed of a matter which differs in nothing from that of the mould, but that it has been run into this form by the force of fire, and the other has not yet been fo run, but is on any occafion ready to be fo run, and will mix itfelf infeparably with the glafs in a large fire: confequently, if there be not great care ufed, as well in the choice of the glafs as in the manner of ufing it, when the whole is finithed there will be found great diticulty in the feparating the glafs from the mould, and often this cannot be done without wholly deltroying the impreflion.

All earths run more or leis eafily in the fire as they are more or lefs mixed with faline particles in their natural formation. As all falts make earths run into glafs, and as it is neceffary to ufe an earth on this occation for the making a mould, it being alfo neceflary to the perfection of the experiment that this earth thould not melt or run, it is our butinefs to fearch out for this purpofe fome tath which naturally contains very little falt. Of all the ipecies of earth which Mr Homberg examined on this occaion, none proved to

## G E. M

much divefted of fulte, or fo fit for the pury 5 , as the common tripela, or Tarpori, uled to polill thes and flones. Of this earth there are two conman hinds: the one reddih, and compefed of feveal ahkes or :ift ta; the other yellowih, and of a fimp'e thriture. There are both to be had in the hops. the liater kird is from the Levant; the former is found in Ergland, France, and many other places. The tripela numt be chofen foit and finooth to the touch, and not mixed with fandy o: other extranecus matter. Th: yellowih kind is thee beft of the two, and is commonly called Vonetian tripol:. This receives the impreflions very beautifully; and never mixes with the glafs in the operation, which the red kind fometimes does. Mr Homberg ufually employed both kinds at once in the following manner: firf powder a quantity of the red tripela in an iron mortar, and fifting it through a fine fieve fet it by for ufe; then forape with a knife, a quantity of the yellow tripela into a fort of possder, and afterwards rub it till very fine in a glafs mortar wihh a glafs peftle. The finer this powder is, the finer will be the impreflion, and the more accurately periect the calt. The artificer might naturnlly fuppofe, that the beft method to obtain a perfect fire powder of this earth would be hy walhing it in water; but he mult be cautioned againft this. There is naturally in this yellowilh tripoli a fort of uncluofity, which when it is formed into a mould keeps granules together, and gives the whole an uniform glofly furface: now the wafling the powder takes away this unctuofty; and though it renders it much finer, it makes it leave a granulated furface, not this fmooth one, in the mould ; and this muft render the furface of the caft lefs finonth.

When the two tripelas are thus feparately powdered, the red kind mullt be mixed with fo much water as will bring it to the confiftence of patte, fo that it may be moulded like a lump of dough between the fingers : this pafte mult be put into a fmall crucible of a flat flape, and about half an inch or a little more in depth, and of fuch a breadth at the furface as is a little more than that of the fone whofe impreflion is to be taken. The crucible is to be nicely filled with this palte lightly prefled down into it, and the furface of the patte mult be flrewed over with the fine powder of the yellow tripela not wetted. When this is done, the ftone, of which the impreffion is to be taken, mult be laid upon the furface, and preffed evenly down into the pafte with a finger and thumb, fo as to make it give a ltrong and perfect impreffion; the tripela is then to be preffed nicely even to its fides with the fingers, or with an ivory knife. The ftone muft be thus left a few moments, for the humidity of the paite to moitten the dry pouder of the sellow tripela which is frewed over it : then the ftone is to be carefully raifed by the point of a needle fixed in a handle of wood; and the crucible being then turned bottom upwarde, it will fall out, and the impreftion will remain vers beautifully on the tripoli.

If the fides of the cavity have been infured in the falling out of the ftone, they nay be repmired; and the crucille muft then be fet, for the pal c to dry, in a place where it will not be incommoded by the dutt.

The red tripoli leing the more common and the cheager kind, is here made to fill the crucible only t. fuve the other, which alone is the fubdance fit for the in any patt of tl:e ensravinat, becuate if there be a $y$
 wanting in the imprelion. When the eruthte drd pate are diy, a piece of glads mit be chomen of a prosper colour, and cut to a fize proper for the figure, this mult be laid over the moull, but in fuch a manner that it dues not touch the figure, wthermile it would fioil them. The crucible is then to be brodphtt near the furnace by degrees, and gradually teated till it cannot be touched without burning the lingers; then it is to be placed on the furnace under a mulite, furrounded with charcual. Several of thele fmall crucibles may be placed under one nuttle; and when they are properly difpoled, the aperture of the multhe houln have a large piece of burning charcoal put to it, and then the operator is to watch the procefs, and lee when the glafs begins to look hright: this is the fignal of its being fit to rcceive the imprefion. The crucible is then to be taken out of the fire; and the hot glafs mult be prefled down upon the mould with an iren inftrument to make it receive the regular impretion: as foun as this is done, the crucible is to be let at the fide of the furnace out of the way of the wind, that it may cool gratually without breakine. When it is cold, the glats is to be tuken out, and its edges homhl be grated round with pincers, which will prevent it, blying afterwards, which i an accident that fonetimes bappens when this caution has been om tte 1, elimeciol!y when the glafs is naturaliy ten.ker. The diferme corloured glafles are of diferent desreen of larimel, ace cording to their corronition; bue the has ant io no it are always the belf for this puplice, and lis is anumn by a few trials.

If it be defired to comp a Rone in relice which es naturally in creus, or to take one in creu which : naturally in relief, there meds no more thatn to cake an imprelion fint in 1 "ase or fapluer, and to monli that upon the pafle of tripela imfead of the fone itien, then proceeding in the manner before directed, tas procets will have the delined fuccis.

A more fimple and eafy methol than the ahowe, is by taking the calts in gepfum, or platler of Paris as it is commonly called. For this purpole, the avplans muit be finely pulverized, and then mixed with clew water to the conditence of thick cream. This is poared upon the face of the gem or feal of whith the impreffion is wanted, and which marl be previnul? moith ened with oil to facilitate the leparation of the catt ; and in order to enonfine the lipuid platere, it i. on'y no cellary to pin a flip of oiled paper romi the fides of the fal by way of a cap or rime. Whera the phaper is dry, it is to be taken of, and let before the worth of the furnace, in ordes to fre it entisely foom man年are; when it is hit to le uled as a me trix in tro bat.. us y is that formed with the tripuicnthe (), ato it or

 The glafs, ffote o :ninf to a prope hat, is preitel

cem. $\because$ ish $\because$ finall emolument, by that ingenious feal engraver Mr Deuchor of Edinburgh. The only refpect in which it is inferior to the other more operofe and experfive :rethods, confits in the chance of air bubbles aing in pouring on the plafter; which chance, how$\epsilon \because e r$, is in propotion to the fnemelf of the guofum enolowed. When air bubbles do occur, the catts mav be lad aide, as it is fo eafy to replace then.

The annivation of paftes to multiply and preferve the impretions of camaieux and intaslios, is an object rery interefting to artits and to antiquaries, as well as to r.en of learning and taite in the fine arts.

This art, though only lately reftored in any degree of pericction, is of very confiderable antiquity. The great priees which the ancients paid for the elegant gems engravel by the celebrated Greek artits, could not but eariy furget to them the idea of multiplying their nuwber, by taking of their imprefions in wax, in fulfour, in piater, or in clay; but more particulariy in coloured giaf, or that ritrified fubitance commonly calle thafe.

As the impreflions on paite are dumble, and imitate the colours and brilliancy of the original itones, they ferve the fame purpofes as the gcms themfelves. This art was therefore practifed not only by the Greeks, but by all the nations who cultivated Grecian talte.

Many of the finelt gems of antiquity are now loft, and their impreffions arc to be found only on ancient paltes. Great therefore is the value of thefe paftes. N Numerous collections of them have been formed by the curious. Inftances of this are found in the Florentine Mufeum, in Stofch's work on ancient gems with infcriptions, in Winckelmann's defcription of Storls's cabinct, and in the noble collection of Mr Cla:les Townley in London.

The art of taking impreffions of gems feems not to have been altogether loft even in the Gothic ages; For Heraclius, who probably lived in the ninth century, and wrote a book De codaribus e: artibus Romonorum, teaches in very plain though not elegant terme how to make them. Indeed, fome of the few perions who then onfeffed this art, taking advantage of the ignorance ct the times, fold paftes for original gems. Thus the famous emerald of the abbey of Reichnaw near Conftance, although a prefent made by Charlemagne, is now found to be a piece of glafs. And thus the celebrated emerald vafe in the cathedral of Genoa is likewife found to be a piece of pafte (a). The Genofe got this vafe at the taking of Cefarea in the year nos as an equivalene for a large fum of money; nor was any impolition then fufpected, for in the year 1319 they pawned it for 12 comerks of gold.

But this ingenious art, revived indeed in Italy in the time of Laurence of Medici a:nd Pope Leo X. was not caltivated in an extenfive manner till the beginning of the prefent century, when M. Homberg reftored it, as already mentioned. In this he is faid to have been greatly affifted and concouraged by the then duke of

Orleans regent of France, who ufed to amufe himfelf with that celebrated chemint in taking off impreffions in patte from the hing of France's, from his own, and other collections of gems.

According to the French Encyclopedits, M. Clachastat the elder, an engraver of fome note, who died at Paris in 1781 , learned this art from his royal highnef, to whole houlehold his father or he feems to have belonged. Mademoifelle Feloix next cuitivated this art, and it is believed ftill carries it on. She had been taught by her father, who in quality of garçon de chambre to the regent had often affuted in the laboratory of his malter, where he acquired this knowledge. Her collection confilts of 1800 articles.

Baron Stofch, a Prufian, who travelled over Europe in quett of original engraved itones and impreffions of ancient gems, for the elegant work which he publifhed and Picart engraved ( B ), was well acquainted with this art. He had tanght it to his fervant Chriftian Dehr, who fettled at Rome, where be made and fold his well known fulphur impreffions and paites. He had collected 2500 articles. Dolce has arranged them in a fcientific order, and given a defcriptive catalogue of them.

It was chiefly from Dehn's collection that the tafte for fulphurs and paftes has become fo univerfal. They are great objects of fudy, and often require much learning to explain them. They have unqueftionably ferved to extend and improve the art of engraving on ftones; and have been of infinite ufe to painters, to ftatuaries, and to other artifts, as well as to men of claffical learning and fine tafte.

It is wery difficult to take off imprefions, and perfectly to imitate varions-coloured cameos. It cannot be properly done in wax, fulphur, plafter, or glafs of one colour only. The difficulties arifing from their fize and form, and from the various nature of the different forts of glafs which do not well unite into different firata, are very numerous: nor conld the completef fuccels in this chemical and mechanical branch of the art produce a tolerable cameo. Impreffions or imitations, if unaffifed by the tool of the engraver, do nct fucceed: becaufe the undercutting and deep work of moft of the originals require to be filled up with clay or wax, that the moulds may come off fafe without injuring them. Hence the impreflions from thefe moulds come off hard and deftitute of delicacy, fharpnefs, and preciion of outline, till the underworking of the moulder is cut away. But Mr Keifientein at Rome, by his genius, perfeverance, and the affitance of able artits, has overcome thefe difficulties; and has had the fatisfaction of fucceeding, and producing variegated cameos which can hardly be ditinguihed from the originals.

Mr Lippart of Dredden, an ingenious glazier, and an enthufiaft in the fine arts, practifed this branch not unfuccefsfully ; but not finding fufficient enconragement for his paites of coloured glafs, or perhaps from local dificulties in making them well and cheap, he abandoned

[^22]
## ( E M

doned this art. He fubftituted in its place imprefions of fine white alabafter or felenite platter. Such impreflions, when carcfully foaked in a folution of white Caftile foap, then dried, and rubbed over with a foft brufh, take a very agreeable polith. They flow the work perhaps to better advantage than red or white fulphurs do ; but they are not fo durable, and are liable to be defaced by rubbing.

Of the impreffions Mr Lippart publihed three different collections, each of them containing 1000 atticles; and to the merit of having increaled the number of Madamoifelle Feloix and Chrifiano Dehn's collections, which are all inferted in his, he added that of employing two learncd Germans to arrange and defcribe them. The firft thoufand were arranged and deferibed by the late Profeffor Chrift at Leipife, and the fecond and third thoufand by Profeffor Heine at Goettingen. Nor did Mr Lippart ftop here: but to make the ftudy of antiquity more eafy and acceptable to artints, he felected out of the whole collection of 3030, a fmaller one of 2050 of the belt and more inftructive fubjects, of which he himfelf drew up and publifhed a defcription in German.

But of all the artifts and ingenious men who have taken impreffions of engraved gems in fulphur and in pafte, no one feems to have carried that art to fuch perfection as Mr James Taflie, a native of Glafgow, who refided in London from the year 1766 till his death. His knowledge in various branches of the fine arts, particularly in that of drawing, naturally led him to it. The elegant portraits which he modelled in wax, and afterwards moulded and caft in pafte, and which entirely refemble cameos, are well known to the public.

Mr Taffie, profiting of all the former publications of this fort, and by expence, induftry, and accefs to many cabinets in Ergland and other kingdoms to which former artifts had not obtained admiffion, was enabled to increafe his collection of impreffions of ancient and modern gems to the number of above 15,000 articles. It is the greatelt collection of this kind that ever exifted; and ferves for all the purpofes of artifts, antiquaries, fcholars, men of talte, and even philofophers. The great demand for his pattes was perhaps owing in the beginning to the London jewellers, who introduced them into fallion by fetting them in rings, feals, bracelets, necklaces, and other trinkets.

The reputation of this collection having reached the emprefs of Ruftia, the was pleafed to order a complete fet; which being accordingly executed in the beft and moft durable manner, were arranged in clegant cabinets, and are now placed in the noble apartments of her imperial majefty's feperb palace at Czariko Zelo.

Mr Talle, in executing this commifion, availed himfelf of all the advantares which the improved itate of chemiftry, the various ornamental arts, and the knowledge of the age, feemed to afford. The impreffions wert taken in a beautiful white enancl compofition, which is not fubject to thrink or form air bladders; which emits fire when ftruck with ftecl, and takes a
fine polih ; nel which hows every Atroke and touch of the artift in higher perfection than any other fabftance. When the colours, mixed colours, and naturc of the refpective originals, could be afcertained, they were imitated as completely as art can imitate them; infomuch that many of the pafte intaglios and cameos in this collection are fuch faithful imitations, that artifts themfelves have owned they could hardly bo diftinguihed from the originals. And when the coIour and nature of the gens could not be authenticated, the paltes were executed in agreeable, and chielly tranfparent, colours; conflant attention being veltosed to preferve the outlines, extremities, attributcs, and infcriptions.

It was the learned Mr Rafpe (from whom this account (c) is taken) who arranged this great collection, and made out the defcriptive catalogue. His arrangement is nearly the fame with that of the late Abbi Winkelmann, in his defcription of the gems which belonged to Baron Stofch. But as modern works were inferted in this collection, he found it necefiary to make a few alterations, and added fome divifions to thofe of M. Winkelmann, as will appear from the following confpectus, with which we thall conclude this detail.

## I. Ancient Art and Engravings.

Egyptian hieroglyphics, facred animals, divinitics, priefts.
Bafilidian, Gnoftic, and other salifmans, \&e.
Oriental and barbarous ancient and modern engravings.
Greek and Roman original copies, and imitations (the Etrufcan are claffed with the Greek works.)
A, Mythology or fabulous age. Gods, inferior dik vinities, religious ceremonies.
B, Heroic age before the fiege of Troy.
C, Siege of Troy.
D, Hittoric age. Of Carthage, Grcece, Rome, fub. jects unknown.
E, Fabulous animals and chimeras.
$F$, Vales and urns.
II. Modern Art and Engravings.

A, Religious fubjects.
B, Portraits of kings and fovereigns.
C, Portraits of illultrous men in alphabetical order.-
D, Portraits unknown.
E, Devices and emblems.
F, Cyphers, arms, fupporters, and medley of moders. history.

GEMAPPE, a village of Suftrian Hanault, three miles weft-by-fouth of Muns, rendered memorable for 2 victory which the French under General Dumourier obtained over the Autrians, Nov. 5. 1792 ; in which the carnage on both fides was fo drradiul, that three coal pits in the vicinity were filled $u p$ with the dead bodies of men and horfes.

GEMIARA, or Ghemara, the fecond fart of the Thlmud.

Gem

## (i) E M

The word a-na gomara, is commonly fuppofed to densee a fupplemen ; but in ftriztneds it rather fistinio complement, perfecion : being formed of the Chalice 132, ge": $a^{\prime}$, or $g^{\prime}$ 'enter, " to finh, perfect, or complite any thing."

The rabbins call the Pentatauch fimply the law: the er:l part of the Talmud, which :; only an explication of that la $\%$ or an application thereof to particulas cafes, with the decifines of the ancient rabbins thereon, they call the MI/cina, i. e. "fecond law:" and the fecond part, which is a more extenfive and ample explication of the Came law, and a collection of decifions of the rabbins polierior to the Miichna, they call Geira-a, q. d. " perfelion, completion, friihing;" becaufe thry efteem it the funining of the law, or an explication beyond which there is nothing farther to be deiired.
The Gemata is ufually called fimply Talmud, the common name of the whole work. In this fenfe we fay, there are two Gemaras or Talmuds; that of Jerufalem and that of Babylon: though in flrictnefs the Gemara is only an explication of the Mifchna, given by the Jetwif dostors in their fchools: much as the commentaries of our fchool divines on St Thomas, or the mater of the fentences, are an explication of the writers of thofe authore.

A cummentary, Monf. Tillemont o'sferves, was wrote on the Michna, by one Jochanan, whom the Jews place about the ead of the fecond century : but Fa. NIorin proves, fiom the work itfelf, whercin mention is nade of the Tirks, that it was not "rote till the time of Heraclius, or aboat the vear 620 ; and this is what is cailed the Gomara, or Talonud of Ycrufalem, whith the Jews do not uif or elleem much becaufe of its cibcurity.

They fet a much greater witue on the Gemara, or Talmud of Babylon, begun by one Afr ; difontinued for 7 Y yeate, on ocration of the wars with the Saracens and Perians; and finilled by one Jofa, about the clofe of the feventh century. Sce Timad.

Thonof the name Talmud, in its latitude, includes bath tie Mifchua anil the two Gematas, yet it is properly that of Afa and Jofa alone which is meant under that harse. This the Jews prize above all their other writinge, and ceen fet it on a level with Scripture itielf: in effeet, they conceive it as the word of God, derived by tradition from Mofes, and preferved "ithout interruption to their time. R. Jehuda, and afterward, R. Johanan, R. Afa, and R. Jofa, fearing the traditions thould be loft in the difperfion of the Jews, colle ted them into the Nifchna and the Gemara. See Carimtis and Rapbinits.

GLTINI, is Wronomy the TVMas; a confellation or fign of the zadiac, the third in orter, reprefating Conter and Follux: and it is maked thets, n. The Pars in the fon Gumini, in Ptolemy's cataloque, are 35 i, Tyyho', 25 ; in Hevelius's, $3^{\text {'s }}$ : in the Britannic Can l mue. ${ }^{-}$.

ment. In the year 1714 he came to England; where Geminiani: in a thort time he fo recommended himfelf by his ex- quifite performance, that all who profefied to love and andertand mufic were captivated with hearing him.Many of the nobility laid claim to the honour of!, .ng his patrons; but he fecmed chicfly to attach, hi welf to Baron Kilmanfegge, chamberimin to King George I. as ele:tor of Hanover, and a favourite of th prince. In 1716, he publifhed and decicated to his patron 12 funatas a violino violone e cembalo: the firft fix with fague, or double fops as they are vulgarly called; the laft with airs of various meafures, fuch as allemandes, courantes, and iiggs. This puhlication was fo well relifhed by the baron, that he mentioned Geminiani to the king as an excellent performer; in confequence of which our muffician had the honour to erform before his majelly, in concert with the celebrated Handel, who played on the harpfichord. But thou th Geminiani was exceedingly admired, yet he had not a talent at aflociating mufic with poetry, nor do we find that he ever became a public performer: he was therefore obliged to depend for his fubfittence on the friendlhip of his patrons and the profits which accrued to him from teaching. He had alfo the misfortune to be an enthuliaf in painting; and the verfatility of his temper was fuch, that, in order to gratify this paffion, he not only fufpended his fludies, and neglected to exercife his talents, but involved himfulf in debts. In 1.727, he was offered the place of mafter and compofer of the flate mufic in Ireland; but this could not be conferred on a Catholic, and Geminiani refufed to change his religion: upon which it was given to Matthew Dubourg, a young man who had been one of his pupils, and was a celebrated performer on the violin. Geminiani then fet himfelf to compofe parts to the opera quinta of Corelli; or, in other words, to make concertos of the firf $6 x$ of his folos. This work he completed, and, with the help of a fubfription, at the head of which were the names of the royal family, publifhed in $17: 6$. In 1732, he publifhed his opeca feconda, which contains a celebrated minuet that goes by his name. He publifhed many other pieces, the profits of which did not much mend his circumtances; but this perhaps was owing to his rambling difpoftion and cnthufiaftic fondnefs of painting. He was alfo an utter flranger to the bufinefs of an oicheftra, and had no idea of the labour and pains neceflary in the intruction of fingers for the performance of mufic to which they were itrangers. The confequence of this was, that a concerto pirituale, which he had advertifed for his own benefit in 1748 , failed in the performance. The audience, however, compafionacd hi- ditrefs, and fat very filent till the hooks were changed; when the performance was continuel with compulitions of the author's own, and which le ese-cu-d in fuch a manner as was never forgot. The profts alining from this performance enabied him to take a fourney to Paris; where be ftaid long enough to get plates engraveri for a fcore of fulos, and the pa ts of :100 cepras of comertes. About the year 175; he retamen io England, and advertifed them for haloin rór Creminimi wont oer to Ieland; and was kindly enteranaed these by Mr Mathew Dubourg, who had teen his pupil, ani was then matier of the king's tand in Ireland. mama. buds, $\therefore$ we have feen, fhoots are contained with leaves only, and not with flowers: but as a branch may be woididered as a part limilar to the whole plant, and, if planted, would in procefs of revegetation exhibit or produce rocts and fiower, se may in general allow, that the bud conzain the whole plant, or the principles of the whole plant, which mav be unfolded ad hilium: and thas verent ies the feed, in containing a delineation of the tuture plant in embryo: for a! though the bud wants a redicle, or plummla, of wich the feed is poflilied, set it wond uncoubtedy form one, if planted in the carth. Pat as the mednllary fart athering to the bud is too tender, and by the sbundance of juice flowing into it from the earth would be difyed to putrefaction, the buds are not planted in the full, but generally inferted within the bark of another trce; yct placed fo that the production of the matron, or pith, adhering to them, may be inferted fitu the $\mathrm{l}^{\text {ith }}$ of the branch in which the fiflure or cleft is made; by which means there is a large communication of juice. This propagation by gems or buds, called inorulaizon, is commoniy practifed with the frit fort of buds above deicribed.

From the obvious utes of the buds, we may collect the realon vhy the Supreme Author of nature has Sranted this fort of protection to mott of the trees that are matives of cold climates : and, on the other hard, denied it to fuch a, enfoying a warm benign a:mothere, liave not the tender parts of their embryo thoots expofed to isuries and depredations from the fo...itis of the weather. Of this latter kind are the ;hants of the following lint; fome of them very large tru- ; whers fmaller woody vegetables, of the dhrub and wherthreb kind: Citron, oranse, lemon, callava, anch orange, blud apple firuliby iwalow wort, alatermin, bubby geramons, berry-beaing alder, Cinil's :hor, Syitn mallow, boabah or Ethiopian four a rud, juhicia, nold fera, the acacias and fenfitive
 an 1, vibum: $n$, fumach, ivy, tamarik, heath, Barbado chusiy. lavatera, rue, ilrubby righthlades, Guinea homend, cypref, hignum situ, and favine, a foccies of juniper.

On antual plant, whofe root as well as lalk perifhes afies a year, truc buds are never produced; in their itcad, honever, are produced mail branches, like a li:tle ferther, from the wings of the leaves, which willer withont any farther expanfion if the plants climb a. I have no lateral branclies; but if, either by their own mature or from abundance of fap, the plasts bearie branchesl, the ramuli jult mentioned obtain an in reate fimilur to that of the whe plant.

The fame appearance otiam, in the trees of warm comentes, focly at thole enumerated in the above litt, in Vhich a plumula or finall ferther, fend forth branchos without at faly covering; as, in fuch comntries, this te.der bart teetuires no defence or protedion from cold. A caly covering then is peculiar to bud, as it protects the tader embryo enclufed tom all external injuries. When we therefore fieak of trees having buds that are nahed or without icalec, war meaning is the fame as if uc had fad that they have no buds at all.

Tie whis that are to be unfolded the following yea, break torth from the evolved buds of the preient Jear, is fuch a mamer ats to put on the aprearance
of finall eminences in the wings or angles of the lenves. Genmatio Thefe eminences or knots grow but little during the fummer; as, in that feafon, the fap is expended on the increafe of the parts of the plant: but in autumn, when the leaves begin to wither and fall off, the bud, placed on the wings, increafe; and the embryo plant contained in the bad is fo expanded, that the leaves and flowers, the parts to be evo'ved the following year, are ditinctly vifible. Thus in horse chefnut the leaves, and in comel tree the flowers, are each to be obfersed in their refpective buds.

As each bud contains the rudiments of a plant, and would, if feparated from its parent vegetable, become every way fimilar to it; Limaus, to thow the wonderful fertiliny of nature, has made a calculation, by which it appeais, that, in a trunk farce exceeding a fpan in breacth, 10,000 buds (that is, herbs) may be produced. What an infinite number, then, of plants might be raifed from a very large iree!

GEMIIATIO, from gemma, " a bud;" a term ufed by Linnous, expreflive of the form of the buds, their origin, and their contents. It includes both thofe properly called buds, and thofe which are feated at the rootc, ityled buibs.

As to the origin of buds, they are formed either of the footflalks of the leaves, of 1tipule, or of fcales of the bark. Their contents have been already difcovered, in the preceding article, to be either Howers, leaves, or both.

GEMONIE scilex, or Gradus Gemonit, among the Romans, was much the fame as gallows or gibbet in England.-Some fay they uere thus denominated from the perfon who raifed them; others, from the firit criminals that fuffered on them; and others, from the verb gemo, " I figh or groan."

The gradus gemonti, according to Publius Victor or Sextus Rufus, was a place raifed on feveral fteps, from whence they precipitated their criminals; others reprelent it as a place whereon offinders were executed, and atterwards expofed to public view. The semoniee fodle were in the tenth region of the city, near the temple of Juno. Camillus fint appropriated the place to this wife, in the year of Rome 358 .

GENDARMES, or Gens darmes, in the French armies, a denomination given to a felect body of horle, on account of their fucceeding the ancient gendarmes, who were thus called from their being completely clothed in armour; (fee Scuts Gendarmes, infra.) Thefe troops were commanded by captain lieutenants, the king and the princes of the blood boing their captains; the king's troof, befides a captain-lieuterant, liad two fublieutenants, thre enfigns, and three guidons.

Grand Gendarmes, latterly were a tronp compofed of $\mathbf{2 5 0}$ gentlemen: the king himfelf was their captain, and one of the firit peers their captain-licutenant, who had under him two lieutenants, three cnfigns, three guidons, at d other officers.

Small cifndikuEs, were the Scots gendarmes, the queen's, the dauphin's, the gendarmes of Anjou, Burgundy, the Englih and Flemifh gendarmes, having each a captain lientenant, lub-lieurenant, entign, guidon, and quarter-matter.

Scois Cendarmiss, were originally inflituted by Charles VII. of France, about the middle of the 15 th

$\qquad$ prerogative !o she precedone of all the compathes it the gendamene of Fance; and, on pasticular ocradinns, they even preceded the two companics of the hive's raw fuctaires. The !ous of the Soot:inh monarch wore the dual captains of this company; and, after Nary', acceflion to the throne, its commend heloneed io them as a tight. It was thence that Jomes VI. made a claim of it for his ion Prance Honry. This hemour, and its emoluments, were allo enjoyed is Charles I. and the next in command to this prince wis Lobis Suast duke of Lentox. Garge Gordon marquis of Hunty fucceeded the dake of Lemox in the year 1624 , and touk the title of captain or commanler in chicf when Chasles 1. mounted the Lonhth throne. It is rot certain wincther Charles II. was ever caprain of this compans; but it was conferred on his hoother the duke of Yurk, who was captain of the ticuts gendarmes tiil the year 1667 , when he refigned his cotmminum into the hands of the French king. since that time no native of Great Britain has enjoyed this command. See Sco Gut:frds.

All the different gendarmeries are now abolihed, in contequence of the reforming lyitems that have lately taken place in France.

GENDER, among grammarians, a divifion of nouns, or names, to diftinguith the two fexes.

This was the original intention of gender : but afterwards cther words, which had no proper relation either to one fex or the other, had genders atfigned them, rather out of caprice than realon; which is at length eitablithed by cultom. Hence genders vary according to the languages, or even according to the words introduced from one languace into another. Thas, art , , in Latin is feminine, but arbre in French is mafculine; and dens in Latin is mafculine, but dent in French is feminine.

The oriental languages frequently neglect the ufe of renders, and the Perfian language has none at all.

The Latins, Greeks, \&c. generally content themelves to exprefs the different genders by different terminations; as bonur equu, " a good horfe;" bsna equa, " a cuod mare," \&c. But in Englith we trequently go further, and exprefo the diference of fe: by different words: as boar, fow: boy, girl; buck, doe; bull, cow ; cock, hen; dor, bitch, \&ic.-W'e have only abou: 24 feminine:, dittinguilhed from the males, by the rarion of the termination of the male into fr; of which number are abbot, abbeti; coun: counte: ; aitor, actrels; heir, heirels; prince, princet, Esc. which is all that our language knevs of athy thing like gender:

The Greek and Latin, befides the mafenline and fes One, have the nouter, common, and the duubtful s ater; and likesite the epicene, or promitenous, hander one fing'e gender and termination includes the linds.

In f. 3 , the heutenam generals alvass command the right of the principal atack, and oder what they judge proper for the admancement of the fiege during the it hous they are in the trenchen: cacent the attach, which they ane nut to make without an order from the genctal in clict.
Litutenal: Gxare.ti of the (Irdmance. Sce Ord":ace.
Lieutinam: Geneaiae of Arillery, is, or ought to br, a wery great nr thematiciath, and an alle engineer ; to know alf the powers of anthery; to underitand the attack and defence of furtifed phaces, in all its diferent branches; how to difyofe of the artilicry in the dy of buttle to the bell adrantase ; to conduct its march and retreat ; as alio to be will acquinted with all the ruacrows affantur belonering to the tain, and to the latunatary, \&ce.

Muing (Gexeral, the nex: nficio to the lieutemat pucal. His chieflytinefs is to recive orders from Co versh, os i: li abfence from the lieut wnant geme-- Ae doy, winit he is to dithibute to the bigate -ayc n, with whom he is to regulate the gard, con--uys, detachments, ©c. On him refls the whole tarigue cud detit of duty of the amy roil. 1 , is the ram fo: general of the d.y who is charged with the encampment of the army, who places limelf at the head of it when they march, who marks oat the ground of the camp to the quartermafier general, and who places the new guards for the lafety of the camp.

Thie day the army is to march, he diftates to the field officers the order of the math, which be has received from the general, and on other days gives them the parole.

In a fixed camp he is charged with the foraging, with reconnoitring the ground for it, and pofting the efocr:, \&:c.

In inges, if there are two frparate attack, the fecond belong< to him; but if there is but one, be takes, either frem the right or left of the attack, that which the licutenant general has not chofen.

When the army is under arms, he affints the lieute-- Int weneral, whofe orders be executes.

If the army marches to an engagenent, his poof is at t!.e bead of the surds of the army, until they are near - nough to the enemy to rejoin their different corps; afF.r which he retircs to his own proper poft: for the m:jor general are difpofed on the order of battle as the lieutenint gencrah aic ; to whom, however, they are 4, bordiate, for the command of their divifions. The major geacral has one aid-ce-camp, paid for executing Bis orders.

Giexeril is afou ufd for a particu'ar march, or teat of drum ; being the firl which gives notice, commomly in the morning carly, for the infantry to be in seatinefs, to march.

Guafrat is likewife an appellation by which officers in L.w. in the revenues, \&c. are difinguifhed; as, at:orney cencral. folicitor general, \&c. receiver general, comptroller geseral, \&c. See Attorney, \&e.

Grexeail is alfo ufed for the chief of an order of monhs, or of all the boufes and congregations eftaelithed under the ione rule. Thus we fay, the general of the Francifan, Cilkrians, \&c.

GENERALISSIMO, called alfo captain general, Generaliaand fimply gencral, is an wficer who commands all the military powers of a nation; who gives orders to all the other general oftices; and rectives no orders himfelf il Generation. but from the king.
M. Bakzac oblerves, that the cardinal de Richelieu firt coined this word, of his own abfutute authority, upon his going to conmand the French army in Italy:

GENERATE, in Mu/ic, is uled to fignify the operation of that mechanical power in nature, which every found has in producing one or more dififent founds. Thus any given found, however fimple, produces along with iticli, its octave, and two other founds extremely flarp, viz. its twelith above, that is to fay, the octave of its fifth; and the other the fevententh above, or, in other words, the double ochave of its third najor.

Whether we fuppole this procreation of founds to refult from an antilude in the texture ond magnitude of certain paticles in the air, for conveying to our ears vibrations that bear thofe proportions, one to another, as leing determined at once by the partial and tutal ofeillations of any mufical ftring ; or from whatever comony of mature we cloofe to trace it ; the power of one found thus to produce another, when in action, is faid to generate. The fame word is applied, by signior Tartini and his followers, to any two founds which, fimulaneonily heard, produce a third.

GENLR ATED, or GMATED, is ufed, by fome mathematical writers, for whatever is produced, cither in aithmetic, ly the multiplication, diviion, or eatraction of roots; or in geometry, by the invention o: the contents, arcas, and fides; or of extreme and mean proportionals, without arithmetical addition and fubtraction.

Generating lise, or migure, in Gecmery, is that which, by its motion of revolution, produces any other figure, plane or folid. See Glexesis.

GENERATION, in Physsiology, the act of procreating and producing a being fimilar to the parent. Sce Asatomi, ${ }^{\circ}{ }^{1} 57$.

Genfration of Fibbes. See Comparative Anatomy, $\mathrm{N}^{3} 30 \mathrm{t}$, and Ichthyology.

## Generation of Plants. See Botany.

Generation of Infects. Sec Comparatife Auatomy, p. 312, and Estomology, p. 234.

Parts of Generation. See Anatomy, N ${ }^{0} 157$.
Generation, in Mathematics, is vied for formation or production. Thus we meet with the generation of equations, curves, fulids, \&c.
Gentration, in Thicology. The Father is faid by fome divines to have produced his Word or Sun from all eternity, by way of generation ; on which uccation the word generation raifes a peculiar idea: that proceffion, which is really effected in the way of underthanding, is called seneration, becaufe in virtue thereof, the Word becomes like to him from whom he takes this original ; or, as St Paul exprefles it, is the figure or image of his lubftance, i. e. of his being and nature. And hence it is, they fay, that the fecond Perfon in the Trinity is called the Son.

Geveration is alfo ufed, though fomewhat improperly, for genealogy, or the feries of children ifilud from the fome flock. Thus the gofiel of St Matthew commences with the book of the generation of Jefus

Chrift,

Ge:ration Carif, \&ec. Th later and more accurate thmhtura,
G utis.

A, wa. ne, an: comard omament, being made of timel an. sime of then the artized walks or piazza, in
 Why flanted with linden trees, and commanding a the 14 If et ot the hke, with ieveral ranges of rocks biang :and one another, fone covered with wineyard and lertoge, and others with fnow, having openings betwen thens. Immelituly below Genera the Rhone is joined by the 1 tre, a cold and muddy Aream rilng mos the Alps, and deriving a comiderable part of it watu: from the Glaciers. The Rlone is quite clear mal :ratparen, St that the mudy -..tis of the Arve is dithenalathe from it wot wet they have flowed $\therefore$ Reveal milles together. Thete are fur lridges *r the Rhase before it joins the Arre; and from it the city is fupplied with water by means of an hyDaulic machine, which raiko it 100 Paris feet above $\therefore$ level. The princifal buildings are, 1. The maition se ville, or tomimnule, a plain meient edifice, with large rooms, in which the comchit alemble, and public entertamments are held; and in one of them a weekIf concert is had by fubfeription during the winter. The afcent to the upper thory is not by fteps but a paved acclisity: which, hosever, is fo gentle, that horfes and mutes can go up to the top. 2. The charch of St Petcr's, formerly the cathedral, is an ancient Gothic building, with a modern portico of feven large Curinthian columns of red and white marble from Roche. The only thing remarlabie in the infide is the tomb of Henry duke of Rolinn. 3. The arfenal is in good order, and fupplied with arms furticient for I , ,2:20 men. There are many ancient fuits of armour ; and the fealing ladders, lanthorns, hatchets, Sc. ufed by the Savoyards in their treacherous attempt on the city in the year 1602 , to be afterwards nuticed, are here freErved. The magrzines contain 110 cannon, befides mottars. 4. The hoipital is a large hanlome building, by which and other charities near 4020 poor people ave mantaned. 5. The fortifications on the fide of Savoy are of the modern confruction, bat are commandw by fome neighbouring grounds. On the fide of France they are old fahnioned, and at any rate are anther calculated to prevent a furprife than to futtain a regular fiege. There are three gates, towards France, Savoy, and Suitzerland; and the accefs to the lake is guarded by a double jetty and chain.

The territory belonging to this city contains about feren iquare leagues, and is divided into nine parihnes ; the town is by far the moft populous in Switrecland, having about $30,0=0$ inhabitants, of whom, however, $5: 00$ are generally fuppoted to be abfent. I: has a fmall diftrict depentent on it, but this does not contain above $16,=58$. The adjacert crurniry in extremely beautiful, and has many magnifcent viens arifing from the different politions of the namerou hills and mountains with regard to the tuwn and lake. The inhabitants were formerly ditinguilhed into four clafec, viz. citizens, burge iles, inhabitants, and satives; and fince the revolution in 1782 , a fifth clats named domiciliur, has been added, who annually seccive nermiliion from the magillates to redde in the city. The citizens and burgefle, alowe, bowever, are admitted to a thare in the governouent; thofe called inhalitant are Arangers allowed to fettle in the town with cortain privileges; avt the nation are the then of
thene iablatant, who nolkes additional advantages. Genera. The peopte are very active and indullicus, carrying on al catenive commerce.

This city is remorkaine for the number of larned state of
 gha were very carly received in it, being prenchad there in 1533 by Whiliam Farel and Peter Vits of Oa'm, and atterwards fimally ettatimed by the celebratud John Calsin. Of this reformer V Jtaire oterves, that he gave his name to the reliniuns doctrines frit broancid by other", in the bame miner that Americus Vefnotios gave nanc to the continent of America, which fi.d formerly been difcovered by Columbus. It Was by the affiduity of this celehrated retormer, and the inl:ence tliat :e acquird amons the citizens, that a public academy was firft eftaidihed in the cir , where he, Theodore Beza, and fome of the more eminent firl reformers, read lectures with wnomm n fuecelf. The intolerant firit of Calvia is well knowa; but little of it now appears in the government of Geneva: on the contrary, it is the motl tolerating of all the eflates in Switzeriand, being the only one of them which permits the public exercife of the Lutheran religion. The advantages of the academy at Gencra are very confpicuous among the citizens :.t this day, even the lower clafs of them being exceedingly well informed ; fo that, according to Mr Cose, there is not a city in Eorope where learning is fo generally diffufed. "I received great fatisfaction (fays he) in converfing even with leveral tradefmen upon topics both of literature and politics; and was aftonihed to find in this clafs of men fo uncommon a thare of knowledge; but the wonder ceales when we are told that all of them were educated at the public acadeny." In this feminary the indultry and emulation of the fudents are exsited by the amual difribution of prizes to thofe who diAtinguill themtelves in each clafs. The prizes confift of fimall medals, but are conferred with fuch folemnity as cannot fail to produce a Atriking effect on the minds of youth. There is allo a public library to which the citizens have accefs, and which unjoubtedly tends greatly to that univertal diffufion of learning fo remarlable among the inhabitants. It was founded by Bomivard, remarkable for his fufferings in the caufe of the liberties of his country. Having been a great antagonist of the dukes of Savoy, againil whom he affurted the independence of Geneva, he had the misfortune at latl to be taken priioner, and was imprifoned for fis ycars in a dungeon below the level of the lake, in the cafte of Chillon, whichatand on a rock in the lake, and is connected with the land by a drawlorilgce. In 1536 this cattle was taken from Charles III. of Savoy by the canton of Berne, allided by the Genevans, who furninhed a frigate (their whole naval force) to befiege it by water. Bomivard was now taken from his dungreon, where by contlant walking backward and forward, his ouly amufement, he had wern a hollow in the flow which conifited of folid rock. Bonnivard confidered the hardihips he had endured as ties which cadeared him to the city, and became a principal promoter of the reformation by the mild mathods of perfurmond infraclion. He clofed his benefations by the sitt of his books and manuleripts, and bequeathin: his fortune toward the eflablihment and fupport of the feminary. His wort.s, which chiely relate to the hintery

## $G \mathrm{E}$ ( $\quad 48-] \quad(\mathrm{I} \quad \mathrm{N}$

Geres. hitury of Geneva, are itill preterved with great care and revceet.ce. Th.c library contains 25,002 whlunes, with many curio:s manufcripts, of which on necount l.as been publinhed by the reverend M. Semalior the libraian, who has ikenife ditinguithed hime if bo fiveral Aiterary worhs. Meïrs Bonnet, Sumfure, MI Het. and De Luc, are the other molt dintinguihed hicena: geniules of which Genera can boatt. The latk is pert ticularly remarhable tor the perfection to which he has brought the barcmeter, and which is now fo grate, that very little feems polible to be done by any baty Acomon of elle. His cabinet merits the attution of maturalik, De Luc's as containing many rate and curious fecimens of folcajinet.

Hifory and In the time of Charles the Great, the city and ter-govern-m-nt of Gereva. fii', which ferve to illurate the theory of the globe. It may be divided into three parts: t . Such as talble the naturalit to compare the petrifactions of animals and regetables with the fame bodics wich are till knorrn to exit in our parts of the glate. 2. To compare thefe petrifactions of animais with the fame bodies which are known to exitt in dufferent countrics. 3. To condider the petrifactions of thofe bodies which are no lunger known to exist. The fecond past comprehends the thomes under three points of view: 1 . Thofe of the frimitive montain, which conemin no animal bodies; 2. Thofe of the fecondary mountain, which contain only marine bodies; 3. Thofe which contain terretrial budies. The third part contains the lavas and other volennic productions; which are datiaguifhed into two clalies: i. Thole which come from voicanoes now actually burning; 2. Thofe fiom cxtinguilied volcanos.

In the time of Charles the Great, the city and terhis succefiors, it became fuyject to the German empe-
rors. By reation of the imbecility of the ee princes, lowever, the bithops of Geneva aequired fuch autio. rity orer the inhabitants, that the emperor had hoo 0 ther means of counterbalancing it than by augmenting the privileges of tie people. In thefe barbarou ages alto the bohops and counts had conitant difpute, of which the people took the advantage; and by fiding fometimes with one, and fometmes with the other, they obtained an estention of their privileges from both. The houfe of Sawn at length purchafed the territory, and furceeded the count with adlitional power : againt them therefore the bihops and people united in order to renif their encroacliments; and, during this pevioo, the goverament was itrangely complicatel, by reation of the varions pretentions of the thete parties. The comit of Sovoy, however, had at lath the addrefs to diflole the union betweea the biarops and citizen, by prosuring the eplicopal the for their brothers, ard even therir ilic stimate chidren; by which means their prower becane gradually to extenfise, that tosaris the cormencement of the 16 th certury, Charles III. of Suvoy (hough the governmert (ias accoured entirely repulhican) obtained an almolt abflue suthority over the peothe, and cacrcied it in a math uniol and artitrany maners. Thus siolent commotions tooh wace; and the citizens became divided inte two partice one of which, tif. the patrinte, were digkd Eidecterfin or confederater: the Partions if Sowy being dif raced by the anpulation of Mamalues or lazer. The true ier at of Cimeyan li'serty may thectos be confidered as commencing
with the treaty collated with Berne and rivart in on. the 10: 15:0: in co tom whe of which the duhe -... was i:. a the rt time dey ficu. of lis authority, the hi-
 a - . whilican furm of poremman: madiuced. A lone Saf commence.. whith bavoy un the account; fut the G, aceme proved an cretmath fis that enemies by that con: Lovery and the ahmazae of the inisbitants of Bonne, In 154 , the repulic concluded a treaty riti Zuncla and Beme, ty which is allied to the Swit cantom. Whe hoafe of Savoy mace their lat athompt againt Genera in 16:2, when the city was treacherouly attached in the night time daring a 1 foturnd peace. Two lundre! foldiers had fealed the wall. and got into the wan before any alam was given: but ihe: vere refulfad lig the defperate valour of a few citizas, who perinind in tice encounter. A petard bad Den fifliened to one of the gates by the Shoyard : but the gumer was killd before it could be dilcharged. The war occulioned hy this treachery was nexi year concluded by a folemn treaty, which has eter in:ce been otherved on both lides: though the independence of Gunava was not formally achnowledged by the king of Sardnia till the year 1754

The rettoration of tranquillity from without in confequence of the above treaty, was however foun followed by the Hames of internal diford, fo common in popular governments; fo that during the whole of the lant century the hillory of Gencra atfords little more than an account of the tirugyles be twist the arillocratical and popular partics. About the begiming of the prefent century the power of the grand council was become almol abluite: but in order th reticain it, authority, an ediet wow procured in $17=7$ by the popular patty, enacting, that evers five eurs a general council of the citizus and burghers thould be fummoned to deliberate upon the a:fais of the repubic. In confe puace of ith liw a geneal aldenty wav convened in 1-12; and the very tirst a.t of that akembly was to :b slihh the edict by which they hat been convened. A procecting tio en traordinaty can fearcely be accounted for en the fria cipies of porular fintonefs and incontancy. met tin ${ }^{27} 7^{-5}$ couxcil of 25 , enjoved in their corporate caracity itteral sery connderable prerogotives. By then lutit the mombers of the great council were named; the prini p.i magitrates were fuppied from their own boly; it:y e nooked the great an' generat cuuncil, datibe P-t : previ ufly upon every quelion which w.s to we $\therefore$ roshe betore thefe council. They were valed alfo *ith the chief executive pover, the adminitr tion of manarces, and had in a certain degree the juidiction in cival and criminal caules. Moft of the finaller polts wese iikervie filed by thon ; and they enioved the fole privilege of conterting burherhip. Thele, and other presocative, however, bure balanced by thote of the great concil and the privaleges of the gen+ral council. The tomer had a right to choofe the members of the fenate from their own $10^{\frac{1}{y}}$; receiving appecls in oil caufe above a certain valte pardoning criminals, \&ic. belides which they had the important frivilege of approving or rejecting whitever was propoled by the fenate to be laid betors the peopie.

The general council or aftembly of the people is compufed of the citizens and buthers of the town: theii numbur in eneral amomting to 150 , though ufually not more than 1200 were preent ; the remainder refiding in foreign countriss, or being otherwife abfent. It meets twice a year, choofes the principal magifrates, approves or rejects the laws and regulations propoied by the other ccuncil, impofes tases, cortract alliances, declares war or peace, and nominates haif the members of the great council, 太sc. But the principal check to the poser of the tenate arofe from the right of reelection, or the power of annually exvelliag four members from the fenate at the nomisuation of the fyadics or prisicipal magillrates, and from the right of reprefentation. The fyndics are four in number, chofen annualiy from the fenate by the geneal council; and three years eiapfe before the fame membets on be again appolited. In cloofing thete swasifrates, the wate appointed from its own body tight eandidates, from whom the four fyndics were t) be cholen by the g. ever, hat it in their power to ricied not caly the firlt ei hen candidates, but alio the whole body of fenators in lieceftion: in which cale, four members of the fenate $r$ tised into the grent council: and their places were flled by an equal number fom that concil. With row.rl to the poner of reprefentation, every citizen or turder has the privilege of aplying to the fenate in urder to procure a now regulation in this refpect, ur wi remonllsating againt any ad of the magitracs. To the eie remonilrane es the mitarates were obliged to Eive th caplicit antuer ; for in a fatisfatory anfucr was Giver to one, a fecond was immdiateily prefented. Ith reprefentation was made by a greater or fmatler namber of citizera acerdia, to the importance of the point in queflion.

Since the 17 ,h, however, "vea! , hanges have then 1pace. Thi is that of recte $2, \%$, wich the aritocratical
 proed very ditigneable, being wnidered by the fomer as a hinct of oftr , ifm: for which praton they catched a coery opmonity of procurines it abolition. 'they were how diftinguibed ly the title of negatives,
while the popular paty had that of roporesuanis; ati Getera. the puint in difpute wis the compilation of a new cuge uf hav. This meafure the negatives oppoice, as fugpoting that it would tend to reduce their prosoz? tises; w!ite, on tive other hand, the repreientants uted their utmot endeavours to promne it, in hopes of laving their privileges aus mented by this means. At late in the month of lanury 1777 , the negatives were obliged to comply with the demants of their antagonits; and a conmittee for fomis, a new code of laws was appeinted by the concurrence oi the little, great, and general councils. The committer was to lat for two years, and the code to be laid before the three council's for their juint approbation or recetion. A fketch of the firil part of the code was preiented to the little and great councils on the firt of Septemier 1779, that they might profit by thair oblervation, before it was prelented to the general council. Great dipmes arofe; and at length it was carried by the regatives that the code fhould be rejected and the committee difinsed. The oppotite farty complained of this as unconftitutional, and violent difputes enfued ; the illue of which was, that the great council offered to compile the code, and rubmit it to the decilion of the public. This did not give faridfaction to the popular party, who confidered it as infdious: the contentions revived whth more fury than eier, until at length the negatises fuppofing, or pretending to fuppole, that their comntry was in danger, applied to the guarantecs, France, Zurich, and Berne, entreating them to proteft the laws and conftituthen. This was produccive of no good effect ; to that the negatives fuund no oller method of gaining their point than by forling dillenion among the differtat claffes of imbitants. The nativer were difcontented and jealons on accutat of many excluive privileges enjoyed by that clafs named cirzens: they were befles exafperatel againt them for having, in 1772 , banihed eight of the prineipal nat tives, who pretended that the right of bergherhip telonged to the natives as well as to the citizens, and demanded that this right ought to be gratuitouly conferred intead of being purchafai. The negativer, in hopes of making luch a conliderable addtition to their party, courted the natives by all the methods they could think of, promifing by a public declaration that they were ready to confer upon them thofe privileges of trade and commerce which had hitherto been confined excluively to the citizens. The defign of the negatives were likewife openly favoued by the conit of France, and defpatches were even writen to the French refident at Geneva to be communicated to tho principal natives who lided with the arillocratic pmoty. The attorney-general, conceiving this mede of interizrence to be highly unconlfitutional, prefented a fipitecil remonfrance ; by which the Irench court wive to wuch difpleafed, that they procured his depolition from his oflice; and thus theis party was very wriderably increated among the natiocs. The reprefent, were by no means negligent in their end avours to comiliut: the fawor of the fame party, and enen rombild what they had hitherto oppofed in the itrongeft moner, viz. to facilitate the acquition of the hurgheralip, and to beitow it as the recompenfe of indultery and good behaviour. Thus tho patie, were formed among the natives themtives; and the difienions be-

## G E N

coming every day worfe and worfe, a generdinfurrection took place on the 5 th of February 1781. A difIute, accompanied with violent reproaches, having commenced betwixt two neighbouring and oppofite parties of natives, a battle would have immediately tak. en place, had it not been for the interpofition of the fyndics on the one fide, and the chicts of the reprefens fants on the other. The tumult was beginning to fubfide, when a difcharge of mufquetry was heard from the arlenal. Some young men who fided with the negatives, having taken pofleffion of the arfenal, had fired by miffake upon feveral natives of their own party, and had killed one and wounded another. This was confidered by the reprefentants as the fignal for a general infurrection, on which they inftantly took up arms and marched in three columns to the arfenal; but finding there only a few young men who had rafhly fired without orders, they permitted the reft to retire without moleftation. In the opinion of fome people, however, this affair was preconcerted, and the reprefentants are faid to have been the firft aggreffors.

The reprefentants having thus taken up arms, were in no hafte to lay them down. They took poffeffion of all the avenues to the city ; and their committee being fummoned next morning by the natives to fulfil their engagements with refpect to the burgherfhip, they held feveral meetings with the principal negatives on that fubject, but without any fuccefs: for though the latter readily agreed to an augmentation of the commercial privileges of the natives, they abfolutely refufed to facilitate the acquifition of the burgherhip. The committee, however, embarraffed and alarmed at the number and threats of the natives, determined to abide by what they had promifed; drew up an edict permitting the natives to carry on trade, and to hold the rank of officers in the military aflociations; and conferred the burgherfhip on more than 100 perfons taken from the natives and inhabitants, and even from the peafants of the territory. This was approved by the three councils; the negatives, dreading the power of their adverfaries, who had made themfelves mafters of the city, not daring to make their appearance.

Thus the popular party imagined that they had got a complete victory; but they foon found themfelves deceived. They were prevailed upon by the deputies from Zurich and Berne (who had been fent to conciliate the differences) to lay down their arms; and this was no fooner done, than the fame deputies declared the edict in favour of the natives to be null and illegal. The fenate declared themfelves of the fame opinion ; and maintained, that the affent of the councils had been obtained only through fear of the reprefentants who were under arms, and whom none at that time durf oppofe. The reprefentants, exafperated by this proceeding, prefented another remonftrance on the 1 Sth of March ${ }_{17} 8^{2}$, fummoning the magiftrates once more to confirm the edict; but a month afterwards received the laconic anfwer, that " government was neither willing nor able to confirm it." The natives, now finding themfelves difappointed in their favourite object at the very time they had fuch ftrong hopes of obtaining it, hehaved at firf like frantic people; and thefe tranfports having fubfided, an univerfal tumult took place. The molt moderate of the popular party ondeavoured in vain to allay their fury, by difpering

Ver. IX. Part Il.
themfelses in different quarters of the city; and the Geniv. citizens, finding themfleses at latt obliged cither to abandon the panty of the natives or to join them openly, hallily adopte the latter mealure ; atter whicl, as none could now oppote them, the ollicers of the reprefentants took pofidion of the town, and quelled the infurrection. Various negotiations were carried on with the negatives in order to prevail upon them to ratify the edict, but without fuccefs: on which a few of the magiftrates were confared by the popular party along with the principal nenatives; and as they juitly expected the interference of France on acconnt of what they had done, they refolved to prolong the confinement of the prifoners, that they might anfwer the purpofe of hottages for their own fafety. In the mean time the body of citizens, deceived by the pretences of the popular party, acted as if their power was already eftablifted and permanent. In confequence of this, they depofed feveral members of the great and little councils, appointing in their room an equal number of perfons who wete favourable to the caufe of the reprefentants. The great council thus new modelled, executed the cdict for conferring the burgherfhip upon a number of the natives; and appointed a committee of fafety, compofed of eleven members, with very confiderable authority. By this committee the public tranquillity was re-eitablifhed; after which, the fortifications were ordered to be repaired; and the people were buoycd up by the moft dangerous notions of their own prowef, and a confidence that France either durft not attack them or did not incline to do fo. In confequence of this fatal crror, they refufed every offer of reconciliation which was made them from the other party; until at laft troops were difpatched againft them by the king of Sardinia and the canton of Berne; and their refpective generais, Meffrs de la Marmora and Lentulus, were ordered to act in concert with the French commander, M. de Jancourt, who had advanced to the frontiers with a confiderable detachment. The Genevans, however, vainly puffed up by a confidence in their own abilities, continued to repair theis fortifications with indefatigable labour; the peafants repaired from all quarters to the city, offering to mount guard and work at the fortifications without any pay ; women of all ranks crowded to the walls as to a place of amufement, encouraging the men, and even alfiting them in their labour. The befiegers, however, advanced in fuch foree, that every perfon of difeernment forefaw that all refiftance would be vain. The French general Jatcourt, on the 29th of June 1782, defpatched a meffage to the fyndics; in which he infifted on the following humiliating conditions: 1 . That no perfon frould appear on the freets under pain of military punihment. 2. That a certain number of citizens, among whom were all the chiefs of the reprefentants, fhould quit the place in 24 hours. 3. That all arms thould be delivered to the three generals, 4. That the depofed magiftrates thould be inftantly re-eftablifhed: And, laftly, 'That an anfwer fhould be returned in two hours. By this meflage the people were thrown into the utmoit defpair ; and all without exception refolved to perilh rather than to accept of terms fo very difgraceful. They inftantly hurried to the ramparts with a view of putting their refulution

iereva in : see: fut in the mean time tho fradics foum ————nal : to win frem the generals a delay of 24 houre. D.tins this imerval, not ofly men of all ages prepared to: t'e apy roaching danger, but even women and chilcreat tore the pavencot from the ftrect, carrying the staves up to the tups of the houte, with a view of wilisg them down upon the enmy in cale they hould Asce their way hato the twon. About 80 women ara $\mathrm{g}^{\prime}$ 's, dealied in uniforms, offered to form them$\therefore$ Lues into a compuy son the defence of their country. ".a commine iftity accepted their fervices, and a.c.s them is a berrack focures? from the cannon of toe betieges. The regativas were craty alarmed at - his anseaturce of defperate reftance ; and lome of - oe noolt moderate anong them endenvoured, but with--at ficcelf, to cfect a recunciliation. At the hour a which it was expected that the attack would begin, $\therefore$ ise ramparts were filled wih defenders; and though the molf zealous of the popular party had calculated niy on 3200 , upward of 5000 appeared in the pubic caufe. The French general, however, juitly alarm-- d for the pritoners, who were now i:s imminent danfer, again prolonged the period propoled for the cafitulation. By thele repeated deisy the ardour of the defendats begen to abate. The women firf began to Sure to themleives the horrors of a town taken by afrait, and given th? to an enraged and licentious foldiere; many timid perons fuund means not only to difguite thair own fars, but to infuire others with Then undur the pretence of prodence and caution: at ialt the cominttee of fafety themfelves, who had fo firenuontly declared for holtilitice, entirely changed ineir mind. Being well apprized, however, that it would be dangerous for them to propofe furrendering in the prefent temper of the neople, they afiembled the citizons in their refpective circles, reprefenting, that if the city thould be attacked in the night, it would be no longer pofible to convene them : for which reafon they recommended to them that each circle fhould nominate feveral deputies with full authority to decide in their ftead; adcing, that they ought rather to appint thofe perfuns who from their ace and refectable charactor were capable of affiting their country by their advice, white others were detending it by their whotr. Thus a new council, compofed of about 100 citizens, was formed; in which the chiefs, by various mancuvres, firt intimidating, and then endeavouring to perfuade the members of the necelfity of furrendering, at latl found means to take the thoughts of the people entirely off the defence of the city, and engage them in a fcheme of general emigration. A declaration was drawn up to be delivered to the fyndics with the keys of the city, the chiefs fummonel the principal oficers from their pofls, ordered the cannun of leveral batteries to be rendered unfit for furvice, and at lat took care of themfelves by quitting the town. The people were it the utmof defpair: atd left the town in fuch nublitudes, that when the Sosdinians chtened it in the morning, they found it almolt aeferted. 'Ihis was followed by the relturation of the former macilleates, a cemple: fubjection of the pofular paty, and the eltablithment of a militusy goverim: t.

The d ances which tonk place en this orcation were as cullow 1 A. abotion of the right ci rectection.
2. The abohitn of that right ty slich the eneral cunacil nominated haff the vacancies in the grest woncil. 3. The right of remonltraing was tatien frem the citizens at large, and velted in 36 ad:ane, wo night be prefent in the great council tine firt Pionday of every month. They enjoyed a right of repreientiation, and in confequence of that had a deliberative voice; but on the whole were fo infignificant, tint they were nicknamed Les Ingeses, of " The ihndors." 4. The introduction of the grabeau, or anmal confirmation of the members of the fenate and of the great. council, vefted entirely in the latter. By this law part of the authority both of the fenate and genersl council was transferred to the great council; and by fubjecting the fenate to this annual revition, its power was greatly lefened, and it was made in fuct depend. ent won the general councils. 5. The circles or cluts in which it was cultomary to convene the citizern, and all public affemblies whatever, were prohibited; and fo rigoroully was this carried into execution, that the fociety of arts was prohibited from meeting. 6. The militia were abolihed; firing at marks, evert with bows and arrows, was prohibited; and the town, inftead of being guarded by the citizens, was now pu: under the care of 1000 foreign foldiers, whofe colone! and major were both to be foreigners. Thefe troops were to take an oath of fidelity to the republic, and of obedience to the great council and the committee of war: but were under the immediate command and infpection of the latter, and fubject to the fuperior controul of the former. 7. No perfon was permitted to bear arms, whether citizen, native, or inhabitant. 8. Several taxes were impofed without the confent of the general council; but in time to come it was provided, that every change or augmentation of the revenue fhould be fubmitted to that body. 9. Several privileges with regard to trade and commerce, formerly poffefled by the citizens alone, were now granted both to citizens and inhabitants.

It is not to be fuppofed that this revolution would be agreeable to people who had fuch a ftrong fenfe of liberty, and had been accuftomed to put fuch a value upon it, as the Genevans. From what has been already related, it might feem reaforable to conclude, that an almoft univerfal emigration would have taken place : but after their refentment had time to fubfide, moft of thofe who fled at firft, thought proper to return; and, in the opinion of Mr Coxe, not more than 600 finally left their country on account of the revolution in 1782 . The emigrants principally fettled at Bruffel and Conflance, where they introduced the arts of printing linens and watchmaking. Son after the revolution, indeed, a memorial, figned by abs: 1000 perfons of both fexes, all of them either pafeffed of fome property or verfed in trade or manufactures, was prefented to the earl of Temple, then lord lieutenant of 1reland, exprefling a defire to fettle in that kingdom. The propofal met with general approbation; the lrifh stameri parliament voted 50, eccl . towards deirayitg the ex. pences of their journes, and affording them a proper num ornt fettlement in the illand. Lands were furchaled for 1 ansu §ocol. in a consenient fituation near Waterford; part of New Gencua was actually completed at the expence of $10,0 c<1$.; a charter was granted with very confolrahle rividen; the itandard of gold was itter:
 Ed fu: the accommodation of the wateh manufature; and the foundation of an academy had upon an ufcful and liberal plan. Seven Genevans landed in Ireland in the month of July $17 \mathrm{~S}_{3}$ : but when the nation had expended near 32,0001 . on the Chemie, it was futden'y abandoned. This feems principally to have been owing to the delays necellarily necationel in the evecution of tach a complicated plan; and in fome degree alfo by the high demands of the Genevan commifioners, who required many privileges inconfitent with the laws of Irtland. By thefe delays the Genevans, whote character feems not $t$, be perfererance, were induced to abandon the fcheme, and return to their former place of refudence. Even the few who had already haded, though maintained at the public expence, were ditcontented at not finding the new town prepared for their reception; and as thofe among the propofed emigrants who poffeffed the greateft thare of property had already withdrawn their names, the remainder did not choofe to remain in a country where they had not capital fufficient to carry on any confiderable trade or manufacture. A petition was then prefented by the Gene*an commilioners, requefting that 10,0001 . of the 50,0001 . voted might be appropriated to the forming a capital: but as this had been voted for other purpofes, the petition was of courfe rejected; in confequence of which, the Genevans relinguithed the fettlement by an addrefs, and foon after quitted the
people had formed a ftrong harricad, behin! which they played off two hire purps filled with boing wa. ter and fiap lyes againt the catremities of two bribles whis the military had to wofs hefore the could at tayts then. The commanding offerer was killed and ferenal of lis men wounded by the dicharge of fmali at:as from wincows; and the pavement was earicel un to the tups of homic, in order to be thrown down nume the trons, if they thould furce the baricates and je netrate into the ilrects. The tumalt in the men time continued to increake, and was in daber of lecoming univerlal; when the magiltrates, finding it wonl! be in. patible to quell the infurgents withot a grest effumon of blood, were reduced to the necellity of cemplyin:with their demands. One of the principal magitrati repaired in perfon to the quarter of st Gersai, pro claimed an ediet for lowering the price of bread, graut ed a general amnelty, and relcafed all the infuigent who had been taken into cutody. Thu a mome:i tary calm was produced; but the leaders of the infurrection, fem ible that the magitrates wese eithe: unale or unwihing to employ a fufficient force aswit them, relolved to take advantage of the pres:a mpomensity tw procuse a now chande of govermment. A ic. F .... funtection, tiscrore, took plice on the 2 , at wi the month, in which the folders wase driven fom their pots, difarmed, and the gutc. Refoed by the fer pice The manimater then, comince! that all onomot was railde, determined $t$ come iy with the deamu' of their amtaronists in their fall evtent; and tom tocratical party fuddenly charsing their fentim + f ' , remounced in a moment that fyom to whith they las hitherto fin obftinately adhered. On the alpleati nt of the folicitur general, therefore, for the recovery of ti.e ancient licrtic of the people, the permiliz is an buazing ams, reettablifhment of the militin, ont of them circles or politic.. clubs, the renas of of the garriten from the barracks, and the recal of the reprefentats. who were banithed in $1-82$; thefe muserate d. mands Were received with complacen y and cven fitistacting The prelimmaries were fethed wihont ditiontorat a new catict of pacification was pubiilace under the title of Nudfications a l'ERABion de $177^{\circ} 2$, and approved by the fonate, great council, and general coums. Gene:a. (roen terms as the jealous nature of a free conflitution will admit."

Geneva, as well as the whole of Sivitzerland fcll a vichin to French rapacity in $\mathbf{1 8 0 2}$. The following obfervations, made by a traveller on the fpot, afford us fome information of the confequences of this event to Generd of its degraded itate, and of the manners of the inhahitants.
"The pupuiation of Geneva is about 24,000 : moreover it contains at prefent between 1200 and 1400 French troops: the parties intermix but little, and have had so dilputes, although they certainly regard each other with an eye of jealoufy. The Genevans do the French foldiers the juftice to fay, that they have demeaned themfelves in a very becoming manner during their reilence here: they acknowledge themfelves to be a conquered people, and dare not open their mouths, except to an Engliftman, againit the treacherous invaders of their country, and deftroyers of their liberties.
" You are too well verfed in the hiftory of this people to require being told, that, notwithftanding their prefent humiliated condition, Freedom is the goddels they worlhip; and that, had there been any poffibility of leccring her from violation, they would gladly have bled before her altars. However various has been their fuccefs, in the different revolutions which have agitated this feclude thate, the Genevans have uniformly evinced a courage which awed their enemies, and a determined bravery in defence of their rights, which in fhewing that they prized them highly, gave proof that they were worthy to enjoy them.
"The territory of Geneva is comprehended in the Department du Lerwan, which department contains about 16 fquare leagues of land; its population is eftimated at 609,000 perfons. It is divided into three cantons or hundreds, the largeft of which has Geneva for its capital, and contains about 75,000 fouls, of which 10,000 only are Genevans, 20,000 are French, and the remainder are Savoyards. The prefet, as in all the other departments, is appointed by the Firft Conful, durante beneplacito. The care of the high roads and public walks, public finances, executive juftice, military affairs, and rafiports, are under his immediate direction. All military appointments are given to Frenchmen : one general commands the town, and another the country. At the firft moment of the revolution all the old magiftrates were difplaced, and fince that time the civil officers have been elected by the citizens at large, confequently fome are Frenchmen, and fome Genevans: the prefent mayor is one of the latter: he is a gentleman of great refpectability, and is much efteemed by both parties. Whenever a new code of laws thall be eflablifhed in France, its operations will be extended over the cerritory of Geneva; but at prefent the people here retain their old laws with fome trifling alterations only, rather the form than the fubftance: thus, the guillotine is now fubltituted for the gallows, and the punifhments in general, without varying the degree, are intlicted according to the French manner.
"In their treaty with France, the Genevans Atipulated, that their hofpital mould not be obliged to receive French foldiers: this hofpital was founded in the early sart of the lalt century, by fome of the richeit citizens, and is fo well fupported by legacies, and by annual fub-
feriptions, that the fund enables the directors to expend Geneva. two thoufand louis a year. In contempt of his treaty, Bonaparte has infited on the admifion of French foldiers, for whofe accommodation, however, he promifed to pay a certain fum per diem: in contempt of his promife, again, he has withheld the payment! An hoipital, however, is now preparing at Carouge, a village in Savoy, between Geneva and Grange Colonge, for Frenchmen, to which, it is expected, the foldiers will be removed in May or June. Here is alfo a general hofpital, once the nunnery of St Clair ; it was founded, together with many other ufeful inftitutions, by that ce. lebrated reformer, John Calvin, who fled from the perfecution of Francis I. and found an afylum in Geneva. The revenue arifing from the eftates of this hofpital has, till within thefe laft few years, been commenfurate with its expences; but, for fome time back, it has been found neceflary to collect almoft an additional fourth, in order to fupply its difburfements: twice in the year the treafurer goes round to every houfe, and folicits the charitable contribution of its inmates.
" Prior to the laft revolution, I learn, that 600,000 French livres difcharged all the public expences: with this very trifling fum were paid the falaries of the magitrates, of the matter of the town, of the mafter of the country, the expences of the academy, of repairing the roads, of cleaning and lighting the town; in thort, thefe 600,000 livres were fufficient to defray all the ordinary expences of the government. Since that too-memorable event, the citizens of Geneva have been affeffed to the amount of $1,500,000$ livres, the falaries of the inferior magiftrates are in arrears, the roads are not kept in good repair, the town is very dimiy lighted, and the ftreets, a few of the principal ones excepted, are left with all their dirty honours thick upon them! The inhabitants go fo far as to affert, that, in confequence of the neglect which the public drains have fuffered, they have been affected with fevers and other illneffes to which they had hitherto been ftrangers.
"I underftand, that the revenue of Geneva, fince it has been annexed to the republic of France, arifes chiefly from the following fources.-An excife duty is laid on all provifions (wheat excepted), on wine and merchandife of every defcription, which is brought into Geneva: the annual produce of this tax is about 120,000 French livres; a land tax; a tax on doors and windows; a tax on the fale of eitates; a heavy tax on the collateral inheritance of an eftate-where the inheritance is lineal and immediate, the tax is moderate. To thefe taxes or contributions, as they are called, muft be added la contribution mobiliere, which is a fmall tax on perfonal property, and produces annually about 75,000 livres. The collectors of thele taxes are appointed by the Firft Conful, and are paid very highly for their trouble: the prefet, and all the principal public officers, are very regularly paid, but thofe in a fubordinate fituation feldom get above one-third of their ftipends.
" Divorces feem to be obtained here with too much facility. But, in the firft place, as to marriages, they mult be celebrated, according to the French law, before the municipality, at the maifon de ville. Marriage in France, you know, is merely a civil ceremony, the parties being obliged to fiwear before an appointed magiftrate, that they are of age, and that they have confente:

Geneva confented to become man and wise. The Gencvans,
Lake, Geners. however, do not confider thi ceremony as futficient : but, as our Gretna Green coubles, on their return to Britain, think it neceffary, after the fervour of paffion is abated, and the mercury is fallen, in the animal thermometer, fomething lower than blood leat, to have the holy rites performed with the folemnity prefcribed by lav; fo the Genevans, in addition to the civil ceremony prefcribed by the laws of the republic of France, voluntarily coutorm to the religious ordinance of their own church. That a man fhould be able to obtain a divorce from the wife who is unfaithtul to his bed, is highly reafonable: but here, if a woman leaves her hurband, and relules to return to his habitation, after being fummoned by him for that purpofe, he can repudiate her for difobedience. This doubtlefs was grounded on the prefumption, that, if a woman fled from her huiband, and refilled his folicitation to return, it could only be for the purpofe of cohabiting with fome other man: but an advantage is taken of this prefumption; and now, when the parties, for whatever reafons, are defirous of being divorced, the wife, with the knowledge and confent of her hufband, generally goes into Switzerland, where fhe remains fix months, during which time the hufband fummons het to return, the refufes, and at the end of that term a divorce is declared between them."*

GenEVA Lake. This lake is in the thape of a crefcent; along the concave Gde of which Mr Coxe travelled 54 miles. Switzerland forms the hollow, and Savoy the convex part; the greatelt breadth being about 12 miles. The country on the fide of Savoy is full of high and craggy mountains; but from Geneva to the environs of Laufanne it flopes to the margin of the lake, and is very rich and fertile. The banks rife confiderably in the neighbourhood of Laufanne, and form a moft beautiful terrace, with a rapid defcent a few miles beyond the town. A plain begins in the neighbourhood of Vevay, which continues for a great way beyond the end of the lake, but contracting towards the water by the approach of the mountains. The lake itfelf appears at a ditance of a beautiful blue colour, and the water is very clear and tranffarent. Near Geneva the coaft of the lake abounds with pebbles; between that city and Laufanne it is fandy; from thence to Chilon it is bounded by hard calcareous rocks; and the extremity of the fhore is a marfl formed by mud collected from the river Rhone. The greateft depth of this lake found by M. de Luc is 160 fathoms. Here the birds called tippei grebes make their appearance in December, and retire in February to uther places where they breed. They make floating neits of reeds; but as the lake of Geneva affords none of thefe, they are obliged to migrate to other places where they grow. Their thins are much eflcemed, and fell for 12 . or 14 s. each. The lake of Geneva, like all others fituated between mountains, is lubject to fudden ftorms.

Gexsva, or Gin, among ditillers, an ordinary malt fpirit, diftilled a fecond time, with the addition of fome juniper berries.

Originally, the berries were a ided to the malt in the grinding ; fo that the fpirit thus obtained was flvoured with the berries from the firlt, an l exccuded all tha:
could be made by any other method. At preient, they Genevieve leave out the berries entirely, and give their fpirits a fiasour by diltilling them with a proper quantity of oil $\qquad$
II of turpentine; which, though it nearly refembles the Havour of juniper berries, has none of their valuable virtues.

GENEVIEVE, fathers or religious of; the name of a congregation of regular canons of the order of St Augultine, citablilhed in France.

The congregation of St Gencvicve is a reform of the Augultine canons. It was begun by St Charle; Faure, in the abbey of St Vincent de Senlis, of which he was a member, in the year 1618.

In the year 1634, the abbey was made elective; and a general chapter, compofed of the ruperiors of 15 houfes who had now received the reform, chofe F . Faure coadjutor of the abbey of St Genevieve, and general of the whole congregation. Such were its beginnings.

It has fince increafed very much, and it now confift: of above a hundred monafteries; in fome whereof the religious are employed in the adminitration of the parithes and tofpitals: and in others, in the celebration of divine fervice, and the inftruction of ecclefiaftics in feminaries for the purpofe.

The congregation takes its name from the abbey of St Genevieve, which is the chief of the order, and whofe abbot is the general thereof. The abbey itfelt took its name from St Genevieve, the patronefs of the city of Paris, who died in the year 512 . Five years after her death, Clovis erected the church of St Genevieve, under the name and invocation of St Peter, where her relicks are ftill, or were till lately preferved, her thrine vilited, and her image carried with great procefions and ceremonies upon extraordinary occafions, as when fome great favour is to be entreated of heaven.

GENGIS KHAN, the renowned fovercign of the Moguls, a barbarous and bloody conqueror. See Jenghiz Khan, and (Hifory of the) Mogrts.

GENIAL, an epithet given by the Pagans to certain gods who were fuppoled to prefide over generation.

The genial gods, fays Feitas, were earth, air, fire, and water. The twelve figns, together with the fun and moon, were fometimes allo ranked in the number.

- GENII, a fort of intermediate beings, by thic $\lambda_{3}$. hometans believed to exilt between men and angels. They are of a grofier fabric than the latter, but much mone aitive and powerful than the former. Some of them are good, others bad, and they are cavable of future falvation or damnation like men. 'The orientals pretend that thefe genii inhabited the world many thoufand years before the creation of Alam, under the reigns of leveral princes, who all hore the common name of Solomon; that falling at length into an almolt general corruption, Lblis was fent to drive them iato as remote part of the earth, tiaere to be cosaned ; and that fome of that generation lill remaining were by Tahmurath, one of the ancient kings of Peafia, forced to retreat into the famous mountain of Kiaf; of whofe fuccellions and wars they have many fabulous and ronantic tlories. They atio mule feveral ravhes and degrees amorg this kind of being; (if they are not rather

 fome Pert, or fairics; fume Div, or gian's; and viliers Tuctuins, or fates.

GLNIOGIOSSI, in Anatomz. See Avstomy, Tialle of the Mufcier.

GENIOHSOLDEUS, in Aratomy. Ihid.
GEN1OSTOMA, a genus of plante, belonging to the pentandria clats. See Borazix Index.

GINIPPA, a senus of plants, belonging to the pentindria claf, and in the natural method ranking under the 3oth order, Cuntortie. See Botany Index.

GENISTA, BROOM, or DXELS WFED, a genus of plants, belonging to the diadelphia clafs; and in the natural method ranking under the $3 z \mathrm{~d}$ order, Papilionacee. See Bothiny Inder.

GENITAL, an appellation given to whatever belonss tw the paris of generation. See Anstomy, $\mathrm{N}^{\circ} 157, \mathrm{I}=8$.

GENITES, among the Hebrews, thofe defcended from Alraham, without any mixture of foreign blood.

The Grecks diftinguilhed by the name of genites fuch of the lews as were iffued from parents, who, during the Babylonifh captivity, had not allied with any gent.' family.

GENITIVE, in Grammar, the fecond cafe of the declention of noms. The relation of one thing cantidered as belonging in fome manner to ancther, has occafioned a peculiar termination of nouns called the geative cafe; but in the vulgar tongues they make ufe of a fign to exprefs the relation of this eate. In Englifh they prefix the particle of, in Erench de or $d_{i t}$, \&e. Thou h in taictnet's there are no cafes in either of thete languages; inafmuch as they do not exprefs the different relations of things by different terminations, but by aeditional prepotitions, which is otherwife in the Latin.

GENIUS, a gocd or cvil fpirit or dæmon, whom the ancients fuppoled fet over each perfon, to direct his birth, accompany him in life, and to be his guard. Sce Dimun.

Among the Romans, Feltus obferves, the name $\xi^{e}$ nius was given to the gol whan had the power of doing all thing, drum gai vim chineret rerum omnium gerendarum; which Volius, de Idol. rather chovies to sead genendaru\%, sho has the power of producing all things; by reafon Cenforinus frequently ufes gerere for gignere.

Accordingly St Aucuflin, de Cizitate Dei, relates, from Varro, that the genius was a god who had the power of generating all things; and prefided over them when praduced.

Fultus aide, that Aufurius fake of the genius as the Sin of Git, and the Father of men, who gave them life: other, however, reprefented the genits as the peenien or tutelay god of each place; and it is reatain, the lat iv the mont wlual menning of the word. The anciunts had their genti of mations, of cines, of proviar, \&c. Nohing i- mare common than the folturat inferition on medals, e: vers popetar kov. The Platonite, and other eaftern phibofophers, fuppofed the renii to inhabit the vatt region or extent of air between earth and heaven. They were a fort of intermediate powers, who did the office of mediators between gods and men. They were the interpreters and agents of the gods; communicated the wills of the deities to men; and the prayers and vows of men to the gods. As it was unbecoming the majelty of the gods to enter into fuch trifling conccrns, this became the lot of the genii, whofe nature was a mean between the two ; who derived immortality from the one, and pallions from the other; and who had a body framed of an aerial mattec. Moft of the philofophers, however, held, that the genii of particular men were born with them, and died; and Plutarch attributes the ceafing of oracles partly to the death of the genii.See Oracle.

The heathens, who confidered the genii as the guardians of particular perfons, believed that they rejoiced and were attlicted at all the good and ill fortune that befel their wards. They never, or very rarely, appeared to them; and then only in favour of fome perfon of etraordinary virtue or dignity. They likewife held a great difference between the genii of different men; and that fome were much more powerful than others : on which principle it was, that a wizzard in Atrian bids Antony keep at a diftance from Octavius, by reafon Antony's genius was inferior to and ftood in awe of that of Otavius. There were alfo evil genii, who took a pleafure in perfecuting men, and bringing them cvil tidings: fuch was that mentioned by Plutarch which appeared to Brutus the night before the battle of Philippi. Thefe were alfo called larvie and lemures. Sce Larver and Lemures.

Genius, in matters of literature, \&c. a natural talent or difpofition to do one thing more than another; or the aptitude a man has received from nature to perform well and eafily that which others can do but indifferently and with a great deal of pains.

To know the bent of nature is the moft important concern. Men come into the world with a genius determined not only to a certain art, but to certain parts of that art, in which alone they are capable o. fuccefs. If they quit their fiphere, they fall even below mediocrity in their profeltion. Art and induftry add much to natural endowmeats, but cannot fupply them where they are wanting. Every thing depends on genius. A painter often pleafes without obierving rales; whift another difpleafes though he obferves them, becaute he has not the happinefs of being born with a genius for painting.

A man horn with a genius for commanding an army, and capable of becorring a great general by the help of experience, is one whofe organical conformation is fueh, that his valour is no obliruction to his prefence of mind, and his prefence of mind makes no abatenuent of his valour. Such a difpoition of mind cannot be acouired liy art : it can be poffited only by a perfon who has brought it with him into the world. What has leen faid of thefe two arts $m$ y be equally applied to all cother profetion. The adminifration of es ant ancerns, the art of purning jecp'c to thole employmente for which they ate natur lly forned, the thady of phyfic, and cven gaming itleif, all require a genius. Niture lax thought f: to nathe a dilibution of her

 to one mothe; the wante of mem being the wey tiot link of fociery: he has therefine pitwles wpen prat cular perfons, to give ther aptinde theotom :haty fome things which the has readess ita wathe to other: and the latt: live a greater facilly granted them for uther thisur, which tacility has heen refoled t.) the former. Narure indeed ha mote an unegut ditribution of her ble lives among her children; y t ne has dimherited non: and a man divelited of all kinds of abilities, is as great a phenomenon as an univerfl genius.

From the diverfty of genius the difference of inclination arifes in men, whom nature has had the precaution of leading to the employments for which the defigns them, with muse or lefs impetuofity ia proportion to the greater or lefier number of obilacles they have to furmount in order to render themfelve cip. able of anfwering this vocation. Thus the inclinations of men are to very differnt, becaufe they fothew the fame mover, that is, the impule of their genius. This, as with the pinter, i. what renders one prort pleafing, even when he trefpafos actait rules; white others are dilagreeable, notwithanding their firit regularity.

The genius of thefe arts, according to the abbe du Bos, confifts in a happy ariangement of the organs of the brain; in a juft conformation of each of thele a.rgans; as allo in the quality of the blood, which diipoies it to fermert, during exercife, fo as to fornih flenty of fririts to the fprings employed in the functions of the imagination. Here he fuppofes that the compofer's blood is heated; for that painters and poet; cannot invent in cool blood; nay, that is is cvitimt they munt be rapt into a kind of enthufifm when they produce their ideas. Aritotle mentions a met who never wrote fo well as when his pnetic fury harried him into a kind of frenzy. The admirable pictures we have in Tafio of Armida and Clorinda were drawn at the expence of a difpolition he has to real madnefs, into which he fell before he died. "Do you imagine (Gys Cicero), that Pacuvius wrote in culd blood ' No, it was impolible. He muft have been infpired with a kind of fury, to be able to write fuch admirable verfes."

GENOA, a city of Italy, and formerly capital of a republic of the fame name, fituated in E. Long. 9. 30. N. Lat. 44. 30 - By the Latin authors it is very frequently, though corruptly called fanua; and its prefent territories made part of the ancient Li garia. The era of its foundation is not known. In the tine of the fecond Puric war it was a celebrated emporiun: and having declared for the Romans, was plundered and burnt by Mago the Carthaginian. It was aterwards rebuilt by the Romans; and with the relt of Italy continued under their dominion till the derline of the weftern empire in 476 . Soon after, it fell under the power of Theodoric the Oftrogoth: wloo having deforated the ufurper Odower, became kine if Itals. This happened in the year 498 ; and in a hlont time. the Guths being almoft entirely fubdued ly ieliteins the emperor Jutinian's general, Genoa wis reantexel! to the Roman empire. In 638, it war rherered an, burnt by the Lombards, whofe king l'rothur neestu it in:o a proxitial dukecom.

Genoa. induced the inhabitants to fubmit themfelves for 20 years to the dominion of Henry VII. emperor of Germany. That emperor, however, died in Auguft 1312 ; and the vicar he had lett foon after went to Pita, upoa whicin the difienfons in Genoa revived with greater taty than ever. In 1317, a quarrel happened between the fanilies of Spinola and Doria ; which came to fuch a height, that both parties fought in the fircets for 24 days without intermilion, railed battening engines againt each other's houfes, and filled the city with blood. At latt the Spinolx quitted the city, and retired to their territories in the Apennine mountains. The civil war continued till the year 1331 ; when, by the mediation of the king of Naples, it was concluded, that all exiles fhould return to the city; that the republic thould be governed by the king's vicar; and all the offices of the itate be equally divided between the Guelfs and the Gibellines, the two contending parties.

By this ruinous war, the coaft of Genoa, formerly adorned with palaces and vineyards, was now reduced to the appearance of a barren watle. So great was the general defolation, that, according to Petrarch, the ipectators who failed along were Atruck with aftonifhment and horror. Villani, a cotemporary author, relates, that it was fuppofed by the learned, that greater exploits had not been performed at the fiege of Troy; and that the loffes each party had fuftained would have been fufficient to bave purchafed a kingdom, the Genoefe republic being in his time the richeft and moit powerful fate in Chriftendom. The annalit Stella informs us, that, before the war, the moft extravagant profufion and luxury prevailed among the Genoefe : but that, towards the end, many noble families were reduced to indigence and poverty; fo that, about 100 years after, it became fafhionable for the nobles to live in a plain manner, without any thow or magnificence.

In 1336 , both parties, fufpending their mutual animofities, fent two fleets of 20 galleys each into the German ocean, to the affiftance of the king of France, who was engaged in a war with Edward III. king of England. This naval expedition proved the caufe of a moft remarkable revolution in the Genoefe government. The failors of the fleet, thinking themfelves injured by their officers, whom they accufed of defrauding them of their pay, proceeded to an open mutiny; and, having expelled the admiral, and other commanders, feized the galleys. The king of France being chofen arbitrator, decided in favour of the officers, and imprifoned 16 of the chiefs of the mutineers. Upon this feveral of the failors left the lleet, and returned to Genoa; where they went round the coalts, repeating their mutinous complaints, which were greatly hearkened to, upon a falfe report that the mutineers who had been imptifoned were broke upon the wheel. The factious fpirit increafed; and at laft the Genoefe infilled in a tumultuous manner for having an abbot of their own choofing, and 20 of the people with the confent of the captains of the republic aflembled for that fuipofe. While the mob were impatiently expecting their decifion, a mechanic, generally accounted a fool, mounted a wooden bench, and called out that one Simon Bucanigree fhould be chofen abbot. 'This he-
ing infantly echoed by the populace, he was hirft de- Ginoa. clared abbot, then lord, and at lait dute of Genoa.

This new expedient did not at all anfwer the pura pofe. The dificnions continued as violent as ever, notwithftanding the power of the new magiutrates; and by thele perpetual diviions the republic was at laft fo much weakened, that in 1390 the king of France was declared lord of Genoa. Under the French govermment, however, they foon became exceedingly impatient; and, in $1+22$, the duke of Milan obtained the fovereignty. With this fituation they were equally difpleafed, and therefore revolted in 1436 . Twentytwo years after, finding themfelves preffed by a powerful fleet and army fent by Alphonfo king of Naples, they again conferred the fovereignty of their ftate upon the king of France. In 1460, they revolted from the French ; and, four years after, put themfelves again under the protection of the duke of Milan: from whom they revolted in $147^{8}$. He was again declared forereign of the republic in 1488; and, 11 years after, the city and territories of Genoa were conquered by Louis XII. of France.

The almoft unparalleled ficklenefs of the Genoefe difpofition was not to be corrected by this misfortune. They revolted in 1506 ; but next year were again fubdued by Louis. Six years after, they again revolted; and in 1516, the city was taken and plundered by the Spaniards. In 1528, Andrew Doria, a Genoefe admiral in the fervice of the French, undertook to ref. cue his country from the dominion of foreign princes, and reftore it to its liberty. Knowing well the fickle difpofition of his countrymen, he took all occafions of exciting difcontents among them againft the government. He perfuaded them, that the French (who had again obtained the fovereignty) had left them only a fhadow of liberty, while they pretended to protect them from their enemies. To the nobility he reprefented the difgrace of fuffering the government to be vefted in the hands of foreigners lefs worthy of authority than themfelves. Thus he foon formed a ftrong faction, and formed his plan; for the execution of which he took the moft proper time, namely, when almoft three-fourths of the French garrifon had been carried off by the plague. He advanced with 500 men; and his friends having opened the gates of the city to him, he feized the principal pofts, and thus became malter of it without drawing his fword. The garrifon retired to the forts, where they foon after capitulated, and being driven out of the city, Doria reeftablithed the ancient form of government. See Dokil.

The republic hath fince continued to preferve her liberty, though greatly fallen from her ancient fplendour, and now become a very inconfiderable flate. In 169 , the Genoefe had the misfortune to fall under the refentment of Louis XIV. at which time the city was almoft deftroyed by a formidable bombardment. In the year 1688 , it was bombarded by Admiral Byng, and forced to capitulate; but there were at that time no views of making a permanent conqueit of the city. In 1730 , the illand of Corfica revolted from the Genoefe, and could never afterwards be reduced by them; for which reafon it was fold to the French, who in the year 1770 totally reduced it.

The Gencef territories extend along that part of the Mediterranean fea, commonly callel the suif $f$ Genoa, about 152 miles; but their breadth is very unequal, being from eight to about 20 miles. Where they are not bounded by the fia, the following thates and countries, tahing them from wett to eatt, ars their buundaries, viz. Piedmont, Mionterrat, Milan, Pace:1tia, Parma, the dakedom of Tufcany, :nd the repuhlic of Lirce. This qract, though a great fort of it is mountainous, and fome of that barren enuugh, set produces plenty of excellent fruit, good palture, wood, garden ftuff, and muiberry trees, with fone wine and oil, bat little corn. What they want of the latt, they have either from Lombardy, Sicily, or Naple:

Genoa ftands on the coafl of the Mediterranean fea, at the botiom of a little gulf, partly on the flat, and partls on the declivity, of a pleatant hill ; in coniequence of which, it apleass to great advantage from the fea. It is definded on the land tide by a double wall, which in circumierence is about ten Italian miles. T : o of the itreets conift entirely of a duable itraight row of magaibent palaces. The others, 'thoush clean and weil paved, are crocked and narrow. The palaces of the nobility are almoft all of marble, and many of them are painted on the outfide. That there thould be fuch a profufion of marble here, is not to be wondered at, as the neighbouring hills abound with it. The city contains a vatt number of palaces, chtrehes, and convents, and feveral hofpitals. The palace where the doge refides, and where the great aid little council, and the two colleges of the procuratori and governatri aflemble, is a large itone building in the centre of the city : but it contains fome fine paintings in fretico; two ftatues of Andiew and John Doria in white marble; and an arlenal, in which are faid to be arms for thirty-four thoufand men, with a fhield, containing one hundred and twenty pitol barrels, and thirty-three coats of mail, which, it is pretended, were worn by is many Genoefe heromes in a croifade. Of the rhurches, the finef are thofe of the Annunciation, St Mary Carignan, St Dominic, and St Martha. In the cathedral is a dith made of a fingle emerald. All the inhabitants here, except the principal ladies, who are carried in chairs, walk on foot, on account of the narrownefs or fteepnefs of the directs. The fortifications of the city, towards the fea, are remarkably Arons. There are two fine ilone bridges over the rivers Bunzerva and Bifagno, the firt whereof walles the welt, and the other the ealt fide of the city, within wnich there is alto a furprifing itome bridge juing two hills. The harbour, though large, is fur fom being fufe; but no care or expence have been fpared to render it as iafe and commodious as potlible. The wint to which it is molt expoled, is that called Labeccis, or the finth-weit. The f'ace where the republic's galle:s ie, is called the Darlena, where are a great tumber of Turkifh llaves. On a rork, on the weit fite of the harbour, is the fanal or hichthowe, a high toacr, on the top of which is a lanthorn, condaning thirty-fix lemps. The trade of Genoa is clietly in velvets, diradiks, plulh, and other tilks, brucades, lace, glosec, foetmeats, fruits, oil, Parmelan checlic, anchovies, sud medicimal drugs from the Levant; bat the bednefs of the harbour, and the hish price of commodi. ries, greatly checks the commerce. I:1 1751, fienoa

was decl red a irse port for ten y. : , unde dia C. + ,
 muy have a warchoufe, and insot or expont foods duty free; but fuch as ate difonfor of in the co, os on the contincnt, are taxed pretty hi $-i$. The nolit. ty are allowed to trale in the whoidthe way ; t, catm (a) velvet, filk, and cloti manafuctors - ant is have thares in merot hipe: am? tome of them, as the Palavicini, are actually the greatelt mathonta in $G$
 on by them is baking, and watiarg in lalls ot ca. clange. A new acadeny of painting, hapture, cial and military architecture, was inflituted here in $175 \%$ One may walk the feects of Gera in ine 1ight with the greatelt faicty, which is more than can le faid of maty citics in laty. Enceme fplenderir a d haxay are, in feveral refpecis. rettrained loy filutary laws. No beggars are permitted to alk alms in Genoa, and the inn, are better than tiofe at 'lutin. Whe: a dingle petion is buried, a kind of gatland of a:l lort, of artincial dowers is placed un the cotinn. The Genoefe in general are enteemed craty, in futrious, wid inured to labour above the otler Italiaas.

Inidft the political conrulfions whi hagitated Europe, in confequence of the unexampled French revolution, it was fearcely to be expected that Genoa would eicape the thock. Accordingly in the year 1798 , by the force and intrigucs of the French republicans, its political conftitution was totally fubverted, and changed into what was atterwards denominated the Liourian Republic, which was to be governed in a mamer fimilar to that of their own, and the country alfo was divided into departments. As the preceding campaign had terminated in favour of the combined powers, and left them in the poffetion of every important place in Italy, this only excepted, the capture of it became an object of ti:c utmoft confequence to the contending parties. To ro gain it was the highet ambition of the houfe of A. tria, while the rething of it was matier of inlicitude :the French repablic. The reafon is novious. The con queft of it reitored to the emperor of Gurmmy the polleflion of all Italy, gave him the means of refumi"; his former politions in the Maritime $A!_{1} s$, and reit. forcing his former polition on the Rhine, $W_{i}$ the French it was a place of the utmolt curifquence, becaure while they wore enabled to retain it in their uwn hands, they could cally fivour the operations of their army in Switzerland, or their entrance into Ita!y by the defies of Piedmont.

As the allies were fully determined in its conqueat for the reaicns already alfignel, as we? as for others of an iaferior nature and magnitude, it is but candid to admit that the genceal by whom it was defenled had inrumerable dificulties to 1?ruggle with, and whtacies to furmount. When Mafrena fucceeded Championet, the army was reduced to the moft melanchaly fitation. Contined during the winter feafon to the bleak fummits of the 1 penmines, it was reduced in numbers more than one half, and a contant prey to famine and difeale. 'loadd to the difficulties which everywhere prefented themfilves to Maffena, the higher claffes of the Genocfe louked ufon the French only as the deftroyers of their ?.mk, commerce, and political importance; in confequence of which they fecretly aided every meafure by which they might be driven from the country. Inlkc.d ${ }_{3} \mathrm{R}$

of 1 roly, he remove! to Savoy; from whence he went to France, and at lart upon the invitation of Char!cs 1 came over to England. He was well received by that king, who appointed him lodgings in his court, t.wether with a conliderable falary; and emploved lim in his palce at Geenwich, and other public places. The mont remakable of his performances in Lngland, were the ceilings of Greenswich and York Loofe. He did alfo a Madona, a Magdaten, and Lot with his two duachters, for King Charles; all which he performed admirably will. After the death of the king, when his collection was expofed to fale, nine pictures of Gentilefchi were fold for 6001, ard are now faid to be the omaments of the hall in Marlborough houfe. His mont eateerred piece abroad was the portico of Cardinal Bentisoglio's palace at Rome. He made feveral attemts in face pirting, but with little fiuccefs; his talent lying altogether in hinfories, with figures as bico as the life. He was much in favour with the duke of Backingham, and many others of the nobility. After 12 years continuance in England, he died here at 84 yeart of age, and was buried in the queen's chapel at Sumerfet-houle. His print is among the heads of Vandyke, he having been drawn by that great mater. He left betind him a daughter, Artemifa Gentilefchi, who was but little inferior to her father in bifory painting, and excelled him in portrits.

GENTILIS, Albericus, profefior of civil law at Oxford; an Italian by birth. He had ouitted Italy with his father, on account of religion. He wrote feveral works; three books, in particular, De jure beli., which have not been unferviceable to Grotius. Ht died at London in 1608.

Gertilis, Scipio, brother to the former, and as celebrated a civilian as he, forfook his native country that he might openly profefs the Proteftant religion. He was counfellor of the ety of Nuremberg, and profeflor of las with uncommon reputation. He was a great humanin ; and in his lectures, as well as book, mived the flowers of polite learning with the thorns of the low. He died in 1616 .

GENTLEMAN. Under this denomination are comprehended all above the rank of yeomen + where-f tee $\boldsymbol{C}_{6 \text { m }}$ by noblematu are truly called gontlemen.

A gentleman is ufually defined to be one, who, without any title, bears a coat of arms, or whofe anceftors have been freemen: and by the coat that a gentleman givetl. he is known to be, or not to be, defeended from thofe of his name that lived many hundred years ince.
The word is formed of the French scritiliomme; or ratier of gents, " fine, fahionable, or becoming;' and the saxor man. n. d. honefur, or honefo loco natur.The fame fieninication has the Italian gontilhuom, and the $\mathrm{S}_{\mathrm{p}}$ ninit hidalgo, or hijo dalyo, that is, the fon of fomebody, or a perfon of note.- If we go farther back, we fhall find gentloman originally derived from the Latin antilis hom ; which was ufed among the Romans for a race of nuble perfons of the fame name, born of free or ingenuous parchts, and whofe anceftors had never been flaves or put to death by law. Thus Cicero in tis Tyics, " Gentiles fint, qui inter fe codion funt noninc, al, ingenuis oriundi, quorum maiorum

C.racear, - Some holl that it was formed from genthit i. e. piGeatoos. gan; and that the ancient lranks, who con iuered Gaul, whish was then converted to Chrillanity, were called gemtiks liy the natives, as being yet heathens.Others relate, tiast towards the declemion of the Ro. man empire, ns recorded by Ammianus Marcellimes, there were two companies of brave foldiers, the one called gensife, and the other foatariit; and that it was hence we dorive the names gonleman and thute. See Esoune.-This fentimerit is confrmed by Patquire, who fuppofes the eppellation gentilis and cows.ris to have been tranfmitted to us from the Roman fildiery; it being to the gentilis and foutur:3, who soce the bravel of the foldiery, that the principal benefices and portions of lands were affigncd. See Benefice. -The Gauls obferving, that during the empire of the Romans, the fcutarii and gentiles had the bett tene. ments or appointments of all the foddiers on the frontiers of the provinces, became infemibly accuttomel to apply the ame names, gentilhommes and ecuyers, to fuch as they found their kings gave the beft provifions or appointraents to.

Gentleman U/fice of the Black Rud. See Rod.
Gentlenen of the Chapel; officers whofe duty and attendance is in the royal chapel, being in number 32. Twelve of them are priefts; the other 22 , commonly called clerks of the chapel, affit in the performance of divine fervice. One of the firft 12 is chofen for confefior of the houfehold; whofe office is to read prayers every morning to the houfehold fervants, to vifit the lick, examine and prepare communicants, and adminifter the facrament. One of 20 clerks, well verfed in mufic, is chofen firft organilt, who is matter of the childsen, to inftruct them in mufic, and whatever elfe is neceffary for the fervice of the chapel ; a fecond is 1kewife an organit ; a third, a lutanift ; and a fourth a violit. There are likewife three vergers, fo calleal from the filver rods they carry in their hands; being a Cerjeant, a yeoman, and groom of the veltry; the firlt attends the dean and fibdean, and finds furFiices and other neceffaries for the chapel ; the fecond has the whole care of the chapel, lieeps the pewe, and feats the nobility and gentry; the groom has his attendance within the cliapel door, and looks after it.

GENTOOS, in modern hiftory, according to the common acceptation of the term, denote the profeffors of the religion of the bramins or brachmans, who inhabit the country called Hindoflan, in the Ealt Indies, from the word fan, a "region," and hind or hindos; which Ferihtah, as we learn from Culonel Dow's tranilation of his hiftory, fuppofes to have been a fon of Ham the fon of Nuah. It is obferved, however, th it Hindoo is not the name by which the imhbitants originally ftyled themfelves; but according to the idiom of the Shanforit which they ufe, jumbode $p$, from jusnbro, a " jackall", an animal common in their country; and dep, a larse portion of land furrounded by the fca; or bhertekhunt, from khun', i. e. " a continent," and Cherriut, the name of one of the lint I Idian rajahs. It $i$, alio to be obferved, that they have chuned the name of Hinloos only fince the era of the Tartar governinent, to ditinguif thembles from their canveors the Muratmans. The term Genero or Gent, in the Siaaiferit dialuct, denotis anima! in geve ral, and in its more confined fenic mankind, and i, mo

 furce from the wod Gon?, a Canciul athin ito gis tile or Pagan. The Hindons, or (icntoos, vie with the Chinele as to the antiquity of their nation. They reckon the duration of the world by four jozues, o: diftinct ages; the fint the Suttee jogue, or age of purity, which is faid to have lated about $3,220,00=$ years; during which the life of man was 100,000 years, and his itature $2 t$ cubits: the fecond, the Tirtah jogue, or the age in which one-third of manbind were reprobate; which confited of $2,-2=0,000$ years, when men lived to the age of 12,000 yars: the third, the D waper jogue, in which half of the human race became depraved, which endured to $G=2,2=0$ years, when men's lives were redaced to 1000 years and fourthly, the Collee jogue, in which all mankind were corrupted, or rather diminiked, which the word collece imports. This is the prefent era, which they luppofe will fubfilt for 900,000 years, of which near 5000 arc already palt ; and man's lite in this period is limited to 100 years. It is fuppofed by many authors, that moil of the Gentoo fhafers, or fcriptures, were compofed about the begining of the Collee jogu: : bat an objection occu:s againt this fuppoftion, viz. that the matters take no notice of the deluge ; to which the bramins reply, that all their fcriptures were writen before the time of Noah, and the deluge never extcaded tu Hindoilan. Neverthelefs, it appears from the Alaters themfelves, that they claim a much: higher antiquity than this; infances of which are recited by Mr Malhed.

The doctrine of tranfmigration is onc of the diflinguithing tenets of the Gentoos. With regard to this lubje?, it is their opinion, according to Mr H lsell, that thoie fouls which have attimed .0 a certain degree of purity, either by the irnocence of their manners or the fevaity of their mortifications, are remosed to regions of happineis propetioned to their refeective merits; but that thofe who cannot fo fur furmount the prevaleace of bad example, and the powerful degeneracy of the times, as to deierve fuch a pronction, are condemmed to undergo continual puatimment in the animation of fuccerive aninal forms, until, at the 1 ll ted period, another renovation of the four jogues thall commence, upon the diflolution of the pretent. They imagine dix different Pheres aho this carth; the lighent of which called/witce, is the reidence of Bamo, and his particuhar tavourites. This fphere is atho the habitation of thofe incis who never uttered a falle. haod, ad d of thofe women who bave voluntarily bumad themflises with their hubands; the propricty of which practice is exprefsly enjoind in the conde of the Gientos laws. Jhis code, printed by the latt India Company ia 1776 , iva very curious cullection of Hlin$3 R 2$
due

## G E N [ 500 ] G E N

Gentios, doo jurifprudence, which was felected by the molt ex-
Cenuflexion. perienced yundits or lawyers from curious originals in the Shanicrit language, who were employed for this
purpofe from May 1773 to February 1775 ; afterwards tranflated into the Perfian idiom, and then into the Englih language by Mr Halhed.

The feveral inftitutes contained in this collection are interwoven with the religion of the Gentoos, and revered as of the higheft authority. The curious reader will difoover an atonithing fimilarity between the institutes of this code and many of the ordinances of the Jewih law: between the character of the bramins or prielts, and the Levites; and between the ceremot:y of the feape goat under the Mofaic difpenfation, and a Gentoo ceremony called the a/bunined jug, in which a horie anfwers the purpofe of the guat. Nany wifulete cuftoms and wfages alluded to in many parts of the Old Teftament, may allo receive illuftrations from the intitutes of this code. It appears from the code, that the bramins, who are the priefts and legifators of the country, have refgred all the fecuiar and extentive pewer into the hands of another caft or tribe; end no bramin has been properly capable of the magiitracy fince the cime of the futtee jogue. The oniy privilege of importance which they have appropriated to themfelvec, is an exemption from all capital punifhment : they may be derraded, branded, impricned for life, or tent iato perpetual exile; but it is everywhere exprefsly ordained, that a bramain ihali not be put to death on any account whatfoever.

We have already obferved, that the Hindoos are divided into four great and original tribes, which according to the Gentoo theology, procecded from the four different members of Brama, the fuppofed immediate agent of the creation under the firit of the Almighty. Thefe tribes are the Bramins, which proceeded from his mouth, and whofe office is to pray, read, and inftruct; the Chehteree, which proceed from his arms, whofe office is to draw the bow, to fight, and to govern; the Bice, proceeding from the belly or thighs, who are to provide the neceffaries of life by agriculture and traffic; and the Soonder, from the feet, which are ordained to labour, ferve, and travel.

Few Chriftians, fays the tranflator of the Gentoo code, have exprefled themfelves with a more becoming reverence of the grand and impartial defigns of Providence, in all its wroks, or with a more extenfive charity towards all their fellow creatures of every profeffion, than the Gentoos. It is indeed an article of faith among the Bramins, that God's all merciful power would not have permitted fuch a number of different religions, if he had not found a pleafure in beholding their varieties.

GENUFLEXION, (of genu, "knee," and fecto " I bend,") the act of bowing or bending the knee; or rather of kneeling down.

The Jefuit Rofweyd, in his Onomafticon, fhows, that genulfexion, or kneeling, has been a very ancient cuftom in the church, and even under the Old Teftament difpenfation; and that this practice was oblerved throughout all the year, excepting on Sundays, and during the time from Eafter to Whitfuntide, when kneeling was forbidden by the council of Nicc.

Others have fhown, that the cuftom of not kneeling on Sundays had obtained from the time of the apofles,
as appears from St Irenæus, and Tertullian; and the Ethiopic church, fcrupuloufly attached to the ancient ceremonies, ftill retains that of not kneeling at divine fervice. The Rufians effeem it an indecent polture to worfhip God on the knees. Add, that the Jews ufually prayed fanding. Rolweyd gives the reafons of the prohibition of genullexion on Sundays, \&xc. from St Bafil, Anaftafius, St Juttin, \&c.

Baronius is of opinion, that genuflexion was not eftablifhed in the year of Chrift 58 , from that paffage in Acts xx. 36. where St Paul is exprefsly mentioned to kncel down at prayer; but Saurin fhows, that nothing can be thence concluded. The fame author remarks, alfo, that the primitive Chriftians carried the practice of genuflexion fo fur, that fome of them had worn cavities in the floor where they prayed : and St Jerome relates of St James, that he had contracted a hardnefs on his knees equal to that of camels.

GENUS, among metaphyficians and logicians, denotes a number of beings which agree in certain general properties common to them all: fo that a genus is nothing elfe but an abitract idea, expreffed by fome general name or term. See Logic and Metiphysics.

Genus, is alfo ufed for a character or manner applicable to every thing of a certain nature or condition : in which fenfe it ferves to make capital divifions in divers fciences, as medicine, natural hiftory, \&c.

Genus, in Rhetoric. Authors dittinguifh the art of rhetoric, as alfo oration or difcourfes produced thereby, into three genera or kinds, demonftrative, deliberative, and judiciary. To the demonftrative kind belong panegyrics, genethliacons, epithalamiums, funeral harangues, \&c. To the deliberative belong perfualions, diffuafions, commendations, \&c. To the judiciary kind belong defences and accufations.

Genus, in Medicine. See Medicine, under the Nofology.

Gexus, in Natural Hifory, a fubdivifion of any ciass or order of natural beings, whether of the animal, vegetable, or mineral kingdoms, which agree in certain common characters. See Nitvral Hiffory.

Genus, in $I_{u j f i c}$, by the ancients callied genus melodia, is a certain manner of dividing and fubdividing the principles of melody; that is, the confonant and diffonant intervals, into their concinnous parts.

The moderns confidering the octave as the moft perfect of intervals, and that whereon all the concords depend, in the prefent theory of mufic, the divifion of that interval is confidered as containing the true divifion of the $x$ hole fcale.

But the ancients went to work fomewhat differently: the diateflaron, or fourth, was the leaf interval which they admitted as concord; and therefore they fought firft how that might be moft conveniently divided; from whence they conflituted the diapente and diapafon.

The diateffaron being thus, as it were, the root and foundation of the fcale, what they called the genera, or kinds, arofe from its various divifions; and hence they defined the genus modulandi to be the manner of dividing the tetrachord and difpofing its four founds as to fucceffion.

The genera of mufic were three, the enharmonic, chromatic, and diatonic. The two fiff were varioufly fubdivided;

## G E O $[5 \mathrm{Cr}] \quad$ G L O

Geocentric fubdivided; and even the laft, though that is commonly II Gent:oy. reckored to be without any ipecies, yet different authors have propofed diferent divilions under that tame, withent giving any particular names to the fiecies do was done to the other two.

For the charasters, sic. of thefe feveral genera, fee Evharmoxic, Chromatic, and Dintonic.

GEOCENTRIC, in A/ronomy, is applied to a planet, or its orbit, to denote it concentric with the earth, or as having the eurth for its centre, or the fame centee with the earth.

GEOFFR $A$, a gerus of plants belonging to the diadelphia clafs, and in the natural mothod ranking ander the $32 d$ order, Papilunace.e. See Botany and Matería Medica Index.

GEOFFREY of Mosmouth, bihop of St Afaph, calied by our ancient biographers Gailcfridus Afonumentenfis. Leland conjectares that he was educated in a Benedictine convent at Monmouth, where he was born: and that he became a monk of that order, Bale, and after him Pits, call him archdeacon of Monmouth; and it is generally afferted that he was made bithop of St Afaph in the year 115 t or 1152 , in the reign of King Stephen. His hitory was probably finilhed after the year $113^{9}$. It contains a tabuions account of Britih kings, from the Trojan Brutus to the reign of Cadwallader in the year 690. But Geoffrey, whatever cenfure he may deferve for his credahity, was not the inventor of the flories he relates. It is a trandation from a manufcript written in the Britilh language, and brought to England from Armorica by his friend Gualter, archdeacon of Oxford. But the achievements of King Arthur, Merlin's prophecies, many fpeeches and letters, were chielly his own addition. In excufe for this hiftorian, Mr Wharton judicioully oblerves, that fabulous hitories were then the fafhion, and popalar traditions a recommendation to his book.

GEOFFROY, Stephen-Francis, a phyfician eminent for his chemical and botanical knowledge, was born at Paris in the year 1672 , where his father kept an apo hecary"s thop, and had been feveral times in the magitracy. He received a liberal edacation; and,
 ences at his father's houle with Callini, du Veraty, (: corm pitHombers, and other men of ditinçithed eminenic. At Mornpeilier he attended the lectures of the mol? aste profeliors of phyic, and afterwards vilited the fouth 0. Faace, carefully viewing every ébect delerving of his attertion. He accompanied count de Tallerd to England in 1698, where he becam: acquainted with the chiof men of fience, a: 1 was made a memer of the Royd isciety. He next uent into Holland, and in 1703 he attended the aboe de Ionvois in as tour to Italy. He was, on his return, made bachelor of medicine in 1702, and, in two years after, he was croated M. D. One of his thefes was on the queltion, " An homanis primordia vermis s" which wes tramlated into French ior the fake of iume ladies of exalted rank, Dy whom it was deemed intereiting.

Geoffroy did not haftily commence the practice of medicine, continuing the profecution of his thudies in retirement for fome years. He never appeared anxious to puih himfelf forward, although his knowledge made him be often confulted by feveral gentletaen of the fsculty. He was fo concerned for the recurery of lis patients, that it gave him an air of melancholy, which at inft alarmed them, till they became acquainted with the caufe. He was, in 1709, made profeffor of phyfie by the king to the Royal College, vacant by the death of the celebrated Tournefort. He began with lectares on materia medica; and in 1712 , M. Fagon refigned to him the chemical chair: on both which topics Geoffroy lectured with unwearied affiduity. He was twice chofen to the office of dean by the faculty of Paris, and he filled a place in the Royal Academy of Sciences, from the year 1699 . His health at latt yielded to his toils, and he died in January, 1731. He is known to the chemical world by his table of affinities, far fuperior to any which had appeared betore his time. His greatelt work was his Hinory of the Materia Medica, which, in an unfriihed itate, was publifhed after his daath in the ycar $\mathbf{1 7 4 1}$, in 3 vols 8 vo.

GEOGRAPHICAL mite, the lame with the fea mile; being one minute, or the 6oth part of a degrec of a grat circle on the earth's furface.

## G E O GRAPHY.

## NNIRODUCTION.

## Definition.

GEOGRAPHY is that part of knowledge which defcribes the farface of the earth; its divilions, extent, and boundaries; the relative pofition of the feveral countries and places on the globe, and the manners, cuftoms, and political relations of their inhabitants. The word is Creck, $\gamma$ rugespix, from $\gamma \tilde{x}$ on $\gamma \dot{x}$, terra, " the earth," and respo, /crito, " I write." As every thing that immediately contibutes to the afcertaining of the fituation and limits of countrits and places on the forface of the earth, is within the province of geography, this fcience includes the defcription and ufe wiglober, mans, and charts, with the methods of conitructirg them.

This fcience has been divided into Geography pro- Divifion ofperly fo called, or a delcription of the lands of the segrathon globe, and Hydrography, or a defcription of the waters; but this divition is of little confequence, and is now feldom employed. Geography has alto been divided into general and particular, terms which are variounly underitood by different writers on the fubject. By Varenias, one of the oldell and bett modern writess on general geography, general or miverfal geography is ufed to denote that part of the fubject which comiders the earth in general, and explains its affections a a derreftrial globe, without attending to its arbitraty divilion into different regions; and by partucular or fipecial gutue graphy, this writer underftands the defcription of ie particular regions of the earth: and he divites this latter into two parts; chorography, defaibing fome con-

Introl : fideratle mats of the earth, as of the quarters, and $t$ /he. tom. Sroshy, defcribing a particular province or diffict.

Geography may be convenien tly divided into defarin$t$ iv geography, of that part of the fcience which deforibes the form, limits, exient, and variety of furface of different countries, with the manners and cuttoms of their inhabitants; and phyrical geography, or that part which teaches how to determine the fituations of differeut places on the globe, and to lay down and delineate their poftions for the information of others. Defcriptive geography is the more popular and entertaining fart of the lubject. It is ufually divided into ancient or clallical reographe, geography of the middle ages, and modern geography. The firlt branch of the fubyet coniders the fate of the earth fo far as it was known or dicovered at cifferent periods, previous to the fisth century of the Chrifian era. The geography of the midale ages extends from the fixth to the fifteenth century, and modern geography from the fifteenth century to the prefent time. One of the moit afelul fubdiviions of defcriptive geography is that emFloyed by Mr Pinkerton, who conliders the geography of the leveral countries which he deficribes under four different heads. 1. Hillorical or prosrelfae geography; in which he treats of the names, cxient, original population, progrellive geographical improvements, hiłtorical epochs and antiquities of the countries. 2. Political scograshy; under which he defcribes the religion and coclefiatic inflitutions, govermment, laws, population, colonies, military force, revenue, and political relations. 3. Civi! seography, compreliending manners and cuftoms, language, literature, and the arts, edacation, cities and towns, principal edifices, roads, manufactures and commerce. And, 4. Natural genoraphy, comprehending an account of the climate and feafons, face of the country, its foil, and thate of agriculture, its rivers, lakes, mountains, and forefts, and an enumeration of the natural produtions and natural curiolities, which are - Vid. Pin-ufually fuund within each ditrict *. Deferiptive geogralirter's Ges bhy is fometimes ityled political geography, while phygraj'y, vol. ical or general geograply is called natural geogra4. p. 3. phe.

Imong the other departments of this fludy we may mention facred geography, or that which illutrates the facred writings: and ecclefintic geography, which deferibes the divition of a country according to its church govermment, as into archbifhoprics, bihoprics, \&c.
Mi.nny writers of treatiles or fyitems of gcography give a detailed account of the hilorical events and commercial concerns of the feveral countries which they dcfcribe; but we confider this as unneceffary in a pure gecgraphical work, as thefe departments belong rather io History and Political Economy.

Some fyllematic writers on grography confidering the term in a very comprehentive siew, as including a defcription of the internal fructure of the earth, as well is of its furface, have thought it neceflary to enter into diffuffions refpecting the original formation of the tath, and the mincrals of which it is compoted. How far they are right in this we thall not pretend to determine. In this work, thefe fubiects will be treated of under the aricles Grology and Mineralociy.

Amother fubject relative to the alections of the earth, velpeci, the flyfical and $r^{\prime}$ emical rhanges that taine

fience of Metcoronosy, aid will be fuand winder that fotimearticie.
t.van.

We propofe in this articie to offer on'y an introduc: tory outline of detcriptive geocraphy, as the feveralonject an quarters of the glo'm, and $t$ aeir fubtivitions into em-this trat pires, lingdoms, and ftates, are deferioed th particu-tife. Jaly as is compatible with the limits of this ivork. under the deveral articies to which they belong in the general alohabet.

Our attention will be chiety directel to phyfical geography, efpecia', that pat of which deferibes the contrution and wie of globes, maps, and charts.

Phyfical geography is nroperly a branch of mixed ©i priyfical mathematics, and its principles depend on geametry, geo er-phy. and its kindred feiences, trigonometry and peripective. It is intimately connected with attronony ; and as thele two fciences mutually ilhitrate each other, they are commonly taught at the fame time. The phyfical changes that take place on the earth, as far as it is confidered in its general character of an individual of the folar fyftem, have been already explained under Astrovontr; and we thall have little here to add relpecting them, except as they are modified by the fituation of the obferver on different parts of the earth's furface.

The principles and practice of phytical geography, though frictly dependent on pure mathematics, may be, for the moit part, explained in a popular way, fo as to be underitood by the generality of readers. This fopular view of the fubject we thall attempt in the prefent article, throwing every thing that is purely mathematical into the form of notes. It mut be evident, however, that a reader who is converfant with mathematics will fludy phyfical geography to more advan. tage; and for this purpole, it will be fufficient to poffels a moderate acquaintance with arithmetic, the elecents of geometry, plane trigonometry, fpherics, and perfpective.

It is farcely neceffary to enlarge on the importance or utility of seography. It is one of thofe fciences, the knowledge of which is almoft contantly required. Without an acquaintance with the geography of the countries that are the fcenes of the actions which he relates, the hidtorian mut either be extremely concife, or his narration muft be obfcure and unintelligible. Geography affords the bet illuftration of hillory, and is equally neceflary to the hitorian and his reader. To the traveller, under which denomination we may clafs the foldier, the failor, the merchant, as well as thole who travel for pleafure or curiofity, a presious knowIt dge of the countries, through which he is to pals, is always ufeful, and often indifenfable. To the politician a comprehemive knowledge of gengraphy is of the highelt importance. If he is ignorant of the extent, form, boundarics, aprearances, climate, \&ic. of the country with which he is at war, he will plan his holtile expeditions without effect, and will fond his invading armies only to perith among the de:.les of the enemy, or to meet a more inglorious and deqlorabie rate from the difeaf so the climate.

Even, if we confider geography as a thuly of mere amuk mont and curiofity, it form one of the mol rational and interething itutic; in which we can engage. Nuthins can be more gratiting to the obforver of

Hitory fpeaks of feveral vovares undertaken by ordre of the kings of Egypt and of Perlia, for the purpote of afrestaining the extent of Africa; and Herodotus rc-1-tes that Pharao! Neche, king of Egypt, emploved fome pho ician narigators to fail along the coaft of A frica, for the purpofe of taking a more exazt furvey of it. See Africa.
M. Gofelin, who has confidered the geography of $t^{\text {he }}$ ancients in a very learned differtation, maintains, that the different fallages of ancient writers, who have always declared that the Phomicians and the Greeks circumavigated Africa, are not futticient to prove the certainty of fuch a voyage. The patiage in Herodotus has been difcuffed by him at confiderable length, and he feems to have proved his relation to be nothing more than a romance, founded on the hitorical knowledge of the Egyptians. M. Goffelin, however, admits, that many ancient voyages took place from thofe countries in which geograplyy had arrived it fome perfection ; and there are numerous arguments, proving that all the fhores of the old continent had been failed round. See Bailly's Hifory of Afranam, p. $30 \%$. €dit. 1775.
Xerxes king of Perfia, according to Herodutus, gave a fimilar commifion about the year before Chrilt 480 , to one of his 1atraps named Satafpes, who had been condemned to die. Satafpes entered the Atlantic ocean through the ftraits of Gibraltar, and bending his courle towards the fouth, he coafted the continent of Africa, till he doubled a cape which was called Syloco, and which Riccioli confiders as the fame with the Cape of Good Hope. He is faid to have continued his courfe to the loutb for fome time, and then to have returned home, affigning as a reaton for not proceeding further, that he had encountered a lea io tull of herbage, that his faflage had been completely obltructed. This reafon appeared fo ridiculous to Xerxes, that he ordered Satafpes to be crucified; but in this fentence he appears to have teen rather too precipitate, as it is certain that in leme latitudes there grows fuch a quantity of fea weed, that a veffel can fcarcely make way through it; as in that part of the fea which lies between the Cape de Verd illands, the Canaries, and the coaft of Africa, and is called by the Portuguefe the fea of Saragoffa. This flews that the relation of Satafpes may have been corred, as he might think it dangerous to attempt pro:3 ceeding where he found himfelf fo much entangled.

14 invelligation round the Red fra.

## Grography

 improved hy Alexano der.Herodotus has commemorated another marine expedition, underiaken by Scylax, by order of Darius the fon of Hyitafpes, and which probably took place about the year $4=2$ B.C. Scylax embarhed ugon the river Induis, the courfe of which he followed to its mouth, from whence he failed in the courle of 30 months, either into the Arahian gulf, or the Red fea. This Scylax mult not be contounded with a navigator of the fame nome, who, it a later period, made a voyage of
ed little to the happinefs of manhind, had at leaft the advantage of throwing confiderable light on the fate of
geograply at that time, as they afforled to the Grecks a more perfect knowledge of the river Indus, and of many parts of that vaft country which derives its name from that river. Alexander does not feem to have peretrated to the Ganges, though his expedition led the way to the knowledge of that river; for foon after he went as far as Pdibothra, a town fituated on the river Indus, at its confuence with another river coming from the weit. The followers of Alexander went down the Indus, as far as its opening into the Indian ocean, where they witneffed for the firt time the phenomenon of the flux and rellux of the fea,-a phenomenon which excited in them great aftonilhment and terror. It was after this that Alexander detached, about the year 327 before Chrit, two of his captains, Nearchus and Oneicritus, to inveltigate the coaft of the Indian fea. Nearchus was ordered to seturn by the Red fe:n, and this he effected. Some fragments of his vovage have come down to $u *$, and upon thefe has been formed an excellent work by Dr Vincent, entitled the "Periplus of the Erythrean Sea." This learned and valuable work is juit completed by the publication of the Second Part, and ifford much additional illuftration of the geographical information and commercial enterpriles of the ancients.

Oneficritus failed to the ean, and if we may believe the account that is left of his vovage, he gave us the firlt exact information refpecting the illand of Ceylon. The meafure given by Oneficritus, of the extent of the illand which he inveftigated, viz. $7020 \mathrm{H}^{1+}$ adia, does not correfpond to Ceylon, whether we confider the length or circumference of the illand, (fee Ctylon); and if we take it as the meafure of the length, it more nearly correfponds to that of Sumetra. 'The relations of Nearchus and Onefictitus were extant in the tine of Strabo, by whom the latter is faid to exceed, in point of exaggeration, all the other hiflorians of Alexander's expedition. At the fame time, it mult be acknouledged that there are many things related by Oreficritus, as quoted by Strabo, which fufficiently agree with what we hnow of India, and the productions of that country ; for he fipaks of the fugar cane, the cotton plant, the bambon, \&c.

The kincs of Egypt who fucceeded Alexander, took Ey Ptolemy confiderable intereft in the progrefs of geography. The philadelfecond of thefe kinos, Ptolemy Philadelphus, about the ${ }^{\text {phus. }}$ year 28 o before Chrift, fent into India two ambaffadors, Negathenes and Daimachus, accompanicd by the mathematician Dionyfus. Megafthenes was fent to the king of Palibothra on the banks of the Ganges, and Daimachus to another Indian potentate. No account remains of the proceedings of Dionyfius and Daimachus, but Megalthenes left an account of his journey, which is frequently quoted hy Strabo, by whom it is confidered as a mixture of real adventures and improbable exaggerations. Theie quotations of Strabo are certainly all that remain of the relation of Megathenes; fir the work publifhed under the name of Megaphencs is a literary impofture, fimilar to the works of Berofus, Manetho and Ctefius.

In the reicn of Ptolemy Lathyms, about 115 years before Chrift, other expeditions were undertaken, for the purpole of tailing round the continent of $\Delta$ frica.

Eudoxus and Cyficus having incurred the difpleafure of Ptolemy, were fent on this voyage of difcovery.
 curnavigating Africa, returned by the Rad bes. Lathly , in the reign of Pol my, fimam at Alexamber, about 90 years betore Chrith, Agaarchides, who had been the king's governor, was fent to take a complete furvey of the Red iea, and wrote an account of his woyay, of which, however, there remain only a few extraths that are preferved by Photius, in his Biblivt'teca, a work of

The extevifion of commerce feems aluays to have been ore of the principal objects of thefe visaces of difoovery. It is not furprifing, therefore, that the isbabitants of Marfeillec, which was early celebrated as a connmercill ci:y, apyear amons the ancicut navigators who labeured to cotend geographical hitovildge. Two voyager, Fythias and Futhymencs, underwok an expedition about 320 ycars, before the Chrillian tera. Euthymenes eatered the Athatic through the itraits of Gibraltar, and tumed tow ards the fouth, for the purfofe of taking a furvey of the coaft of Africa. This is all :hat we know of his route; but Pythias flecred northward, and after reconnoitring the coafts of Sjain and Gaul, iaited round the illand of Albion, and ftretching till farther to the north, difovered an illand which is believed to be the modern I eland, or the Thule of the anciunts, terrarum ulima Thule. Perhaps, however, this was ouly one of the Yerro illands. Strabo, who appears to have been prejuliced againt Pythias, treats bis telation as fubulous, founding his opinion principally on the number of incredible circumftances that occur in his narration. Taking thefe circumbtances, however, not accurding to the:r literal meaning, but in a flyurative fen?e, they reprefent pretty well the llate of the fea a:d iny in thefe countries which are fo little favoured by nature. Pythias cortainly feems to have been one of the firft Geeck navigators who entered the Baltic.
We have thus traced the pregrefs of geographical difeoveries to very nearly the period which we afligned as the limit of ancient geography; and flall now notice very bictly fome of the principal fcientitic geograyhers of antiquity, whofe names or writings have defcended to pofterity, and thall afterwards give a fummary fketch of the knowledge which the ancients feem to have poliffed of the habitable globe.

As geography is a branch of knouledge intimately connected with geometry and aftroncmy, it becane an object of confideration with many of the ancient geometers and aftrunoners. We have already nentioned the names of Anaximander of Milet:, and lis countryman Hecateus. Strabo alfo notices Demucritus, Eudonus of Cnido, and Parmenider, to the lalt of whon he attributes the divilion of the earth into anne. i hele were fullowed by Fratothenes, who lived about 2.2 years before the Chimian ara, whd Hiparhus, who thourihed abect of years afterwards; Porstiu, Geminus, and Pofilionius. Lisamibenes wrote three tooks on seugrarthy, of which Strabo criticies fome palliges, though lie frequently detends him againt Hipfarchos, who sitten affects an of ofite opinion. Polyhius wrote on geography as well a hillory, and as well as Geninus and Pollidunis, is frequerdy quated by strato. Polybiur and Gemirus argue with confick rable acutenefs for the pombibility of the tonid zone being inhatited, a circumitance which was generally difbelieved
 are very plaaible, in prove tha the chama: of the --
 of thofe which ate fituated nearer the is ins.

We mult not hore omit a geograpier ana mathes: tieian who lived about the time of New.ende the G... This was Dicearchus of Mellime, the diti ic ev The phatur, who wrote a defription of Gueco in inati. verfo, of which fonc itagments yet remenit . What re:
 of fereral momatains meafuret gometrialis by linar. chan. Thus, for intance, the hei, the of Mount Cyl. lawe is anted it 15 thdia, and hat of Siatyocat atcut 14. Taking the thaium at $9+\frac{1}{2}$ biec, we have for th: hatter of thele heights, at molt 1400 tules, whe:eas many of the ancients ampred $3=0,400$, of even 500 fladia, as the heio ht of fome of their mountains.

With Dicearchus we may mention another geometer nuticed by Plutarch in his life of Paulus Enilius; viz. Xenagoras, a diciple of Arillotic, who alf, employid himfert in meafuring mountain, and has alfisned ouly 15 肘位, which is equal to about $1+17$ triles, as the height of Muant Olympus. In fome of the later periods previous to the Chrittian ara, we find the names uf feveral geographers, as Artemidoras of Epliefus, who wrote a geographical work in elcven books, of which nothing remains; Scymnus of Chio, author of s delcription of the earth in iambic verles, whirh rem. i., in a very mutilated ftate; Iidorus of Charax, who ie: a defcription of the Parthian empire, an!' Suylan os Caryades, author of a voyage round the Mediterrane an fea, which is itill extant.

The work, of all thefe geographers, however, are Strabs trifing when compared with the geography of Strabo, a work in 16 books, which has conce down to us entire. This is one of the moll raluable works of ant:quity, bath from the fpirit of difcuflion which runs through it, and the mumber of curious obfervations which the author has collected of different geographers and navigators who preceded him ; and of whole weths nothing remains except thefe extracts. Strabo lived ia the reigns of Auguitus and Tiberius, and was auar!y cotemporary with Pomponius Mela. This later seo-Pomponie, grapher wrote a work de fitacola, which is little mure Méa. than a bare fummary, though it is valuble, as it gives 2.4 a fketeb of what was known in his time refpe ling the flate of the habitalle globe. Pomponius Mela was followed by Iulius Solena, whoo Fas alfo tre ted of geography in his Polyhitor, a complation which is fufficiently iduable frum the number of curiuas obfervatims which are there collected.

Of all the ankient geographer, pollerity in molt in Poolen: debted to Pulemy, who produced a work much more icientific than had ever before heen writen on this feicice; : a geograghy in eight books, which mutt erar be c.raderel :is one of the principal monkment: of the la hours of it authur. In this work there appens, for the fiff time, an application of geometrical principles :c the conilruction of map-; the different projections of the fphere, and a diltrinution of the feveral places on the earth, according to their latitudes and longituies. This work mult haice been the refalt of a great meny relations buth hiflurical and geographical, that had been collected by Ptolemy. It has palied through nu merous editions.

Vol., IX. Part II.

hended Letween the Indus and the Ganges, was calle 1 Hitor:by them India on this fide thie Gianges. Further on tou..rds the north of China, in the neighbourhood of the montains where thele rivers derive their fource, they placed feveral nations of people, of whom they related the mot ridiculous fables. Beyond thefe, fitl more towads the ealt, they placed the Seres, and upon the cuatl of the gulf, which is now the bay of Cochin China, called by Ptolemy the Great Bay, were fitated the Sia a, to called by Ptolemy, though they are not mentioncel by Surabo, Pomponitas Mela, or Selinus. The Sires were probably the inhabitants of the northern Farts of China, and the Sinx, thofe of the fouthern parts of China, who very early occupied Cochin China, Tonquin, \&c. countries which in the lequel they have entircly fubjugated. They maintained a commerce by land with the Scres, and their route is peinted out in one of Ptolemy's maps. Beyond the Seres, according to Strabo and Pomponius Mela, lay between the Criental fea, though Ptolemy, for want of certain intelligence refpecting that part of Afia, confiders the point as undecided, and places there feveral unknown countries. The ancients cariied this extremity of Afia much farther to the eaft than it is found to extend by modern geographers; for, according to them, the Seres and the Sinse were fituated about the longitude of $180^{\circ}$, while the meridian of Pekin, or about the middle of the Chinefe empire, reaches no farther than to $134^{\circ}$, reckoning the longitude from the moft diftant of the Canary illands, as was done by Ptolemy. To the north of the Indus the ancient geographers placed the Scythians, and Hyperboreans (the Tartars and Samoides of more modern date) and fome other nations to an indefinite extent, who were fuppofed to form on that fide an infurmountable barrier, having behind them an ocean of ice, which was believed to communicate with the Cafpian fea, though this was at leaft at the diftance of 450 leagues.

The boundary of Afia, alligned by the ancients to the fouth, was the Indian ocean, and they were acquainted with its communication with the Red fea, by means of a iltait, the figure of which is very ill expreffed in their maps. This is alfo the cafe with the Perfian gulf, with which they were acquainted, but which in the ancient maps has nearly the form of a rhombus, one fide of which, towards the mouths of the Indus, was pretty well known to them, but the fide next the mouths of the Ganges is very inaccurately delineated, being continued nearly in a ftraight line. It is even probable that the inand which Ptolemy calls Taprobana, was only the peninfula of India very much disfigured in the delineation.

The fituation of this ifiand of Taprobana, fo cele-Situation brated among the ancients, is a problem in geography of the ifland that is yet unfo'ved. It is commonly fuppofed to be of Taprothe modern illand of Ceylon; but the dimenfions of it bane. as laid down by ancient geograpleers, render this fuppolition doubetul, and there are fome who rather believe it to be the modern Sumatra. The ancients had allo fome obfcure knowledge of the peninfula of Malacca, which they called the Golden Cherfonefur, and they feem to have examined the gulf formed by that land, which is now the gulf of Cochin China, or commonly called the gulf of Tonkin. It is fonewhat extraordinary that they do not feem to have been acquainted

## Part 1.

G E O G R A P II 1.

Hiftory. quainted with Java, Bornes, and that numerous group of illands which form, in that quarter, the greate.t Aichipelago in the world. It is equally fingular that the Maldives had efcaped the obfervation of thefe navigators. This leems to prove that they never ventured out into the open fea, but kept clofe along the thore. P:olemy indeed lays, that his illand of Taprobana was furrounded with many hundreds of fmaller illands, to fome of which he gives names; but all this is involved in
()i Africa, the ancients knew only thofe parts which lay along the coalt, and to a very fmall diftance inland, if we except Egypt, with which they were well acquainted, at leaft as far as the cataracts of the Nile, and a little beyond them, as far as the iland of Meroé, towards the 2 th degree of north latitude. Their knowledge of the coaft of Africa on the fide of the Red fea, extended no farther than the mores of that fea, except that part which was dependent on Egypt ; the interior of the country being inhabited by ferocious and antractable people. They were till lefs acquainted with the courtries which lay beyond the itrait, and Ptolemy appears to have given no credit to the navigators who were faid to have failed round that part of the world, for he has lefit the continent of Africa imperfect towards the fouth. Strabo and Pomponius Mela were, however, decidedly of opinion that Africa was a peninfula, and that it was joined to the rett of the contircat only by that narrow neck of land which is now alled the ithmus of Suez. The ancients feem to have had no knowledge of that large and beautiful illand of Madagafcar, unlefs we fuppole that Ptolemy had fome imperfect acquaintance with it, under the name of the inand Menuthuus. The coaft of Africa upon the Mediterranean fea, was once covered with towns, dependent on the Roman empire, flourihhing and polified, white it preients at prefert nothing but a neft of pirates, whom the jealoufy of the great commercial mations fupports, to the difgrace and prejudice of civilized ftates. Proceeding from the fraits of Gadez or Gibraltar, they l:ad become aequainted with the coatt as far as a cape which they called Hefperion-Keras, probably the modern Cape de Verd, or the cape that lies a little to thic welt of it, though in the maps of Ptolemy it is thrown a littie back inland. The Fortunate illuds, or the Hefperides, at prelent the Catariec, better known by fame than in reality, feem to lave been the boundaries of ancient geography to the wett, as the Seres and Sinee were to the eafl. It appeare, however, that the Cape de Verd illands were not entirely unhnown to the ancients, and they are probably the fane with what were then called the Gorgades of Compones, which were fuppofed to be two days fail to the wett of He-fperion-Keras.
"There is little doult (hays Mr Pattem) coneem. ing the namcs by which mot of the principal countrie of Europe were known to the ancients; nor is there any difficulty in difpofing the chinef nation, which ancient writer, have enumerated in the foush-weit part of A.fa or on the African coall of the Mediterranean; but :ith the north and north-eatt parts of Emope, about tho thirds of Alia tuward, the fane quartor, and neariy the fame proportion of Africa toward, the fouth, they appear to have been wholly unacru inted. Of America Whey did not cyen fifpect the exitence; asid if it ever
happened, as fome writers bave imagina, then prece- Herv, nician merchant thips were driven by horm a-ors the Athantic to the American ilhores, it dineonot appor t'sit any of them :cturned from theace : : :eport the di. cowery.
"The names of proviace, fubstivibions, an! pety tribes, mentioned by ancient author, in thon comeriev which were the chief fenes of Ruman, (irecian, or Ifraelitih tranfaction, are almolt in rumeross is in a modern map of the fame countrics : add the feuntiuns of many oi them can be very nearly allignod : but the limits of each, or indeed of the fates or nation to whicis they bclonged, can, in very ferm intances, he preciely fised. Thus the fonthern boundaries of the Sermatic in Europe, camot be alcertained within a degrec at the nearelt ; and in France, neither the limits of the people called the Belgæe, Celtax, and Aguitani ; nor thofe of the Roman divifions, viz. Belgica, Lugdunenfi, Aquitania, Narbonemis, and the Province, can be laid down, in many places, but by a hardy conjecture. The fame obfervation may be juitly applied to the Tarraconenis, Lufitania, and letica of $S_{\text {pain }}$; to the Cauci, Catti, Sucri, \&ic. of Germany; and, above all, to the Britannia prima et fecunda, and other divifions of the Pofty:n Roman government in Britain : of which not only the Ahls, Pat limits, but the fituations are $11 i 11$ in difpute." * i. page 2--

During the middle ages geographey, as well as mot Genitraphy other arts and fciences, feems rather to have gone back-of the mid. wards than advanced. The weaknel; of the Romande age emperors, the relaxation of military dici line, the boundle's pafion for lusury and pleafure, and the continual incurfions of the barbarous nations, while they contributed to haten the fall of the veftern empire, allo accelerated the ruin of the arts. It feems as it theie dellructive hordes of barbarians, the Goths, the Huns, and the Viandals, had enveloped the whole surld in one profound and univerfal ignorance. This darknefs, which overfpread the whole of Europe, did not permit geography to make any advances for a very confiderable time. There were indeed fonte mavigators who inveligated countries that were filll little known, but they were fo ignorant, that they afiord us very little new light. There was one named Cofmes, who made a voyase to lmdia, which procured him the name of Indo-P'eulter, and who gave an account of his rovage under the title of Sacred Gerarap/ys. This man was to egregioully ignoranat, as to believe that he had difcovered that the earth was a plane, and that the diverify of the feafons, and the inequality of the day and nights, were oning to a very high mountain fituated to the north, behind which the fun fet to a greater or lefs depth.
The voyages of the Arabims to the Eatt Indies Difiouer (fue the hifter of Commpres), contributed to throwics ofthe father light nin that extenive part of the globe. Con- traisuns. querors of the countries on the Red fea, and enthuiafthe propaga'n of their religion, they carried their arms as far as the eatemity of ludia. We foe them in
 publhbet tew of heir a :mation, ia which weean trace with twerable :ccuary, the f' . en wifited ly their as them. The in? of seendit, fo celden tet is their

relations do not give us as favourable an idea of the Chinele as we derive from their own hitory; on the contrary, if we may believe thefe Arabian travellers, this people were, even at that time, in a ftate not very civilized.

We are now arrived at the modern period of our hiftory, duing which the molt important difcoveries have been made, and our knowledge of the habitable slote more than doubled. The difcoveries and improvements during this peried are fo numerous, that it will be impofible to give here any thing more than a chronological vies of the moft remarkable, referring for a detailed account of them to the geograghical and hiftorical articles in this work.

The tafte for voyages of difcovery began in Europe foon after the revival of literature in the $15^{\text {th }}$ century, iuft before the commencoment of which, namely, in the reiga of Henry 111 . king of Spain, about the year 1395, the Canary illands were more fully linveyed than at any former period.
1415. Prince Henry 111. fon of John king of Portugal, laile? round the coait of Africa.

14:7. The Canary illands were fubdued by Bethancourt, nephew of the admiral of France.

1420 . The ifland of Madeira was examined by John Gonfalvo and Trittan Vaz, two Pcriuzuefe.
1446. Cape de Verd was difcovered Ly Dennis Fernandez.
1487. The Cape of Good Hope was difcovered by Barthelemi Dinz. The difcovery of this cape led the way to that of the new world. This great event, which gave a new tight to the genius of mankind, is one of the mof important in the hitory of geography. A particular account of this difcovery will be found under the article Anerica. The following are the dates of the principal geographical difcoveries which have taken place between that of Columbus, and the voyages of our celebrated navigator Cook.
1496. Florida, by Sebaitian Gabot, an Englihman.
1498. The Indies, by Vafco di Gama.
1499. The river of Amazons, by Y'anez Pinçon.
1500. Brazil, by Alvarez Cabral, a Portuguefe.
1504. Newfoundland, by fome Normans.
1518. Mexico, by Ferdinand Cortes.
1519. The Itraits of Magellan, South fea, and Phillippine illands, by Ferdinand Magellan.
1525. Canada, by Jean Verrazan, a Florentine, fent by Francis I. of France.- Peru, by F. Pizarro of Spain.
1527. New Guinea, by Alvaro de Salvedra.
1534. Chili, by Diego Almagro.
1535. California, by Ferdinand Cortes.
1567. The iflands of Solomon, by Alvaro de Mendoza.

16:8. New Holland, by Zechaen.
1642. Van Dieman's land, by Abel Janfen Tafman.
1643. Brower's land.
1654. New Zeuland.
1678. Louifana, by Robert Cavelier de Lafalle, governor of Frontiniac.
1700. New Britain, by Dampier, an Englihman.
1739. Cape Circumcifion, contelted between the French and Englifh. Said by Montucla to be difcovered ! y two French veffels.
1767. The ifland of Taiti, by Wallis, an Englifhmar:.

## A $\mathrm{P} \quad \mathrm{H} \quad \mathrm{Y}$.

1778. The Sandwich illande, by Cock.

Within this period there are reckoned 25 voyages round the world, riz. thofe of Magellan, Drake, Ca-Num $3+$ vendifh, Noort, Spilburg, Lemaire, L'Hermite, Cle-varster pington, Carreri, Shelvack, Dampier, Cowley, VYoodes the we Rogers, Le Gentil, Anfon, Wallis, Roggewein, Bou-the world. gainville, Sarville, Divon, three rosages of Cock, La Peyroufe, Marchand, Vancouver, and Pages.

Within thefe few years, very confiderable light has been thrown on the ilate of our geographical knowledge, by feveral valuable voyages and travels that have lately appeared. The difoveries that have keen fucceffively made in the great South fea, and in other parts of the world, efpecially the extenfive itland of New Holland, are now fo fully eftabiihed, as to add confiderably to the certainty of our geographical knowledge; and the voyages of Cook, La Peyroufe, and Vancouver, have afforded us more exact furveys of the coalts of thefe countries than we could, fome years ago, have dared to hope for. The :accounts of the late embalfies to China, 'libet and Ava, afford many authentic materials for a modern fyem of geograpliy, the place of which mu.t have been fupplied by more remote and doubtful information. From the latter of thefe accounts we are become familiarly acquainted with an empire (that of the Birmans), which a chort time ago wis tearcely known (fee Asis, 8t-152.) Our knowledge of Hindoftan and the neighbouring countries has been greatly extended by the refearches of the Aliatic Society, and fome other late works; while our acquaintance with the interior of Africa has been rendered lefs imperfect by the exertions of the African Society, and by the travels of Park, Brown, and Barrow; and the northern boundaries of America, even as far as the fea which appears to furroand the northern extremity of that vall continent, have been more fully difclofed by the journeys of Hearne and Mac. kenzie.

The late voyage of Turnbull, however infignificant it may be in other refpects, has at leatt the merit of enlarging our knowledge of the manners and political tranfactions of the South fea illanders, and of introducing to our acquaintance, in the perton of Tamahama, the chief of Owhyhee, a fovereign, who, in ambition and defire of improvement, bids fair to vie with Peter the Great ; and to transform a nation of favages, to a civilized people.
a civilized people.
With all the advantages which geography has lately Prefent dereceived, the fcience is itill far from being perfect; andirets of geothe exclamation which D'Anville is faid to have made graphy. in his old age, "Ah!' mes amis, il y a bien d'erreurs dans la geographie"-Ah! my friends, there are a great many errors in geography, may ftill be applied with confiderable juflice. Many points in the fcience have been but very lately afcertained. Thus, the extent of the Mediterranean fea was almoit unknown at the beginning of the 17 th century, although it is now almolt as exactly afcertained as that of any country in Europe. In a book publihed by Gemma Frifius, de orbis divifione, in 1530 , we find the difference of longitude between Cairo in Egypt and Toledo in Spain ltated at $53^{\circ}$ inftead of $35^{\circ}$, and other meafures of extent are proportionally erroneous. Not many years ago there was an uncertainty with refpect to the extremity of the Black fea and the Cafpian, to the amount of $3^{\circ}$ or $4^{\circ}$;
H. pory ant io Inely as the yan $: 760$, the lum itumice of Gidraitar ata of Cac.z was not ktown within half : dts:ee.

 percenty explom, asd Burolent 'luhes is atill !efo
 no contei court of the Entih chamel, thom he we :te aflerel ty Nant Bemel the this is the c.ff ; and has !een or: ved by the trigunometrical ferve? of Britwa that have yet been pubith: ", that the re are may geos errors :a cor bont conty tara. We have had oecalion to remaris the.: geograpley has lometimes been retrogtefive, and there connot be a gieater proof of the truth of the offervation, than that in a map of the Shetland inlends, publifhed not long age, by Pseton, they art teprefented as too large by une thind, toth in iength and treadth, and their rehtive potitions are very inaccurate, though in the maps of the fame illands fablithe 1 tefore the year 1750 , they are laid dorm with much greater accuracy, as appeats from furveys made by order of the late king of France, and from the maps publithed by Captain Donelly, and at Coperhagen, in the year $17^{8} 7$.

In Atia we are imperfectly acquaited with Tice:, and fome other central regions; and even P atin, Arabia, and Aflatic Turkey, are but little known. O! Auttralafia, or New Hollind, and New Guined, almot nothing is known except the coafts, and a great part of them towards the fouth has been lut imperfectly explored. Of Polynelia, or the numerous illands in the South Pacific ucean, we are alfo very ignorant; and in the Pacific ocean, particularly towards the fouth pole, many difcoveries probably remain to be made.

Our ignorance of the central farts of Africa is notorious, and the improvement of our geographical knowledge in that quarter has, for fome years, been a savourite object. It may admit of doult, however, whether this object will be fpeedily a:tained, as the obstacles to inveftigation in thofe inhofpitable tracts, leem nearly in immountable by buman prudence and courage. Even the thores of Africa have not been conpletely furvezed, cfiecially thele towards the fouth and taft.

America has of late been much more fully cxplored than at any former period : but fill the weltern parts of Nurth America, and the centris and louthern regions of South America, are very little known; and the Spaniha feitlements towards the north are farcely known, except to their own inbabitants.

The fcience of geography will probably be never perfectly undertlood, as, befides the numerous oblacles which oppoie the progrefs of the traveller, it is fcarcely poffble that exact trigonometrical furveys of every place and country, the only certain method of afcertaining their exact fituations and relative pofitions, can be made.

Political geography mull ever remain the moft unecrtain part of the fcience. New changes are perpetually taking place in the relations of teighloouring itates, according as ambition, tyranny, or commercial convenience dictates. Territory is transferred, by ccilion or by conqueft, from one nation to another. Whoever will - ompare the redations of the European flates, as they
apperr in the prefent maps, ame in thofe tubliked haif ith +y. a centary ats, will licarcely rero wife t'e conntries to ve the thate The great disitons indeed emain an beforn, :ut the i mondaries of mont of them ate thatively clavad. A mamber of independent An**s, at 1 in one inatine, a larice kingdom, hase been fisalown up 'y. the mijultathe antation of the more roveral he, .
 of Lative. The republics of Hoilond, of simp it land, Vernice, ate no more: the kingioms of Pe land and surdinia have cealed to exith; the fuccelif of St Peter, who once gave laws to painces, and governed Enrope with unloounded fway, is now a wretcherl exik, and his dominins are doomed to increale the aiteraty ovisgrown puser of defpotic uptarts. Whether the prefent gencration of emperors a dings, ereatei by the niglity Napoleon, will remain as long as did the diates on whole ruins they have been raifed, or are re t! er ephemeral production, dooned to perih at the eetting of that fim which now give, them life and vigour, is a quattion which future experience alone can dotermine.

The limits prefcribed to this article do not permit us to cster on a critical examination, or even a chatacterific inetch, of the geographical works that bave appeared in the modern peried of the hiftory of the fience; and a bare enumeration of names would be equally tirefome and uninterefling. Some of the beit modera works will be mentioned in the fequel; at prefent we thall conclude this Part in the words of an able judge of the prefent Atate of the fcience.
"The Spaniards and Italions (Lay, Mt Pinkerton) have been dormant in this fcience; the Frencle work: of La Croix and others are too brief; while the Ger. man compilations of Butching, Fabri, Ebeling, \& $c$. are of a moil tremendous protixity, arranged in the moft tattelefs manner, and exccediny in dry names, and tritling detaile, even the minutenefs of our gazetteers. A delcription of Europe in I + quarto volume, may well be contrafted with Strabo's defeription of thr world in one volume: and gengraphy feems to be that branch of lience, in which the ancients have cilanlith ed a more clafical reputation than the moderns. Every great literary monument may be faid to be erected liy compilation, from the time of Herodotus to that of Gibbon, and from the are of Homer to that of Shakefpeare; but in the ufe of the materials there is a wils diffirence betwcen Strabo, Arrian, Pcolemy, Paulanis. Mela, Pliny, and other celebrated incient narats, an i molern general geographers; a!l of whom, "val: d'Anville, feem under graduates in literatur, without the dittinguifhed talents or reputation, which have companied almoft every other literary exertion. Ye: it may fafely be aftirmed, that a production of reat value in uniserfal geography requives a wiler cotent of various knowledge thath any other literary department, as embracing topics of the moll multita, ines. defription. There is, however, one name, that or d'Anville, peculiarly and jufly eminent in thi Ceverce lut his reputation is chietly derived from his mon, and from his illuftrations of varions parts of amic: grography. In fpecial departucut: Gollelin, an! ather foreigners, have alf, been recently diting ithcd; nor is itneceflary tor remind the reader of the ". . $P_{1}$ I. merit of Rennell and \iment in wur own country *"

## Chat. I. Of the Surfaci, and Gearal Divifons of the Earth.

IT has been fuppofed, by the lefs enlightened part of mankind in all ages, that the furface of the earth is nearly a plane, bounded on all fides by the fky. It was thern, lowever, in the article Astrovony, ( $N^{\circ} \mathbf{2 6 0}$-2こ: ) that the earth is of a Ppherical figure, and an account was there given of the manner in which the true form of it was determined. Independently of the confiderations there detailed, the fpherical figure of the earth may be inferred, in a popular view, from the following facts.
3. When we fland on the fea-fhore, while the fea is perfectly calm, we eafily perceive that the furface of the water is not quite plain, but convex or rounded; and if we are on one fide of a broad river or arm of the fea, $\therefore$ the frith of Forth, and with our eyes near the water, look towards the oppodite coath, we thall plainly fee the water elevated between our eyes and the oppolite iliere, fo as to present our fieing the land near the edge of the water.
2. When we obferve a hhip leaving the floore, and going out to fea, we firit lofe light of the lull, then of the fails and lower rigging, and laftly of the upper part at the matts. Again, when a flip is approacking the thore, the firft part of her that is feen from the land is the topmant, then the fails and rigging appear, and lattly the hull comes gradually into view. Thefe appeartaces can arife only from the flip's failing on a convex furface; as, if the furface of the fea was plain, a hip on its firlt appearance would be vifible, though very tmall, in all its parts at the fame time, or rather the hull "ould frit appear, as being moft ditinguinhable ; and, in going out of fight, it would in the tame manaer difappear at once, or the hull would be the latt part of :hich we fhould lofe fight.
3. Many navigators fent on voyages of difcovery, have, by kecping the fame courfe, at length arrived at the port from which they fet out, having literally failed round the globe. This could not happen if the fea were a plain.
4. When we travel to a confiderable ditance, in a dircetion due north or due fouth, a number of new flars rucculively appear in the heavens, in the quarter to which we are travelling; while many of thofe in the oppolite quarter gradually and fuccellively difappear, and are feen no more till we return in a contrary direction.
5. In an cclipfe of the moon, which has been thewn (Astronomy, $\mathrm{N}^{\circ}$ 199) to he owing to the obfcuration of the mom's furface by the thadow of the enth, the boundary of the obfured part of the mron is always circular. Now, it is cricent that mo budy, which is wot fituicel, can, in all fituation, (all a circuhar flosdo:

The diawere of time cont is geterally romputed

polar with the equaterial axis. Taking this laft, therefore, at the mean diameter, the circumference will be $=24,912 \mathrm{miles}$, and coniequently the extent of the furferficies will be $=197,552,160$ miles, of which it is computed that at leatt two-thirds are covered with water.

In the above computation no account is taken of the mountains and other eminences on the furface of the globe; for, although theic are of confiderable confequence in a geographical point of view, as they conftitute the moll natural and remarkable boundaries of countries, and by their iniluence on the foil and climate of the different regions, contribute in a great degree to form thofe fhades of ditinction which diverify the inhabitants of the feveial quarters of the earth, they are, however, too tritling, when compared with the diameter of fo great a body, to make any fenfitle crror in the calculation.

The furface of the earth is exceedingly diverfficed, al-Divifions molt everywhere rifing into lills and motentains, or of the finking into valleys; and plains of any great extent are e.sth. extremely rare. Among the moft extenfive plains, are the fandy deferts of Arabia and Africa, the internal part of European Ruffia, and a tract of conliderable extent in the late kingdom of Peland, now called Prufian Poland. But the moft remarkable extent of level ground, is the valt platform of Tibet in Afia, which forms an immenfe table, fupported by mountains running in every direction, and is the moft elevated tract of level country on the globe. Thie chict elevations or monntains that occur, with their elevation, \&ic. will be $d=$ mentioned under Geology. The greateft concavitiesOceans. of the globe are thofe which are occupied by the waters of the fea, and of thele by far the largen forms the bed of the Pacific ocean, which itretching from the eaftern fhores of New Holland to the wettern coaft of America, covers nearly half the globe. The concavity next in fize and importance, is that which forms the bed of the Itlantic ucean, extending between the new and the old worlds; and a third concavity is filled by the Indian ocean. Smaller collections of water, though Atill large enough to receive the name of ocears, fill up the remaining concavities, and take the names of Arctic and Antarctic oceans.

Smaller colle etions of water that commen.icate freely seas. ${ }^{43}$ with the occans, are called fear, (vid. A; fig. I), and of riute thete the princifal are the Mediecrancan, the Boltic, claxi. the Black fea, and the White fea. Thete feas fometimes take their names from the country rear which they tlow; as the Iriblica, and the Gemman ocean. Some large bodies of water, which appea: to have no immediate connexion with the great body of waters. being everywhese furrounded by lad, are yet cailed fia:; as the Carian fea.

A part of the fearunning up within the land. fo as Baviot ${ }^{44}$ to form a hollow, if it he large, is called a bay or b , sof; as the hay of Bilcay, gulf of Mexico: if fmat', a ciek, rout, or haid $n$.

When two large bodies of vater communicate by a cenat marow jais between two atjocent lands, this pali is

 water a'ualy piows threwgh a derat with coniderabie Fonce and se wity, formins what is called a current,
 rection. Tuas. in the fleats of Gitraltar there is a contant current from the Atlasic into the Mediter zazean, though the furice of the later never feems to be elevated beyond its ufual level. I here is alvays a current round Cape Finizerte and Caye Ortegal, fetting iato the bay of ificay, and it has been difcovered by Ma;or Remel, that this current is continued in a direction N. W. by W. trom the coalt of France to the xettward of Ireland and the scilly ilands. Hence he draws this ufful practical intruction for mavigatons who are entering the Englith chancl from the Atlartic, viz, that they thould kee; no higher latitude than $48^{\circ} 45^{\prime}$, le.t they hould be carrids by the current upon the roch : of Scilly. Fer want of this necefliary precaution, it is faid that many finips have been loft on

A body of freh water, entirely furrounded by land, is called a icute, boi, or lough (as D, fig. 1), with the exception of the fea above mentioned; as the la'e of Geneva, Lake Ontario, Lake Champlain, Loch Lomond, ふ̀c.

This term, or is fynorimes, loch or lough, is fometimes applied to what is properly a gulf or inlet of the fea, as Loch Fyne in Scothad, ani Lough Swilly in Iteland.

A confiderable ilream of wate: rining inland, and running towards the fea, is called a river; a tmalitr Atream of the fame kind is calied a rivale or luosk. Vid. E, fig. 1.
49 . The great extent of land which forms the reft of the
Contments. globe, is divided into innumerable bodies, tome of which are very large, but the mincrity extrcmely imall. There are three very extenfive tracts of country, which may all be denominated continents, thoush only two of them hase hitherto been dillinguilhed by that appellation. The :ar? confiderable of thefe cominents is what has been calle. the o!d world, comprifing Europe, Afia, and Africs. The fecond comprehends Nortis and South America, or what has been denominated the new sworld, and is little inferior in extent to the former. The third great divino fomm the country called New Holland.

A body of land entirely furrounded by water is called an ifand, (vił. d, fiz. r.) as Bitain, Irclard, Jamaica, Midagafcar, \&c. According to the ilrict meaning of this defnition, the large divition juft mentioned are iliand; for it is almof certainly aceetainal, that the continent of No:t'1 America is evesyathese hounded by the fea, and it has lorgt ceafed to be dout ful that Nou Holland is in the fame circumfemece, ard it is yenerally called the largent illand in the word. But perhans it would te better to confine the tera, to thofe numberlef imaller nlands thet appear above the farfice of the waters. When a namker of fmaller ilhand are ituatud near cach cher, the whole aficmblage is commonly called a group of ifland, as $i, b$. The large niemblages of illand that hare been difcovered in the South Parific ccean, have litely beea comprehended under the name of Pu'ynefa, contlituting a fixth divition of the whone - the the wher for being Lurye A"s, blien,
 Guinea, under the ware of Amplatia.

 Eic. Indeed the chminent of Africa may o contidered as a vall penilifa. i cing wited to Atia unly ly the finall illhmur of sue:

The naroow neck of land which joins a perinfuta to fochive. the main land, or which connects two traits of counsry together, is called an iflonus, as $d$. The moit remartable ithmutc are the ithmus of Darien, connecting the continents of North and Sou:h A merica, and the ittimus of Suez, inining Africa to Afa.

A narrow tract of land iteetcings far out into the fr nustur fea, being united to the main land by an ithmas, is ario cas: called a fromentory, and its extremity mext the fa, if called a cape: as cf, fig. 1. The molt remarkable capes are the Cape of Good Hope, at the fouthern extremity of Africa; Cape Horn at the fouthern extremity of South America; the North Cape at the northern extremity of Europe; and Cape Talmara, at the northers extremity of Alia.

It mey alint the memory of the young geographer, to compare together the above divifions of land and water. We may remark that the large budies of land, called continents, correfpond to the extenfive tracts of water called oceans; that iflands are analogous to lakes; peninfulas to feas or gulfs; itithmutes to itraits; promontories to creeks, \&c.

The inhabited parts of the earth are calculated to occupy a fpace of $35,990,56$ g fquare mile, of which the four quarters into which the globe is ufually divided are fuppoied to have the following proportions:

| Europe, | 4,$4 ; 6,265$ |
| :--- | ---: |
| Afa, | $10,765,823$ |
| A frica, | $9,634,5=7$ |
| Americ, | $1,1 i=, 874$ |

The whole population of the eath ha, be en comput ed at $700,500,020$ fouls; and of thefe

| Afla is fuppofel to contain | $500,200,002$ |
| :--- | ---: |
| Europe, | $150,000,000$ |
| Africa, | $32,000,000$ |
| Amelica, | $20,002,000$ |
| and Autralidid and Pulynefia, Sc. | 500,000 |

Hence the proportical number of inhabitents :o every fuare mile in each quarter is as sullows:

| In Aiz | 46 |
| :--- | :---: |
| Europe | 34 |
| Airica | 3 |
| America | 3 to every two fiva.e mite. |

Farles on In order to afcertain the relative pofitions of places the glabes. vericu imhatitants. The ball thus prepared, is called an arificial gloke, and what we lave delcribed is proFerly the berreqrial glole, fo called to dillinguith it from anctiber of a fimilar form, and furnifhed in a fimilar ra taner, but the furface of u hich reprefents the various aflimblages of fars or conitellations that appear in ti:e sesovens, and therefore this is called the colefial globe. and countries on the tarth, certain circles are fuppofed to be drawn on its furface, analogous to thofe which were mentioned in Astronomy, as fuppofed to be dravn in the heavens. As thefe circles are really reprefented on the artificial globes, it will be proper here to confider a little more particularly their nature and

Lquatern: A great circle drawn on the globe, at an equal diftance equmoctiai from both poles, is the equator or equinoctial line, and reprefents on the globe a fimilar circle, fuppofed to be dramn round the earth, and ditinguilhed by the fame names. By failors this is commonly called the line, and when they pafs over that part of the water, where it is imagined to be drawn, they often make ufe of various fuperititious ceremonies. The two parts of the globe into which it is divided by the equator, are called the northern and fouthern hemifplires.

The equinoctial line on the earth paffes through the middle of Africa, in the almolt unknown territorics of Macoco, and Monemugi, traverles the Indian ocean, faffes through the ifiands of Sumatra and Borneo, and the immenfe expanfe of the Pacific ocean; then extends wer the province of Quito in South America, to the mouth of the river Amazons.

As every circle is fuppoled to be divided into $360^{\circ}$,
Through every $15^{\circ}$ of the equator there is drawn on the glube a great circle paffing through the poles. Thele circles are called meridians, because when the fun in his apparent courfe from eaft to welt reaches the correfpording circle in the heavens, it is noon on that part of the earth over which the meridian is fuppofed in pafs. Properly fpeaking, every place on the ear: ho has its own meridian, though to prevent confufion, thefe circles are drasin on the artificial globe,
only through every $15^{\circ}$ uf the equatio. Io fupply the Prmeples place of the other metidians, the globe is hurig in a and thong brazen citcle, which is called the trazen ratr- Practice. dan, or fumetimes only the meridion. The brazen 59 meridian, like the couator, is divided into $360^{\circ}$, but Frazenme. thefe are marked by nincties on each quadrant, being ridan. on one half of the meridian numbered from the equator to the poles, and on the other half from the pules to the equator. On thic. oppofite inde of the brazen meridian there are two concentric faces, which are divided into degrees corretponding to the months and days of each month, the degrees being marked on concentric fpaces from the north pole to about $23^{\prime 0}$ both ways. The ule of thefe divilons will appear hereafter (B).

60
Through every tenth degree of the meridians, there parallels are drawn on the globe circles parallel to the equator, uf latitude. which, for a reafon that will appear prefently, are called parallels of latitude.

Before we proceed in defcribing the other circles, \&c of the artificial globe, we thall here make a few remaks on the ufes of the equator, the meridians and parallels (c).

The equator ferves to meafure the diflance of one of latitude place from another, cither to the eaftward or weftward, and longi* and this ditance is called the leng:tude of the place.tude. The meridians ferve in like manner to meafure the diftance of one place from another in a dircet line north or futth of the equator, and the difance of the place thus meafured is called its latiturte.

The longitude and latitude of places may be illufrated in the following manner. Let PEF' $Q$ (fig. 3) reprefent the earth or the globe, (fuppofed to be traniverfe) whofe axis is PCP', the north pole being P , and the fouth pole $\mathrm{P}^{\prime}$; and let EAQR repicfent a circle paffing through the contre C , in a direction perpendicular to the axis $\mathrm{PP}^{\prime}$. This circle corefponds to the equa. tor, and it divides the earth of the glove into two hemifpheres, EPQ being the northern, and EPQ the fouthern hemifphere. Let G, I, K, reprefent the lituations of three places on the furface of the globe, through which let the great circles $\mathrm{PKP}^{\prime}, \mathrm{PI}{ }^{\prime}$, and PGP', be drawn, interfecting the equator EQ , in $n, m, a$, refiectively. The circles are the neridians of the places K, I, G. As every circle is fuppofed to be divided into $360^{\circ}$, there muft be $90^{\circ}$ from each pole to the equator. Hence the latitude of the place K is meafured by the degrees of the arc intercepted between K and $n$, and the latitudes of $G$ and $I$ are meafured by the degrees of the arcs intercepted between $G$ and $a$, and I and $m$ refpectively. Thefe latitudes will be called north
(P) The meridians are properly only femicircles, reaching fros pole to pole, and of thefe there are twentyfiur.
(c) In Geograythy, as in cther fciences, there are two methods of conveying infruction. Onc is, to lay down the principles of the lcience firft, and afterwards apply thefe to the practice of it; the other method is, to conbine the principles and practice in one view. The former is ufually contidered as the more fcientific, but we are inclined to think that the latter is ofen to be preferred, as being lefs dry and tedious, efpecially to a general reader. We lave here, therefore, -lofen to explain the nature of latitude and longitude, and the problems refpecting them, before completing the defcrigtion of the globe. We thall procced in the fame manner, uniting as far as pollible, the principles and practice in one view. Naking, therefore the terrefirial globe our text book, we fhall thence explain the princigles of geography, rather than detail thefe in a fegarate fection, and afterwards illuftrate them by the globe.

## Part II.

G E O G R A P II l.
trinciples nonth latitudes, becaufe the faces lie in the norihern and hemifphere. Let there be two other places, WV, in Prattice. the fouthern hemilphere; the latitude of W will be mealured by the degrees of the are intercepted between W and $a$; and the latitude of V by the arc intercepted between $\mathrm{V}^{+}$and $m$; and thefe will be called fouth latitudes. Further, let the circle $c, c, d, v, G$, be drawn parallel to the equator; this circle is called a parallel of latitude, and as it does not pals through the centre, it is evidently lefs than the equator, or it is a fmall circle. Now, all the ares, fuch as $\mathrm{R}, e, a, \mathrm{G}, \& c$. intercepted between the parallel and the equator, mull be equal, fince the circle is parallel to the equator; and hence every point in this parallel, or every place on the earth through which it is fuppofed to pafs, has the fame latitude.

Latitude is the fame all ower the earth, being conftantly nieafured from the equator to the poles.

The longitude of a place is meafured by the degrees of an arc of the equator, intercepted between fome particular meridian, and the meridian pafling through the place. Thus, fuppofe $G$ to reprefent the particular meridian, and $m$ to reprefent the place whofe longitude is required; the longitude of $m$ is meafured by the arc $m a$ of the equator, intercepted between $a$, the point where the meridian of G meets the equator, and $\pi$ the point of the equator where it is cut by the meridian of the place $m$. The particular meridian from which we begin to reckon the degrees of longitude is called the prime or forjl meridian, and it is different in different countries.

The method of eftimating the ditances of places by zongitudes and latitudes, is of confiderable antiquity, and was employed by Eratolthenes, who firt introduced a -egular parallel of latitule, which began at the itraits of Gil,raltar, paffed eaftwerds though the illand of Rhous to the mountains of India; all the intermediate places through which it paffed being earefully noted. Soon after drawing this parallel through Rhodes, which was long confidered with a degree of preference, Eratofthenes undertook to trace a mevidian, paffing through Rhodes and Alexandria, as far as Syene and Meroë. Pythias of Marfeilles, accurding to Strabo, confidering the itland of Thule as the moft weftern point of the then known world, began to count the longitude from thence, while Marianus of Tyre placed their firf meridian at the Fortunate illands, or the Canaries; but they did not determine which was the weftermoft of thefe illands, and confequently whish ought to ferve as a frit meridian. Among the Arabiaus, Alfragan, Albategnus, Nalfir Eddin, and Ulug Beg, alfo reckoned from the Fortunate illands; but A. bulfeda began to reckon his !oncitude from a meridian $12^{\circ}$ to the eaftward of that of P'olemy, probably becaufe it paffed through the wetten extremity of Africa, where, according to him, were fituated the pillars of Hercules; or becaufe it paffed through Cadiz, which was at that time rendered famous by the conquefts of the Moors in Spain.

When the Azores were difcovered by the Portuguefe in 1448 , fome geographers made ufe of the inland of Tercera as their firt meridian. Other georraphers, as Blaeu, father and fon, placed the birt meridian at the Peak of Teneriffe, a mountain fo firele:ated above the fea, that it may be eatily known by navigator: ; Vol. IX. Part II.
while others have made the ithad of sa Philip, one of Pumetes the Cape de Verds, the firit meridian, becaule they conceived this to be the place wheae the maynrtic needle had no variation. For a long time it was cuitomary to reckon the longitude in noft countrice from the infe of Ferro, one of the Canary inlcs; but it is now cullomary for each nation to reckon the longitudn, either from the metroplis of the country, or from the mational obfervatory dituated near it. Thus in France, Paris is the firt meridian, and in Great Britain, the Koyal Obiervatory of Greenswich. As in feveral good maps, the ifle of Ferro is fill uled as a firlt meridian, it may be proper to remark, that the obfervatory at Greenwich lies $17^{\circ} 45^{\prime}$ to the eat of Ferro. Hence it is very ${ }^{6} 6_{2}$ eafy to ealy to reduce the longitude of Ferro to that of Greenwich; for if the longitude required be eall, we have only to fubtract $17^{\circ}{ }^{-1}$ tran the longitude of and the remainder is the longitude ealt from London; on the other hand, if the place be weft from Ferro, we obtain the longitude weit from London hy adding to that of Ferro $17^{\circ} 45^{\prime}$. If the place lies between Ferro and London, its longitude from London will be obtained by fubtracting its longitude eatt from Ferro from $17^{\circ} 45$. It is evident that by the reverfe of this method, we may reduce the longitude from London to that of Ferro.

In the dingram referred to above, if $G$ reperfent the obfervatory of Greenwich, $a$ will be the point from which we begin to reckon the degrees of longitude, and all places fituated to the eaft of $a$, fuch as $\mathrm{R}, \mathrm{m}$, will have eaft longitude, while thofe fituated to the weft, as $n$, will have wetl longituce. In reckoning the longitude, we fometimes number the degrees only as far as $180^{\circ}$, but at other times they are numbered ald round the equator from the point $a$; for initance, $180^{\circ}$, till we come to $a$ again; hence reckoning in the direction $a, \mathrm{R}, m$, we thou'd fuy that every place was in fo many degrees eaft longitude, while it we reckoned in the direction $n, \mathrm{E}$, we thould fay that all the phaces had fo many degrees welt longitude all round the equator. To accommodate the globes to both the modes of reckoning the longitucte, the equator is ufually divided both ways, in a continucd ferics from o at the inft meridian to $360^{\circ}$.

It is evident, that as the parallels of latitude become fimaller as they approach the poles, the ares of thede parallels intercepted between the fame two meridians will be alfo fmaller as we proced from the equator to the poles, though in fact they conditl of the fame abfolute number of degrees. Hence it will be eafy to fee that a degree of longitude mutt be fmaller towards the poles than at the equitor, and mult become gradually fmaller and Emaller till we arrive at the poles, where it will be equal to nothing. Thus the are $G \pi$. contains the fame number of degices as the arc $a, m$, though the former are is much fnaller than the latter. As a degree of longitude is therefore dificrent at every degree of latitude, it becomes neccitary to afcertain the relative proportion between the two; and for this purpofe the following table has been conitucted, which fhews the abfolute meature of a degree of longitude in geopraphical miles and parts of a mile for csery degree of latitude, taking the degree ongitude at the equator, equal to 60 geographical miles.

| 12 | 67.6880 | 28 | 61.1001 | 44 | 49.7783 | 60 | 34.6000 | 76 | 16.7409 |  |  |
| ${ }^{1} 3$ | $67.426+$ | 29 | 60.5237 | 45 | $48.93{ }^{1} 3$ | 61 | 33.5489 | 77 | 15.5665 |  |  |
| 14 | 67.1448 | 30 | 59.9293 | 46 | 48.0705 | 62 | 32.4873 | 78 | 14.3874 |  |  |
| 15 | 66.8424 | 31 | 59.3162 | 47 | 47.1944 | 63 | 3 t 4161 | 79 | 13.2041 |  |  |

Hence it appears that the degrees of latitude are all equal, and that a degree of longitude at the equator is: equal to a degree of latitude, as each is $-\frac{1}{6}$ th of a great circle. In the fecond of the atove tables, a degree of longitude at the equator is effimated at $6 \% .2$ Englih miles, or about $69 \frac{1}{5}$. The length of a degree in mikes is ufually eflimated at $69 \frac{1}{2}$, but this is too much. Hence, to redice degrees of latitude, and thote of longitude near the equator, to Englib miles, it is neceflaty to multiply them by 69.2 , or, it gwat accuracy is not required, by 70.
0. Probresi I. To find the latitucte and lungithie of a Probecta on iateruce and ung: tonc. c. --
brazen meridian, and the degree of the meridian that lies immediately over the place is it: Iatizult. Obferve where the meridian cuts the equator, and that degree will be the lonjitude of the place.

Examplc. To find the lattude and longitude of Edin-1urgh.-Bringing Edinburgh below the meridian, we find over it nearly the 56 th degree of north latitude $\left(55^{\circ} 5^{\prime}\right)$, and the point where the meridian cuts the equator is nearly $3 \frac{1}{\frac{1}{3}}\left(3^{\circ} 12^{\prime} \mathrm{W}\right.$. Long. ) degrees weft frem London.
N. B. The longitude and latitude of places cannot be afcertained exactly by the globes, as thefe are not calculated to thow the fractional parts of a degree; but they may befound with fufficient correctnefs for ord:nary purpofes.

Corollary 3 , The diffencec of latitude and lon-

Principles gituie between two places is Eound by fubtracting the and lefs from the greater, if they lie the fame way, i. e. north Practice. or touth, eat or welt; or by aiding the two together, if they lie in a different direction.

Cor. 2. Thute places that have the fame latitude with any giren place are found, by bringing the given place to the meridian, and oblerving what places pats under the fame degree, while the globe is turned round.

Cor. 3. Thofe places which have the fame longitude with a given place, are found by bringing the place to the meridian, and oblerving what other places lie under the graduated edge, while the globe is at reft.

## Problem II. The latitude and longitude of a place being given, to find the place itfelf on the glue.

Turn the globe till the given longitude comes under the brazen meridian; then mark the given latitude on the neridiai, and immediately below it is the place required.

Example. What place is fituated in $4^{\delta^{\circ}} 23^{\prime}$ N. Lat. and $4^{\circ} 29^{\prime}$ E. Long. from Greenwich? Anf. Breit in
Gs France.
As the fun, in his appareat motion round the earth, meafures a great circle in about 24 hours, or in one hour paffes over $\frac{1}{5}$ th of fuch circle, or $15^{\circ}$; it is evident that all places which lie $15^{\circ}$ weft of any meridian, muft have noon or any other tinie of the day, an hour latcr than thofe fituated under that meridian; and that all places which lie $15^{\circ} \mathrm{eaf}$ of any meridian, mult have the fame times of the day an hour fooner. Hence, becaute the meridians drawn on the glone make a difference of an hour each in the time of places, they are formetimes called hour-circles; and the longitude of places is fometimes reckoned in time as well as in degrees.

Degrees of longitude are reduced to hours and minutes, and $v . v$. by allowing an hour for every $15^{\circ}$, and called horary circles, this name is generally confined to a fmall brafs circle, which is adapted to one or each pole, and graduated into twice twelve hours; fo that an index fixed to the axis, or the menidian, points out the leveral hours of day and night as the globe revolves.

In glubes of the cid conftruction the hour circles are fyed on the outfide of the meridian, but this prevents the meridian from being moved quite round, which is required in fome prublems.

Mr Jofeph Harris, formerly affay-mafter of the mint, contrived an ingenious method of remedying this inconvenierice. He placed two horary circles between the meridian and the globe, one at each pole, and they were fixed tightly between two brafs rollers, placed about the asic, fo that when the globe was turned, they were carried round with it, while the edge of the brazen meridian ferved as an index to cut the hurary divifionc. A globe, thus furmihed, ferves univerfally and readily for performing problems in both torthern and fouthern Iatitules; and aifo in places near the equator; whereas, in globes of the old contruction, the axis and horary circie prevent the brazen meridian from beng moved g.ite rand in the lurizen.
 Inment more fimple by Mr G. Wright of London. at ea prole, on the map of the plabe, each cir le being divited mos a duable let of 12 hours, as in the ufual hour circles; but here the hours are numbered both to ther right and left. (bue fig. 4.) The howe hand, or : cx. in fluced below the brazen meridian, in luch a - . hat it may be moved at plenture to any upuirea the circle, and remin these fulliciot!y thealy
 entirey inderendent of the pole. In this manner the motion of the globe round its axis, cerrying the four circle, the time is pointed out by the flationary index.

In the globes conitruated by the late Mr Geotge Adams, the equator is made to anlwer the purpote of an hour circle, by means of a femicircular wise plared in its plane, (fee Q F, lig. 5.) and carrying two indicas $F$, one on the caftern, the other on the wellem, fide of the brazen meridian. The method of ufing thefe indices will be thewn prefently. In thefe glohes the equatur is alfo marked svill twice 12 honr, which in creale taum eat to welt, the hous :s the weth of the fitit 12 being afterniva hours.

$$

Bring the given place to the meridian, and fet the index to the given hour. Then turn the globe till the index point to 12 at noon, and the places then under the menidian are thofe required.

## b. By Adams's globes.

Bring the given place to the meridian, and fet the i: dex to 12 at noon. Then turn the globe till the in. dex fhall point to the given hour ; and all the places then under the meridian have noon at that time.

Ex. 1. It is now 30 min . palt 10. A. M. at Edinburgh; In what places is it noon? Anf. Near Stockholm; at Dantzic, Brellaw, Preiburg, Vienna, Pofega, Ragufa, Tarento, and the Cape of Good Hope.
$E \times$. It is now midnight at London; Where is it noon ? - Anf. In the north-eaft parts of Afia, in the middle of Fox ifles; at the Friendly inles (nearly), and at the eaft cape of New Zealand.

From the differrent fituation of places with refpect to latitude and longitude, the inhabitants of thefe places received from the ancients denominations that are ftill retained.
other. If we conceive a line through the centre of the earth, and terminated in two points of its furface, thefe extreme points are antipodes to each other. Thus, the city of Lima in Peru is nearly the antipodes to Siam in the Eaft Indies; and Pckin in China has for its antipodes Buenos Ayres in South America. Thefe places are always in oppofite longitudes, and (except under the equator) in oppoite latitudes.

The celeftial appearances to the antipodes are thefe. I. The hours are contrary, as to the perixci. 2. The days of the one are of the fame length with the nights of the other; hence the longeit day to one is the thortelt to the other, and vice verfa. 3. They have contrary feafons at the fame time. 4. Thofe itars which, at one place are always above the horizon, are, to the other, always below it. 5 . When the heavenly bodies are rifing at one place, they are fetting at its antipodes, and vice verfa. For various opinions refpecting the antipodes, fee the article Antipodes.

The antipodes of any place are the periœci to the antoeci of that place; and the antoeci to their periceci. This will account for the method prefently defcribed of finding the antipodes on the globe.

## Problem V. To find the antæci to any given place.

Bring the given place to the meridian, and thus afcertain its latitude. Then count from the equator towards the oppofite pole as many degrees as are equal to the latitude of the place; and the point where this reckoning ends is the place required.
Ex. I. Where are the anteci to the Cape of Good Hope? Anf. At Malta nearly.
Ex. 2. What people are the artoci to the inhabitants of Quebec in North America? Anf. The inhabitants of Patagonia in South America.

## Problem VI. To find the periœci of any given place.

Bring the given place to the brazen meridian, and fet the horary index to the upper XII. Then turn the globe till the index point to the lower XII. The place which is then below the meridian in the fame latitude with that of the given place, is the fituation required.

Ex. 1. Where are fituated the periaci of Newcafle upon Tyne? $A n f$. In the Alcoulki or Fox illands.

Ex. 2. Required the perioci to California in North America. A $n f$. Near the mouth of the river Indus.

## Problem VII. To find the antipodes to any given place.

Find the antaci of the given place (by Problem V.) and then find the periaci of the latter (by Problem VI.) This laft is the place required.

Ex. 1. It is required to find the antipodes of London. Anf. The latitude of London is $51^{\circ} 31^{\prime}$ N. the antoeci to this, or $51^{\circ} 31^{\prime} \mathrm{S}$. on the prime meridian, is in the fouth Atlantic ocean; the periceci to this is in $180^{\circ} \mathrm{W}$. Long. and $51^{\circ} 31^{\prime} \mathrm{S}$. Lat. a little to the fouth of the illands of New Zealand. The inhabitants of the fouthern ifland of New Zealand are therefore the neareft antipodes to London.

Several other circles befides thofe which we have mentioned are defcribed on the artificial globe, and are fuppofed to be drawn on the earth. Thefe we fhalt now proceed to defcribe, and explain their geographical ufes.

Principles
and Practice.

Thus, thofe places which have the fame longitude, or are fituated under the fame meridian, but are in oppofite latitudes, the one lying as many degrees to the north of the equator as the other lies to the fouth of it, are faid to be Antokci to each other. From this definition it is evident, that thofe places fituated under the equator have no antaci.

The appearances arifing from the changes of the heavenly bodies are different in the oppofite places. Thus, 1 . The days of the one are equal to the nights of the other, and vice verfa; but they have noon, midnight, and all the other hours at the fame time. 2. They have contrary feafons at the fame time: when it is fummer at one place it is winter at the other, and fo of fyring and autumn. 3. The ftars that never fet at one place, never rife at the other, and vice verfa.

Again, thofe places that have the fame latitude, or are under the fame parallel, but are in oppofite longitudes, i. e. lie under oppofite arcs of the fame meridional circle, or $180^{\circ}$ from each other, are faid to be perioEC1 to each other. Thofe places which may be fituated at the polcs, have evidently no perixeci.

The celettial appearances to the perioci are as follorr. 1. The length of the day or night is the fame to both places; but the hours, though dittinguifhed by the iame numbers, are contrary; noon at the one being midnight at the other; and any bour in the forenoon at the onc being the fame of the afternoon to the other. 2. Both places have the fame feafons of the year at the fame time. 3. The fame flars that never rife or fet to one place, alfo never rife or fet to the other. 4. The heavenly bodies rife in the fame point of the horizon at both places, and continue for the fame interval above or below it.

Laftly, Thofe places which are fituated direstly oppofite to each other, by a dittance equal to the diameter of the arth, are foud to be Astipodes to each
$\therefore$ os ipules.

Principles and $\underbrace{\text { Pratice. }}$ 72 The Eclip. tic.

The Eiliptic (Astronomy, $\mathrm{N}^{\circ}{ }^{43}$ ) is a great circle drawn on the globe, croifing the equator obliquely in two points, called the equino itial points. (Astronour, $N^{*}$ 44.) This circle eatends on each fide of the equator to the latitude of $23^{\circ} 28^{\prime}$, and is divided into 12 great parts correfponding to the 12 figns of the zodiac (fee Astronomy, $\mathrm{N}^{\circ} \mathrm{F}=$.), and marked with their characters, and each fign is lubdivided into 30 degrees. The eciiptic has allo its poles, which are two points that are diftant $90^{\prime \prime}$ every way from the circle on each fide. As the ecliptic declines from the equator $23^{\circ}$ $28^{\prime}$, its poles are confequently diltant from thofe of the equator, or of the globe, by the fame meafure. This circle properly belongs to the celeltial globe, but as it is extremely ufeful in performing many geographical problems, it is always drawn on both globes, and requires to be noticed here, fince it determines the pofition of feveral of the circles which we are about to mention.
Through thofe two points of the ecliptic, where it is at the greatell diftance from the equator, there are drawn on the globes two circles parallel to the equator, called tropics. That in the northern hemifphere is called the Tropic of Cancor, as it paffes through the fign Cancer ; and, for a fimilar reafon, that which is in the fouthern hemifphere is called the Tropic of Capricorn. The two points through which they are drawn are called folfitial points. The imaginary line which correfponds to the tropic of Cancer on the earth paffes from near Mount Atlas on the weltern coall of Africa, paft Syene in Ethiopia: thence, over the Red fea, it paffes to Mount Sinai, by Mecca the city of Mahomet, acrofs Arabia Felix to the extremity of Perlia, the Eaft Indies, China, over the Pacific ocean to Mexico, and the ifland of Cuba. The tropic of Capricorn takes a much lefs interefting courfe, paffing through the country of the Hottentotc, acrofs Brafil, to Paraguay and Peru.
If the poles of the ecliptic be fuppofed to revolve about the poles of the earth, they will defcribe two circles parallel to the equator, and $23^{\circ} 28^{\prime}$ ditant from it. Two fuch circles are drawn on the globes, and are called Polar Circles, that in the north being called the Arctic Polar Circle, or merely the Arfic Circie, while that in the fouth is called the Ansertic Pular Circic, or Antarctic Circle.
Both the tropics and the polar circles are marked on the globes by dotted lines, to dirtinguith them from the other parallels.
The meridional circles that pafs through the equinoctial and folftitial points are called Colures; the former being called the Equinoctial and the latter the Suc;isial Colure.

For an account of the variety of day and night is different parts of the globe. fee Asthosomy, Part 11. ch. i. fect. 2.

By means of the tropics and polar circles, the earth is fuppofed to be divided into tive fpaces, to which the ancients gave the name of Zones, or Belis. Thus the Space included between the two thopins was called the Torrid Lone, becaufe it was fuppofed to be fo much heated or roafed by the vertical tin, which there prevails, as to be uninhabitable. The ancient terms are aill occafmally ufd, but the ocunries between the
tropics are now more commonly called the In:rairopi-
cal Resions. cal Regions. The two fpaces included between each tropic and its correfponding polar circle were called Temperate Zones, and were diltinguihed according to their pofition into Nor:hern and Southern Temperate Lones. Lattly, The faces between the polar circles and the poles were called the northern and fouthern Frigid Zones, and were fuppofed uninhabitable from exceflive cold. Thefe laft are ufially denominated the Polar Regions.

The countries lying between the tropics are the Countime greater part of Africa, the fouthern parts of Arabia, between the eattern and weltern peninfulas of India; all thofe be trop c: clutters of iflands lying between the fouthern continent of Alia and New Holland, called the Sunda, Molucca, Philippine, Pelew, Ladrone, and Carolina illands ; the northern half of New Holland, New Guinea, New Britain ; molt of the groups of iflands in the Pacific ocean, as the New Hebrides, New Caledonia, the Friendly and Society ifles, the Sandwich and Navirators illes; the Weft India illands; the greater part of South America; the Cape de Verd iflands, and thofe of St Helena, Afcenfion, St Matthew, and St Thomas. Sce the map of the world in Plate CCXXXVI, or the plain: chart in Plate CCXXXVII.

All places fituated between the tropics have the fu: vertical twice in the year, at noon; but the time of the year when this happens is different in the different latitudes; at the equator, the fun is vertical when he is in the equinoctial points, or when he has no declination. The inhabitants of the other intratropical regions have the fun vertical when his declination is equal to their latitude, and on the fame fide of the equator. Thus, the inhabitants of New Caledonia, about $20^{\circ} \mathrm{S}$. Lat. have the fun vertical when his declination is $20^{\circ} \mathrm{s}$. To illuitrate this, it will be fufficient to oblerve that, as the ecliptic is that circle in the heavens in which the fur is fappofed to move, the fun's rays are perpendicular fuccetively to every point of the earth which lies below that point of the ecliptic in which the fin happens to be, and he will therefore be vertical to all the places through which the ecliptic (continued to the earth) paffes fuccellively.

The inhabitants of the torrid zone have their diadows 1 mphic... at noon day fometines to the fouth, i. e. when the fun's declination is north, and mometimes to the north, i. e. when the fun's declination is louth. They were therefore called by the ancients Amphifil, from $\alpha \mu p$, , abciai, and $\sigma x a x$, fhadow. Sie Auprisctitand Ascis.

In the north temperate zone are fituated the whole of counlrice Europe except Lapland; Barbary, and part of $\mathrm{E}_{\mathrm{s} \text { ? }} \mathrm{pt}$, in the tem. in Africa; nearly the whole continent of Aha; a yreat perate zore. part of Nurth America; the Azores, and the Canory and Madeira illands.

In the fouth temperate zone lie the fouthern part of Africa, the fouther: h if of Nuw Holland, Niw Zaland, and the fouthern part of Sou:h America.

In the temperate zones the fun is never vertical, and the leageth of the dys and rights differs much more than in the turrid zone.

Principh north, and thafe an the fouthern zone, towards the and Practice

Si Countries is the f:1gid zones. fouth. They werc hence called by the ancients $H c$. terofoiz. See Heteroscii.
The countries that are fituated in the northern frigid zone, are Lapland, Spitzbergen, Nova Zembla, the northem parts of $A$ fia and America, and part of Greenland.

No land has yet been diccovered within the fouth polar circle, though it was long fuppofed that a large continent was fituated there, which was called Torra $A_{z}$ Aralis Incognito. Our celebrated navigator Cook made many attempts to penetrate the icy fields which abound in thefe feas, in fearch of this imaginary continent, but without fuccefs, he having penetrated no farthcr than $72^{\circ}$. See Cook's Diffoveries, $\mathrm{N}^{\circ} 49$. and 71.

Within the polar circles the fun does not always rife or fct every $2 \downarrow$ hours as in the other zones; but for a certain number of days in fummer he never fets, and for a certain number of days in winter he never rifes; the number of days during which the fun is prefent or abfent increafing from the polar circles to the poles, fo that at the poles he never fets for fix months, nor rifes

When the fun continues above the horizon more than 24 hours, the inhabitants of the polar regions have their fradows catt all around them; and hence they have been called Perifcti. See Pertscir.
The ancients dit not employ regular parallels of latitude, but they divided the fpaces between the equator :and the poles into fmall zones correfponding to the length of the longeft day in each divifion. To thefe fubdivilions they gave the name of climates, the fituation and exteat of which they determined in the following manner. As the day at the equator is exactly 12 hours throughout the year, but the longeft day increates as we approach the poles, the ancients made the firf chimate to end at that latitude where the longeft day was $i 2 \frac{1}{2}$ hours, which by obfervation they found to De in the latitude of $8^{\circ} 25^{\prime}$. The fecond climate extended to latitude $1 t^{\circ} 25^{\prime}$, where the longeft day is 13 hours, and thus a new climate extended, to as to divide the whole tract between the equater and the poles into 24 climates, in each of which the longeft day was lorger by half an hour than in that nearer the equator. The ipace between the polar circles and the poles they divided into fix climates, in each of which the length of the longeft day increafed ly a month, till at the poles it was fix month, long. Hence, the 24 climates between the equator and the polar circles are called Hour C/invates; and the fix between the polar circles and the poles are called Mon:h Climates. For further particulims refpecting this anciert divifion of the ylube, and a t.able of the climates by Ricciolus, fee Chinite. As the table given under that article is calculated only for the middle of each climate, and nether nentions the breadth of each, nor i, extended to ell the ciimates, we dall here futboin one in which are given the latitude at which each climate terminates, as brewh in degrece, and the kengh of the longeft day $\because$ the arallel ouminuting each.

Hovr Climates.

As the divifion of the globe into climates, though Places in now almoft difufed, is of tervice in flewing the length the northe of the longeft day in different countries, we fhall here ern ciienumerate the principal places in each northern climate, mates. thefe being beft known and noft interelting.
I. The Guld and Silver Coalts in Africa; Malacca in the Eaft Indies; and Cayemie and Surinam in Suuth America.
II. Abyfimia in Africa; Siam, Madras, and Pondicherry, in the Eaft Indies; the itthmus of Darien; Tobago, the Grenades, St Vincent, and Barbadoes, in the Weil Indies.
III. Mecca in Arabia; Bonub.y, part of Eengal, in the Eall Indies: Canton in China ; Mexico and the bay of Campeachy, in North America; and Jamaica, Hifpatiola, St Chrikopher's, Antigua, Martinique, and Guadaloune in the We!t Indies.

## Part II.

$\begin{array}{lllllllll}G & E & O & \quad & \text { F } & 1 & \mathrm{P} & \text { II } & Y\end{array}$

IY: Efyit and the Canaries in Anica: Delli, the capital of the Mogul empire, in Niaa math of the fulf of Mesico, and Eaft Flurida, in Nuth A:uchis, the Havannah in the We:t Iidis
V. Gibraltar ; part of the Aediterravean fea; the Barbary coalt in Africa: Jerufiem, 1 Treha, cat ital of Perfia, and Nankin, in China, in Afa; and CuliYornia, Now Mexico, Neet Florida, Gecryia, and the Carolinas in North America.
VI. In Europe, Liftsn, Madrid, the illands of Minorca and Sardinia, and part of Greece or the Morea; in Afia. Afia Minor, part of the Cafpian fea, Samarcand, Pehin, Corea, and Japan ; and in North America, Maryland, Philadelphia, and Williamburgh in Virginia.
VII. In Europe, the northern provinces of Spain, the fothern provinces of France, Turin, Genoa, Rome, and Conftantinople ; in Afia, the reft of the Cafinin, and part of Tartary ; and in North America, Bofton and New York.
VIII. Paris and Vienna, in Europe; and New Scotland, Newfoundland, and Canada, in North America.
IX. London, Fianders, Prague, Drefden, Cracow, in Europe; the fouthern provinces of Ruffia and the miisdle of Iartary in Afia; and the northem part of Newfoundland, in America.
X. Dublin, York, Holland, Hanover, Warfaw; the weit of Tartary, Labrador, and New South Wales, in Frorth America.
XI. Newcalle, Edinburgh, Copenhagen, and Mof. cow.
XII. Southern part of Sweden; and Tobolik in Siberia.
XIII. Stockholm; and the Orkney ifles.
XIV. Bergen in Norway, and St Peteriburgh.
XV. Hudfon's ftraits in North America.

XV1. Mot of Siberia; and the fouthern paris of Greenland.
XVII. Drontheim in Norway.

XVIII Part of Finland in the Ruflian empire.
XIX. Archangel on the White fea.

XX . Iceland.
XXI. Northern parts of Ruffia in Europe, and Siberia in Afia.
XXII. New North Wales, in North America.
XXIII. Davis's fraits, in North America.

XX1V. Samoieda in Afia.
XXV. Northern parts of Lapland.
XXVI. Weft Greenland.
XXVII. Southern part of Nova Zembla.
XXVIII. Northern part of Nova Zembla.
XXIX. Spitzbergen.
XXX. Unknown.

The only parts of the terreftrial globe that we have yet to defcribe and illuftrate are the Quadrant if Al/itude, and the $W^{*}$ oden Horizon; and thefe it is neceflary

1. शuactunt of Aluizule is is thin flexible flip of brak, ghadiated int: $9=?$, mad made to fox on eny par of the Lrazen metridin by means of a net and forew. Quetrant Ruesed this mut it moves on a pives, and by its tiexibi-facticus lity may be applied clofe to the furface of the glohe. The fudrant of altitule is wied to mealuse the ditances of places from callo othe on the terreltrial globe, and to aforrtain the atitudes of the fin, ftar:. \&ic. on the celcilial globe.

To nexafure the difance between two places on the glbe, nothing more is reguired than to ffetch the gra duated edge of the quadrant betweea them, and marh the number of degrees intercepted. Thefe reduced to geographical, or to Englih miles (by N' 63 .) give thr abfolute diftance between the places. It is moit convenient to bring one of the places to the zesith, whici. may be done by rectitying the globe for the latitude of that place as inmedi tely to be eyplained, and then to tretch the quadranit to the other place, the diflanc: marked, fubtracted from $90^{\circ}$, gives the true difance in degrees. If the diftance required be greater than $90^{\circ}$, it is profer to reettify the globe for the antionger of the given places, and add the ditance cofferved to $00^{\prime \prime}$ : the fum is the diftance required.

It has been very generally fated that tie bearing of one of the places from the other may be found by int ferving, oa the wooden horizon, in what point of th compati, the quadrant of altitude thus fived in the zeniti, cuts the horizon. This is conidered by Mr Patelent ... 2 mitahe: "For (fays he) fuppecing one of the place to lie due catt of the other, they are in the fame parallel of latitude, and confequently it is impolible tha the prime vertical of either of them (that is, a circ!e cutting the eaft and weit point: of the herizon, floali: pafs through the other, unlefs they both lay under then equator. A line thewing the bearings of places is called a rhumb line. The lines of north and fouth oa the globe, being meridianc, and thofe of ealt ant $\mathrm{a}-\mathrm{ft}$, be. ing parallels of latitude, are confépuently circles; Lut all the remaining rhumbs are a hind of firal lines."

The globes are fupported by a wooden frame ending wo ${ }^{8,7 / 7}$ abose in a broad that margia, on which is paited a par tho: zon. per marked wih feveral graduted circles, This broal margin is called the wooden horizon, and ieprelents the sutional horizon of the carth, or the limit between the vilible and the invifible hemifpheres. On the paper with which the wooden horizon is covered, ate drawn four concentric ciscle. The innermolt of theie is . divided into $3^{\text {6o }}$ degrees, divided into four guadrant: The fecond circle is marked with the paints of the compafs, i. e. the tout cardinal pointe, catt, weth, no:th, and fouth, (D) earh twing fubtivited into ci,ite paits o: rhambs, (he Ceupass.) The circle neat to that jut meationed contains the twelve ings of the zodi..a, dallinguithed iy theia proper naries and charicte:s; and
(D) The cardinal points of the comfafs are thus determined. The two, wints in which the merioian of any place when produced fo as to pafs through the nearelt gok, cut the horionn, (wfins thi in an allrumomical fenfe, fee Astrovomy, ane the north and kuth points; the former being that print where the nutilaza firit cuts the borizon in the northern hemifphere, and the fouth, that where it irte met the hurizon in the fuatacen hemifphere.

Principles and eacii fign is divided into 30 degrees. The laft and circle fhews the months and days correfponding to each $\underbrace{\text { Practice, fign. }}$

This wooden ring can reprefent the rational hoizon of any place marked on the terrellial glove only, when that place is fituated in the zenith; and the method of bringing the place into this fituation is called rectifying
(
Problem VIII. To raify the globe according to the latitude of any place.
Find the latitude of the place, (by Problem I.) and fee whether it be north or fouth. Then elevate the pole of the globe which is in the fame hemifphere with the latitude, as far above the wooden horizon as is equal to the latitude; bring the given place to the brazen meridian, and it will be in the zenith.

Example. To rectify the globe for the latitude of Edinburgh. The latitude of Edinburgh is $55^{\circ} 58^{\prime} \mathbf{N}$. therefore raife the nort/2 pole $55^{\circ} 58^{\prime}$ above the horizon, and bring Edinburgh below the brafs meridian.

It is for the purpofe of more eafily rectifying the globe, that one half of the brazen meridian is graduated from the poles to the equator; as, where this is not done, it is neceffary to take the complement of the latitude, or the difference between it and $92^{\circ}$, which in fome cafes requires a calculation.

The place being brought below the meridian, when the pole is elevated to the proper degree, it is evidently in the zenith, or $90^{\circ}$ diftant every way from the horizon. Thus, in the above example, if we count the degrees from that part of the meridian below which Edinburgh is fituated, we fhall find that they amount to $90^{\circ}$ each way; for counting from Edinburgh along the meridian to the north pole, we have $34^{\circ} 2^{\prime}$; which added to $55^{\circ} 58^{\prime}$ the elevation of the poles gives $9^{\circ}$ on that fide. Again, counting from the fame point of the meridian towards the fouthern part of the horizon; we have $55^{\circ} 5^{\prime}$, as far as the equator, and $34^{\circ}$ $2^{\prime}$ from thence to the horizon, making, as before, $90^{\circ}$, and as the graduated edge of the meridian is $90^{\circ}$ both from the eallern and weftern fide of the horizon, Edinburgh, in this fituation of the globe, is in the zenith.

When either of the poles of the globe is thas elerated above the horizon, fo as not to be in the zenith, the globe is faid to be in the pofition of an oblique follere, in which the equator and all its parallels are unequally divided by the horizon. This is the moft common fituation of the earth, or it is the fituation which it has with refpect to all its inhabitants, except thofe at the equator and the poles. To the inhabitants of an oblique fphere the pole of their bemifphere is elevated above the horizon as many degrees as are equal to their latitude, and the oppofite pole is depreffed as much below the horizon, fo that the fars only at the former are feen; the fun and all the heavenly bodies rife and fet obliquely, the feafons are variable, and the days and nights unequal. This pofition of the frhere is reprefinted at fig. 6. where the equator $E Q$, and the paral-
lels cut the horizon HO obliquely, and the axis PS is Principles inclined to it. Hence this potition is called oblique.

If the globe is placed in fuch a pofition that any Practice. point of the equator is in the zenith, it is faid to be in the pofition of a right or direcf/phere, becaufe the equa- Right tor and its paralleis are vertical, or over the horizon at fiphere. right angles. This pofition is leen at fig. 7. where the axis PS is in the plane of the horizon, and the equator EQ is in a plane perpendicular to it. The inhabitants of fuch a fphere, which are the inhabitants of the earth below the line, have no elevation of the poles, and confeçuently no latitude: they can fee the fars at both poles; all the ftars rife, culminate, and fet to them; and the fun always moves in a curve at right angles to their horizon, and is an equal number of hours above and below it, making the days and nights always equal.

If the globe be fo placed that one of the poles is in Parallel the zenith, and confequently the other in the nadir, it fphere. is in the pofition of a parallel fphere; fo called becaufe the equator EQ (fig. 8.) coincides with the horizon, and the parallels are of courfe parallel to it ; while all the meridians cut the horizon at right angles. The inhabitants of a fphere, in this pofition, have the greateft poffible latitude; the ftars, which are fituated in the hemifphere to which the inbabitants belong, never fet, but defcribe circles all around; while thofe of the contrary hemifphere never rife : the fun is above the horizon for fix months, during which it is day, and is, below the horizon for an equal interval, when it is night.

The wooden horizon is a neceflary part of the apparatus of both globes; but it has been flewn, that in the terreftrial globe, it can reprefent the rational horizon of a place, only when the globe is rectified for the latitudeof that place. In the celeftial globe, it reprefents the rational horizon in all pofitions.

In Adams's globes there is a thin brafs femicircle NHS (fig. 5.) that is moveable about the poles, and has a fmall thin circle N diding on it. This femicircle is graduated into two quadrants, the degrees of which are marked both ways from the equator to the poles in the terreftrial globe : this femicircle reprefents a moveable meridian; and the fmall fliding circle, which is marked with a few of the points of the compafs, is ealled a vifible horizon, the ufe of which will appear prefently.

Before we proceed to the remaining problems on the terreftrial globe, it will be proper to take notice of fome geographical principles that are connected with the horizon.

It is evident, that the extent of the fenfible horizon of an obferver depends on the height of his eye above the level furface of the earth. An eye placed on the furface of the earth fees fearcely any thing around it ; but if it is elevated above that furface, it fees farther in proportion to its elevation, provided always that its view is not olftructed by intervening objects. Thus, in an extenfive plain, the eye can fee farther, if elevated

[^24]Grincipies to a proper heighe, than it can from the fame hay he in and a town or among hil! : and, at ca. where the farface
$\qquad$ is perfectly equal, the view in in propution to the lecight of the eye. It becones an int reiting problem to afoer tain the extent of the vidble hurizon, or the ciftance to which a perfon can fee at any given height of the eye; as, when thi is known, we car caloulate prety acenrately the ditance of an object feen from fuch a height, as land feen from the tonmait of a llip at fes.

For fowing this problem, it mut be remakel, that the diftance of an oblerver from the boundary of the horizon, or from a diftant object, is different ibhon meafured along the furface of the earth, and when mevfured in a direct line. To illatrate this, let HDN (fig. 9.) reprefent a fection of the earth, of which $C$ is the cantre, and let D be the fituation of an olferver, whofe eye is elevated to $B$. The lines $\mathrm{BA}, \mathrm{BE}$, tongents to the curve at H and E , reprefent the limit of the vifible horizon, or the radii of the circle circumicribing vifion. If the eve were elevated fill higher, is to $G$, it is cxident, that the extent of the vifble horizon will be increafed, being now reprefented by the tangent GF. The length of the tangent BA , or GF, is eafily found by plane trigonometry (E).
Honzo of It was rensarked above, that the vilble horizon is of the fea. moft diftinct at fea, from the abrence of thofe ubjects which obttruct vifion on land. Hence the fenfible horizon is fometimes called the horizon of the fea, and this may be obfersed by looking through the fights of a quadrant at the moft diftant part of the fea. In making this obfervation, the vifual rays BA, or GF, by reaton of the fpherical furface of the fea, always extend a little below the true fentible horizon SS, and confequently below the rational horizon HN , which i, parallel to it. Hence the quadrant fhews the depreition of the horizon of the fea lower than it really is; and it is obvious from the figure, that the higher the eye is fituated, the greater mutt he this depreffion. Thus, the depreffion, when the eye is at G, marked by GF, is evidently much greater than that marked by BE, when the eye is at $B$. The depreftion of the horizon of the fea is not always the fame, though there be no variation in the height of the eye; but the difference in this cafe

Vol. IX. Part II.

 atmot, here. Nien there foriaction, the vilual roy Pa, ", watd be BE (when the eve in At B), an: L and lio the nout didant point; lut, ly reation of the re is thr $n$, 1 point on the fuatane of the eantil heyom li, as $i$, misy be feen by an cre frutted no high or it a 1 ; ind if tic seffactina wer till greater, a thill mone datant point might be observed.
 repeting the difference butneen the apmem an ! tiue twon levels; a fubject that will be more fally ditulted under the appas Levelimig. Two or more flices ari on a tride level, race ave whea they are equally diln from the centre of the earlh, and one place is higher than another, or abo:e the true level, when it is fatther from the centre of the earth. A line that is equally ditant in all its points from the centre, is called the line of true level, and it is evident that this line mult be curved; and either makepart of the earth's furface, or be concentric alwith it. Thus the line DAO, which has all its pointe, $J$, $A, O$, eqุually diftant from the centre $C$, is the lite of true leज1. But the line of fight DMP, as given by the ope. ration of a level, is a ftraight line, which is a tangent to the earth's furface at D , always tifing higher above the true line of level, according as it extends to a greater ditance. This ftraghe line is called the line of apparent level. Thus MA is the height of the apparent level above the true at the diftance DA, and OP is the exceis of the apparent above the true level, at the diftance DO.

The following table was conitructed by Cafini, for the purpore of fhewing the excefs of the apparent above the true level at various dittances from the point of obfervation. It confits of three columns, in the iirft of which the ditance of the obferved object from the place of obfervation is given, from one fecond to ho minutes, or a degree. In the fecond is given the length of the arc meafured on a great circle of the earth, that correfponds to the obferved diftance, in feet and inches; and in the third is given the height of the apparent above the true level in feet and inche, correfponding to each obferved and real diftance of the ubjeit.

3 U
(E) In the right-angled triangle ACB (fig. 9.), the length of CB is given, fuppofing the height of the cye BD to be 6 feet; for adding 6 fect to $10,9+3,+00$ feet, the length of the femidiameter of the tarth, we have $19,9+3,4 \subset 6$ feet for the length of BC. Then, making the liypothenufe CB radius, we fhall havi, As radius to the fine of the angle BCA , fo is CB to BA ; and this will be nearly the fame as the arc DA. Again, without rinding the quantity of the angle at $\mathrm{C}, \mathrm{BA}$ may be found, by confidering that $\mathrm{BA} \mathrm{A}^{2}$ is equal to the difference of the fquares of $C B$ and $C A$, i.e. $B A^{2}=C B^{2}-C A^{2}=(C B+C A) \times(C B-C A)=C B+C A$ into $B D$; and hence $\mathrm{BA}=\sqrt{(\mathrm{CB}+\mathrm{CA}) \times \mathrm{BD}}$.

To illuftrate the laft in numbers, we have $\mathrm{CB}=19,94,4,406$ feet, and $\mathrm{CA}=19,943,400$ fect. Then, to find E.A, we have $19,942,406+19,943,400(=39,896,8=6) \times 19,9+3,406-19,9+3,400(=6)=239,322,836$; Whence $\mathrm{BA}=\sqrt{239,320,836}=15470$ feet nearly, or :bbut three miles.

The diftance, to which a perfon can fee, is found to vaty as the iņare root of the altitude of the eye. To find a general expreflion for this quantity,

> let $a$ be the altitude of the eye in feet, $d$ the dillance at that altitude in miles;
then we have $\sqrt{6}: \sqrt{a}=3: d=\frac{3}{\sqrt{6}} \times \sqrt{c}=1.2247 \times \sqrt{a}$. Hence, we deduce this general rule : Multiply the Gyuarc root of the leight of the eye in fith ty $\mathbf{3} 2247$, and the product will be the difance to which we can foe

G $\quad \mathrm{E} \quad \mathrm{O} \quad \mathrm{G} \quad \mathrm{R} \quad \mathrm{A} \quad \mathrm{P} \quad \mathrm{H} \quad \mathrm{Y}$.

Part II.
Prii.ciples and
$\underbrace{\text { Practice. }}$
from that heithe in miles. Examile. Let the beight of the eye be 49 feet. Mu'tiply the fquare root of 49 or 7 , by 1.2247 , and ve have 8.5729 or about $8 \frac{1}{2}$ miles for the dillan.ce to which the eye can fee at the height of 49 feet.

Frone

The above tabie will anfwer feveral ufeful purpofe. Ia the firlt place, the height of the apparent level above the true may be found by it at any diflance, from one iecond to one degree, or $69^{\text {²}}$ s miles. Thus, at the diflance of $30^{\prime}=$ alout 35 miles, we have i $5: 820$ feet for the length of the arch of a great circle on the earth, $a: d$ correfponding to this we have 797 feet 8 inches $4^{8}+$ parts for the excefs of the apparent level above the irue. 2. The extent of the vilible horizon correfponding to any height of the eve, may be found from the table by obfervation. The femidiameter of the horizon does not ferfibly differ from an are of a great circle on the earth, containing as many minutes and feconds as are equal to the angle of depreffion obferved, and the number of feet contained in fuch an are may be found in the table. Thus, if the depreffion, as obferved by obfervation, be $40^{\prime \prime}$, its femidiameter is alfo about $40^{\prime \prime}$, and the length of the are correfpo ding to it is $2+3,-60$ fet.

The following table, alfo taken from Calfini, thews the different depreflions of the horizon of the fea at different heights of the eye, both by obfervation and calculation; with the difference betwist the two occafioned by refraction.

| The heizht of the eyle above the furface of the fea. | The depreffon of the horizon of the fea. |
| :---: | :---: |
| Feet. Inches. | , |
| 1157 6,9 | $\begin{cases}32 & 30 \text { by obfervation } \\ 36 & 18 \text { by calculation }\end{cases}$ |
| Difference by refraction | $34^{8}$ |
| 775 2,3 | $\begin{cases}27 & 0 \text { by obfervation } \\ 29 & 36 \text { by calculation }\end{cases}$ |
| Difference by refraction | 236 |
| 57111,0 | $\begin{cases}24 & 0 \\ 25 & 25 \\ \text { by obfervation } \\ \end{cases}$ |
| Difference by refraction | 125 |
| $387 \quad 3,4$ | $\left\{\begin{array}{lll} \text { I9 } & 45 \text { by oblervation } \\ 20 & 54 \text { by calculation } \end{array}\right.$ |
| Difference by refraction | 19 |
| 288 4,3 | $\begin{cases}15 & \text { o by obfersation } \\ 17 & \text { I by calculation }\end{cases}$ |
| Difference by refraction | 2 I |

In the abore table, the deprefion, as chimated $b_{j}$ calculation, is greater than that by oflervation in every cafe except the latt, in which the latter is greater by two fecond, than the former ; but this difference wai too fmall to be dificovered by the inftrument that Ca fini employed.

Refraction leffens the angle of depretrion, by raing the objects obferve l; but as this refraction is iteli rariable, the depretion and estent of the horicon :!lo sary. We are informed by Cathin, that even in the finell weather he obferved the refracion to differ at the lame hour of different days, and at different hours of the fame day. The truth of this obfervation may be eafily alcertained by looking through a telefope furninied with crof -hairs, and fixed in fuch a polition that fome highiy elevated object, as the weathercock of a tteeple, may be feen through it; for, on obferving the weathercock at different times of the day, it will be feen fometimes on the centre of the object-glafs; fometimes abore, and fometimes below it. A fimilar experiment may atio be made with plane fights fixcd on a crof-taff. It has long been obferved, that the top of a dittant hill may fumetimes, when the refraction is very great, be diItinctly feen from a fituation from which, at uther times, when the refraction is much lels, it is not difcernible, even though the fky be very clene.

Many of the following problems may feem to belong to the celedial rather than the terretion globe; but as they may be folved equally well io theans of both, and as perfons not uncommonly proficis a terrelatial globe without it, ufual companion, we thall throw as many problems as polfible under this head.
Probeem IX. Tu fand the fun' place in the ccliptic for Pryems
ary giver time. $\quad$ thfor

Find the daty of the month in the calendar on the wooden horizon ; and oppofite to it, in the adjoining circle, will be found the fipn and degree in which the $3 \mathrm{U}_{2}$ fun

From the above, it is eafy to deduce the method of computing the difince of any object feen in the horizon from a certain height. Thus, furpofe a man at the math-head, 130 feet ahove the is ter, fees hand or a thip jutt conring in fight. We know, that, at his height, an eye can fee $1+$ mi's, confequently the objed feat will be about 14 miles or about five leagues diftant. If the objeat is within the horizon, or neater the place of obfersation, its ditance may be calculated pretty exaetly, by defending from the matheal the the nijgest juth onnor to the horizon; meafaring the height at which this takes place, and thence computing the diftance.

Principles fun is on the given day. Then look for the fame fign and degree in the circle of the ecliptic drawn on the globe, and that is the fu's's place at noon for the given time.

Ex. 1. What is the fun's place on the fth of June ? AnI: $\ln 13^{\circ} 57^{\prime}$ of the fign Gemini.

Ex. 2. Required the fun"s place for the firit day of every calendar month ?

| J Ja | M 11 |  | July | $0_{5} 9{ }^{\circ} 4$ |
| :---: | :---: | :---: | :---: | :---: |
| February | \#\# 12 | 35 | Augur | $\Omega 918$ |
| March | < 11 | 9 | September | 吹 99 |
| April | r 11 | 56 | October | $\triangle 8.27$ |
| May | ¢ 11 | 14 | November | 17916 |
| Junc |  | 3 | December | $f 933$ |

Problem X. To find the fiun's declination fur any gi-
ven time.
Find the fun's place for the given day by Prob. X. and bring it to the brazen meridian. The degree marked on the meridian immediately over the place is the declination required.

Ev. Required the fun's declination for 18 th March ? The fun's place for the given day is $20^{\circ} 7^{\prime}$ of $x$, and this being brought to the meridian, will be immediately below $3^{\circ} 54^{\prime} \mathrm{S}$. which is therefore the decination required.

From the above example, it is evident that the method of binding the declination of the fun currefponds to that of finding the latitude of a place on the globe, given in Problem I. the fun's declination being meafured in the fame way by an are of the meridian interpofed between the equator and the fun's place in the eclip:ic ( F ).

## Problem XI. To realify the globe for the fun's place and the day of the month:

Find the fun's declination for the given day, by Problem XI.; then elevate the pole that is in the fame Femifphere with the degree of declination, as many degrees as are equal to the declination.

Ex. Rectily the globe for the fun's place on the 6th October ? Anf. The fun's declination on that day is $5^{\circ} \mathrm{S}$. therefore the fouth pole mult be elevated $5^{\circ}$ above the horizon.

Rectifying the globe fur the fun's declination correponds to the rectifying of it for the latitude of a given place. See N* 88 .
Probrem XII. To find the time of the fun's rijang and - Setting at a given place, for any given day.

Rectify the globe for the declination on the given day, and bring the given place to the meridian, and fet the index of the hour circle at XII. Turn the globe, till the given place come to the eaftern edge of the horizon, and the time of funrife will be thewn by the pofition of the index. Then turn the globe till the given place come to the weltert part of the horizon, and the polition of the index will point out the time of funfet.

## A $\mathrm{P} \quad \mathrm{H} \quad \mathrm{Y}^{*}$.

To perfurm the fame problem by Adams's globes.
Rectify the globe for the deciination, bring the given place to the meridian, and fet the horary index at 12 as before; then turn the glube towards the weft, till the given place reach the wetern edge of the horizon, and the index will point to the time of fumsite. The time of funfet will be known, in like manter, by bringing the place to the eallern ide of the horizon.

If the hour circle in the ordinary globes has a dou'sle row of figures, the fun's rifing and fetting may be found at the fame time; for if the place be brought to the eatern part of the horizon, the time of funrife will be Dhewn by the index, in that circle where the hours increafe towards the eaft; and the time cut by the index in the circle where the hours increafe towards the weit, will flow the time of fulfet.
Ex. 1. Required the time of the fun's rifing and fetting at London, on the $29^{\circ} \mathrm{h}$ Auguit ? An/. The fun rifes at mine minutes after five, and fets nine minutes before feven.

Ex. 2. Required the time of funrife and funfet at Edinburgh on the nt of June? Anf. For funrife, 27 mi nutes after three; for funfet, 33 minutes after eight.

Corollary. From this problem we may eafily find the length of the day and night for any given time; for, having found by the globe the time of funrile and funkt, the double of the latter is the length of the day, and the double of the former the length of the night.
Problem XIII. To find the fun's meridian altiutde on any given day, at a given place.
Rectify the globe for the latitude of the given place, by Problem V111.; find the fun's place on the given day by Problem IX. and bring it to the brazen meridian. Then fix the quadrant of altitude in the zenith, or over the given place, and bring it over the fun's place; and the degree of the quadrant lying over the fun's place will thew the meridian altitude.

If the globe has no quadrant of altitude, the fun's meridian altitude may be found by counting the number of degrees on the meridian, between the horizon and the fun's place.

Ex. Required the fun's meridian altitude at Edinburgh on the 21 It of June? Anf. $57^{\circ} 30^{\prime}$, or the greateft poffible, this being the fummer folttice.

Corollary. It may be known whether the fun's meridian altitude be north or fouth, by the following obfervations. When the fun's declination and the latitude of the place are of different names, i. e. the one north and the other fouth, the meridian altitude is of the fame name with the declination. If the declination and latitude be both north or both fouth, the altitude is of the fame name with the declination, if the latter be the greater; but, otherwife, the altitude is of an oppofite name.
Problem XIV. Having the latitude of the place and the day of the month given, to find the fun's alutude for any given hour.
Rectify the globe for the latitude; find the fun's place, and bring it to the meridian, and fet the horary index
(F) For a table of the fun's declination correfonding to his truc place, fee Vul. III. p. 170.

## Fart II.

## G E O G R A P H Y.

Punciples index to noon; turn the glube till the inkex point to and the given hour, then fix the padrant of altitude in die Fristice. zenith, and bring its griduatel elo. over the fun's
place, and the degiec cut by the fun's place will be the altitude required.

Er. What will be the fun's altivde at 12 o'llack A. M. on the 30 oth of Nosember at Edinburgh? $\operatorname{snf} . \mathrm{b}^{\circ}$ jo $J^{\prime}$.

Problem XV. Heving the fin's mertitian altitule gi wen at anty place, to find the datitude of the place.
Bring the fun's place for the given day to the meridian, and move the globe in the horizon till the diftance between the fun's place and the northern or fouthern edge of the horizon, (according as the cafe may require), be equal to the given altitude. The degree of elevation of the pole will thew the latitude required.

Ex. The fun's meridian altitude obterved at a cer$t$ ain place on $5^{\text {th }}$ Augul is $74^{\circ} 24^{\prime} \mathrm{N}$. What is the latitude of the place > $A n f .1^{\circ} 3^{6^{\prime}} \mathrm{N}$.
Problem XVI. The latitude of the place and the day of the manth being given, to find when the fun is due eafl or due wigf.
Rectify the globe for the latitude of the phace, bring the fur's place to the meridion, and fet the index to XII. Fix the quadrant of altitude in the zenith, and if the fun's declination be of the fame name with the latitude, bring the graduated elge of the quadrant to the eaftern fide of the horizon; but if the declination is of a different name from the latitude, bring the quadrant to the weltern part of the horizon. Turn the globe till the fun's place in the ecliptic come below the edge of the quadrant, and the index will point to the hour when the fun is due ealt. Subtract this from XII. and the remainder thews the time when the fun is due weit.

Ev. At what hours is the fun due ealt and weft at the fummer and winter follitice at Greenwich ? Anf. At thie fummer folitice he is due ent at 20 minutes part feven, and due weit at 20 minutes before five. At the winter folitice be is due ealt at 20 minutes before five, and due weft at 20 minutes pait feven.

Corollary. When the declination and latitude are of the fame name, the fun is due ealt after rifing; out when the declination and latitude are of oifferent names, he is due ealt before riing. As it is not convenient to obferve on the gl. be when the fun is due eaft before riling, or while he is under the horizon, it is better to bring the oppofite point of the ecliptic due weit, and then the index flews the time when he is due eait.

Probley XVII. Having a place in the torrid zone given, to find on what two days of the year the fun is sertical at that place.
Find the latitude of the given place, and kceping that in view, turn the globe round, noting the twn points at the ecliptic that pab below the degree of latitude. Find in the calendar circle of the horizon the days correfponding to thofe points of the ecliptic; and thele are the days on which the fun is vertical at the given place.

Ex.1. On what days is the fun vertical at St He-
 an. bel: A nverneer. and

Ex. 2. Ropuite! the days on whieh the fin is per- Prann,
 pril 19. and Augut 23

Find the fun', place for the given dey, and briag 16 to the br zen meridian; then turn the globe, and nse all the placts which path under that point of the mevi dian: thefe will be the places to which the fun is vertical on the siven day.

Ex. 1. In what places is the fun vertical ot the fummer bolltice s sof. At Canton in Chama, at C:featt ia Bengal, at Mecc. in Arabia, and at the IItva:nah.

Fiv. 2. 'To what places is the fun vertical on the $16{ }^{\text {H. }}$ of May and 29th of July Su/: At Bombay, Pecqu, in the northern part of Manill, in the middle of the Ladrone illands, at Owhybee, Mexico, in H fpanso!a, and at Tombuctoo in the central parts of Africa.

## Probliny XIX. Havins the day and hour at any giowe place, to find where the fun is then vertical.

Find the fun's declination by Problem XI. and the places where it is noon at the given time, by Problem III.; then any of thofe places where it is noon, whofe latitude is the fame as the fun's declination, will have the lun vertical at the given time.

E\%. On the itt of Augult at Edinburgh, it being 35 minutes palt four, P. M. it is required to tind where the fun is vertical ? Anf. The fun's declination on that day is $18^{\circ} 1 y^{\prime} \mathrm{N}$. and the place where it is noon at the given time, that lies nearef in latitude to the declination, is Kingllon in Jamaica: this, therefore, is the place required.
Problè XX. A place in the northern frigid zone being given, to find when the fun begins to appear aluwe the borizon, and when to difappear; as alfo the lensth of the lunseld day and migho.
Rectify the globe for the latitude, and bring the afending figns of the zodiac (fec Antrosomy, $\mathrm{N}^{\circ} 52$ ) to the fouthern part of the horizon; obferve what degree of the ecliptic is interfected by that point of the horizon, and in the calendar circle find the day of the month anfwering to that degrec. That will thew the time of the lun's firl appearance above the horizon at the given place, and this is the end of the lonselt night in that latitude. Then bring the defording jowns to the fame part of the horizon, and oblerve the diy which aniwers to the degree of the ecliptic interlected; this will fhew the time of the fun's difappearance, or the beginning of the longed night. Noiv bring the alcending figns to the northern part of the horizon, and obferve the degree of the ecliptic, and the correfponding day as before, which will give the time when the fun begins to fhine continually, or the beginning of the longett day. Again, bring the delcending figns to the fame point, and thus will be given the time when the fun cafes to thine continually, or the end of t?: longell day.

En. At what time does the furs begin to :ible

Principle; above the horizon at Nusth Cape in Lapland, the latiand tade of which is $72^{\circ} \mathrm{N}$. ' When docs he dilappear, and $\underbrace{\text { Praste: }}$
how long is he entirely abtent during the longett night
sinf. He bevins to appear on the 26 th of January, and entirely dilappears on the $16 t h$ of November; he is therefore abfent for 7 ! days.

Cer. From the fun's firlt appearance at the end of the longelt night to the beginning of the longett day, and from the end of the longell day to the fun's total difappearance at the beginning of the longef night, he ifes and fets every day.
Promlem XXI. To fint in what part of the northern frigid zonte the fun begins to Jhine continually on a grich day.
Find the fun's declination for the given day, and fuberact this from $90^{\circ}$, the remainder will thew the latitule required.

Noti--The given day mutt be between the 21ft of March and the 2tit of June, as at no other time does the fun begin to ftime continually in the northern frigid zone.
E.x. Required the latitude in which the fun begins to thine without fetting on the tit of June? An/. The lim's declination for that day is $22^{\circ} \mathrm{N}$. and this fubtracted from $90^{\circ}$ leaves $68^{\circ} \mathrm{N}$. the latitude roguired.

Proble: X XII. The length of the longel day in any fiace being given, to find the luritude of that place.
Bring the firt degree of Cancer to the meridian, and
fet the horary index at noon. Then turn the globe towards the welt, till the index point to the hour of funfet, or half of the length of the given day; raife or deprefs the pole, till the fan's place in the ecliptic is exactly in the weftern edge of the horizon. The elevation thus obtained will be equal to the required latitude.

In Adams's globes, after bringing the firit degree of Cancer to the meridian, and fetting the index to noon, the globe mult be turned towards the weit, till the index thew the time of funfet, and the fun's place muft be brousht to the eaftem fide of the horizon.

Er. In what latitude is the longelt day 18 hours long ? Anf. In latitude $58^{\circ} 30^{\prime} \mathrm{N}$.

By this problem the limits of the hour climates may be pretty nearly afcertained.
froblem XXIII. To find the latitudes of thofe places in the frigid zone where' the fun is continually above the horizon for a given number of days.
Count from the firft degree of Cancer towards the nearelt equinoctial point, as many degrees as is equal to half the given number of days; bring the point thas obtained below the meridian, and note the degree of the meridian which it interfects. This fubtracted from $90^{\circ}$ will leave a remainder that is nearly equal to the latitude of the place.

Ex. In what latitude does the fun never fet during 76 days? Auf. In latitude $71^{\circ} 3 \partial^{\prime}$, or very near the fouthern part of Nova Zembla.

Note.-This problem cannot be performed accurately by the glabe; for as the fun requires 365 days fix hours to move through the whole $360^{\circ}$ of the eclipnic, he does not advance quite a degree in $\boldsymbol{2}+$ hours.

By this problem the limits of the month climates may Principles be pretty nearly aicentained.
Pronnem XXIV. The hour and day being given at amy place, to find in what places the jun is rijinu, and in whot he is fertils; whire it is noun, and where midnisht.
Find by Problem XIX. the place to which the fur is ventical at the given time; rectify the globe for the latitude of that place, and bring the place below the meridian. In this pofition of the globe all thofe places that lie within the weftern edge of the horizon will have the fun rifing, and all thofe which are in the cditern edge of the horizon will have it letting. Again, to thofe places which lie under the upper femicircle of the brazen meridian, it will be noon; and to thofe whirh lie below the lower femicircle, it will be midnight.
L.x. Suppofe it to be four o'clock P. M. on the $4^{\text {th }}$ of June at London; where is the fun at that time riling, and where is he letting; to what places is it noon, and to what midnight ? Ahf. Tbe north-ealtern part of Siberia, Kamtichatka, the moit weltern of the Sandwich illes, and the moft eaftern of the Society illes, are within the weltern edge of the horizon, and confequently to thefe the fun is rifing. At Tobolfk, in the Cafpian fea, in the delert of Arabia, in the middle of the Red fea, in Abyflinia, in the central parts of Africa, and in the country of the Hottentots, the fun will be letting, as thefe places lie within the eaftern edge of the horizon. New Britain, the illands of Martinique and Trinidad, and the middle part of South America, which lie below the upper femicircle of the meridian, have noon ; and Chincte Tartary, the eattern part of China, the Philippine ifles, and the weftern part of New Holland, which are fituated below the under edge of the femicircle, have midnight.

As the remaining problems on the terreftrial globe $\mathrm{O}_{\mathrm{n}}{ }_{\mathrm{r}}^{\mathrm{twi}}$. chielly refpect the continuance of twilight, it is proper, light. before we proceed, to make a few remarks on this fubject. For the explanation of the term, fee Crepusculum and Twhlight.

The Crcpufeulum, or Twilight, it is fuppofed, ufually begins and ends when the fun is ahout $18^{\circ}$ below the horizon; for then the ttars of the 6th magnitude difappear in the morning, and appear in the evening. It is of longer duration in the folitices than in the equinoxes, and longer in an oblique fphere than in a right one; bectule in thofe cafes the fun, by the obliquity of his path, is longer in afcending through $18^{\circ}$ of latitude.

Twilight is occafioned by the fun's rays refracted in our atmofphere, and reflected from the particles of it to the eye. For let A (fig. 10.) be the place of an obferver on the earth $\mathrm{ADL}, \mathrm{AB}$ the fenfible horizon, meeting in B the circle CBM bounding that part of the atmofphere which is capable of refracting and reflecting light to the eve. It is plain that when the fun is under this horizon, no direct rays can come to the eye at $A$ : but the fun being in the refracted line CG, the particle $C$ will be illuminated by the direct rays of the fun ; and that particle may reflect thofe rays to A, where they enter the cye of the fpectatur. And thus the fun's light illuminating an innumerable multitude of particles, may be all rellected to the freetator at

Priscipie. A. From B draw Bi) touching the (ir-le ADL in ond $D$, and le: the that le at $S$ in the line $A 1$; then the Practuce :ay SB will be refieded into the firution HA , and will enter the eve, becaule from a principle in uptios the andle of iveduce DRC is equal to the angle of retlection ALF.. See Ormics. thin ray SB, or BA, will therefore Le the frlf that reache the we at dawn in the morning, and the lint that fall, on the eye st night, when twili, ht ceaies, becaute as the fun gets lower down, the particles of the air at B' will no longer be illumin:ted.

The defth of the fun below the horizon at the beginsing of the moning or end of the cwening twilight, is determined by oblerving the moment when the air firt begins to thine in the monning, or ceafes to fhime i: the evening; the: finding the fun's place for that time, and hence the time till his rining in the horizon, or atter his difappearance blow. This depth of the fun below the horizon has been variomly tated by difierent altronomers, but it is now generally ellimated at $18^{\prime \prime}$. Accordingly in Mr Adame's globes there is a circular wire fixed $18^{\circ}$ below the horizon, to reprefent the limits of the crepufulum (fee PVIY, fig. 5.)

As the caufe of twilight is tut conftant, its limits muft continually viry; for if the exhaiations in the atmofphere be more copious or more extentive than ufual, the morning twilight will besin fooner, and that of the evening lat longer than ondmars; as the more copious the calalations, the more rays will be retleciud from tham, and confequently the more they will hine, and again, the higher they are, the fooner they uill be illuminated by the fun. From this circumitance the evening tailight is commonly longer than the morning, at the fame time, and in the fame place. The refraction is a'fo greater according as the air is more denfe, and not only is the brightnefs of the ntanofipere variable, but the fame takes place in its height above the carth; therefore, the twilight is longell in hot weather, and in hot countries, all other things being equal. The chid differences, however, arife from the different fituations of places on the earth, or from the difference of the fun's place in the heavens. Thus, the twitight is longett when the earth is the pofition of a parallel fohere. and thorteft in that of a right fphere (fee $\mathrm{N}^{\circ} 90$. : and in an oblique fphere, the twilight continues longer at any place, in proportion as that place is nearer to either of the poles; a circumbtance which affords confiderable relief to the inhabitants of the northern countries in theit long winter nights. Twilight continues longeft in all places of north latitude, when the fun is in the trogic of Cancer, and to thofe in futh latitude when he is in the tropic of Capricorn. The time of the fhotell twilight aifo varies in diferent latitudes: thus, in E.gland, the Rortest twilight is about the beginning of Oetober and of March, when the fun is in $\approx$ and $x$; hence, when the difference between the fen's declination and the depth of the quator is lefs then $18^{\circ}$, fo that the fun loes not defoend more than $15^{\circ}$ below the horizon, the twilight vill continue through the whole night, as happens in Fritain from the 22d of May to the 22d of Jul:.

Jo the latitude of $49^{\circ} \mathrm{N}$. tuilight continues for the *hole night, only on the 2 ift of June, or the time of the fumner folftice; Lut it all places turther :o the
nu:it: it contimes for a crotein number of day before lam ulos and iftor tictummer hollite.
und
Near tite noth puit there is contiven? twilioht from the zat of Sypaboer, the thene of the funs permanent abfence. to the 1 zih of Nuvenher. It the: ceales till abuth the 3 zih ci Jonuary, when it again appears, an l continu: tili ti e 21t of M ach, the time of the fun's permanat atruearance. Hetce the inhabitant- of thene phace- nearent the fole, though they nower fee the fun for nearly in montls, have, however, the benefit of twilight for above the hatfof that time, and are cotitoly evcluded from the fun's hight litule more than 12 weeh, during fix of which the moon is contantily above the hotizon.

Were it not for the gradual change from light to to of of darknefs, and aifer er'a, which is the conterpence ofta....s. twilight, mab inconsenience would arite. A fudden chance from the daknefs of michuight to the full fictidor of the fun, and the reterie, nould injure the fight. and would, in many cates, be produtlive of much dan. ger to travellers, who would be overtaken by utter darknels before they had time to prepate fur its ap. proach.

Find where the fun is vertical at the given time, and rectify the globe for the latitude of that place. ()). ferve what places are within the limits of twilight, or not quite 18 below tie horizon. To thofe which are fituated within the wellem zone, between the horizon and the parallel of $18^{n}$, it will be wilight in the mors:ing; and thofe which are in the ettiern zone will have it twilight in the evening.

Tins problem may be more convenienty performed by rectifying the globe for the antipodes of the place which has the fun then vertical, and oblerving ishat places are fituated in the zone formed above the horizon, betneen it and a parallel circle of $14^{\circ}$.

Es. It is required to find where it is twilight on the fth of June, when it is three o'cloch, P. M. at London. Sh: Kamtichatka, the Sandsich ille, and the Marquelas, hase twilight in the morning; and the inhabitants of Madagafoar, of lioct, and the ealem part of Perlia, have twilight in the evening.

## Probiem XXVI. To fud the duration of swiilsh: at a grien paide on any gives day.

Rectify the globe for the latitule of the place; find the fun's place for the given day by Problem X . and bing it lelow the meridian, and fet the lomary index to X1l. Turn the globe till the fun's place le juit wothin the circle that marks the limit of twilight, atd the index wi!l bew the begiming of twilight. Subtrace the time of the begiming of trilight tom the time of forsiang at the given phace (found hy Problem X11.) and the remairder will then the duration of twilishe ot the given place.

Nis.- The above rele wiil anfwer both for the ordinary globes, and fur thofe of dams. crept that in the letter the funs pance muit be brought lecloss the neitera fart of the horizon. A more convenient way in beth globes will be, to brise that point of the eliptie which is onvate to tha funs phece, $18^{\circ}$ aloove

Principles the wetera hurizon, ath the index will then fiew tie and beciming of twilight.
E. How long will twilight continue at Lomidon on the following days: March 2d; September $25^{\text {th }}$; and December $26^{3}$ Anf. On the 21 of March it will continue one hour and finty minutes; on the 25 th of Septenber two hours; and on the 25th of Decenver, 1. . hours ten minutes (C).

Problem XXVII. To frew the caufe of day ar, $i$ night by the slobe.
It will have appeared, from the confleration of the raule of day and right given under the article Astroxomy, that only that half of the earth which is oppofte to the fun, is illuminated by his rays, while that whica is turned from him is involved in darkne!s. As the earth revolves on its axis from welt to eaft, in the face cf 24 hours, every place on the earth in the courfe of that time alternately enjoys the light of the fun, and is deprived of it.

To illuftrate this by the glowe, rectify the globe for the fun's declination, fo as to place the fun in the zenith, and the horizon will reprefent the boundary beineen light and darknefs; that hemiphere which is above the horizon being illuminated by the fun's rays. and that which is below the horizon being derived of light. If now a patch is put on the globe, fo as to reprefent any place, and if the globe be made to revolve from weft to ealt; when the place is hrought to the weftern edge of the horizon, the fun will appear to the inhabitants of that place to be rifing in the ealt, though, in fact, the appearance arifes from the place itfelf coming beyond the limit of darkners. As the globe continues to turn, the place rifes towards the meridian, and this produces the appearance as if the fun were advancing towards the meridian in a contrary direction. When the place comes below the meridian, it is noon to that place, and the fun appears to have attained its greateft lieight.

As the place proceeds towards the eaft, it gradurlly recedes from the meridian, and the fun appears defcending in the weft. When it reaches the eaftern edge of the horizon, and is proceeding below the boundary of light and darknefs, the fun appears to be fetting; and during the whole time that the place is moving below the horizon, the fun will not appear till the place once more rifes in the weit.

## Problem XXVIlI. To find at what places an eclipfe of the moon is vitiblc at any given time.

Find the place to which the fun is vertical at the given time, and rectify the globe for the latitude of that place. As the moon is oppofite to the fun, which illuminates the fuperior hemifphere of the globe, the
ec lipfe of the moon will be vinble to all the piaces that Principles lie helow the horizon.

As the flaces below the horizon are not cafly examised, this pioulem may be more conveniently perfommed by rectiying the globe for the antipodes of the place to which the fun is sertical at the givea time, rather than for the place ittelf; as in this latter potition of the globe the moon being in oppolition to the fun, will be vertical to the place belos the zenith, and ita ecliple will be vinble at all the places no: above the i.orizon.

Ex. 1. On the $4^{\text {th }}$ of Janua:y 1506 , at 55 minutes pait is P. M. reckoning the tince at Greenwich, there was an ecliple of the moon. It is required to find thofe piaces to which the eclipfe was vinible, A\%f Through tie greateit part of Africa, in fone part of Europe, in Alia, South America, and a great part of North America.

Ex. 2. On the roth of May 1S08, when it is eight o'clock A. M. at Greenwich, the moun will be tutaliy eclipled. In what places will the eclipfe be vinble? Anf. In moft parts of America; in the illands of the Pa cific ocean, and on the eatern coalt of New Holland.

## Sect. II. Of the UJe of the Celetial Gloke.

The celeftial globe, with refpect to the circles that Celental are defcribed on it, and the apparatus with which it is sone. furnithed, farcely differs from the terreitrial globe, which has been fo fully defcribed in the preceding fection. The furface of the celeftial globe is made to reprefent all the fars that are commoniy vifible to the naked eye, arranged under their conftellations, and bounded by the figures which have been given to thefe conftellations by the early aftronomers. (Sie fig. 5.) In Adams's celeftial globe the moveable femicircle ( $\mathrm{N}^{\circ}$ 9I.) turning round the poles reprefents a circle of declination, and the fmall circle on it, an ariticial fun or planet.

Both the globes are often furnifhed with a mariner's compafs, which is ufually placed in the lower part of the frame.

It mof here be remarked, that the reprefentation of the heavens on the celeflial globe, though probably much more accurate than that of the earth on the terreftrial, is not fo natural as the latter; for, in viewing the ftars on the external furface of a globe, the fpectator fees them in an oppofite pefition to that in which he obferves them in the heavens, fo that to form a juft conception of their exact fituation, he mult fuppofe his eye to be feated in the centre of the globe. Hence, if a large hollow hemifphere were made of glafs, and if the ftars in the correfponding hemifphere of the firmament were painted in tranfparent colours on its furface; an eye fituated in the centre of fuch a hemifphere
(c) If we have the latitude of a place, and the fun's declination given, we may find the beginning of the morning and the end of the evening twilight by calculation. Thus, in the oblique-angled foperical triangle ZPN (fig. 11.) we have given $Z \mathrm{P}$ the co-latitude; PN the co-declination, and $\mathrm{ZN}=108^{\circ}$ being the fum of $90^{\circ}$ the quadrant, and $18^{\circ}$ the deprellion at the extremity of twilight. Then by fpherical trigonometry we may calculate the triangle ZPN, the hour angle from noon, and this reduced to time, at the rate of $15^{\circ}$ per hour, gives the time from noen to the beginning or end of twilight. For the mode of calculation, fee Siumerics.

## Pat II.

 G E O G R A P H IPrinciples fphere would Co the itars exably as they appear in the and heavens.
Piactice.
The great ufe of the celentid ghose is to perform a variety of problems with refyeit to the ttars, and the motions of the hearenly budies through the face which the: occupy.
Problem I. To place the cetaficl ghbe in fuch a firuation as that it hatl chibit an ascurate repretentation of the face $f$ the hewters at any given priace, and at any given towe.
Rectify the globe for the latitude of the place, as in Doblem V1II. of the terreftrial globe, ar by letting the pole of the celeftial globe pointing to the pole of the earth, by means of the compafs that is ufually annexed to the globes; fird the fun's place in the ecliptic; bring this to the meridian, and fet the horary index at noon. Again, make the globe turn on its axis till the index point to the given time, and in this fofition the globe will exactly reprefent the face of the heavens, correfponding to the given time and place; every comtellation and itar in the heavens anfwering in pof.tion to thofe on the globe. Hence, by examining the globe, it will immediately be feen what ftars are above or below the horizon, which are on the eatern and weftern parts of the heavens, which have juft rifen ahove the horizon, and which are about to link below it.

As this problem will be found extremely wfefu? :o the fudent of aftionomy, we thall here quot the example given in illuftration of it by Metirs Bruce of Newcathe.
$\because$ Required the fituation of the fars for the latitude of Newcattle, on October 6th, at eight o'ciock ia :he evening ?
"In our prefent furvey of the heavens, we Aall comzence at the north point of the horizon, and procted :ound eaftward; noticing the difierent conftellations, and the relative ituation of the prisapal fiters in thefe con. -ellations.
"Tte irft far which Atrikes the eye of the obfer$\because \leq-$, in the north-eat part of the heavens, is Capella, in the constekation Auriga, or the Waggener: It is of the Irf macritude of the altitude of $23^{\circ}$, or nearly the furth part of the cifiance from the horizon to the ze:ith. There are two fars of the fecond magnitule, which form with Capella a triangle :- The ftar which forms the thort fide of the triangle is in the right froulcer of Auriga, and is marked 3 ; it lies at the diftance of about 8 from Carella, further to the north; its altitude is $10^{\circ}$-The tar forming the longer fide of the triangle is in the Bull's northern horn ; its ditance from Capella is more than $26^{\circ}$; its altitule not mote than $5^{\circ}$, and azimuth N. E. There are thre itars of the fourth mannitude, a little to the fouth of Capella, that bear the narre of the Kids.
"If a line be driwn through the wo fars that form Sie upecr fote of the triangle, and continued to the turizon, it $v$ ill poi: t out Cator, $\alpha$, in Cemini jut riting, szi:nuth E.N. E: it is between the firft and fecond magnitude. The other ftars in this conftellation have rot yet rifen.
$\because$ A line drawn between Caftor and Capella, and conirned higher it the heaven, will poini i ut Perieus, in

फ.i. 1X. l'at 11.
tude, $\alpha$, numad sikerok, an ! $t$, of the thai n.agai- Jin mo tude, one on chh ride of Alyenib, at the diftance of pont about $5^{\circ}$ : they form I line a littie rurved on the file Pacto. nex: Auriga. The altitude on 1/gmib is $37^{\circ}$; azimu:n A. E. by E.
$\because$ A hitle to the fouth of P.r: .. i the Yind of Meduta, which Perfeus is holdinet in his hand. Beadestro or three fimali ilars, it contains one of the fecond, an? one of the thit maynitude. The nare of the brighte t is Alg $x^{\prime}$; altitude $33^{\circ}$, azimnth E. N. E. Algol i only : $v^{\circ}$ dillant trom Alzenis.
" Directly bclow the Head of Madsfa, a out 14 " above the horizon, ase the Pleiades or feren thars: They are feated in the thou!der of Tatrus, and are fo eafit hnown, that no defcription is nectllary. Aldebasan, a flar of the firft magnitude, which form the eye of Taurus, is juft rifing ; azimuth E. N. E. A vertical circle drawn through Algol will point to it. There are two ftars of the third magnitude, and feveral fmaller very near Addebaran, which form with it a tiangle. The whole clufter is called the Hyaizes.
" A line drawn from ildebaran through A!gol, and continaed to the zenith, will direct to Caliopeia. This contains five thars of the third magnitude, betide feveral of the fourth: it is in form tomething like the letter $Y$, or, as iome think, an inverted chair. It is fituated above Perfens, within $30^{\circ}$ of the zenith. '1 he altitude of the brightet Atar, $\boldsymbol{z}$, called Scheiar, is $6=^{\circ}$; azimuth, E. N. E.
" Below Cuhiopeia and welt of Perfeus is Andromeda, which contuins three thars of the fecond magnitule. A line :oom Algenib, parallel to the horizon towads the fouth, will pais very near theie thece flors: and, as the, are all of the fame magnitude, and placed nearly at the fame diftance of $15^{\circ}$ from each other, they may eanly be known. The name of the tar nearelt Poricus, an which is in the foot of Andromeda, marked $\%$, is $\Lambda$ : matuk: its altitude is $49^{\circ}$; azimuth E. N. E. The mame of 3 , in the girdle, is Mirach: its altitude $44^{\circ}$; azimuth E . The altitude of $\alpha$, in the head of Andru. meda, is $46^{\circ}$; azimuth E. S. E.
" About $26^{\circ}$ below Mirach are two fars in Arics, not more than $5^{\circ}$ ditant from each uther, forming with Mirach an ifofeles triangle: the mut e iltem flar,, is of the fecond magnitude ; the other, 3, of the third, atttencied by a Imaller itar, marked $\gamma$, of the icurth marnitule. A line draun from Mirach, perpendicular in the horizon, will pafs bet"een the twe, and befides, will point to a ftar of the fecond magnitute, disectly l: not above $5^{\circ}$ from the horizon.
"This itar is the firt of Cetus, marhed $\alpha$, and is of the feend magnitude: it is named Merkar. A ine drawn from Capella through the Peinde, wil alio puint to it. Cetus is a large conftelation, and comains eight ftars of the third magritude; they aill lie $\cdots$ the weft of Menkar ; $\beta$, a llar in the tail, is more than $40^{\circ}$ diftane from it. The azimuth of $\beta$ is S. E. by L; atitude nearly the fume as Nenhar.
"I he conse ila.ion flices is fituated next to Aries; it contaias one fid of the third nagritude, nathed $\alpha$.
 Mlahar $15^{\circ}$. A line drawn ficm Almazk, through a in Aries, will point to it.
" If we return again to $\propto$, in the head of Andromeda, W: at If time three utlier tiars neares the mer dias, which,
 ard are placed at the distace of $15^{\circ}$ from each other; they are all of the fecond magninde. The two flars forming the wellorn bide of the fquare are called-the npper one Scheat, which is marked $\beta$, and which is is the thigh of Pegatus; the under one Markab, which is marked $\alpha$, and which is in the wing; the lowent ftar in the eafern fide of the fquare is in the tip of the wing, and is marked $\%$. The altitule of Scheat is $55^{\circ}$; azimoth S. E. $\frac{1}{3}$ E. Altitude of Narksh, $43^{\circ}$; azimuth S. E.ty $S \div$ E,
"A line drawn through $\%$ and $S$ (the dagonal in the fquare of Pegafis) and comtimed to the meridian, will puint out Cygnus, a remarhable confeliation in the form of a large crofs, in which there is a tiar of the fecond magnitude, named Denet, or Arided; it is mark. cd $\boldsymbol{\alpha}$, and is almof directly upon the meridian at the altitude of $80^{\circ}$. Cygnus contains fix fiars of the third magnitude. I he cuntellation Cepheus, which contains no remarkalle ftars, is fituated between Crgrous and the north pole.
" Below: Pegnfuc, and nearer the meridian, is Aquasius, containing four flars of the third magnitude. A line drawn from $a$ in Andremeda, through Markab, will peint to $\alpha$ in Aquarius. Its altitude is $32^{\circ}$; azinuth S.S. E.
"A bright itar of the firlt magnitude named Fome'. h.aut, in Pifees Auttralis, is then $\mathrm{a}_{\mathrm{p}}$ on the horizon; azimuth S. S. E.
"Delphinus is a finall conftellation, fituated about $30^{\circ}$ telow Cygnus upon the meridian; it contains five ttars of the third magnitude, four of them being placed clofe *ogether, and forming the figure of a rhombus or lozenge. A line drawn through the two under ftars of the fquare will point to it. Its altitude is about $10^{\circ}$.
"A little to the weft of Delphirus, bu' not quite fo high, is Aquila, containing one very bright ftar of the firit magnitude, named Alair: It may very eally: be known from having a flar on each fide of it of the third aagnitude, forming a ftraight line. The length of the tine is only about $5^{\circ}$; altitude of Atair $40^{n}$; azimuth S. S. W.
"Confiderably above $\Lambda$ tair, and a little to the W. of Cygnus, is Lyra, containing a llar of the firlt magnitude, cne of the mof brilliant in the frmment. It it called Lyra or Vega, and is $35^{\circ}$ to the N. VV. of Atair; altitude $60^{\circ}$; azimuth W. S. W. Lyra, Atair, and Arided, form a large triangle.
"We come now to notice three conftellations, which nceupy a large face in thee wellern fide of the heavens: thefe are Hercules immediately below Lyra; Serpentasius between Hercules and the horizon, extending a litthe more towards the fouth; and Buistes, reaching from the hacrizon W.N. W. to the altitude of $45^{\text {e }}$.
"Hercules contans eight lars of the third magnitude; the flar in the head, $\boldsymbol{\alpha}$, naned Ras Algethi, is within $5^{\circ}$ of a in the heal of Serpentariac. This lat is a flar of the fecond magnitude, and is named Ras Alhague: its altitude is $30^{\circ}$; azimuth, S . WV. by W. $\frac{1}{2}$ W. $\Lambda$ line drawn from Lyra, perpendicular to the horizon, will pafs between thefe two fars. 'The other flars in Hercules extend towards the zomith, and chofe in Serpentaius towards the horizon.
" The conftellation Boütes may eafly be known from Prancip'es the brilliancy of Areturus, a ftar of the firt magnitule, and luppoled to be the neareft to our fyitem of any in the northern hemifphere : it is within $10^{\circ}$ of the horizon; azimuth W. N. W. Buotes allo contoins fiven flars of the third magnitude, moilly fituated higher in the heavens than Arcturus. The ftar immediately above Arcturus is called Mezen Mirach, and is marked t . The ftar in the left fhonlder, $\delta$, named Se ginus, forms with Mirach and Arcturns a Atraight line.
"Between Serpentarius and Boötes is Serpens, con. taini:g one flar of the fecond magnitude, and eight of the third: $\boldsymbol{a}$ in Serpens is nearly at the fime diftance from the horizon, as Arcturns; azimut: Wi.
" A bove Serpens, and a little to the cat of Bointes, is the Northern Crosn, containing one ftar of the fecotid magnitude, maned Gemma, and feveral of the thirl, which have the appearance of a femicircle. A line drawn from Lyra to Arcturus will pafs through this coniteliation.
" We come now to Urfa Major, a conftellation containing one flar of the firlt, three of the fecond, and feven of the third nagnitude. It may eafly be ditinguih. ed by thofe feven liars, which, from their refemblance to a waggon, are called Charles's Wain. The four ftars in the form of a long fquare, are the four wheels of the waggon; the three ftars in the tail of the Bear, are the three horfes, which appear fixed to one of the wheels. The two hind wheels, a named Duble, and $\beta$, are called the pointers, from their always pointing nearly to the north pole. Hence the pole ftar may be known. The altitude of Dubhe is $30^{\circ}$; azimuth N. by W. $\frac{7}{z} \mathrm{~W}$. The diftance between the two pointers is $5^{\circ}$; the diftance between the pole ftar and Dubhe, the upper pointer, is $30^{\circ}$.
" Urfa Minor, befides the pole ftar of the fecond magnitude, fituated in the tail, contains three of the third, and three of the fourth magnitude. Thefe form fome refemblance to the figure of Charlcs's Wain inverted, and may eatily be traced.
" Draco, containing four ftars of the fecond and feven of the third magnitude, fpreads itfelf in the heavens near Urfa Minor: the four ftars in the head are in the form of a rhombus or lozenge : the tail is between the pole ftar and Charles's Wain.
" Befides thefe conftellations, there are a number of cthers, which, as they contain no remarkable ftars, we have not defcribed; an enumeration of thefe will fuffice. The Lynx, between Uria Major and Auriga; Camelopardalus, between Urfa Major and Caffopcia; Mufca, and the Greater and LefsTriangles between Aries and Perfcus, Aculeus, c?ale to the head of F'cgafus; Sagitarins fetting in the fouth-welt; Antinous and Subiefki's Shield below Aquila; the Fox and Goole between Aquila and Cygnus; the Greyhounds and Berenice's Hiir between Boütes and Urfa Major, and Leo Minor beluw Usfa Major" *.

The aitron * Bruce's in defcribing the method of performing the problemsto Goog, aon the celeftial globe, will be fornd explained in the $\hat{s}^{\prime} y=0$ article Astrosoms, or under their proper head in the ed po zo: general alphabet of this woik. See Iscrassos, Az1suth, Definatiges, Eir.

## Part II.

Princin'es Pronitiv II. To find tha right afectifon and dacination mark the degree of the meridian under whic!s it lies. That degree thews the declination of the ftar, and the degree of the equator cut by the meridian gises the itar's
right afeenfion.

The right aicenion of a flar may aifo be found by placing the globe in the pofition of a right fiphere, and then bringino the itar to the eaftern part of the heizon ; for that puint of the equator which comes to the horizon at the fame time with the ftar, marks its right afectidun. See Astrosomy, No 249, 250.

Ex. 1. What is the right afcention and declination of the flar Sirius? Anf. Its right afcenfion is $99^{\circ}$, and its declination $16^{\circ} 27^{\prime} \mathrm{S}$.

Ex. 2. Required the right afcenfion and declination of Aldebaran, or the flar in the Bull's Eye marked $\alpha$. Anf: Its right aicenfion is $66^{\circ}$, and its declination $16^{\circ}$ $s^{\prime} \mathrm{N}$.
Problem III. Having the right afeenfon and declina-
tion of a far given, to find the fiar on the globe.
Bring that degree of the equator which marks the right afcention below the brazen meridian, and counsing along the meridian towards the north or fouth, as far as the degree of declination, the required far will be there found.

Ex. 1 . The right afcenfion of a certain flar is $162^{\circ}$ $15^{\prime}$ and its declination is $57^{\circ} 27^{\prime} \mathrm{N}$.; What is the name of the flar? Anf. The lower pointer of Urfa major, marked $\beta$.

Ex. 2. The right afcemfion of Arcurus is $211^{\circ} 30^{\prime}$, and its declination is $20^{\circ} 13^{\prime} \mathrm{N}$. : it is required to find it on the globe.

This problem is extremely ufeful in difovering the names and relative fituations of the different flars.

Problem IV. To find the latitude and lonyitude of a given fiar.
Bring the folltitial colure (fee $\mathrm{N}^{\circ} 75$ ) below the brazen meridian, and there fix the quadrant of altitude over that pole of the ecliptic which is in the fame hemifphere with the given flar. Then, keeping the globe fteady, bring the graduated edge of the quadrant over the given ftar, and the degree of the quadrant cut by the flar, counted from the ecliptic, marks its latitude, and the degree of the ecliptic that is cut by the quadrant is the longitude of the given ilar (H). See Astrovoms, $\mathrm{N}^{\circ}=2,2,253$.
Ex. I. What is the latitude and longitude of Arcturus ${ }^{2} A n f$. Lat. $31^{\circ} \mathrm{N}$. Long. Libra $20^{\circ}$.
E.. 2. What is the latitude and longitude of Capelha ? inf. Lat. $23^{\circ}$ N. Long. Gemini $18^{\circ} 3 z^{\prime}$.
Problem V. Having the day of the manth given, to find at wha: hour any far comes below the meridian.
Find the fun's place, and bring it to the merimin, and fet the lorary index to XII.; turn the glohe till the given flaz come below the meridian, and the indes winl point out the hou:.

To linow whether the boner is in the forenom or Prinziples afternoon, it is mecelary to ohferve, that if the flar be to the calt of the fun, it will reah the meridian later than the fan, but if it be to the welt of that luminary, it will come to the meridion fooner: hence, in the frmer cafe, the lour will be P. M. and in the lette: A. M.

Ev. 1. At what hour dces Sirius come to the meridian on the $9^{\text {th }}$ of February ${ }^{2}$ inf. At 7 minutes palt 9 P. M.
$E$. 2. Required the hour when Cattor pantes the meridian on the fame day. Anf. At 52 minates patt 9 P. 1I.
Problem VI. Having any, far given, and a given how, to fond on what day the fur will come to the meridia: at a given hour.
Bring the given flar below the meridian, and fet the horary indes to the given hour. Make the globe revolve till the index come to twelve at noon; and the day of the month which corciponds to the degree o: the ecliptic then below the meridian, found in the $\mathrm{c}_{\text {- }}$. lendar circie of the wooden horizon, will be the day tc. quircd.
$E \cdot \cdot 1$. On what day does Algenib, the firit par o: Perfeus, come to the merician at midnight? Avf. On the $13^{\text {th }}$ of Novembe:.

Ex. 2. On what day docs Arcfurus come to the neridian at 9 o'clock P. M. A $\%$. On the 10 th of June.

Problem YII. Having the 'a:titude, the day of the mont' and the hour of the night $\{$ vern, to fond the altitude and azimuth of aty given far.
Reatify the globe for the given latitude; bring the fun's place below the meridian, and fet the horary is dex at XII. then turn the globe till the index point at the given hour. Fix the quadrant of altitude at $90^{\circ}$ from the horizon, that is, in the zenith, and bring its graduated edge over the place of the flar: the degree of the quadrant intercepied between the horizon and the flar is the altitude required; and the diftance between the foot of the quadrant and the neareft part of the horizon, will be the azimuth.

It is evident that this roblem on the celential chlone is exactly fimilas to Problem XII1. on the terrettria! globe, for finding the altitude of the fun.

Er.1. What will be the alitude and azimuth of Cor Hydra on the 21 ft of December at $L$ ondon, at 4 o'clock A. M.? $A n$. The altitude $30^{2}$, the azin.uth S. $14^{\circ} \mathrm{W}$.

Ex. 2. Sappofe an obferver at the Cape of $G$ od Hopr, on the 21 ft of June at milnight; required the altitude and azimuth of Araurus to him? A",' Alti t.de $12^{\circ}$, azinuth N. $55^{\circ} \mathrm{W}$.

Probilan VIll. Having given the czimath of amy given fiar, and the day of the mon:l in a given lativitue; to find the liour of the $n$ Fin, and alutitale of the , iat.
Reatify the fio:e as in the lat protlem; fix the gantrant of ateit an in the zenith, and bring it to the given azimut. Tum the githe till the par come he $3 \mathrm{X}=$
(a) It muft be remembered that the longitede of the heaveniy bulics is not cfirated in degrees $2 n 3$ rai u: ike their right denfion, but in figns, degret, and mintes, as the fun's phace is reck met.
P.incifics low the grad:ated cuge of the quadrant, when the
of the far will be feen by the quadrant.

Ex. Suppofe the azimuth of D:athe to be N. $23^{n}$ W. at London on the 1 it of September; it is required to find the alritude of the flar, and the bour of the night? Art. The altitude of Dubhe at that time is $31^{\circ}$, and the hour is 9 o'llock P. M.
Problem IX. The latitude of the place, the alitude of aftur, and the day of the month, being given; to find :te a imuthand the hour of the night.
Reality the globe as before, and having fixed the quadrant of altiiude in the zenith, turn the globe and quadrant of altitude till the latte: comes over the flar at the given degree of altitude. In this pofition the index will thew the time of night, and the pofition of the quadrant at the horizon will fhew the azimuth of the itar.

In the fame way the hour of the night and the szimuth of the fun may be found, by fixing a patch on the globe in the fun's place, and bringing it to the quadrant as directed for the tar.

As the fun and flars have the fame altitude twice in the day, it is proper to know whether they are to bee taft or weft of the meridian; or whether the hour recquired be in the evering or the morning.

Ex. At Edinburgh, on the 25 th of December, in the forenoon, when the fun's altitude is $7^{\circ} 20^{\prime}$, required the hour and the fun's azimuth? $A n$. It is 10 $0^{\circ}$ clock A. N. and the fun's azimuth is $\mathrm{S} .27^{\circ} 30^{\prime} \mathrm{E}$.
Problem X. Having the aximuth of the fun or a far, tio latiude of the place, and the hour of the daygiven; ts find the alitude and day of the month.
Reatify the globe for the latitude of the place, fix the quadrant in the zenith, and bring its edge under the given azimuth. Bring the fun's place or the far to the edge of the quadrant, and fet the index at the given bour. The degree marked in the quadrant will iiew the altitude; and if the globe be turned till the index points to twelve at noon, the day of the month, anfwering to that degree of the echiptic which is interfected by the brazen meridian, is the day required.

Ex. The azimuth of the flar $\alpha$ in the Northern Crown was obferved at London at 9 o'clock P. M. to be S. $89^{\circ}$ W.; required the altitude and day of the month? $A v$. Altitude $38^{c}$; day of the month 1 ft of September.

Yrobiem X1. Havint obferved two fars to lave the fanee czimuth; to find the hour of the night.
Rectify the globe as before; turn the globe and move the quadrant till the edge of the latter comes over both fiars, and the horary indes in this pofition of the globe rill give the hour required.

The following is a fimple and eafy method of finding when two ftars have the fame azimuth. Hold a imall line with a plunmet at its lower extremity between the eye and the two flars, and if both flars fall within the hate, they have the fame azimuth. The fame may be done by obferving when any two flars pafs behind the yerpendicular edge of a wall at the fame time.
$L_{x}$. Vega and Atair were obferved to have the fame azimuth at London on the 11th of May; required the Hour of the night ? Anf. 15 minutes paft $2 \mathrm{~A}, \mathrm{M}$.
$\therefore \mathrm{P} H \quad 1$.
This problem may be applied to the regulating of Principles cluchs and watches, by reducing appareat to real time, as explained under Asfrongmy.
and
Problem XII. To find the rifing, fotiing, and culminating of any fiar or piante, its continuance above the horizun, its ohlique a/cenfion and defcenfon, and its eafern and wejern amplitude; the place and day being given.
Rectify the globe as in the foregoing problems; bring the given ftar or the given planet (finding its flace in an ephemeris for the given day, and marking it by a patch on the globe), to the taftern part of the horizon, and the index of the hour circle will point out the time of rifing : the degree of the equator that comes to the horizon with the given flar or planet, marks its oblique afcenfion, and the caftern amplitude is fhern by the diftance of the flar or planet from the eaftern part of the hoizon.

Bring the flar or planet to the meridian, and the index will point to the time of its culminating.

Move the globe till the flar or planet come to the weftern part of the horizon, and the time of its fetting, its oblique defcenfion, and its weftern amplitude, may be found in the fame manner as directed above; for its rifing, oblique afcenfion, and eaftern amplitude, the number of hours pafied over by the index, while the ftar or planet is moving from eaft to weft, will ftew the time of its continuance above the horizon.

Ex. 1. Required the above circumflances with refpect to Sirius on the $14^{\text {th }}$ of March at London. Airf. It rifes at 24 minutes paft two P. M.; comes to the meridian, or culminates, at 57 minutes paft fix P. M.; and fets at half-paft eleven PM. Hence it remains above the horizon nine hours and fix minutes. Its oblique afcenfion is $120^{\circ} 47^{\prime}$, its oblique defcenfion $77^{\circ}{ }^{1} 7^{\prime}$, ard its amplitude $27^{\circ} \mathrm{S}$.

Er. 2. It is required to find the fituation of the feveral planets on the 19 th of January 1806. Anf. Mercury is about $22^{\circ}$ to the welt of the fun, and rifes foutheaft by eaft, at 20 minutes before feven A.M. Venus is an evening flar, and fets about half paft eight. Mars is a very little to the eaft of the fun, and rifes and fets fo near the fame time with the fun, that he cannot be feen. Jupiter is a morning flar, and rifes about fix o'clock. Saturn is a little to the eaf of the far Spica Virginis, and rifes about half an hour after midnight. Herichel is vety near Saturn, and rifes about the fame time.

## Problem Xill. To find thafe fars wh.ich never rife, and thofe which never fet, in a given latitude.

Realify the g'obe for the latitude of the place; then, holding a black lead pencil fo as to touch the furface of the globe at the northern point of the horizon, turn the globe, fo that the pencil may defcribe a circle: all the fars which are between this circle and the elevated pole, never fet. Again, holding the pencil at the fouthern point of the horizon, turn the globe fo as to defcribe another circle there, and all the flars that are bctween that circle and the pole, below the horizon, never rife.

If the place is in fouthern latitude, the flars that ne ver fet arc found by defcribing a circ'e st the fouthers

Principies point of the horizon, and thofe that never rife by a fiand milar circle at the not them point (1).
Practice. Throughout almast the whole year, the moon rifts

163
Harveit
monon il.
Lu Iated.
later every fucceflive day, by above three quarters of an hour ; but at a confideratle dillance from the cquator, as in the latitude of Britain, France, and fome other courtries, a remarkable anomaly takes place in the moon's motion about the time of harveft. At this feafon, when the moen is about full, the rifes for feveral nights fuccefively at about 17 minutes only later than on the preceding day. This is attended with confiderable advantage, for as the moon rifes before twilight is weil ended, the light is as it were prolonged, and thus an opportunity given to the induftrious farmer to continue longer in the feld, Eor the purpofe of gathering in the fruits of the earth. From the advantage derived from the full moon at the feafon of harveft, it has been called the harvef moon. The following problem has been contrived for the purpofe of illufrating the phenomenon by mears of the globe.

## Problem XIV.

Rectify the globe for any confiderable nothern latisude, fuppofe that of London. As the angle which the moon's orbit makes with the ecliptic is but fmall, we may fuppofe, without any confiderable error, her orbit to be reprefented by the ecliptic. In Septemtor the fun is in the beginning of $\bumpeq$, fo that the moon, when full, being in oppofition to the fun, mult be in or near the beginning of $r$. Put a patch, therefore, in the globe at the firft point of $r$ in the ccliptic; and as the moon's mean motion is about $13^{\circ}$ in a day, put another patch on the ecliptic $13^{\circ}$ begond the former, and it will point out the moon's place the night after it is full. A third and fourth patch, put at the diftance of $13^{\circ}$ further on, will thew the moon's place on the fecond and third nights after full, \&c. Now, bring the firlt patch to the horizon, and obferve the hour pointed out by the index; turn the globe till the fecond patch comes to the horizon, and it will appear by the index that there are only 19 minutes betweta the time of the firit patch riting, and that of the fecond. This fimill difference in the moticn of the moon evideatiy arifes from the fmall angle which her orkit makes with the horizor. The remaining patches will come to the horizen with a little greater difference of time, and this diference will gradually increafe as the monn advances in the coliptic ; but for the firt week after the fuil moon at harveft the difference will not be more than two hours. If patches be continued on to the firt point in $\bumpeq$, it will be found that the time of their rifing, ir coming to the horizon, will increafe coniderably tilh the latt will be above $1 \frac{1}{2}$ hour later in coming to the horizon, becaule that point of the ecliptic mahes the greateft angle with the horizon.
The point of the ecliptic, which makes the lent angle with the horizon at riling, makes the greatell angle at fetting; and, coniequently, when the difer-
ence is leaft :t the time of riing, it is greatel at the time of fetting.

## Problem XV. To explain the cquation of time by the slabe.

## 124 S.quaten ch tune 1t-

 The difference between apparent time and mean or luitrated. equal time, has been explained in Astronony, from $\mathrm{N}^{\circ} 50$ to 60 ; and the method of computing the equation of time is alfo there defcribed.To explain the equation of time on the globe, make, with a black lead pencil, marks all round the equator and ecliptic, beginning with $r$, at equal diftances from each other, fuppofe about $15^{\circ}$. Then, on turning the globe, it will be feen that all the marks on the frit quadrant of the ecliptic, reckoring from $n$ to $s s$, come to the brazen meridian fooner than the corre! ponding matks on the firf quadrant of the equator. Now, as the former marks reptefent time as meafured by the fun, or a dial, and the latter reprefent it as meafured ty an accurate clock, it will be evident, that through the firf quarter the dial is fafler than the clock.

Still turning the globe, it will be feen that the marks on the fecond quarter of the eciiptic, reckoning froms To to $\bumpeq$, come to the meridian later than the correfponding marks of the equator ; confequently in this quarter the fun or the dial is flower than the clock. By moving the globe round, and marking the approach of the dots in the third quadrant, it will be feen that, as in the firft, the dial now precedes the clock, and in the fourth quadrant, that it is behind it, accordirg to the explanation given in Astrexomy.

## Seet. III. Of the Corgruzion of Gituet.

The cenftruation of globes is of corijer whle import- cienera ance; as, in performing the problems in which they are corftras e-ployed, very mech depends on the acceracy with tion o: which they have been conitufed. We ilall here, gitbtherefore, defribe pretty rimusely the method; is which the artilts of Dritain and France mas: that globes.

There are certain geneal dicuman es vicici an attended to in the conltruction of every globe.

There is frit prosided a wocden axis, funco leate: than the intended dian-mer of the globe, wal to the c:tremitics of this asis, which is the bafis of the whol: fucceeding natatar, there a-e fixed two metallic wire, to ferve as phes. Now, t.ou hetwifherical caps formted ort a woulen mones or cloch, ase apthicd in the :axis Thele caps are cunapued of pateboant, or fuils of pas. per laid one oven ancher on the mald, that they are of the rhiclonefs of a crowa picee: and ster the whow has thood to dey, wad has tecontio a fulis budy, min it. fion be mate with ot tharp kuite alues the midule, ano the two earss are thus thiped wf the montd. Whea the exdments of the cluse are thus lais, the arth procedito Atangthen the vork, and make the
furface mooth and equal. For this purpofe, the two poie: are fued in a mitalio femicircle, of the propoded fize; and a compofiton made of whitening, mixed with water and che, heatel, meited, and incorforated together, is daubed all o-er the paper furface. While the plape is applied, the globe is turned round in the femicircle, the edge of which pares away all the matter that is luperiunus and exceed; the proper dimenfions, and freads the reft over thofe parts that require it. Atcer th:is operation the ball Rand to dry, and when it is thonughly dried, it is again put in the fenicircle, and feeh plater applied to it, and thus they continue to apply commofition and dry the ball alternately, till the ierace accuatciy touches the temicircle in every point, when it becomes perfectly firm, finooth, and equal.

When the ball of the globe is thus finifhed, the map, comaining a delincation of the furface of the earth, is -o be pated an the globe. For this purpofe, the map is engraved in fe:eral gores or guficts, fo that when thele are accurately joined together on the fpherical A.face, they may cover every part of the ball, without - Gerlapping each other. The greatefl nicety is required in forming the engreel guffer, as will in the accuracy of the engraving, as in the choice and thape of the paper amployed. The method of decribing the gores or gufietc, whally employed by the Britilh artint, is as follows.
I. From the given dimeter of the globe there is ioud a right line $A B$ (fig. 12.), equal to the circumistence of a great ciecle correfpuding to that diame$\because$; an 1 thi line is divided into 12 equal parts.
2. Through the everll point of wifion, $1,2,3,4$, ise. with a difance eval to ten of the divilions, arches ase cefribed creflint each other as in D and E ; and Heie figuets are patied on the plobe, fo as when joined Wether to cover it, whode funtice.
3. Each part of the line $A B$ is divided into 30 - qual part, !o that the whole line, which may reprefent the cratur, is diviled into zrico.

4 . Froat the point: D and E , which reprefent thee Fhes, wib a ditance $=23^{\prime n}$, there are deforited arches at, $a b$, (3. 13.) which form twath parts of the potur circles.
5. In a finitar manner abrat the fame foles D and E., with a ditance $=66 \frac{1}{1}^{\circ}$, rechoned from the equator, hare are delcabed other ard hes, $c\left(6,{ }^{\prime}\right.$, which are the :we'fh part, cit the tropics:
6. I: forming the calelid she, through the point of the up...or narket e (fig. 13.) reprefenting the
 puin D and E , thece is dramban arch of a circle; at if the compement of t.ac decination from the fole i) b akon in the ernopaites, and an weth be deferib.

 : ticne, co.
S. 1.4-fine maner are detrmined the decinaniman

of laying down or delineating the gores of a celefia! Princ:opes ghobe. Thofe of the terreftrial globe are delineated in mach the fame manner, only that every place is laid down on the gores, according to its longitude and latitude, determined by the interfection of circles; and then the outline of the coants, boundaries of countries, \&c. are added, like the figures of the confeliations above mentioned.
9. When the furface of the globe has been thus projected on a plane, the guffets are to be engraved on copper, to fave the trouble of making a new projection for every globe.
10. In the mean time, a ball of paper, plafer, or the like, of the intended diameter of the globe, is prepared in the manner above defcribed, and by means of a femicircle and fyle, great circles are drawn on its furface, fo as to divide it into a number of equal parts, correfponding to the number of guffets; and fubdividing each of thefe according to the other lines and divifions of the globe. When the ball is thus prepared, the gufits are to be accurately cut from the printed engraving, and pafted on the ball.

When the papers have been thus pafted on, and fuffered to dry, nothing remains but to colour and illuminate the globe, and to cover it with a thin layer of the finett varnifh, that it may the better refift duft and meifture. The ball of the globe is now finihed, and is to be hung in a ftrong brazen meridian, furnihed with hour circles and a quadrant of altitude, and fitted into a ftrong wooden horizon.

The method employed by the French artifts in pro- Methed or je:ting the gulfets of glober, is thus defcribed by M. forming the La Lande.
" To form celefinal and terreftrial globes, it is necef. fary to engrave gores, which are a fort of projection or developement of the globe. The length PC (fig. 14.) of the a is of the curve, is equal to a fourth part of the circumference of the intended globe; the intervals of the parallels on the axis PC are all equai; the radii of the circles K D I, which renrefert the parallels, are equal to the co-tangents of the latitudes, and the arches of each, fuch as KI, are nearly equal to the number of degrees that correfpond to the breadth of the gore (ufally $35^{\circ}$ ), multiplied by the fine of the latit:ade: thus, there will be found no dififculty in tracing them; but the principal difficulty proceeds from the change which thofe parts of the gores undergo, when they are glued upon the globe; as, in order to adjuft them to the fpace which they ought $t$ o occupy, it is necenlary to make the paper lefs on the files than in the middle, becaufe the fides are too lons.
"The method ereployed by artifts for engraving the gures, is thas defribed hy Bion (Ljase des Glober, tom. iii.), and by Rofert de Vausondy in the fuenth

- ume of the lincyciopedic, and this mathod is fufttiont in pratical purpuies.
" Jraw on the parer a line AC, equat to the chord (fis), to make the half breadth of the gore ; and a ferimbiculas 1C, ciun th thre timas the chord of 3", is make the haf length: for thefe paper, the dim : Fors if which will be equal to the churd, become equal to the are thenclios when they are patted on the glube. Divide the height CP into rine parts, if the pitallels are to Le dramn in every $10^{\circ}$; divide alio he quatri" BE into nive equa narts; theregh each di-

* Le: Lu"je

Globes are made of vatious lize, fiom a diamcter firenume. of three inches, to that of as many feet; bit thenetn ..f
 fulficiently large for moft of the purpoles for which globes are employed. Some larige ghoes were made about 100 years ago, in France, by P. Corovelli, a Francilcan monk, which were in confderable reputation. They were engraved, and the plates are tilit to be feen at Paris, at the houfe of M. Defnox, in the Rue St Jacques. There are fome large globes at Cambridge, which were drawn by the land; bu: the largelt globes of which we have any acconnt, are tho ef which were made for the late urfortunate Loui XVI, and were kept in the palace of Marly. They were 12 feet in diameter, and we belicve, ate till 6 A iting at Paris, whore they ocolyy inu entite room. each of them being part!y in an upper room, and portly in that bedow it, the flour of the upper ruom furming the borizon.

The ascount which we invesiven of the method of contructing globes, will be ukfal to thoie who pu* chafe thefe inftruments; but to allit them thil furtace, we finall fubjoin the following practical sulcs for the choice of glubes.

1. The faper; fhould be well and neatly fatted co? the ghoses, which may be k:avn by the lmes and circles mecting coatly, and cotinuint all the way even and whole; the circles mot braking into ferctal arches, nor the parers either coming hor, or laping over one another.
2. The colours thould be tanpmant, and not hid :oz thick upon the glove, to lide the mames of the vhers.
3. The glc'e mould hang crealy betweon the braze:1 meridian and the wooden howen, nut incioning cither to the une fide or the other.
4. The globe thonld move as cloie is the horizo and the meridian as it conveniently may, otheraile there will be too much trable to find againit what part of the giobe any degrce of the meridian or hom zon is:
5. The equinoctial line honld be even with the hor:zon all romd, when the north or fouth pole is elevatest $90^{*}$ above the horizon.
6. The equinoctial lire hould cut the hotizon in the eaft and weft points, in all the elevations of the pole from o to $\mathrm{g}^{\circ}$.
7. The degree of the brazen meriuian matked 0 , flatuld be cxactly over the equinoctial liac of the glo'te.
8. Exatly han of the brazen mecidian fondel be above the horizon, which may be known by bin ithe any of the decima! divifers on the meridian to the worth point of the horizon, and finding thecir comple neent to $92^{\circ}$ of the fouth print.
g. When the 'guadrant of aititude is iloced as fan from the equator, or the brazen merilia:, athe the i. elerated above the burzon, the begiming of the degton of the gladratht hand reacin iust th the $i$ ban Gutace of the horizon.

Gation onc linut to atother, is degrees of the cquator muft Puacien. Phatice. pats whier the graduated edge of thie brazen neitciats.
$: t$. The wouden borizon thond be made fublan:4t and trong; it being generally ofterved, that, in mont alubes, the horizon is the fint purt that fuis, a fersunt of its laving been made too theht.

1:1 wife g globe, the eaturn fite of the horizon Aoudd bekept towards the obterver, (unlefs in particular problems which require a different pofition); and ti at fide may be known by the word eeff on the hori7 in. In this polition the obferver will have the graduter bide of the incridian towards him, and the quadrant of altit:de directly before him; and the globe will be exactly divided into two equad parts by the groduted fale of the meridian.

In periorming fome problems, it will be neceffary to turn about the whole globe and horizon, in order t.) look at the wett fide; but this turning will be apt to difurb the ball, fo as to thift amay that degree of the globe which was belore fet to the horizon or meridian. This inconvenience may le avoided by thrufting the feather end of a quill between the ball of the globe and the brazen meridian, and thus, without injuriog the furface of the globe, it will be keft from turning in the mevidian, while the whole is moved round, to as to examine the wellern fide.

We have airendy mentioned fome improvements which have been made on the clobes, for the purpoie of ranedying the cefect in the old conftruction, af placing the hour circles on the outfide of the brazen meridian. Some other in:provements and modifcations lave been contrived by various artits ; hut of theic we thall on'y mention thole of Mr Senex, Mr B. Alartin, Mr Smeaton, and Mr Adams.

Mr John Senex, F. R.S. invented a contrivance for remedying thefe defects, by fixing the poles of the diUrmal motion to two fhoulders or arms of brafs, at the difance of $23^{\frac{1}{2}} \mathrm{C}$ from the poles of the ecliptic. Thefe ihoulders are itrongly faftened at the other etid to an irun axi, which pafes through the poles of the ecliptic, and is made to move round with a very hiff motion; Co tiant when it is adjuted to any point of the ecliptic which the equato: is made to interlect, the diumal notion of the globe on its axis will not difturb it. When it is to be adjuited for any particular time, ether faft or future, one of the brazen ihoulders is Dought under the meridian, and held fait to it with one hand, while the glube is turned about with the wher; fo that the point of the ecliptic which the equator is to interfect may pais under the o degree of :ie brazen meridian; then holding a pencil to that point, and turning the globe about, it will defcribe the e pustor according to its polition at the time required; and trantering the pencil to $23^{\frac{1}{2}}$ and $66^{\frac{1}{2}}$ degrees on the brazen meridian, the tropics and polar circles will be fo deccribel for the fame time. By this contrivance, tl.e ceecrial givise may bc fo adjutted, as to exhibit not cnly the rifing and fitting of the thats in sif age, and is all lotitude, but likewife the other F.enemen : that depend upon the motion of the diurT. 1 mund the annual axis. Senex's celeitial globes, effecialiy the two greatetl, of 27 and 28 inches in Ameitr, Five been conftructed upon this principle; fo that uy nocane of a nut arderex, the pote ...
the equator is made to sevolve alout the pole of the celiptic.

To seprefent the above appearances in the mon na- Praftice. tural and caty mates, Mr iB. Martin applied to the contrivance of Mr Sence a moreable equinoctial and fultitial colure, a moveable equincetial circle, and a moveable ecliptic; all fo connecicd together as to reprefent thoie imaginary circles in the leavens for any age of the woild.

In order to the performance of the problems which Improve relate to the altitudes and azimuths of celeftial objects, ments ty Mr Smeaton, F. R.S. has made fome improvements ap. Mr Smezo plicable to the celeflial globe; and to give fome idea ${ }^{\text {ton. }}$ of the conftruction, they may be deicribed as follows: Inftead of a thin tiexible flip of trats, which genera!ly accompanies the quadrant of altitude, Mr Smeaton fubflitutes an arch or a circle of the fame radius, breadth, and fubftance, as the brafs meridian, divided into degrees, Exc. fimilar to the divifions of that circle, and which, on account of it ftrength, is not liable to be bent cut of the plane of a vertical circle, as is ulual with the common quadrant put to globes. That end of this circular arch at which the divifion begins, retts on the horizon, being filed off fquate to fit and reit iteadily on it throughout its whole breadth; and the upper end of the arch is firmly attached, by mears of an arm, to a vertical focket, in fuch a manmer thas $u$ ben the lower end of the arch refts on the horizon, the lower end of this focket fhall reit on the upper end of the brafs meridian, directly over the zenith of the globe. This focket is fitted to and ground with a fteel fpindle of the length, fo that it will turn freely on it withcut thaking; and the fteel findle has an apparatus attached to its lower end, by which it can be faftened in a vertical pofition to the brafs meridian, with its centre direcily over the zenith point of the globe. The fpindle being fixed firmly in this pofition, and the focket which is attiched to the circular arch put on it, and fo adjuited that the lower end of the arch juft reits on and fits clofe to the horizon; it is evident that the altitude of any object abose the horizon will be llemn ry the degree which it interfects on this arch, and its azimuth by that end of the arch which refts on the terizon.

Befides this improvement, Mr Smeaton propefes that, inflead of fxing the hour index, as is ufually dore, on one end of the axis, it be placed in fuch a mamen that its upper furface may move in the plane of the hour circle rather than above it. To effect tilis, he direcis the extremity of the index to be filed off fo as to form a circular are, of the fame radius with the :mer edge of the hour circle, to which it is made to tit exaetly, and a fue line is drawn in the middle of its upper furface, th point out the hour, inflead of the tapering point wualiy employed. By this contrivance, if the hour circle be made four inches in diameter, the time may be liewn to lialf a minute. For a mose particular account of M: Smeaton's imerovements, we refer the reader to the $79^{\text {th }}$ vuiame of the Philof ${ }^{\text {phical }}$ "itanfe tims.

Another improvement of the celefisl globe, ny which it is betice adanted to ditrommical purpofe, is deferibed in the artic!, Astrono.ny, Vol. III. p. 178 . Ift

In the bo: I ae tho wheels and two pinions, whofe perscume eut at Vad $U$; eithe: of which may be turnd by the fmen winch W. When the winch is put upon the asis $'$, and tumed hachward, the terrel. trial n!?be, wish its horizon ant celettial meridian, keep a. reit ; an the whele Tphere of circles turns round from calt, by fouth, to welt, carrsiag the fun Y, and mom $Z$, round the lame was, cauling them to rife above and fet below the borizon. Eut when the winch is put uron the axis U , and turned forward, the phace wish the fun and moon keep at rett; and the carth, with its horizon and meridian, turn round from wett, by fuith, to eaft; and bing the fame puints of the himen to the fun and mon, to which thefe bodies come when the earth kept at reth, and they were carfidd round it; hersing that they rile and fet in the fane points of the horizon, and at the fame times in the hour circle, whethe the motion be in the earth or in ti.e beaven. If the earthly globe be turned, the hour inder goes rumal it. how ciscle; but if the fyhere be turned, the hour cinde goes round below the index.

And fo, be thin contruction, the machine is equally $\therefore \therefore$ ed to thew ether the real motion of the earth, or the apprent motion of the heaven.

To ractiey the fphere for ufe, frrtt flacken the ferew in the upright hem $R$, and tahing hold of the arm $U$, nove it up or down until the given degree of latitude for any place be at the fine of the ftem $R$; and t. . W the axis of the fphere will be properly elecated, to as to iland paraflel to the axis of the world, if the mathine be bet north and fouth by a mall complef; 3hi done, count the latitude from the north pole upon bieceletial meridian LL, dum towards the north notch of the horionn, and let the hiorizon to that hatitude; then turn the nut $b$ until the fun $Y$ comes to the piven day of the year in the ecliptic, and the fun will be it its proper place for thit das: fand the place of the mon's :ffending node, and alto the place of the mona, Iy on Ehameris, and fet them right ac(ominely: latly, curn the winch W, until cither the fun coms to the nacidian LL, or until the meridian comes to the fun (accusting as suu want the fuhere or the earth to move), and (et the hour index to the XII. marked noos, and the whole mathine will be reetilied. Then turn the winch, and oblerve when the fur or nown rie and fet in the horizom, and the hour indes will thew the times thereof for the given day.

Thofe who have made the mielies açuminted with the efe of the globes, as cetcired in the firtit and le. cond fewions of this chapter, will be at no lofs to perform mans urchlems refiefing the motions of the benverly tedie, by means of this fohere.
in the $f_{1}$ herce, as to view from its coate the reprefen- Priecipes tation of the heavers dramn in its concavity. The lower part of the fhere, or that part which is not vithe in the latiture of Eritain, is wanting; and the $w$ meap aras is fo contived, that it may be turnod round with as lithe exertion as is requilite to wind up a common jack. Dr Lomg has given a defription of this fiphere, accompanisd witid a tigure, in his Altronomy.

The invention of the armillary flacre is thought by La Lande to be as ancient as that of aftonomy ned. It has been attiituted to Athas, to Hureules, to Anaximander, and Mufeus ; while others have fuppoied that it oripinated in $\mathrm{L}_{\mathrm{e}}$ ypt. The Pphere of Axchimedes, which became fo celebrated, appears to have been fomething like that of D: Long, as it was certainly compoca of a qube of ylaf, which, betides containing the circles of the Tphere, firsed as a planetarium, and reprefented the motions of the planets. Claudian has celcbrated it in tome beautiful liics. See Archirned:s.
A combination of the armillary fphere with a planetatium was conflrucied by the late Mr George Adams, and is hared in Plate XIII. nig. I. of his Attronomical and Geographical Effays.

## Chap. III. Of the Confiruction and Uje of Maps and Charts.

## Secr. 1. Defrription of Maps and Charts.

It has been feen, that the furface of the earth may Diftinction be delineated, in the moft accurate manner, on the fur- of maps and face of a globe or ¢phere. This mode of delincation, charts. however, can be employed only for the purpofe of repretenting the general form and relative proportions of countrits on a very confined fcale; and is, befides, fiom its bulk and figure, not well fuited to many of the purpoles of the geographer. To obviate thefe inconveniences, recourfe has teen had to maps and chatt, or delineations of the earth's furface on a plane ; where the form and boundaries of the feveral countries, and the objeets moft remarkable in each, whether by ica or land, are reprefented according to the rules of perfpective, io as to preferve the remembrance that they are parts of a folerical furface. In this way, the feveral comties or difticts of tle earth may be reprefented on a larger feale, and celineations of this kind admit of more eafy reference.

115
In maps, the circles of the fiphere, and the boundarics Defripurn of the countries within them, are drayn as they would of a map. appear to an cye fituated in fome pcint of the finere, or at a comfiderable ditance above it. In maps of any conflcralle ectent of country, the meridians and parallels of latitude are circular lines, but, if the map reI refents only a fmall diltrict, as a province or county, thofe circles become fo large, that they ming, without any confideratle error, be reprefented by firaiyht lines. In charts, w!ich are alfo called hydrographical maps, as they are reprefentations rather of the water than laid, the meridians and parallels are ufually reprefented by ftraight lines, crofing each other at right angle, as in the fmaller mays; and, in particular parts, there are drawn lines diverging from leveral points, in the direction of the points of the compafs, in order to mark

## Part II.

Pinciples the bearians of particular places. In maps, the ithand
and face of the country is chietly regarded in the dilines-
Practuce. tion; but in charte, which are defigned for the purpolis of nasigation, tie interna! face of the land is ieft nearly blark, and oniy the fan-coaft, with the principal ojjects on it, ruch as churches, light-houtes, beacon, ©c. are accusately delineated; while particular care is taken to marh the rocks, thoals, and quickfands in the fin, that may eruanger the fafey of veniel; the derths or loundings of the principal bays and harbours, and the diaction of the winds, where thefe are itationary or peculiarly prevalent. Another ditinction of maps and charts is, that in the former, the fea-coatt i, thated on the hie hest the land, while, in the latter, it is thaded tomarts the fea.

Ia maps the upper fide reprefents the north, $t^{\text {the }}$ lower lide the fouth; that on the right hand the eaft, and that on the left hand the welt. All the margins of the map are gracuated ; the upper and lower howing the degres of longitude, and the right and left marginn the degress of latitude.
see fig. 1. to which the reader muit refer in going over the following defeription). If the map is on a fmall feale, only every ten degrees of longitude or latitude are marked on the margin; but, if the map is drawn on a large feale, every degree is numbered, and fometimes every half degree is marked with the number 30 in fmaller figures. The fuace inciuded between every ten degrees in fmall maps, or between every two degrees in thole on a larger fcale, is whally disided into tea fpaces, which are alternately left blank, and marked with parallel lines, to denote the fubdivifions of fingle degrees or minutes. Through erery ten degrees of laitude a line is drawn, reprefenting a parallel of latitude; and through every ten degrees of lorgitude, or at imaller intervals in each, where the fize of the map will admit of it, there are drawn lines repreferting meridians. In fome mans thefe lines are continued from tide to ide, of from top to bottom, acrofs both fea and land; but in other maps, they are fometimes only dawn acrost the fe:l. The firlt mevidian, however, and the principal circles of the fphere, as the equator, tronice, \&c. thould always be drawn directly acrofs the man. In mon maps, it is marked on the margins, whether the longitule is eait or welt, and the latitude north or fouth; but, if this is not marked, it may eanly be known, by oblerving towards what part of the map the degrees increafe. If the degrees of latitude increale from the lower to the upper part of the map, the country delinented lies in north latitude; but if they increafe from above durnwards, it lies in futh latitude. Again, if the degrees of lon-itude inczeafe toward the right, the countries are in eaf longituie; but if towats the iuft, they are in well longitude.

The principal o!jjects that diverffy the face of the country delineated in the map, fuch a rivers, mominit., rocets, lakec, roads, citie., towns, forts, 心e. are markel in fich a manmer, at thit they may be moth eatily dif tingriflied. A river is denoted by a black croorad line, drawn very fine tovards the funce or then of the river, and gradually becoming bronder :as it amomaches iosurds the mout, ; and the lather nivers, or sival, Wh! ! uaite their waters with thofe of t.e phe (inal aream, are dennted by cimilar lines appe..rity to brati h wifom the firti.

 atpeazance of emose iffung from it fumanis. If ust or toreth are represnted by a number ot lithetrean $r$ niarub, flaced is a gromp. L Lev ate dam: 1 by a circumferibed fyot dladed witadert hita, am! bivo fens by a more refular fyot of th. . What hind, more itghely ihaded, or, where the map i- coloured, pinteis of a dight greas. Roaldsare reprecentad in a map in too alraight lines drawn parallel to each other, for the principal roads, or by a fingle ftedstat lime for the hoter or crofs roads. Cities are denutad uy a large lacule, or the figure of a clurch with the sluple in the middic; and if the city is the met:opolis of the country, this is denoted by a white circular face in the milde of the houfe or chuch. Small towns ate ulually reprefented by circles; and where a fmall church with the lleeple at one end oucurs, it denotes a prath. Whre the natp is on a large fcalc, or repretents onty a fmall uithict, the town are denoted by a group of firall liowes, or more commonly by a nuaber of fimall theded fiputs en each fide of the road. A fort, caitle, or fortined town, is denoted by a femiciocular pace furrotesd by an angular edge reprefenting buftions. Tise thoals apon the coalt are reprefented by fmall dots; the depth of water in bays and harbours by figure, deneting the number of fathome, among vilich is cometimes dient the fare of an anchor, to thew that in that place there is good anchorage for thip:

The boundaries or limit, that divide countrics from each other are dittinglihed in mans by doted lines drawn round each country or ditrici, in fuch a direction as to thow its proner form. Where the mp is coloured, the cotntrics or ditiricts are ditinguilhed from each other by the fide of the boundary next each being thaded by a different colour from that of the adjoining. Thus, in a map of Eurore, the boundary of France may be thaded green, that of Spain red, that of It.fy yeloon, that of Germany blue, \&ic. In one eorner of the mu? there is waally drawn a fale divided into a number of equal pati, by which the number of miles or leagues from one past or the map to another mis be mealured. S.metimes the parts into which the forle is divided are uled to wetote geographical mites, of co to a degree; but move commonly they correfpond to the mike in uto in the country where the map is made, :", in Britain, to Britih itatute miles of $60 \frac{3}{5}$ to a decree.

To manh more ditiactiy the bentings of difirent parts of the map, thas is uftally added in forme blank frace a circle with fixur rach, harhing the four cardinal peint of the comprs; the rond point being diftinguilhad by the figure of a flat did, and the catl poist by a cauf.

Till of late, the only dilinction between the land and water in maps and chart, was aturdeal by the

 Hiacuib the form and evtent of the lan!; mal, where the

Stcr. II. Of the Cu arugh of Map aw Chaw .
Thi: comtafive of maps confths in nataing a $\frac{1}{}$ rojestion of the lurface of the abbe on the plane of fome me of its ciscler, fumpoing the cye to be placed in fome particular paint. The deforibing of thele projection depends on the principle of perfuective, and the projection of she fphere. The genoral princip'es will be explained under thure articles, but the particular mode of drawing maps properly forms a pitit of the prefent treatife.

The methods of confrucing mans vary according to the tize or fesle of the wap, and to the projection em-

These are three projections employed in confructing mafe, the oribanaphic, the ficreosraplic, and the ghoular. In the orthon raphic projedion the eve is duppofed to view the part of the globe to be projected, from an infmite diftance. In this proicetion the part, about the midulle of the map are very well reprefented, but thate towarls the mar in ate too much contracted.

I: the therographic projection, the eye is fuphofed
lel or meridian forms an are of a freater circle, in propor- Presciples lion as it approzches nearer to the centre of the map.

By either of the e projections only half the globe can be reprefented in one projestion ; but in the nap of the wo:ld, the tho hemilpheres are ufually drawn on the plane of the fame cincle, adjacent to each other. By Mereator's projection, ufually employed for charts, and to be defcribed frelently, the whole globe may be reprefented in one projection, but much diflorted.

If the projection of a map of the world be formed on the plane of a meridian, the two projections will reprefent the eatlern and weitern hemifulberes of the globe.

When the projection is made on the plane of the equator, in the fituation of a parallel fphere, the projections reprefe:t the northern and fouthern hemifolheres, which apfear as their concave furiace would be feen by an eye placed at the oppofite pole. In this way the meridians become fraight lines diverging from the fame centre, and the parallels are circ!e having the fame comnion centre.

The following is the myod of conftrusting a mar of the worid, on the plane of a meridian, according to the globular projection. (See fig. 17).

About the cenare C , with any radius as CB , deferibe Ghbulat a circle, reprelenting the meridian that is to form the rojection Flane of the hemitphere. Draw the diameters NS, of a map of and $\Lambda \mathrm{B}$, crufing each other at right anzlec, and the former of thele will be the central meridian, and the latter the equatur. Divide each femidimeter into nine erfu.l farts, ind divice tach quadrant of the circle alfor into nine equat part, each of which will be equal to $11^{\circ}$. IE the fale oi the mup be fufficiently large, each of thefe may again be divided into ten equal pats or degrees. I he next ol ject $i$ i to defcribe the meridians prthing throush every $10^{\circ}$ of the fuator. Suppore we ase to draw the meridian of $80^{\circ}$ weil of Grcenwich. We bave bere three points given, the two poles and the point $80^{\circ}$ on the equatur, and it is eafy to defcribe a circle that thall pafs through thele three points. Thisarch will be the merdian. The method of drawing a circle through any three pcints is, in this cale, as follows. About the centre S, with the radius SC, defcrilie a circular arch, as XX ; and about the centre N , with the fame radirs, deloribe the arch ZZ; then about the ceatre $80^{\circ}$, with the fame difance, deffribe arches 1, 1, 2, 2, croling the former, and draw lines from 2 to 1 on each fide of $A B$, crofing each other, and $A B$ produced, in $D$. I) is the centre of the circular are, reprefenting the meridian of $80^{\circ}$ weft from Greenwich; and with the fame radius the meridi:n of I4 ne $^{\circ}$ weft longitude may be draisn. All tha other meridians are to be drawn in a fmitar manner, ty de. feribing a circulat arch throu h thee points $N, S$, and the required degree. (Se Glomerru.)

For defcribing the parsllels, furwote that of $60^{\circ} \mathrm{N}$. Jat.; about the centre $O$, with any radius, deferile the circle IGH, and about the points $60^{\circ}, 60^{\circ}$, in the primitive circle, with the larae dintance, deicribe the arcs $c c, d d$, cutting the circle $\mathrm{FG}, \mathrm{B}:$ thongh the points of interfection draw ftraight lises, and the point where thete lines mect in NS produced, as in I, is the centre of the arch that will reprelent the parallel of $60^{\circ}$. The cther parallels are drawn in a fimilar manner, obferving that the firft circle, fizh as FGH , mul have for its centere that pint in the central meridian through which the paral.t i whe disam. Fig. 19. repretents this
 and Fleted.

 hord of whare, and the vertat tine of ha't ild an: ec ate : thea add $t$, eher time mate of the hat chan',
 the verfed bive: the quations is ow wo to se dimater, and "o thin to the radim of the cinde requind. In this mannor the radii of all the merilines and paralleh may be found.

Ac, in drawing maps on a laree foble, compatice of an ordmary fize will not anfiver for decribiny the circalar ates, it is comeniont to have fome other mechanical contrivance for this purpolic; and it is found that a thin tlexible ruler of tough wood, called a trw, m.y be fo hended as to forrio a curve, very ucarly circulat, that will pafs throwh the three points that are to determine the moridian or parallel. In this way the circles on mase on a large fonle are wfually deann by engraversand ttulents of cemapiny; and where the circle is of very hase radis, the mechod is fufticiently accurate; hut it ouyt by no ma aus to be employed where compatie, of a proper iize cam be procused, or convenicntiy ufed.

The follumisy is the method wive 1, D: H.itom, Sor defriling a glolular proection of the earth on the plane of the c!ator. Fur the north or foulh hemiPheres draw AOEE, for the e puinoctial (fig. 19.), divilling it inso the four quadrants $\mathrm{E} .1,10,0 \mathrm{~B}$, and bE : and eich quatrant into 9 equal pars, repreienting exch $5^{\circ}$ of lon itule ; sult then from the printh of diwisen, draw hins th the cemare $C$, for the circles of imgimuc.  map; then C1) whit te the (a) ' fotheg then.

 fome faze:.. :hof is $A B$, chat y: gim....

Pishtre uivine aitu il the paralleis into the flme number oi crand part, but lemer, in propation to the numbers for the leveral latitudes, as directed in the lat method for the rectiline il parallels. Then through ail the corremonding diviions draw carwed lines, which will reprefont the meadians, the extreme meidims being EC and Fi). Letly, N:mber the degrees of lutitude and lonsitude, and place a icale of equal part, either in miles or degres, for meafuring ditances.

When the place of which a map is to be made is but fimall, as when a county is to be delineated, the mehatans will be fo nearly paralid to one anuther, and the whole will differ fo little from a plane, that the map may be lidd down in a much more eaty manticr Anan what is given above. It will be here furtheie:t to f.icafure the dillances of places in miles, and note them donn in a plane rectugular manner. The method of delinesting luch partial maps is the province of the firbewor. See Siriening.

Aercator's projection is chictiy confined to charts for the purpoles of navigation. In this projection the merioians, parallcls, and rhumbs, are all traight lines; but inttead of the degrees of longitute being everywhere cqual to thon of latitude, as is the cafe in plain chart, the degrees of latitude are increaled as we approach towards either pole, being made to thofe of longitude in the proportion of radius to the fine of the ditance from the pole, or cofne of the latitude, or, what is the fame lhing, in the ratio of the fecant of the latitude to radius. Hence all the parallel circles atc repreferted by equal and paralle! draight lines, and all the meridians are pazallel lines alfo ; but thefe increale indetinitely to: asds the poles.

From this proportional increafe of the degrees of the meridian, it is evident that the length of an arc of the meridian be imming at the equator, is proportional to he fum of all the fecalsts of the latitude ; or that the increated meridian bears the fame proportion to its trae ase as the fum of all the fecants of the latitude to as many times the radius. The increated meridian is alto malogons to a fcale of the logarithmic tangent, though this is not at fint very evident. It is not cera an by whom this analogy was titll difcovered, but the difovery appears to have been made by accident. It was fitit publi hed and introduced into the practice of narigatioa by Mr Menry Bond, by whom this property $\therefore$ ine tioned in an edition of Norwood's Epitome of Naigation, printed about 1645 . This analogy, though it had beon found true by actual meafurement, was not ©ceurately demonitrated. Nicholas Mercator offered to dichuic, for a fum of money, a method which he had Wifcovered for demomtrating it ; but this was nut ascepted, and the demonll ration wa, we believe, never
 sears after, however, the demonfration was again difiwered, :and publikied by James Gregory.

The mevidian line in Mercator's chart is a fenle of legarthanc tan ents of the half colatitudes. The dif$\therefore$ eners of lungitule on any rhumb, are the logarithms
 O, i, bin ? to each other as the tangents of the ar, !es
 tanectin 1 a table of the differences of lonatude, to te-

is to the tangent of any uther hamb, fo is the diferches of tie loganthmo of any two tangents, to the aif. ference of iongitud: an the propofed rhwen, intercepted beiween the two lacitudes, of who hati complements the logantlonir tangents were tak. $n$.

I: was the grat hady of our predecelloss to contrive fuch a chart in plane, with ftraight lines, on whicis all or aty part, of the world might be truly let down, aicording to their longitudes and litioudes, bearings, and drlances. A method for this purpole was hinted at by Itnieny, near zoco yeurs fince, and a general map in fuch an idea, was made by Mercator: but the principles were not demonitrated, and a ready way hown of defcribing the chart, till Wright explained how to enlarge the meridan line by the contimal addition of ficante, fo that all degrees of longitute might be proporticnal to thofe of latitude, as on the globe; which renders this chart, in feveral retpeits, far more convenient for the navigator's we, than the globe iffelf, and which will truly thew the courfe and ditance fom place to place, in all cafes of failing.

For further particulars relpecting the comtruetion, and for the ufe of charts, fee Niviciaion.

Ia choofing maps, it is proper to evamine particularly whether the curved lines of thale that ought to have the meridians and parallels arches of circles ve tatly circular. If the map is compofed of more than one theet, the theets thould be fo joined togctier as that the correfonsing meridional lines and parallels be each in one continued line. The colours in painted maps, as was viferved with refpect to globes, fiould be fine and tranfparent, and not kid on too thick!?

Maps folded for the pocket anfwer very well for travelling, in fo far as they point out the relative lituation of places; but, owing to the intervals at which the parts are palted on the canvais, the ditances between places cannot te atcertained with any degree of accuracy.

## Sect. III. Of the LYe of Maps.

Maps are of great utility in the fludy of geography and hiltory; and if they are accurately drawn, many of the probienis that are ufually performed on the globes, may be folved mechanically by means of maps.

In confulting a map, it is not fuaticient to find out in it the name of the place of which you defre to know the fituation, although this is frequentiy all at which the confuiter of a map aims: it is, beides, proper for the Ilddent to inform himlelf refpecting the relative polition of the pace, with regard to its vicinity to uther places; its bearings and dilance from the principal places ia the fime or nee howarg ditriats ; whother it is near the lea iture, and is near a convenient bartour; whether it be fated un fome principal river, and on what dide of the river; whether it is in the neighbourhood of a comiderab'c cansl; whether it be near a lake, mountain, foreft, \&c. and many other litio particulars that vill readily fursedt themfelses to an mentive reader.

The probicems that are ufarlly performed by means of mals, are the following.

1.1 maph on a large fone, or where the mentions and Uhotmers. paralls in of latitube are traight line, the latitude of the curac:-
 and the nlare，in that it m．$\because$ crols the fime deoreve of lati－ tuse on exch ifte of the mop；and the de ree crombl will he z＇se brim！e requiral．Un，with a ；air oi com－ presemen $\%$ the thozelt ditance o the place trom the nowent pronke），and ap＂ly the ditume to cither tide of the man，fo as to howi one wist of the compas－ fes on the fame parallel ；tho the wher point will thes the degree of latitade as mearusal on the graduate． 1 marin，comise from the paraliel noth or fowth，ac－ cordias as the flace is in morth or forth latioule．

The lowende of the place may be fou in a timilar manrer，！y ftrctching the thred ower the place，or lasing a ruler acrof it，fo as to cut the fame oegree of 1．en itude on the top and bottom of $t$ ：e map，and thint is the degree rejutred．

The above meth an ander very well in phin chats or in ：raps of comties，but when the me：dians and parallels are curved lines，we mutt find how ofien the ditance of the place，moure 1 by the compafies from the neareit parallel，will reach the nest parallel in a fraight dirco－ tion，and from thence the latitude may be found with fulicient exaztnels．Thus，fuppofe we are required to find the littitude of Borlin，the canital of Prulia．The neareft parallel is that of $52^{\circ}$ rorth latitude；the dif－ tance of Berlin fron this parallel will reach the parai－ 1 l 1 of $60^{\circ}$ in four tince，neafuring on the map of Cu－ rope．The fourth part of ten，of two and a half，add－ ed to 50 ，gives the latimde required，or $52 \frac{1}{5}$ ．

To find the longitule on fuch meps，meature how often the difance of the place from the nearelt meridian will xeach the ne：t neridian．＇lhus，in the fame intance， the dituce of Eerlin from the menidian of 10 ，which is the nearett towards the eat，taben three times，will extend a litule berma tice maridaan of 22 ．Add to 10 the third part of tais，ditatice，which is about three and a half．and we have $13^{\circ} 30^{\prime}$ for the longitude of Eer－ lin euft rom Loodon．

## Prozlev 11．The iasitude and lingitude of a place laing Grien；to fad the fiace on the mat．

Where the meridians and parallels are flraight lines， this is done by treteling one thread from the given la－ tilule on one lide of the map to the fame lutitude on tiee other hite：whle another thread is flrethed be－ twcen the corefonding derrees of longitade．The interfecting point of the tu threads feres the place re－ quired．Thu，sure we are requited to find the place oho＇e latitude is $32^{n} 29 \mathrm{~S}$ ．and longitute is $5^{\circ}$ $23^{\prime}$ E．Stretching me insud between the given lati－ thede，and naotion bet＂wn the ：iven bonsitude，we thall finc that they crol owr the Cy\％vi Good I Iope， which is the refure the place requited．

When the mondiane qud parallels are cuanct lires， the mont accurate vay will be to deteribe a circie of la－ titule through the given do－ree of latitude on cach dide， and a circle＂＂f longitude through the conrefponding de＂． grees of lorgitude，and the interfetion of thele circles will fiew the place．An eatier methol will be，linow－ ing between what two pradilels of latitnde an ！loryituche the place lio．，and confequently ly what four lines it is boundel，to find the fla．e by tial，by conlitering the ！roportional diltance of it from cath line．

If a pasallel of latituld happen to be drawn on $t^{\text {the }} 1.2$ ？thm，h the qiven fine，this problem ie eally iolved，by tacing along the manall，abal iccine what other 1＇ace it pahis throwhe If a parailel is 1,0 o drama thro：th the eiven place，the with a fair of come thes the disunce of the place from the neareit pa－ ralkl；thea keeping one foot on the parallel，and the ohlar in ti ha potitum as to deforibe a line parallel to the parallel of latitude，move the cornguite，and all the places over which the point that is not on the paralle： Jofer，have the tione latitade with the given phe：

This methal will not fucceed in mats on which a lrese tatet of country is delinented on a fmall feale．
Panali：I IV．Given the livilude of a place；to fin． on the map ali thide place that lave the Junne tro tuat．
Mind the longitude of the given place，and if a meri－ dian palfes through it，oblerve all the flaces that lie under this meridian；or，if a meridian does not pais thrount the place，find by the compante，as in the lats probiem，thoe places that are fituated at the lame pa－ rallel dikance with the given place from the nearelt meridian．Thee plancs hive nearly the tane longitube with the given place．

## Probien V．7，find the antret of a sizen place．

Find the latitude and lonsitude of the place by Fro－ blem I．and find ancther place of the lame longitude， whole latitule is equal to that of the former，but in at contary airetion．The imabitants of this latter place are the antes：to the latter．

Er．Suppotic a thip to be in the Indian occan，in lat． $13^{\circ} \mathrm{S}$ ．and lonc． $32^{\circ} \mathrm{C}$ ．it is required to find the anteci to ber prefent fituation？Arf．The place Whelt has weariv the fame longitude，and an equal la－ titude in a contrary direction，viz． $13^{\circ} \mathrm{N}$ ．is Madras．

## Problem VI．To jind the periaci of a given piace．

Find the longitude of the given place，and fubtrac？ it from $180^{\circ}$ ：the ramainder will be the loncitude in an uppotite direction of the perieci．Then find a place laving an cqual loncitade with this lat，and having the fame latitude with tibat $0^{\prime}$ the given place ：this lat－ ter is the fituation reguired．

For．It is required to find the periexci to the inhabi－ $t$ ats of the gif of siam．A．／．The longitude of Siam is にご $5=1$ ．Which，fubented from $150^{\circ}$ ，leaves
 at it the fane 1 titurhe with siam，viz，about $14^{\circ} \mathrm{N}$. is the ithmus of D ）aic：a．
Promera VII．T．Find the antipues of a giact place
Thin frollem iv luleed on mats in the lathe mather $\therefore$ on the globe．
Patati：a VIII．Marinsite i ur at any phacestaen；o Sinit what iotur it is in ayty fatt if the whrld．
Find the difference of longitude betwen the two flace ，and reduce this to it．cyusl shlue in time，by … An for val. the civen hour, if the pi ce $\operatorname{Pr}$. a - and the fune is the time requiral. It the ot the given place, fubtrat the difitance of lom itude in tome from the given hent, and the dillesure is the tim: tought.
re-1f, after adding, the fin is foun 1 greater 11min, 12 mult be cancolle?, and the hours riut lien rwaged from A. M. to P. M. and ace vedia; and it, on firracting, the diaerence in time between the two phaces happens to be greate: than the given how, is mutl be added to the stien how, and we hours changed as leare mentioned.

Ex. Suppofe it to te a prefent 9 . 1. IT. at Liben, what time of the doy is it at Pekin in China $A$ ? Yie cifterence ot Sonsitude Letwen Fckin and Libbon is $123^{\circ}$ is', which reduced to tinge gives 3 hours 22 asinnes a and fince Pekin lies to the ealt of Libon, tis mutt be sdded to 9 , the gisen hour, gising a fum ai 1 - hours, 22 mirutes; but as this is gre:ter than 12 , we mont take I 2 away, and the diference, 5 hous 22 - :nutes, changed from morning to aftemoon hours, is Sit time recquired. It is theretore 22 minutes paft five F. N. at Pekin.

Probify IX. To find thofe places in the torrid zone te : Altect:'e fun is ritrical on any given dey.
Find in an ephemeris, or nautical almanack, the fun's A Cortion for the given day; then obieve, in the mpp if the world, all thole places wlich lie under that paathe of latitude, which is the fane with the dechaAor, thit thele wiii be the places reruired.
$E \cdots$. It is required to find it what places the fun will ie vari it on the 25 th of Nlarch and 23 d of Septem:Fer: sin'. The fun's declination on the 22 th of Aarch, is 19 ' 5 . and on the 23 d of September $6^{\prime} \mathrm{N}$. $\therefore \because$ the pincienl places that he near the parallel of 19. 5. and 6 N. are the inond of St Thomas, the middite burt of the illands of Sumatra and Burneo; the G.ltipagn inte, and Quito in South America.

The Analemma, or Othog1antic Projection delineated in Ptate CCXXXV, will 位ve many of the moti curiow problems, and wibl the athitarce of maps will Le Amnt equivatent io a texeflial globe. The paralLel hace dreinn on this figure reprefent the degree of tie fun's d. climarine from the equator, whether month
 mathel the momen and day which cortepond to tisch Ene! toch decinations. The fine of the fugure dues not annit of linvis: every day of the year infented; but bs mhing alinuare for the inturmediate day, in pro"tinz: "t tic F!! , the decli, ation may te guefied at
 an I to the the hour of lumiting or funstans before what rix $0^{\circ} 1$ ork. As 60 minutes make an hour of time, aturth pait of the frace between each of the 1. Lr-iine will requfut 1 ; minute: which the exc can

 "apta to anf or any conn a purpole. The cives alf an ir wal the rentre at the ahtance of 117 earh, An) whe pint of the compras which the iun rifes and is a and no what paint the tialight Legins and ends.
$\begin{array}{llll}\text { A } & \mathrm{P} & \mathrm{H}\end{array}$
Patill.
Ia oncer to make ate of this an. .emma, it is onty Pimeipits nencirry to confider, that, when the latitude of the plive and the fun's decianation are both north or Loth fwe h, the iun rien berore fix o"loch, between the eatt ant tive clevated pole: that is, towards the north, if the laimbe and declination are noth; or towards the fath, is the latitude and dechotion are fouth. Let us mon foghe it is requited to fad the time of the dun's risus leting, the length of the days and nights, th. tine shen the twilight be, in- ad ends, and what pa: of the harizon the fun rites $\mathrm{a}_{\mathrm{i}} \mathrm{f}$ fets on, for the Liard puiat in England, Franktust in Gemany, or Absertie in Fratce, on the zoth of Apaii. The la tioue of thele pinces by the ma*, wit be sond nearly $50^{\prime \prime} \mathrm{N}$. Place the moveable index to that its point may toweh $50^{\circ}$ on the quadrant of north latitu'e in the figure; then oblerve where is edge cuts the pratlel line on which Aprii joth is written. From this reckon the bour-line towards the certre, and you wil rind that the paaticl line is cut by the ituex nearly at the di. Hance of one bour ant 15 mintites. So the fun ries at one hour 15 minutes before fix, or 45 minutes after fur in the morning, and lets 15 minutes after even in the eveniag. Ihe length of the day is if hours 30 minutes. Obferse how fir the interfetion of the edge of the index with the parallei of Apil 3oth to wifatet from any of ihe concentric circies, which you will ind to be a little bevond that marked two ponts of the compar, and this hews that on the 3 oth of April the fun rifen two points and fomewhat more from the eafl towards the morth. or a litle to the northward of eart-north-eif. and fets a little to the northwarl of wef. north-rect. Fo find the beginning and ending of the twilight, take from the graduated arch of the circle 17'- degrees with a pair of compalles; ruve one tuo: of the compafies extended to this diftance along the parthlel of Apuil 3 cth, tiil the other full touctios the ed, e of the index, which mutt fibll point at 50 . The place where the other ioct refs on the parallel of april 30 oth, then denotes the nunger of hours before fix at which the twilight besina. This is fomexhat more than three hours and a half, which llews that the twilight then begins foon after two in the morning, and liserife that it begins to appear near five points from the eall towards the north. The ufes of this analenma may te varied in a great number of ways; but the example juit now given will be futticient for the ingenious rader.

## Suct. IV. Of the Orizin and Progrefs of Maps.

The: frit map of which we have any certain record, Ofigine is that of Anaximandur, about 560 years before the mups. Chimlian era. This is mentioned by Strabo, booki. and is fuppofed to be that referred to by Hipparehus, under the nome of the ancient map.

It has been alleged, that Sefortris, king of Egypt, on bis return from his boalled apedition, after having traverfed great part of the earth, recurd d his match in maps, of which he gave copies, not onty to the Egyptiam, but to the Scythims, to the great admiration of both poople. This in the selation of Ealiathia, ; but M. Montucla confider it as a very improbable hlory, • Montusiu, and thinks that the invention of naps camot be dated HiJ. do frior to Amaximander *. Sume have fuppofed that the Natiemat. Jews laid down the holy lad in a map, when they dif tom, iv.
tributed ${ }^{\text {p. }} j^{8} 9$.

## Part II.

Principies tribute 1 the vificreat ? ortions to the nine tribier at S'iiloh; a fuppofition wiich is derived from Johluas ace count, that they were fent to walk through the land, and that they defcibed it in feven parts in a book. Jo. fephuc alfo relates, that when Johnua fent people fiom the diferent tribes to meafure the land of promife. he fent with them men well thilled in geometry. All this, howerer, is no proot that thefe perforts drew a iketch of the country, according to our ided of a map; bit probably only wrote down, for the fatistacion of their employers, the extent, boundaries, and general chamacteriftics of the divilion of the land.

Herodotus has given a minute defcription of a map contructed by Atiftagoras, tyrant of Miletus, an abridgement of whach will ferse to sive fome notion of the maps of thofe times. It wasdrawn upun bralis or copper, and feems to have been merely an itherary containing the route through the countries which were to be traverfed in a march which Aritagoras propofed to Cleomenes, king of Sparta, for the purpofe of attacking the king of Perfia at Sufa, that he might thus affift iu reltoring the Io:ians to their liberty. The rivers Ha1i, Euphrates, and Tigris, which, according to Herodotus, mult have been crollied in that expedition, were Luid down in this map; and it contained one Atraight line, called the royal road or high way, which comprehended all the flations or places of encampment, f: m Sardis, the beginning of the route, to Sufa, a diftance of 13,500 ftadia, or $1687^{\frac{1}{2}}$ Roman miles of 5000 $f$ fet each. The number of encampments in this whele reute was inf.

Ptolemy of Alexandria, the celebrated geographer mentioned in $\mathrm{N}^{2}$ 21. conitructed mans to illuitrate his defcription of place, and theie ate the fort that have regular meridians and parallels, the better to define and determine the firtuation of plices. Ptulemy acknowledges that his maps, with thie. Jdition of fome improvemeats of his cwn, the principal of which was certainly the introduction of merilians and paralick, were copied from previous maps made by Marianus Tyrius, \&c. They are, however, often very inaccurate.

According to Atheneas, a work which feems to have contained mars, was written by Baeton, under the title ot Alexander's march; and a work on the lame fubject is mentiosed a, the production or Anyntibus. We are informed by Pliny, thet this Baten was one of the furveyors of Alexander. marcher; and he quotes the exact number of miles wit thefe narcles, accurding to Batton's menfuration, and contirm their authenticity ly the letter, of Atexander. 1 liny alio remark , that: a copy of this conqueror's furveys was given by Zanobiur, his treafurer, to the gengraphe: Patrocies, who was admizal of the ficets of selemeus and Antiochus.

Among the mof celebrated of the auricht maph, are the I'cutingerian tation, fio called, becane pubilined by prutinger of Aughurg. Thefe tathes comain a itinerary of the whole Roman entelre; all place escept feas, vood, and defe:t, Leing laid down according to theis meafured ditances, thotigh withunt any mention of latitude, lanefinde, or bearing. A particular deleription of this manment of antiquity is given in the 18th voiume of the Hinory of the Academy of Inferiptions, and in the Ilistory of the Academy of Sciences for t765, from which M1. Muntucla has draven up the folloning account. The map of Peutinger, as it is in the Vioz. IX. Patt II.

## R $\triangle$ P $\boldsymbol{P}$ そ

urigival is the impurial librare, is ex.ally in i ee: foot in hei-ht, and 23 feet eigit inche, in le:. 11 , : cording to meafures taken by Buthe; from a rony of the fplendid edition eiven by scheele in $1 / 53$. 1: wo prehe:ads the whole extent of the Roman ear.ive, from Conttantinople to the ocean, and from the tha -rous A. fica to the northera parts of Gaul; hu the tate wheh it affords of this valt extent of country is by noment calculated to give $u$ an itea of its figure, mince the $35^{\circ}$ of lomgitude which it comptehends, occu:y 2080 ivches, while the $13^{\circ}$ of latitude are r mprifed whin the fince of one foot; thas the countrics repreinated are fo dictigured, that the Mediterrancan appear only like a broad river, and all the countrics are fo difonte i, towards the north and fonth, that they camot he tecognifed.

Moit of thofe who have feen this ancien* map, lave confidered it as the rude and bungling work of a man littie converfant with geography, and still lefs fo with mathematics; but Edmund Bratz confoters the dithortion of this map as fimilar to what we fee in fome pices of perfpective, and that it ought to be examined it an fome certain near point in order to perceive the oby-its in their natural propurtion.

Buacho fuppofed 1 mg ago, that this map was confructed with more ficientific fikill than it aplears to be at the firit glance; and that the apparent irregularities which we obterse in it, might have been introduced defignedly, tor the purpofe of deriving greater advantages as to what was intended for the principal woject. In fact, as the Roman routes extended almont entirely from eaft to wetl, they paid more attention to the meafures in this direction than thofe between morth and fouth; and the map in this way might have had thee greater convenience of being mure eafily rolled up, and confequently more portable.

Thus far Buache hazarded no more than conjecture; but a labour undertaken by him with a very dirlerent view, led him to the true defign of the map of Pcutinger
He had been tracing a fcale of climates, and of ther length of the days and nights, for the purpofe of attact.ing it to fmall maps of the diflerent countries of Europe. As the fpace occupied by the feale was proty maci? extended in height, but had very litule breadth, le formed the idea of drawing a kind of map upon two fales, one pretty much extended for the latitule, and the other very much contrafted for the loncitude, prefeiving the hollows of the coatis and buondaries of cac!: Atate. As this difpofition of hiv map ferangely di tign? red the conntrics which it was intended to reprelent, l was led to imanime that this map might be the reverig of that of Peutinger. This was fulicient to engage him to conilruct another map upon the fame priscinle. hat in which the feale of lungitudes was much grate:than that of the latitudes. He then faw that hee had been right in his fuppofition, and that the nap waifis be hall lait conilructed had a confiderable refembtase to that of Peatinger. This latter is in fact only a plan chart, coniltructed upon two fcales, of which that of the foncitudes is very great, and that of the latitudes much. imailer.

One dificulty alone arofe. By fuppofing that he $0^{\prime}$. firved in this map a cuilom at prefent eltablithed anoi. 5 geographers, of reprefenting the neridians by lise: drawn perpendicular to the baic of the chart, and the
parallets

Principled parallels to the e, water by fraight lines drawn parallel
ard to thin lame bate, Buache fund a confiderable error.
Instance live butiom of the gulf of Venice and Rome did not then appear, as they ought to do, under the fame maridian. He four, however, far the folution of this diffcult. The method of drawing the meridians parallel to :he fides of the chart. is a matter of pure agreement, and had probably net been observed in the map of r:hich we are leaning. The ancient Roman geogratiers having confdered that Italy was naturally divided Dy the Apperive, according to its length, into two part, int were nearly equal, had therefore delineated the lergth of lala from Trent to the end of the pennthat, parallel to the lower margin of the map, and had anernaucis arranged the other parts which the map was to conan. conformably to this difpofition; and as the length of Italy is not in a direction parallel to the equaltor. it would happen neceflarily that the meridians and parallels, if they had been drawn on this map, would fave been parallel neither to the fides nor to the lower margin of the map, and that the vertical line palling through Rome malt interject the gulf of Venice at about the middle : but this line is not a meridian.
' 1 ! us, this map is not io rude a work as has been in:-ined, hut has teen entirely conlructed according (t) rule ; and it even appears that the author had emCove pretty good materials in its compilation, as the positions are laid down in a manner that differs little - Af Aes-from modern observations *.

From the time of Ptolemy till about the 14 th century, no new maps were publihied ; and the firth maps of any enteem among the moderns were constructed by Alienator, to whom we are indebted for the projection according to which marine charts are conilructed. Bettor was followed by Ortelius, who undertook to cunkruct a new fit of maps with the modern divifions of countries and names of places, for want of which the maps of Ptolemy were become almolt ufelefs. After Mercator and Ortelius, many others published maps, Which were chiefly copied from thole above mentioned, till about the made of the $17^{\text {th }}$ century, when Blaeu publihed his large atlas, or Colingraphe blaviane, in which is a pretty accurate description of the earth, the fra, a td the heavens, comprited in 12 folie volumes. then: the fame time an atlas in tho folio volumes was published in France by N1. Sarfon, the maps of which we in general very correct, containing many improvemenes of the travellers of thole times. The maps of Blase and Stanton were copied with little variation both in England, France, and Holland, till from later obfervations De Life, Robert, Wall, \&ic. fublihed til more accurate and copious let, of maps.

The works of recent travelers and navigators have confiderably improved the construction and accuracy of our maps and chars; but there is shill much to be done, epecially with repeat to trigonometrical furveys, before my high degree of correctnels can be acquired. Among the lathi maps and charts, thole conflicted b) Mr Aronsfnith are in the greaten t ellimation.
A) a collection of good and accurate maps is of the
heads, according to their five, of the caveat of their
fate. $1, t$, Tho ie which confift more than fix sheets, fuch as De Rouge's map of Europe in 50 half theets, and Cant's map of France in 183 theets. 2dly, Thole from fix to four thees, to which clafs belong feveral maps of kingdoms. And, $3^{\text {div }}$, Thole from one tret to four, which is the imalleit five that can anfwer the purpose of an atlas. We thall briefly notice the belt maps of each faze.

Fianipheres, or Maps of the World.-We know of no very large map of the world that can at present be confidently relied on: the belt is that of Mr Arrowfaith in four thees; and Fatten has publithed very good maps in one fleet.

Mops of Europe- 1 It faze. That of De Bouse, publifhed at Vienna, or that by Sutzmann in 16 thees, which is the better of the two. ad Size. Arrowfmith's in four fleets. $3^{d}$ Size. That by Faden in one fleet.

Alaps of England.-I. The trigonometrical furveys of the counties, publifled by Linuley and Gardner, and by Faded. II. Cary's atlas of the counties, and his England and Wales in 8I tets. III. Fader's map in one fleet.

Maps of Wales.-I. That of Evans in nine fleets. III. The maps in Pennant's Tours, and Evans's Cambrian Itinerary.

Mops of Scofland.-I. The furveys of the feveral counties. 1I. Ainilie's nine thee map. 111. An excellent map by General Roy, and Aintlie's reduced map in one iheet.

Maps ci Ireland.- I. Surveys of counties. III. A valuable map by Dr Beaufort in two theets, or Faden's in one heat.

Maps of France -1. Caflini's, mentioned above, and the atlas nationale in 85 theets. 111. Faden's one theet map, and a map, in departments, by Bellycime in tour fleets.

Maps of the Netherlands.-1. Ferrari's man in 25 fleets. Il. Atlas de Department Belgique. III. Ferrani's map reduced by Faden.

Mops of Holland.-1I. Kep's maps of the United Provinces. Ill. Faden's map of the Seven United Provinces in one thee.

Maps of German:/-II. Chauchard's map of Germany. Ill. A map of the - Autrian dominions, in one that, by Baron Lichtenitern.

Maps of Priflia.-1. Sortzmann's atlas in 21 fleets. 111. Surtzman's reduced, in one Beet.

Maps of Sfain-Lopez's athos, nut, however, very accurate. Il. A map of Spain in nite fleets by Montale and Chanlaire. 111. Fader's map in one thees.

Maps of Por:usal.-II. Gcoffry's in proved by Rainsford, in fix fleets. III. De la Rochette', chorcgraphical map in one theet, published by Faden.

Naps of Italy.-I. The maps of the leveral fates. Ill. D'Anville's map of Italy improved by De la Kochette, in four flictts, publified by Fader.

Maps of Turkey in Europt.-III. Arrow mich's map of Turkey in two sheets. De la Rochette's map of Greece in one the et.

Maps of Swizerland.-1. Weiss's athos, publifhed at Straburg in 800 . 111. Wadis's reduced map in one sheet.

Maps of Denmark - I. Naps of the provinces, ender the direction of Bygge. III. Fading's maps of Denmark, Sweden, and Norway, in wire theet.

Maps of Sucden.-I. Ailas of the Swedinh provinces, by Baron Hermelin. IlI. De la Rockette's, by Fadern, in one theet.

Maps of rifa.- The beft gencral map of Xha is that by Arrowfmith in four theets, publithed in $18: 1$; and D'Anvile's, in fix theets, may fill be conlulted with advantage.

There are few good maps of the individual countries; but the following are eiteemed among the beit.

Of China.-D'Anville's atlas, and a map by Arrowfmith.

Of Tartary.-A map by Witfen, in fix theets, and one by De Witt in one freet.

Of 'fapan.-Robert's map in one fleet.
Of the Birman Empire. - The maps publithed in Mr Symen's cmbaffy.

Of Hind\&fan.-Rennell's map in four theets. His atlas of Bengal, and his map of the fouthern provinces.

Of Perfia there is no good modern map; but La Rochette publihed a beautiful one, to illullate the expedition of Alexander the Great.

Of Arabia there are fome good partial maps in Niebuhr's journey.

Of the Afiatic Iflands there is an excellent chart by Arrowfmith, in four iheets.

Of Au/lralalia, or Niw Holland, the beft drawing is contained in Arrowimith's chart of the Pacific ocean.

Maps of Africa.- The belt general map of Africa is ftill that of D'Anville, though fome little additions may be made to it, derived from the journeys of Park
and Prosin. Major Renncilt pankil marsma. ons. fukted with adrantage.

Of siby/twia these is a mol map in Eruer: : ?
Of EARupt, the beit najus ale lhat of tle ? ? i by Nichuhr, and that of Loner E.vpt by la Rochette.

Of the Mahomban Siater, the bell maps ate those by Shaw, and a chart of the Mediterranean in four theets, by Fader:.

Of the Cape of Good IIpe, the bell is Barrow's fursey.

Maps of America.- There is no modern general map of America that can be relied on. The beif it that of D'Anville, in five lhec:s, publilled in 1746 and $17+8$.

Mr Arrowfmith has publifihed an excellent map of North America, on a very iarge fcale, but has omitted the Spanith dominions.

Of the L'nited States, the beft map is Arrowfmith: in four theets, publihed in 1802; and there are very gooi maps of the individual provinces in Morle's American Geography.

Of the Britifb Po/kons in America, befides Arrowfmith's map above mentioned, there is a good map of Upper Canada by Smith, in one theet.

Of the We/l India I/lands, the be!t map is that of Jefferys in 16 theets, from which a fmaller one in one theet has been reduced.

Of South America, the beit map is that publifhed by Faden in 1\%99, in fix fheet, from an engraving done at Madrid fome years before.

## A P P E N D I X .

 tions of BEFORE we conclude this article, we munt make a fudy of few obtervations on the method to be fothowed for acquirftudy of ing or imparting geographical knowledge.geography. As fome knowledge of geography, as well as of chronology, is abfolutely neceflary, before hiftory can be properly undertlood, the rudiments of thefe fciences thouid be learned, as foon as the capacity of the pupil will allow. It happens fortunately, that fome of the moit ufeful parts of geography, thofe which confider the relative fituations, extent and boundaries of countries, with the manners and cultoms of their inhabitants, are highly interefting; and provided that a knowledge of them be conveved to a child in a pleafing manner, they are well fisted to interef his curionty, and awaken his attention. The more fcientific parts of geography, and a detailed account of the minute circumtances refpetting each country, though extremely uferul, and ind ed neceflary to the more advanced fludent, may he withheld for a little without any great lofs, till his age and judgement permit him to lee their utility and upplication.

In teaching geogajify to very young children, thic ir chicf attention thould be directed to thote circumflances which are molt interefting; and even with this limited view much may he learned at a very carly period. For this purpole the difected map that are ufuAly full at toy hop, rasy be emplosed with considerAble adrantage; but it is the resreted, that the maps 1. Sd in prenaring thefe ane feiden theen frem the moit
correct copies. Thofe works alfo which, under tine dis. guife of fictitious royages and travels, are intended t., convey a geographical knonledge of various countries. afford a very pleafing and profitable mothod of instruction. A late work of this kind, by M. Jaufret, entithed the Travels of Rolando, may be advantageounly put into the hands of young people; and, as they are firther adranced, the travels of - lyachartis the younger by the Abbé Barthelemi will give them confiderable information refpetting the mannels, cuflom, and hitiorical events of ancient Greece.

When the young fudent is fuliciently advanced to prolecute the itudy of geography on a more extenlive and fcientific plan, it would be defirable that he thould begin by reading fome elementary tieatife on altronomy, fuch as that of Mr Boonycattle, or the senctacie de la Nature; or, if he has acquired a proper degree of mathemrtical knowledge, he may read Laplace's Suflenc d'u Mundt, the altronomical part of Ry,iffon's Xíchanical Pholjophy, or the attronomical article in this dictionary.

It may ha pene, thet, fiom a defect of ear'y cducation, or want of time, a preliminary courle of attronomy canot be commanidu. Still, honever, confiderab'e progref may be made in gengraphy, by the mechamical mean of maj and fluce. The flulent hould, therefore, prowide himbelf with a pair of the bett globec, choien according to the direstions laid down in $\mathrm{N}^{2} 1=7$; and wiht a few good mers of thofe countrics which $3<2$
are
are moit intereiting, particuharly maps of Europe, Afia, Africa, and North and South America, the Britih inands, France, Germany, Italy, Rullia, and Denmark, which may be collected from the lift given at N ${ }^{\circ}$ ェг.

Being provided with thefe materials, the fudent thould firft read over Chap. I. of Part II. of this treatife, or a fimilar part of fome elementary work in geo-s-aphy. On the elementary principles of geography we would recommend the general principles prefixed to Mr Pattefon's gencral and claffical Atlas; and for teaching the ule of the globes, Bruce's Introduction to Geography and Aftronomy. For a complete account of modern geography we cannot refer to a better work than that of Mr Yiukeston; and for a combined decomet of ancient and modern geography, the pupil may haw recourfe to a work on that fubject by Dr Adam of Edinburgh.

Atier reading over the preliminary part above mentioned, the pupil may go through the fecond Chapter of Part II. folving all the problems as he goes along on the tewnitrial globe; and thus he may proceed progreflively tir wh the whole article, leaving that part of Part I. which treat of the hitory of geography for the lait ohjec: of his enquiry.

In ftudying the particular circumitaness of each country, the pupil hould always have the map of the country before him; and, as he goes along, fhould trace there the fituation of each particular place; of the principai mountains, lakes, the fources and directions of the rivers, the form and bounding of the fhores, \&c. In his progreflive view of particular geography, it will be proper for the pupil to begin with the country in which he refides; and, after having made him. felf malter of that, to preceed fucceffively to thofe which border on it, or whofe connection with it is the moft interefting.

Thus an inhabitant of thefe illands, after having taken a view of Eurore in gencral, fhould make himfelf acquainted with Britain and Ireland (by perufing the articles England, Scotland, and Irfiand in this Dictionary or in other works); whence he may proceed to France and its dependencies in the Netherlands, Sifizerland, Italy; thence to Germany and the Austrian territories, Prussia, Sweden, Denmark, and Russia; whence he may return to the fouth of Europe to Spain, Portugal, and Turkey, \&c. After Europe, the United States of America will probably he found the molt interelting; the pupil may therefore ftudy the geography of North America before that of Asia. From Asia he may proceed to Australasia and Polynesia; thence to Africa, and fo conclude with South America. Nothing will contribute more to the advancement of geographical ftudies than the conftruction of maps. If the pupil has time therefore he fhould early be infructed in this part of the
fubject by at firit drawing a map of the world according to the directions laid down in $\mathrm{N}^{*}{ }^{118}$. then one of Europe, and fo of other quarters and countrics. In conftructing this map, it will be proper firft to lay down thofe places which are near the coalt, in order to form the outline of the maritime part of the country, and only the molt remarkable places inland, efpecially thofe which are fituated in the courfe of the principal rivers. In every map the molt prominent features of the comtry, as the mountains, lakes, rivers, and principal cities and towns, thould firit be attended to, and from thefe the pupil may be introduced to the other places in the order of their magnitude or importance.

The moft agreeable and interefting method of fluddying particular geography, after having become acquainted with the elementary principles of the fience, would be to perufe the beft books of voyages and travels; for from thofe, where the traveller can be dependcd upon, the mett correct fyftems of geography are compiled. Many of thefe, however, are too prolix and particular to be put into the hands of moft young people, and a judicious abridgement of the beft of them will anfwer every purpufe; and perhas Dr Mavor's collection may be recommended, as the beft of the kind in the Englifh language. For thole whofe time and convenience will admit of their reading the belt writers of voyages and travels, there is no want of fuch works; and Mr Pinkerton has given at the end of his excellent work, a lift of the beft in mott languages. We fhall here only notice a few of the beft and latent.

## INTRODUCTION.

THAT part of natural hiltory which treats of the internal itructure of the earth, as far as wc have been able to penetrate below its furface; of the arrangement of the materials of which it is compofed, and of the changes urich have taken place in thefe, is called Geology, from $\mathrm{q}^{2}$, the carth, and noyos, $n$ difcourfe. This feience has been called by Werner, Geognosy, and is by him defined to be that fart of mineralogy
which, confidering minerals as a part of our sloke, treats Ir troduc. chetly of their bearings and poftions with refpect to cach tion. other (A). Till of late this department of literature * Foura. de was called phyfical geography, but at prefent the terms ${ }^{*}$ Poy/igue, Geology and Geogsosy are generally adopted; of toan Iv. thefe we have preferred the former, as being equally p. 44. exprelive and more familiar; and under this head we propofe to include every thing that is ufually comprehended under what have been called theuries of the carth.

Geology difiers from Cosmociony as a parl from

[^25]

## $\underbrace{\text { tion. }}$

 parts of the earth.Importance The fience of geology is of condiderable importance in many points of view.

1. The tiodent of natural hifory cannot but derive a great fund of proft and advantage from a fcience, which makes him acquai: cd with fo large a depatment of nature. Minetal budiec, whether we comider them as individuals of nature, or as coliected into thase mafies which form the llata of the earth, and the mountains that rile above its furece, are peculianly intereting to the naturailin, as wail from the vaility of form and beauty of aprearance whis! fome of them prefent, as the ufeful purpofes to which many of them are applied. The other hingdums of nature delight us with the difplay of order and detign exhibied in their organization, or intereft us from the intimate comevion which fubints between many of them and ourfles. Thefe are objects of the lienuiful; while the thependous mountain, the awful volcano, the towering cliff, the gloomy mine, and the majettic cavern, are objects of the grand and the /hbilime.
2. To the miner, and all thofe who are employed in fearching the buwels of the earth for the treafures which they contain, geology, as well as mineralogy, forms an elfential qualification. Experience has thewn that certain miserals and metals are found more fiequently attached to fome of the ftony materials of the earth, inan to cthers, and that a few of them are only found in particul..r itrata. Examples of this kind will be given prelently. We have allo learned that the arrangement of the materiah in the carth is fo far regular and unifurm, that when we how the particular materials near which certain metals and minerals are commotly fund, and the what dipotiona ia thefe places; and when we find in another firiacion the fame materiah dippofed in a fimior mamare, we are pretty cettion that the netal or mineral of which we are in farch in or far dinant. We are therefore enceararel to pollecte the femel with every probabiiity of cali. Thede whon watertake so diact on invertigation of thin kind, or to carry on the operatimas requific: fir the obtaining what is fought, wone's do well to infors them an befordant of fuch fact as are

 :utited win the:n. Fow wat of this neceflary informa- tion. iac. "e oiten fic rriestors impofe on the credulity. and impore ill the banes, of gmtenct of landed propers, who are las to fuppofe that they polieis on fome part of tinis thate a rich vin of metal, ham of coal, \&c. the volking of which will confiderably improve their i: rome.
3. The fature of undertakings of this kint, partly t. h, lar. from the villany of the projector, and partly from the d propme ignorance of his employer, fhews the advantages that tor; gentemen of landed eitates would derive from tho tuly of geology. An acquaintance with this icience would guard them againtt the artifices of defigning men, and prevent them from enbarking in uncertain and expentive projects, the iffue of which is too often ruin ard difappointment.
4. But the tualy ol geology boafts a nill higher ad-and to the vautage. Nothing bas more contributed to demonitrate Chriftamthe thath of the divine writings, and to clear up many do:btful paflages in them, than the difooveries that lave lately been made in the ftruqure and formation of the earth. The original fate of the globe is fo intinately comected with that which it at prefent exhilists, that we cannot properly undertand the latter without referring to the former; and recent experience has thewn that the obfcurity in which the philofophical hiowledge of this fulject was involved, has been high. 1 l f vourable to thofe fyitems of atheitim and intidelity which prevailed in the laft age. Much of this obicurity is now removed; and the invellizations of Whitchurt, Werner, Kirwan, Howard, and fome other geologith, by proving that the fuppofition of a deluge is the only lypothefis on which we can account for the prefent ilate of our glabe, have contributed as much to the advancement of truc religion as of philoforthical knowledge.
" So numerous indeed, and foluminous, have been the more modern geological refearches, and fo obvioully connected with the object we have now in view, that fince the obicuration or obliteration of the primitive traditions, trange as it may appear, no period has occurred fo favourable to the illuttration of the original thate of the globe as the prefent, though fo far removed from it. At no period han its furface been traverfed in to many different directions, or its hape and extent under its difierert modifications of carth and water been to nearly actertained, and the relative denfity of the whote fo accurately determined, its folid condituent ratts fo exactly dithingainded, their mateal relation, both as to paltion and compecition, fo clearly traced, or purfeci to fuch coriduble depths, as within thefe latt thisty vears. Neitler hase the telfimonies that relate to it been cyer in criticaliy examined and carefully $\times$ kiraw:
 in the later half of the is hematery *."

Geobogical refarcies feem at firt whe to be nterde. Defientic
 dent that the part of the earh which it is in our power rat ming th examine, is inimitely fmath when compared to that wh athe whith is antitely bevorid our :each: wad even much of the cis wated pais, that are or above the furface, would heon t.) be fo completely cut off from us by inaccedible focinion, and the ice and how with which the lum-
$\therefore \therefore 2$

## G E O L O G $\quad$ F.

Intrase : $\quad$ ane the are perpeteally covered, that the krowled.e of the ir frueture and compotitions ene. : : for ever remain impufect. Nuch of thefe diffcraties, however, is rather ayparent than real. It is twe that our refearcher cin extend but a very little v. We.ors the furface; but fo far as our experience 4., ye: tang't us, any larther inveltigation would be fore: a matier of curiofity than utility. Thofe metals and minerals which prove of mott fervice to mankind, are found at no very great depth in the earth, and fome of then almoit on its furface; and when we have peretrated key nd theie, the materials difcovered are of a nature io uniform, and of a texture fo firm and hard, that it is poffible they may extend even to the centre. Again, the irvelitations of Saufture, De Luc, Dolomieu, and Humboldt, have proved that the moft dangerous precipices, and the higheft fummits of thofe immenfe mountainous chains which traverle the earth in fo many directions, oppofe but feeble barriers to perfovering induftry and philofophic ardour.

The diverfity which occurs in the itructure and local arrangement of fubterraneous fubitances, feems to throw another difficulty in the way of the geologit; hut the farther his refearcbes are extended, the more will this apparent diverfity be diminimed. The practical ©kill which fome miners poffels in many parts of the world, proves that the mazes of this labyrinth are not without a clue; and we may fafely conclude, that when our knowledge of the itructure of the earth, and the difpofition of its materials, thall be itill farther extended, the greatcr part of the obfcurities under which the fukject is now veiled, will be entirely romoved. Multiplied obfervations of later years have enabled us to form certain general conclufions, and lay down certain general laws, which muit materially affit future ctfervers.

In the modern improvements of geology the Germans led the way, and Lebmann may te confidered as the father of the frience. Eminently ikilied in general phylics, practical mining, mineralogv, and chemiffry, and fully acquainted with the circumftances attending the relative fituation of moft mineral bodies in very extenfive tracts of different countries which he examined, he was enabled to deduce, from a long feries of obfervations, fome general conclufions, which have, with fome exceptions, been ince verifieo in every part of the world.

Lehmann was fullowed in his own cotntry by Eergnan, Ferber, Gmelin, Cronitedt, Born, and Werner; in Italy, by Arduini and Tilas; in Switzerland, by Saufure and De Luc ; in Rultia, by Pallas; in France, by Delametherie, Saint Fond, Dolomieu, and Lavoiner; and in Britain, by Hutton and Kirwan, names which muft ever be held in the higheit eftimation by the cultivators of this part of natural bitary.

Before entering on the ftudy of geology, it is neceflary to acquire a competent knowledge of chemil? $y^{\prime}$, and a pretty extenfive acquaintance with mineralogy, as thefe fciences form an effential introduction to the wore general refearches refpecting the ftructure of the earth. The former fupplies the means of afcertaining -he nature of the fubitances met with; and the latter r.ult be well underfood, before we can arrange the fe Fibftances under their profer heads, and before we
can comprehend the terms employed by geological I troduc* witers.

The ftudy of this fcience, like that of forme other parts of natural hiftory, particularly botany, can be profecuted with but little advantage in the clofet. The ftudent muft examioe the declivities of hills, the teds of rivers, the intenior of caverns and of mines, the receffes of the ravine, and the utmoit fummits of the mountain, before he cat obtain that degree of knowledge which is neceltery to conftitute a ivilful and philofophic geologif. Whtile making thefe pe:fonal obfervations, he flould fludy the works of the beft writers, and compare the facts related and defcribed by them, with thofe which he himfelf has obferved. The writings on this fubject may be divided into two principal clalfes, one comprehending thofe works which contain a fyitematic account of the whole, or fome part of the fubject; fuch as Bergman's Phytical Geography, the Geological Elfays of Kirwan, the Thesrie de la Terre of Delametherie, the writings of Werner, \&ic. : and the fecond compriing thofe works which treat of the geology of particular countries in the familiar ftyle of travels; as Born's Travels in Hungary, Ferber's Travels through Italy, Saufure's Voyage dans les Alpes, Pallas's Travels, Jar's Voyages . .iciallurgiques, Saint Fond's Travels in England and Scotland, \&c. After having acquired a knowledge of the principles and general facts of the fcience from the former, the ftudent will, by means of the latter, increafe his knowledge in the moft familiar and agreeable way.

In the ketch of geology which we are to give in Arrange the following article, we fhall confider the fubject un-ment. der three general heads, which will be the fubject of as many chapters.

In the firt chapter we thall defcribe the arrangement and ditribution of the materials of which the earth is compofed. Here, after giving fome general notion of that arrangement, we iball confider each of the primicipal materials under a feparate fection, in which we thall firft lay down thofe general marks by which each is diftinguifhed, defcribe its general arrangement, and mention the places, efpecially in Britain, where the fubltance is found in greateit abundance, and thofe metallic or mineral bodies which are commoniy found in connection with it. After having brietly confldered each fubitance, we fhall bring the more general diftribution of them under one view, fill directing our attention to the arrangement of thefe materials in the Britif inlands.

In the fecond chapter we thall give a brief outline of the molt remarkable theories that have teen framed in modern times, to account for the diftribution of mineral bodies, and the mannes in which we find them now arranged. In this chapter we thall dwell more particularly on the two rival theories which at prefent divide the geologiral world, and thall enumerate fome of the objections which have been made to each.

In the third chapter we thall give fome account of the deramgement of the fubitances that compote our globe, fo far as it has originated from known caufes; and this will lead us to the confideration of EARTH. puakrs and Volcanors.

The materi in ci which the omeral mif of the eth is compod, are vationty ditribued is different parts.

## Gencral

 d.Ariuti.n olvine maz tet a.sof tBe carth. In fome places they form irregular mates or block, either buried below the furiace, or elerared to a greater: or lel's height above it. In moll plaze, bumerar, the materiah are armaged in a more reghar manner ; thofe of the lame hind ueing cullected intu extenfive maftes, lying in layers or Atrata, above or below a fimilar ma's of ancther kind, or thate alternate with each other to a confiderasie derth. Theie derata ase fometimes found arranged in a direction parallel to the ho. rizon; at others they are vertical, or perpendicular to the horizon, appearing as if the herizontal ftrata had been litted up, and lad upon their edges. More commonly the ftrata are arranged in a direction inclining to the horizon, when they are faid to dip.The uppermott fritum is in malt places covered to a certain depth with mould that has evidently been formed from the decompontion of organized fubflances. In many parts of the earth this mould extends to a very confiderable depth, and conttitates the fuil ; in other places it is barely fufficient to form a coating to the ftrata, and in oti:ers it is entirely wanting.
14
A good inftance of nerizontal dirata oscurs ahout and verticaitwo miles to the eait of Balle"cattle in the north of firata. Ireland, of which we thall ipeak more particularly by and by. One of the moit curious examples of vertical thrata in Britain is found in the fmall inlond of Caldey, on the coalt of Pembrokelhire, where the ftrata of which the whole illand is compofed are placed in fuch a manner, that their edges are all expeled to view, and they may be fucceffitely examined from the one end of the inland to the other. It is feicom that an opporunity cffers of examining the arrangement of flrata So eafly as is afforded in this fmall illand. In mo:t cafes it is neceflary to penetrate to great depths before we can acquire an impertct knowledge of the itratification of the earth; and in no intance have ne vet proceeded a mive telow the furface. In Caldey illand, however, the ffrata may be examined to the extent of more than a mile, beginning at what may be fuppoled the upermot lisatum, which is not more than a rou: thick, to that which may be called the fowelt, at the oppofite end of the ifland, being a mals of red ftone of

## 15 more than a mile in depth.

Derange- Sometitacs the itrata ire continued in a regular arment of the rangement, preferving the fame inclination to a very tesata. confiderabie exter: ; but more commonly they appear in fome pars feparated, as if they had been brokea afuncer. Theic tepinations are ufually in a perpendicular direction, and the cavicies are found filled with various neteroseneous matter: Sometimes thefe are chiety compuled of fragments of the aljacent itrata, but for the micit part they confift of mineral or metallic fut:dize es of a different nature.
Whes thefe fiffures are flled up with broken fragments, or rubble, as it is called, it very commonly happers that they become the beds of brocis or rivers. Thus the river Derwent runs for a confiderable extent in D:rbythire over a fifure of this kind. When the Eflure is rilled up with a folic fony mation, this torms Vol. 1X. Part 11.

 ou, Cirebinm:.

 with the other parts of ile mat, on in : :the: : : :

 than before. Sometimes one fide of the mafs is now: daprefiel than the uther, as is commonly feen in conty of the itrata in Derbethire; at others tho two pats i. the mats are fo diturbed as to incline toward each other, as if they had beon broken upwatds. When the edges of the itrata un cuch ide of the fifure ate th.t. divided and diarranged, they are faid by the ninersis trap.

The chafris thus furmed are fometimes of confice:able width. Sone are found in Comsall nearly 20 fes: acrofs, and almott fall of metallic and uther mireral fubitances. It rot unfrequently happen, , that thele fifures are eropty, containing nothing but water in the bottom. A celebrated chaim of this kind is ltewn at the Peak in Derbyllire; and if a fone be thrown i.., it is heard to itrike from fide to fide for a condiderable time, till at length it feems lolt in fubterraneous wate:

If the country in which the flrata lie runs in a we ving direction of hill and dale, the ftrata ufually fre ferte the fame waving dircetion, heeping pretty rearly parallel to each wher. A curious example of this kind Fin: has been delcribed by Gerhard, as occurting in the cusmota: difrict of Mansfield in Germany. See fir. I. In Stratain thole places where fome remarkable dialocition of the stratasa atrata has not tiken place, their difribution is in ge- ${ }^{-}$. neral extremely regular, certain materials lying above or below certain others in an uniform nanner. The oblervations of later geologilts have difco:ered pretty nearly the arrangement that takes place in moft countries; and we fhall prefently give fome examples of the ftratification of feveral parts of Europe. Before we attempt this, however, we mutt mention fome circumftances in which the materials compuling the firata ditfer from each other.

The general oblervation of all motern geologitts Divifor of proves, that all thefe materials may be diftributud under be matent two general claffes; one condifting ot thofe fabftances ${ }^{\text {ils. }}$ which are found more or lefs connected with the remains of organized bodies, as the bones, teeth, ir.d fhells of animal, the trunks of trees, and other parts of vegetable bodies; and the other comprehending thofe in the fibftance of which thefe organic remains are never found. $A \subset i:$ is now generally believed that the latter of thefe are of a formation prior to the furmer, we thall here adupt the general divifion of them into primary and fecondary. We might go atill farther in this divilion, by arranging them under more heads; one, for example, contaning thote in which organic remain are fparingly found, and others containing thofe fubfances which are found only in rarticu'ar places; but as the firla of thefe involves in it a particular theory which we drall notice fully hereafter, and the others allude to facts which will be mentioned when treating of the feparate materials, we fhall not bere extend our i $\Lambda$

Tis dilhr.
ent flates

Thit natue $g$ gate hat low been aprifed to all fones which are compofed of an a gregate of çuartz, feldpar, and miea, diltributd ia fuch a manner as that each of them appear in a foparate flate; but as this dofinition I:s been confidered as too loofe, and comprehending t.o many varietics, the name is at profent rettricted to that hind of granitic ftome in which the quartz, feldfrar, and mica, are found in grains or cryit 1 is. Oi the tree lubltance, the feltipar is generally the mot athundant, and the mica the leatt fo.

Granite is found in the lowedt and the highen fituation, of the earth that have yet been examined. It furms the lafis of all the other flrata; and though thefe are fometimes found below it, this fituation feems th have been the confequence of fone accident, by which the infericr fablances were thrown below the granite. Many mountains feem almof entitely compored of granite, as Grfrom one of the Rhatian Alps; and there is a high hill of white granite :hout lix miles to the weft of Sirontian in Scotland. Sometimes large mafics of granite are found in a detached fituation at fome diftance from the mountains to which they appear to belong; and thefe maffes feem in fone infances to have been broken off, and rolled down the momtain, and in others to have been carried away by irrefinib'e torrents, or diftodged by earthquahes. On the fummits of the mountains near Port Sonnechin in Scotland, are found large quantitics of cetached pieces of granite, forme of them of amazing fize *.

Granite is molt commonly found in raft olocks, feparated fiom each other by rifts or chafms, irregularly difpofed. This is the cafe in mof moustains, efpecialiy in thofe which bave high, pointed fires. The ftructure of thefe blocks is pretty uniform, there occurring Seldom more than two varieties, one called porphyritic granite, in which the bafis is of a fine graio, containing large crytals of feldipar. Oi this variety many inHances occur in the north of Scutiand, and i.enr Carlfbad in Fohemia. The other principal variety is that is which the grasite is found in dillinet ghobular concretions, compofed of concentric lamelle. Thi vaicty was obiferved by Mr Jamefon, on the raal between Dreften and Pauzen; and Mr Barrand, in his defeciption of the Cape of Good Hope, mentions Feveral globular coneretions of inmenie fize. The itle of Arran
in Boctland alfo afords infances, of the fame variety. It is allo found in Corlica, and is often called Corica granite.
It has been doubted by fome geologits, whether the true granite is ever found firatifed ; but numerous inftances of its firatificatio: have been latcly adduced, that leave no room to doubt that this is fometimes the carfe. Pallas takes notice of tome Aratified granite on the banks of the river Berda, where what he conidered as perfect primitive granite, compatly crytullized, is difpoied in layers of various degrees of thickneis, fome not excee ling one-eighth of an inch, and bounded both above and below by blocks of foild granite + . Again, $+P_{a} h_{a_{3}}$, on the banks of the Gromoklea, he obferved fimilar Travivol. . layers of granite raming in a direction from north to ${ }^{p}$ s 21. fouth, each ted being from one fan to three feet fix inches in breadth, and cumifting of the mot perfect primitive granite, which he comfiders as a continuation of that nineral trat which produces the cataracts of the Duicper $\ddagger$. Mr Playair mentions an example of $\ddagger$ Ibid, volftratified granite which he faw in Chorley foren in Lei ${ }^{11}$ p. 503 . cefterhire, where real granite is dippofed in beds on the eaftern border of the foreft, efpecially near Nount Sorrel. Another inflance of real granite uffpoled in regular beds, is alfo mentioned by Mr Mayfair as occurring bear the village of Priefllaw in Berwickinire ||. Mr || Playfair', Jamefon obferved the Riefengebirge, which, feparates illyfirationt, Silefia from Bohemia, to be for 150 miles compoted ofe jze. granite difpofed in horizontal firata, and he obferved a four. fimilar Afratification in Saxony and Lufatia $\$$.

Granite conflitutes the bafe of moll of the Britin vol. ii. 227 mountains, but is more commonly met with in the north and weftern parts of the ifland. There is a confiderable mafs of granite which runs longitudinally through Cornwall, from Dartmore to the Land's End*. Confider- * Playfair, able maffes are found in Scotland, but their extent has $3: 0$. not been accurately afcertained. According to Mr Playfair, there is no mafs of any magnitude in the fouthern parts, except that of Galloway, which occurs in two pretty large infulated tracts. Mr Playfair thinks that Dr Hutton greatly underrated the quantity of granite in Scotland, which, efpecially in the north, he confiders as extending over a large diftrict. If we fuppofe a line to be drawn from a few miles fouth of Aberdeen, to a few miles fouth of Fort William, it will, according to Mir Playfair, mark out the central chain of the Grampians, along which line there are many granite mountains, and large traets in which granite is the fimproprevailing rock + .

It is remarkable that in the mountainous regions of ${ }^{\ddagger \text { Annall de }}$ Peru, efpecially in the environs of the volcanoes, no $M u f$. Nut. gratite is fomd, exceft in very low fituations, at the $\mathrm{j} y$. . bottom of valleys $\ddagger$.

Several varieties of granite are ful jeet to decay, from $\mathrm{D} \in \mathrm{e}$ : of the decompoition of the feldfpar which they contain. granite. This circumfance will probably explain a curious fact. It is found that the granite exiffing in the interior of mountains is much fofter than that near the furface, probabiy from the decay of the feldfpar in the latter, while it remains in its original fate in the former (B).

Granite
(B) The decompofion of granite arnears to go through feveral fages, from the folid rock to the loofe fand.

G E O L O G Y.

Arrange. ment, \&c. of the M.. terials ot the Earth.

* Gour. de
$P_{b_{X}} f$. tom.

Granite is by no means abundant in metallic and the richer mineral fubitances; it, however, contains a confiderable variety, fume of which have as yet been found in no other fubll nace, efpecially molybdena. Iron azes are very commonly found in geanite, epecially the compat brown iron flone. It fecms to be owing to the prefence of iron that granite affumes that fine reddith colour with which we tometimes fee it tinged. One of the mont remarkable inttances of this kind is afforded by the rocks to the fouth-eatt of the valley of Chamounif, at the foot of the Alps. Thefe rocks, from their red appearance, are called Les Aisuilles Rowser, or the red ncedles. Thefe rocks were mentionel by Sauflure, tut he had not afcertained their compofition. This has fince been done by M. Berger, who found them to be compofed of granite, with a confiderable quantity of oxide of iron *. Bifmuth, cobalt, blende, galena (an ore of lead), and feveral ores of copper, are alfo fometimes met with; but the metal moft frequently found in granite is tin, efpecially in the great mining feld in Cornwall.

## Sect. II. Gneifs.

Gnenss, by fome writers called kneifs, is not unfrequently confounded with granite, from which it differs rather in the arrangement than in the nature of its component parts. Thele in gneifs are arranged in a fchiftofe or flaty form, whereas in granite, they are in diftinct grains or cryftals, the layers being generally in the direction of the mica. It fometimes is intimately incorporated with mafies of granite, but, in molt inftances, it repofes on the granite, being generally the fecond layer. In defcending into the valley of Chamouni, Sauffure obferved a fine bed of true granite incorporated with a rock of gneifs, which was arranged in very fine leaves + . Sometimes the gneifs lies entirely below the granite; but this is uricommon. More generally there is found a vertical mafs of granite, with ftrats of gneifs on each fide of it. Very freguent!y granite and gneifs alternate with each other.

Sometimes whole mountains are compofed of gneifs. Thus, Ben Lomond fearcely contains atiy other fubftance, and the Schaw, which is the moit northern point of the northernm of the Shetland iflands, is entirely gneifs. Mountains of this kind are, in general, neither fo high nor fo fteep as thofe of granite, though Mount Rofa in Italy, and a few others, muft be excepted. The fummits of thefe mountains are alfo generally more rounded than thofe of granite mountains. 'The bafes of sll the Shetland iflands feem chiefly compofed of gnei's, and the middle part of the Pyrences is almolt wholly Eormed of this and granite.

It is curious that where gneifs is contiguous to gra-
nite, its quar:z and fellefer are moe aponerst, and the mica lefs fo; whike, where it is mo: untant trom granite, the contrary happet.s $t$.
 Is a lafe of ian, as the magnezic in in itone, ant tnatial the fatt: pritue; leal ores, tin cre, thende, cubalt, coper, $M$. ${ }^{25}$ and arterical pyrite, and not unfremently tiver ures. Wh ons an

## Sect. III. . Micaceous Schifut.

$$

& i X_{r}
\end{aligned}
$$

$$
E_{0} r_{1}=
$$

Tris is otherwile called fchifofe nica, and mica fate ${ }^{2} ;{ }_{2}$
It is alo compofed of the lame material with granite ${ }^{1}{ }^{27}{ }^{27}$ and gneife, tacept that it contains little or an feldipar, 1 an the quartz and mica being arranged in lyets as in gneits.

This fubftance alfo is very abundant in molt rock and mountains. It generally compofes the third layer or Atratum, being immediately above or without the gneifs. It not uncommonly appears to be the only fubItance compofing the hill or mountain, from the gneifs and granite being probatly fo completely covered as to be out of right.

Micacecus thiftus compofes the rocks that are found where immediately to the north of Dunkeld in Scozland, an! ourd. it is here penetrated in every direction by veirs of quartz. The fuathern hores of Loch. Tdy, the mountains of Glen Lochy, the wale of Tumel between Loch Tumel and Loch Kannoch, contain much of the fame fubitance; and the lower part of Glen Tilt is chienty compofed of it. In the nettern Highlands toward; Ben Lomond, micaceous fchittus alfo abounds, and fome of it is tound in the north of Argylethire. The Shetland illands are moftly comfofed of micaceous ichiitus, in thick layers above the gneifs, with a tew malies of granite interfperfed.

It not unferquently happens that a sed of micaceous fchiftus is interlected by veins of granite. Mr Jameloan obferved an example of this in Gien Drumnond in Ba. . $M \rightarrow$, $f$ denoch, of which he has given a plate. The veins are tie z̧es very large, ard run acrofs mise ftrata of fchiftus in a di vil irection near!y paraliel to each other ${ }^{*}$.

The metallic ores found in micaceous fchitus, are ne: chienly thofe of iron, copper, tin, lead, cobalt, and an- ? timony.
SECI. IV. قuriz.

Quartz is not unfrequentiy found difinet from fend enz... fpar and mica, and fometimes whole mountains sie found eompofed of it. In particular, the monntain wf Kultuc, at the fouth-eaft end of the lake of Bakn? among the Altaifchiau mountains, which is 48 -o fice: long, $3: 0$ high, and above $40=0$ broad, conilt, e: tirely of milk-white quartz; whd the mountain of Flits.

$$
4 \Lambda_{2} \text { berg }
$$

Thefe are thus marked by Mr Jamefon. In its beginring difintcgration it fulits into raner, having a greater or ? if tender.cy to the quadrangular furm; lut thefe malle, have ftill a co aree of connexiun amoneft the niflves, as is the cafe upon the mountain top. The ment ftep is the enlargement of tie fifure, by which the nathes ate

 glens with their thendonsmins. Latify, Theme dewheimmes, by the wetion of the weather, are completely Cinterratec, foming a loofe iand, whirh in tot ben the tops or fides of the monctink, or is carried in graz

Aranno- bere in Latave, is alnoit wholiy compofed of it. There ment, ©e. is alfo an extentive sidge of quartz, fome niles long, in oi the Ms- Buaria, and Momet mentions a rock of it 60 feet tetial. of ne Eirth. Mountains of it are alo found in Thuringin, St -1.13, and Saxony. It tometimes forms layers between gincits and micaceous fchiftus. A contiderable fratum of this kind, confitting of granular quartz, is found between granite and micaceous fehiftus in the illand of ITlay, lee fig. 4. $\%$. It is ofter found forming fipires on the tops of mountains, and appearing like fnow.

Quartz is found in feveral parts of Britain ; but there $\therefore$ very little of it in the fouthern part of the illand. Williams found it very common in the Highlands of Scotland, where he has feen it regularly ftratifed, with other regular itrata immediately above and below it; and fometimes compofing high mountains entirely of its own itrata. Thefe ftrata are fometimes moderately folid; but often are naturally broken into fmall irregular malles, with tharp angles, and of a uniformly fine granulated texture, refembling the finett loaf fugar.

There are large and high mountains of this fone in the fhires of Rofs and Invernefs; and in a clear day thefe appear at a diltance as white as fnow, being quite bare of vegetation, except a little dry heath around the
Whiams' Miastat

The mountain of Swetlaia Gera, one of the Uralian chain, confilts of round grains of quartz, white and tranfparent, and of the fize of a pea, united without any cement.

No metals are found in quartz, though it fometimes contains petroleum.

## SEct. V. Argillaceous Schiffus.

$\overbrace{}^{4}$ rgiliace--135 iclaiftus - me: ibe.'

Thts ftone, which is otherwife called clay fate, is the thunchieffir of Werner, and the argillite of Kirwan. It is of the lame nature with gneifs and micaceous fchifuns; but in this the ftratification is fill more complete, and all traces of crytallized granite entirely difappear. Duubs have arifen whether this fone is primitive; but there are now cleared up, as it is frequently found altemating with gneifs and micaceous fchittus, efpecially it Saxony, and with other primitive ftrata. It fometimes haflens, too, that both gneifs and granite reft upon it.

There are two varieties of this ftone, one hard, and the other foft; but the hard often graduates into the iofter.

Sometimes this fone i fuund forming whole mounthins; but more commonly it enters into them only partidly. I: lome, howerer, there are encire ftrata of it, as at Zillurthal, in the Tjrol. The famous mountains
of Potofi conflit entircly of argilhiceous ichitus, and Sauflure found it on the fummit of Mont Blane.

In Britain it is not very common ; but is fometimes found on the higher parts of mountains. Thus it forms the fummit of Skiddaw in Cumberland.

Argillaceous fehitus, efpecially the fofter variety, is remarkably rich in metals. We have faid that it forms the greater part of Potof, one of the richeft filver mines. The ores of copper and lead, fulphur, pyrites, blende, and calamine, are alfo found in it. The great belly of copper ore in the Parrys mountain in Anglefea, is found below this fubttance. It allo fometimes contains antimonial and mercurial ores.

## Sect. VI. fa/por.

It was fuppofed, by the earlier mineralogits of the Jafper delaft century, that jafper was only pure quartz, fo muchicribed. penetrated by a colouring metalic oxide as entirely to deprive it of its tranfparency; but Sauflure and Dolomieu, with their ufual accuracy, difcovered that it confilts of flint, and not of pure quartz, having in combination a quantity of argillaceous matter, more or lefs mixed with oxide of iron.

Primitive jafper is always opaque. It is commonly found imbedded in other ftony matters. In colour it varies from red to green, and frequently confitts of a!ternate ftripes of red and green, formetimes perfectly diftinct, at others running together. There is a beautiful variety figured by Patrin, in which a dark-red ground is crofled in every direction with curved white lines, leaving here and there circular fpaces of red furrounded with white, forning eyes.

Striped jafper is fometimes fo abundant, as to be the Where chief material of fome mountains, in which it is mixed found. with broken fragments of granite and other primary compounds (c). Mountains of red and green jafper alfo occur. Generally, however, it appears in ftrata, interpofed between layers of micaceous fehiftus, or alternating, and fometimes mixed with compact red iron flone. It is found in the fouth of France, repofing on granite; and in the Altaifchan mountains, it fometimes lies below argillaceous fchiftus, but has there never been found in contact with granite. A coarfe kind of jafper is fometimes found in the hills near Edinburgh; and fome fine fecimens are met with in the northern mourtains.

## Sect. VII. Hornfone,

This fone is confidered by Dr Kirwan as the fameHorntore with petrofitx, but Patrin and fome others diftinguilh defribed. them.

[^26]
## Chap. 1.

G E O L O G Y.

Arranze them. According to Patrin, horntone is a compound m.n', \&cc. primitive rock, conipofed of the fame elements with of he Matescis ot, the Earth. ing to the itone a dull, giav, or fometimes blackilh, colour, and containing a pretty large quantity of the argillaceous mater of mica. Petrolilex, according to him, is purer than hornitone, and commonly of a grayih or greenith colour, femitranfparent, and very hard, fo as to give fire with iteel. They are often found united, and fometimes form entire mountains, containing fragments of feldipar interfperfed. They are commonly found in large thick mafies or blocks, though they are fometimes itratified like the fchiltofe ftones. Dolomieu is miltaken, when he afferts that petrofilex is only found in primitive mountains, as it will appear hereafter, that it is fometimes a fecondary compound. At Tuhumas, in the ille of Rona, Mr Jamefon found a mafs of rock chienly compofed of horntone and quartz, from 12 to 15 feet wide, and of confiderable iength, lying between two beds of gneifs.

## Sect. VIII. Pitchjone.

$3^{8}$
Pitchtone The Germans have given the name of pitchfone, or defonbed.

39
Where found. pechffein, to a ftony matter, which is found in large mafifes of an irregular form, and of different colours, as yellow, brown, red, green, \&c. having fometimes the appearance of rofin, and fometimes that of an enamel, or of glafs imperfectly tranfparent. It is never cryftallized.

It is found, either in large maffes, or in veins. At Mifnia, it is found forming entire mountains; and in
other countries there are mountains containing ifrata of pitchitone, fometimes alternating with granite, at others with porphyry. Mi Jamefon defcribes a large vein of it of a green colour, feveral feet wide, traverfing a mafs of red argillaceous fanditone, at Tormore in the ifle of Arran. This vein is extremely curious, and contains iftratulx of different fubitances depofited in - Gomefn's the fame fillure *: Alwother curious vein of pitchifone Mineral. of is defcribed by him as traverfing a bafiltic rock, toge2te I/A, vol ther with a vein of horntone, in the itkend of Eigg t. ${ }^{\text {i. p. }} 13$. vol. 2i. Mr . Jamefon coniders this as the firlt example of pitchP. 44 . itone travering bifalt, difcovered in Europe, though fimiar appearances have been found on the top of the peak of Teneriffe.

Pitch ftone is orly confidered as a prinitive rock, wheas it is neariy ailied to porphyry.

## Sect. IX. HLrnbictá, atal Hornbleado Slate.

40
Hornbien ie Horsblfade: is fometimes found exifting feparately s.:t. from the compounds in which it ufually occurs, as is the csie in siberia, where there are mountains of black fecta bichie. It is ofen found mised with quartz, nieca, feldipar, or whorl, of a greenih or biack colour. Mofe commonly, however, it occurs in immenfe Ifrata, fometimes i: layers of gneif, argillaceous fchiftus, or primitive limefone. A itratum of it above primative limeltone has beea found it Miltiz. It is formtim. sicen beiow granite, or granite is even found imLedded i.i it. A rock of horntlende, repofing on gra1 Min of ri.ie, has been feen by MrJamefon in the dife of iman; ike, and on the fide of Loch Fine he found it wherating 5 :- 49 with itrata of micaceous fehilur f

The principal metailic lubitances found in horn- Arrangeblende ilate, are native fulphuret of iron and copper mert, ac. ose. of the $\mathrm{Ml}_{1-}$ :erials of $=$ 41
Serfentine is a itone of a fimilar nature with refpeet fuund in : to its ingredients with thofe we have been defcribing. 42 It takes its name from its appearance, being generatlyserpentire of a greenih ground, marked with white, yellow, ditrbect. brown, or reddihh fots, fo as to bear fome refernblance to the thin of a finake. Its green colour is owing to a quantity of fightly oxidated iron which it contains. It is ufually opaque; but fometimes parts of it are femitranfparent, and though not ve:y hard, is capable of receiving a good polifh.

Serpentine is by no means uncommon, and is often wherfound in layers alternating with primitive limeltone, or :2and. below gneifs. The hill of Zobtenbeg in Lower Silefia, confifts almoit entircly of ferpentine, difpofed in nearly vertical itrata, with a little hornblende interfperfed. Whole mountains of green ferpentine are alfo found in Siberia, and near Genoa, where it is calied gabbro or pulverezza. It is alfo found near the White fea, and the mountain of Regelberg in Germany is chie.ty compole i of it. Rocks of it are found near the Lizard Point, ons the coant of Cornwall ; and hills of it occur in fome of the Shetland itlands.

Metals are feldom found in ferpentine, except a mag. netic ore of iron, which not unfrequently forms a part of the ferpentine rock;, imparting to them its magretic power. Veins of copper fometimes traverie i..

## Sect, XI. Porphory.

Porphyry generally confits of the fame materials as patho.. ${ }^{4}$, granite, but in dilerent proportions, ani having aito-dtame: gether a different appearance; forimiead of being cry:tallized as in granite, we find in the true forphyries in uniform compact mafs, in which are difieminated fnait ciyftals of feldipar, and tometimes of fchor'. There are, however, many varicties forming thades between granite and true porphyry, feveral of which are delcribed by mineralogits.

Porphyry is very abundant in mang fruations, furm- whe ${ }^{45}$ ing a contidorable part of hills, and even mountais. w.... It fometimes alternates with gneils, and has been found below it. Gneifs has alfo been found in the aidit of porphyry. It fometimes occurs in the midat of micaceous fchitue, and lometimes forms an esternal ceveing to other primitive fireta. Whole mountaits of porphyry, arranged in immenfe flati, fometimes repule on : bate of granite or gneils. This itone is foutal in the greateft aburdance in lever.il places between the tropicc, efipecially in South America, whete it is fumetime: met with at immenfe hicights •

* 1 nnt ${ }^{2}$

Porphyry is very common i.n mat pats of Scuthand, Nil Nut and, in particular, forms a confiderable Atratum at the p. 4oc. top of the Calton hill at Edinburgh, being in fome places 12 or 15 yards thick, covering a bed of breccial.

Porphyry is found in comblerable quantity between Nesce.ble and Wooler, and cluchs of it of conale t:bis: fies may be every where feen feattered about in the fiells. The feldipar of thefe porphyries being letis duatise thas the aett of the ittore, is partly dettroycd in

558

Arrarge. ment. \& of th: M.t terale of the Earth - Suirt $f: x, d^{\prime}$,
Traveh, vol. i. P. 164 .
fore biocks, and aptears corroded in others; fiom which circumftance the perphyries are fo porow, as to appear as if they had been burnt. Forphyries of a dimilar appearance are found in the mountain of Elurcle in Provence, on the road from Frejus to Antibes *.

There is a variety of porphyry mentioned ly Chatpentier, a great 1 art of whole compoition is indurated clay, and nodules of clay of different colours are foond in its fubtlance. Specimens of a fimilar nature occur in the wettern illands of Scotland. There is alfo a fpecies of -orphyry nearly aliied to horntone.

The two varictics laft mentioned are rich in metallic ores; in the former there being formed ores of filver, copper, iron, lead, and antimony; and, in the latter, fparry iron ore, native fulphuret of son, g elena, black Elende, and ores of bifmath.

A ftone of a porphyritic nature is defcribed by Wer. ner under the name of fohifofe porplury, and is confidered by Kirwan as the fame with the horn flate of Charpenticr. It is found among the primitive rocks of Altai, and on the borders of the lake of Baikal, in which latter flace it is mixed with granite and hornblende. It is alfo found in Siberia, and in Bohemia. Sauflure found it near Plaffenfprung, intercepted between Arata of gneifs.

## Sect. X11. Puddingstone and Brectia.

The difinetion between the fe two fony metters was mentioned in note C : they are both fufficiently common, confifting of diferent materials. The breccia ufually lies in bodies, almoft at the top of the other primitive ftrata, with fome of which it fometimes altemates. Siratified breccias, confliting of frasments of fiints and jwiner, cemented by hardened clay, are frequently found in Siveria, and fometimes altemate ftrata of breccia, forphyry, jafper, and other primary compounds, comFofe a conficerable part of mountains. Some mountains in the rorth of Scotland conta"n mafles of breccia, compofed of fracments of red granite, micaceous fchiftus, and quartz, in a bafe of fandftone. Mount Scuraben convains ittata of this hind, furmounted by a rock of white cuartz. Similiar appearances take place at Cromarty, at Muray frith, and two or three miles to the fouth of Aherdeen ; but in many of thefe inftances the breccia muit be confidered as fecondary. Much of the northern coafl of Scotland abounds with Lreccia.
Ofpading. I'uddingtlone is alfo extromely common. A mounitc.e. tain of it is found in Siberia, near the rivulet of Tulat, being compofed of fragments of jaiper, chalcedony, aigue marine, and romelian, cemented by a quartzofe matter. Immenfe heaps, and evena moturtain of puddingunone, ore found at Meiferheim, in the palatinate. Paddlinefone is toond in confiderable abundance in patfing from Lech Nels to Oban, in Scotland, and between Invernefs and Dumolla. Larre detached rocks of pulding ${ }^{\text {fone }}$ were foen by Pallas in the village of Femirdfti, in the Crimet. Some of thele maffes are feven of ti, he fothom long, lying one above an-
Surv. XIII. Sienit.

This name ku bec:introduced by Werner, to de-
note a primary rock, effettiaily compofed of grains of Arrangefelumar and hornblende, intimately Clended together, ment, \&c. in which the homblende is generally moft predominent. of the MaHe trat called it sreenflone, but afterwards gave it the the Eath of name of ion'e, as le fuppofed it imilar to a flone deforibed by Pliny, as found at Syene in Upper Egypt, where it was dug in great quantities, and from thence carricd to Rome, for the purpofe of building fublic edifices.

S:cnite fometimes contains a few grains of quartz and mica; but theie feem to be accidental, and are always in very fmall quantity. This ftone is not commonly ftratified.

Sienite ufually overlays moft of the other primary rocks, and has often a bed of breccia interpofed between it and the inferior ftrata. It is very commonly found repofing on porphyry.

It is found in Saxony, in the environs of Drefden; Where at Meflen in Thuringia; in Hungary, and in general found. in almoft all primitive chains of mountains, efpecially in the Alps. It is doubtlefs the fame which Sauffure found in the fummit of Mont Blanc, and which he calls granitelle.

Metallic veins are not unfrequently found in fienite. Metals is At Scharffenberg, veins of filver and lead are found init, it ; and it is faid, that the veins of ftrontian in Argylefire run in a fimilar rock.

## Slct. XIV. Prinitive or Granular Limefione.

IT was long doubted whether limeftone was ever to primitive be found unmixed with organic remains, or primitive; limeftone. but the obfervations of late mineralogits and geologifts have fully proved, that primitive limenone exifts in confiderable quantity. This Atone is of a granular ftructure, and of a whitilh gray colour, though frequently of a dark iron gray, or reddifh brown. It is fometimes fcaly or lamellar; at others nearly compact, and is now and then found to have a fplintery fracture. It is generally unmixed with other primary compounds; but fometimes particles of mica, quartz, hoinblende, \&c. occur in it.

This fone is always found alternating with the pri-Where $\begin{gathered}55\end{gathered}$ mary ftrata, efpecially vith gneif, micaceous, and argil-found. laceous fchiftus. It lometimes forms whole mountains, as in Stiria, Carinthia, and Carniola, in Switzerland and in the Pyrenets, being ofton found feven or eight thoufand feet high. Three mountains in Switzerland, all exceeding 10,000 feet in height, are chretly compofed of it In thefe fituations it commonly forms immenfe blocks, without any regular dip or direction; but it is fornetimes fratified, as at Altenberg near the lake of Neuenberg. It is fomctimics interpofed between fienite and hormblende flate. One of the mofit fingular mountains of granular limeftone is that of Filabres in Spain, confifting of a block of white marble three miles in circumference, and 2000 feet high, without any mixture of other earths or Sones, and with farcely any filfure.

A confiderable part of Mont Ferdu in the Pyrenees is compofed of alternate vertical bards of granite, porphyry, limeftone, homblende, and petrofilex.

Granular limeftone is found in various parts of Britain, efpecially in the nerth of Scotland. One of the moft remarkatle examples of it occurs in the inland of eflay,

## Sect. XI. Priniti: Trop.

Pamitue
tray de.
forbed. and pyrites.

Trar is a rame that was long ago given ty the Swedifh mineralogists, to ditiaguith ceitain dlume that are of a compact texture, and a daik culour, comating part of feveral mountains. The word orisinatly fignifies a tharcafe, and was given to mount mins containgr this flone, becaufe their ithata retire one veinind the other like the iteps of a llireafe. Rut as many rocks of a very different kind, both in their naturemifomation, have received the common rame of tato, conndersble confufion arofe anong mineralogitc. wit, refivet io what particular stones thould receive this appulation. Moft of the Trench mincra?_ lit, as Sanime, Du'omicu and Santiond make trat to dirify a primitive rook, but they do not always mo 30 the lame re-k. Other raneralogite, efpectily tha $G$ man, waderhaal iy the name of trait, ceetsin fec mary, iucho, wad efpecially what are common'. callded lafol..

Weatier comprehends under the ramic of trap, fesesa! ieries of rooks, which ate primeipally characterild by their containing hornblende, which is found almot pare in thofe which he cordiciers as the mot ancie:nt, or what gencilly lie the lowett; and it degencrates graJually in the fucceeding ftrata into a kitd of thakith, Errug inou, hardened clay. He diffinguihes three feries or iormations of traps; primitive triap, tramision or intermediate traps, and ftratiform or flotiz traps. We Thill here confider the firlt of thefe.

Plimitive trap is almoft wholly compofed of houn tlende, though it is fometimes mixed with feldipar, or more rarely with mica and fome other fubttances. Under this gencral defeription Werner compretenels four tony fubikances; ho:nblende and hornblende flate, which we have already noticed in Section IX. primitive greenfone, and fchiftufe greemtone.

Primitive gree ilone is a mixture of hornblende and Seldfar; under this there are leveral varicties, according as its texture is more or lefs granular, or compact. §. Common greentone, in which the hornblende and feldipar are intimately blended, is granular, and bears confiderable refemblance to fienite, in which the hornblende is predominant. 2 A fecond variety bas fmaller crains, in which are imbedded cryitals of Seldfpar, being of a ftructure between the granular and porphyritic. 3. A third variety has the grains of hornblende and feldfpar extremely fmall, fo as to be icarcely diftinguifhable. This fone lofes its granular appearance, and becomes entirely porphyritic. i. Laffly, when the mafs becomes quite honogeneous, and of a complete green colour, it forms what was once called - Brebsan: green porphyry, and conltitutes the furth varicty *.

Schittufe greentone is compofed of compact icldfpar, hornblende, and a little mica, of wiich the horubleade and feldfar are nearly in equal quastity, and it now and then contains a little quartz. Is, itrusture is achifofe.

We have been thes paricular in defrribing what

 furbing charachers of :ray, an it rhation os bait, \&er in his Geological Ialys H. whime that ane
 where, taking in not only the comp ofon int who the exture, grain, and fuerife gntiy, as mething of this hind has been concrived and done by Wer nier.

Primitive trap is offen found in waft frata in the whrie midn of gnets, and veins of it rumins through gneifs, fourd hav been fund in Fincultorf in Silefia, and in Bn. hemia. It is allo fometimes found ingranite, and it is found affing through wrate and micacenes fchifius iv: the Weitern inks of Scotlad. Swinfond found it altermati \& with granite, near it M1.10; and Charpentier, thth gueifs. It femetimes forms emtire mountains, as in the territory of Dena Dons; and in Norncy t is fund reporis o on granite. It fonctimes ahitmates with arg:-ureous :Mintur, as at Leilenburgh.

Primitive trap frequetily cortains metis, tfecialy ys? the ores of izon and copt er.
tomdint

## Sict. XVI. Tipaz Rock.

This flone is compoled of quariz, fchori, :opaz, and ici... : \% Helobuaga (a kind of harderted clay), the thrue furnice fatiface conlituting fall day ess or plates alterating with each other. It fumetines contans curities er geou, lined on the imile with cryals of cartz and topazes. The twatue of the fone is twiwen the fchiffuie and the granulu: ; that in, is is curapoled of
 Itructure.
 tain near Avtrbac:, in the metalic munt:iho of Sas-
 ce in it.
Uect. XVII. Siliceowr Schij?us.

Siliclovs fchifus, or finty flate, is the kiefelfchicfes sitrats of Werner; but theae feems fome difpute betweea bis dhiftus difiples, whether it be a primitive or a fecondary rock; on which account we have paced it latt in the former feries. Brochant does the fame; but Mr Jameion, in his Iketch of the Wernerian seognofy, ylaces it among the tranfition formations, or thofe which in.mediately fucceed the primitive. It is thus deicribed by Mr Jamefon. I:s cclour is bluith gray; it is internally tiu l; its fracture in the great is impertectly Baty; in the fratl,
 ments are indeterminately angular, and fretty tharp aino of edged; it is ftrongly traniuctat on the edges; it i: ilamorics, hard ard brittle, difficuitly fangible, and nc: farticular- p. 4*. ly heavy *.

An entire mountain formed of ti.is fone is found in Whot
Lufatia, in whith there are no petrifaction. It is alfo "atic.
found in the Alps, interpured between gueti:s and homfone. Schlendgenbery, a mountain in Saxony, is for the noit part com, fed of it, nixed with hormble nle

Arrange－ftance which Sauflure calls palaiopetre，which is com－ ment，sce．monly confidered as petrofilex．
efthe Ma－ ＊T1．${ }^{\circ}+$ at thichali．
－Mifimeral，
（a）illo
$f^{\prime \prime}+D+C^{*}$
Flis＋y fate is defribed by Mr Jemefon as amanc the mineral fublances found in bunfreshite．Ite farticulaly notices an immenfe rocky mafs of it at the entrance of the valley at Leadhills，by which the me－ thlic vins are completely interrupted＊．

No metulb hate been found in it．

## B．Secondery Compounds．

Thr：fubfances which we are now to notice are ditinguithed foon thofe which we bave been defcrib－ ing，in containing more or lefs the remains of organiz－ ed Leings．As the inferior thrata of thefe fecondary sompounds ufually contain fewer organic remains than thofe above them，they are fometimes fubdivided into wo orders，one of which is confidered to be intermedi－ ate between the primary and fecondary itrata．This is Werner＇s clafflication，of which we thall give an ac－ count in the next chapter．

## Secr．XVIII．Sccondary Limefone．

Under this title we fhall comprehend what Werner calls tranfition limeftone，floetz limeftone，and limeftone． Secondary limeftone is a calcareous mafs，fometimes grmular，and fometimes compact，the former approach－ ing to primitive limeftone．Its fracture is scaly，and it is fometimes femitranfparent．In colour it is very various，fometimes red，or rather blackiih，with white veins，confifting of calcareous fpar．It is often of a grayih caft．It fometimes forms vaft blocks，without iny appearance of fratification；at other times it is evidently ftratified．It abounds with remains of marine atrimals，and often contains nodules of aghte，and other amilar itones．

A variety of calcareous fone is defcribed by mine． stogith under the name of fwinellone．It is either compact，flaty，or porous，and is faid in general to con－ t．in no petrifactions，though fome found in the moun－ din of Kinneculla contains many．It is confidered by sirwan as primeval limeftone，impregnated with pe－ troleum．

Limettone is fometimes found in oviform balls，com－ monly containing a grain of fand in them．

There is a varicty of limeftone that is very porous， and abounds in remains of vegetable matter，as impref－ fions of leaves，\＆ic．

Secondary limeftone is very abundant in moft parts of the world，forming a confidcrable part of many mountains，and being often the principal fratum to a conliderable depth below the furface．The mountain Therg，in the Hartz，is compofed of vaft mafies of it， irregularly rifted，and mountains of a fimilas kind are tound in Siberia and in the Vivarais．In fome of thofe moountains vaft caverns have been formed．Sccondary limeefone mountains always repofe on fome primitive fiune；thus，in Siberia their hafe confifts of granite， purphyry or hornblende；in Saxony，of granite，or gramular limeftone，and fometimes of argillaceous chiflus；in Switzerland，thefe mountains repofe on ar－ gillacemus fehiftus or gneif，or fumetimes on calcareous puddingfone．In the Ciimea，there is an immenfe extent of fecondary limeftone，between Koflof and

Perekop，which is minutely defcribed by Pallas．Great Arrange－ part of the fummit of Mont Perdu，the highelt of the nient，sce． Pyrenees，is compoied of fecondary limeftonc，arranged in nearly yartical frata，and fo full of the remains of of the Ma－ manine animats as in fome places to appear as if com－ terias of pofed of nothing elie．Here it feems to repofe on gra－ nular limetione．

The bafe of Mount Ingleborough in Wettmoreland， which is near 30 miles in circuit，confifts entirely of limeitone，coataining valt quantities of fea fhells．This flone alfo forms the principal inferior flrata through the greater part of Derbyhire，being arranged in beds of vanious degrees of thickneff，from a few inches to about 200 fathoms in fome places，not having been perforated； and abounding with thells，and other marine remains．

It is found in many quarries in Scotland diftinctly Ar ratified．Mr Jamefon notices quarries of limeftone at Clofeburn，and Barjarg，and at Kellhead in Dum－ friesthire．

## 66

Secondary limefone often contains metallic veins，Me tals efpecially in Derbythire，where it abounds with galena，found in it． blende，fulphur pyrites，and copper pyrites．Sulphur is alio fometimes found in it．Kirwan remarks，that in the reft of Europe limellone is feldom metalliferous．

The ftune commonly called alabaffer，employed in Alabafter．${ }^{67}$ making itatues and ornaments，is properly a carbonated linee，nearly allied to marble；though it is afually fup－ pofed to be a variety of gypfum or platter ftone．There is a gypfeous alabatier that will be noticed prefently．

Calcareous alabafter is not often white（though as white as alabafer is a common proverb），but gencrally tinctured with iron of a yellow，brown，or reddiih caft． It is femipellucid，and ufually fo foft as to be feratched by the nail．
It is commonly found in blocks，in marble ouarries， as in the illand of Paros，and in feveral parts of Italy， particularly in the territory of Volterra in Tufcany，in Malta，\＆c．A variety is found in the form of ftalac－ tites of a conical or cylindrical form．

## Sect．XIX，Gray Wacke．

Gray wacke is a ftone compofed of fragments of Gray quartz and arg：llaccous fchiftus，cemented by an argil－wacke den laceous matter limilar to the fchiftus，varying in fize， from that of a hen＇s egg，till they are fo minute as to be no longer vilible．It fometimes contains a matter fimilar to filiceous fchiftus．

1 here is a variety of this ftone，called by Werner gray wacke ftate，which is a fimple ftaty fone，which bears a confiderable refimblance to argillaceous fchiftus． From thic，however，it is to be dittinguilhed，according to Mr Jamefun，by the following characters．
＂It has feldom a greenith or light yellowith gray colour，as is the cafe with primitive flate，but is ufually aft and fmoke gray．It does not fhew the filvery con－ timuous luftre of primitive clay flate，but is rather glim－ mering，which originates from intermixed fcales of mi－ ca．Quartz fcarcely occurs in it in layers，but ufually traveries it in the form of veins．Further we do not find crytals of feddfar，fchorl，talc，chlorite flate，or maagnetic iron ftone are to be obferved in it．It con－ tains petrifactions，particularly tiofe varieties that bor－＂ Mineralen der on gray wacke．It alternates sith gray wacke $*$ ．＂My ineralen－
Thefe flones are diftinaly flatifiel，but the direction frics．

## Chap. I.

 G E O I O G I. 5r:Arrange- of their ftrata is not parallel to that of the other rocks ment, \&e. on which they lie. They are very commonly found of the Ma- covering limeltone, efpecially at the foot of mountains.
terials of Gray wacke is found in Erzgehirge, at Braunfdorf, the Earth.

Where
found. Ricfberg, and Averbach, in Voegtland, in Tranfylvana, on the banks of the Rhine, in Lahnthal, and fome other places in Germany. It is alfo found in Britain; and Mr Jamefon notices it among the minerals of Dumfriesthire, where the gray wacke flate is found near Moffat, in the vicinity of Langholm, in the higher parts of the valley of Eik, and behind Bumfwark. The frata found in thefe places yield a very good flate, nearly free from mechanical mixture, and well adapted 70 to the roofing of houfes.
Metals This fpecies of ftone is rich in metals; the greater
found in it. part of the veins of lead and filver in the Hartz, efpecially thofe of Clauthal and Zellerfeld, are in gray wacke. In Tranfylvania, in Vorefpath, it contains even rich mines of gold. The gray wacke ftrata on the banks of the Rhine are alfo traverfed by fome metallic veins, but thofe of Saxony contain nothing but blind coal.

## Sect. XX. Secondary Trap.

Secondary trap.

Several. varieties of trap occur among the fecondary ftrata, and muft be here enumerated. They all confift principally of greenftone, or that mixture of hornblende and feldfpar, which conflitutes the primitive traps, noticed in Section XV. but in the traps we are now to mention, the mixture is much more intimate, the grains confiderably finer, and the mafs appears lomogeneous. We flall here notice only three principal varieties; the amygdaloid or toadftone, the globular trap, and the greenftone, called by the Wernerians tranfition greenftone.
$\begin{array}{cc}y_{2} & \text { tranition greentane. } \\ \text { I. The amygdaloid, called in Derfbyfire toadftone, }\end{array}$ bodortoad-and fometimes cat dirt, appears to confift of hornblende flone.
flate in a flate of decompofition, and appears very fimilar to a kind of wacke, of a very fine grain. It is of a blackifh colour, and very hard, and ofien contains a number of bladder holes, which are fometimes entirely empty, at others are partially or wholly filled with fpar.

It 1 uns in immenfe folid beds, without any appearance of Atratification or fiffure, of unequal thicknefs, having been feen from 6 feet to 600 thick. It comnionly aiternates with the frata of fecondary limeftone, as in Derbyftire, and fometimes feems to penetrate the inferior ftratum of limeftone to a very confiderable $\boldsymbol{d}_{\text {upth }}$. It contains no metallic veins, and it is faid entirely to intercept thofe which it paffes in the limeftone ftrata. Saintfond affirms that lead ore is fometimes found in cat dirt ; but he feems to have been deceived by the vaguenefs of the term, as the miners of Derbyfture give the fame name to a greenilh variety of limefone, which is fometimes traveried by veirs of lead ore.
2. Globular trap. This is a fchiftofe greenftone, partially decompofed, and alfo iefembles a fne-grained wacke; but it appears in the form of large balls, compofed of concentric layers, with a hard wucleus. It is tound at Altenzulze in Voegtland, and forme other places. It fumetines contains seins ef copper and irols. 3. Greenftone. This is almon entirely comofed of feldfar, ufuntly of a pale flefl-red cchour, having fometimes iml edded in it grains of grayih quatz, feales of Vol. 1K. Part II.
 feldfar. This roch may be confounded with preny-mert is.

 three to tweive feet thick on the upper fide of the Satari- ...... nia vein in the valley of Leadhill, and in the tarout thin betucen W, amphras and Ekdale:ruir.
Gret. SスI. Sandfone or Grit.

Tuess terms, hile many others which we meet with ir sanditae minerdlogy, are very vaque and indefinite, and are uiki to denote three or four kinds of thone : a colcarontr, an aryilliceous, and a tiliceous fandtone. We thill here confider only two of them, the argillaceus and the fill. ceous.

1. Argillaceous farditone. This is the fundien urgiwe. of Werner, and the argillaceots grit of the othary pun ind. miners. It is compofed of grains of quartz, and tome- *ne. times of filiceous fchiftus; more rarely of feldipas. Thefe grai:s are of various fizes, and are cer.ented in an argillaceous matter, commonly containing iron; whence this ftone is fometimes called fort. st: and ftone. From the coarfenefs or finenels of the graine, it receives the names of coarfe and fine fandfone. There is a very coarfe hind found in Derbyfhire, containing a confider able quantity of quartz pebbles.

This fpecics of fandlone is found in immenfe beds, fometimes above 100 yards thick.

It is very diatinctly fratiried, and is commen? div:1ed by filfures, into the ftrape of parallel pipeds. It fometimes alternates with layers of compact limeftone, and often lies above a ftone which we are inmediately to mention, flate or fiver.

Sandlione is fometimes formed into globular concre. tions, compofed of concentric lamellæ.

Sanditone is one of the moft abundant products of where nature, occurring in almoft every country. In Britainf fund. it forms the uppermoft ftratum in many parts of Derbyfhire; and in the inle of Arran there is an immenfe feparate mafs of it, forming what is called the cock *. *Fumefon's In the fame ifland it is found in Glemranza, repofing on Min. of the fecondary limeftone.

The glubular concretions of fand!tone are uncom- ${ }^{\text {p. }} 76$. mon. Mr Jamefon obferved them in the ifle of Skye, t Aineral. near the harbour of Portree 4 ; and Reufs oblerved the of the $1 / \mathrm{lc}$, fame in Bohemia $f$. vol 11 1) $5_{7}$

This fyecies of fandfone ufually contains many pe- Crograpb. trifacions, but is generally not very abundant in ne-von Bobmen, tals; it however fometimes contains veins of cobalt. vul.s. f. 4o.
2. Siliceous fandfone. This is a ftone of a fimitar siliceous nature with the laft, except that the cementing mafs is fandfone. alfo of a filiceous nature. It is found in the ports of Domica and Campara, in the ille of Arbe, and on the coaft of Dalmatia, where it contains fetrifactions. The hill of Platinburg confifis of fandftone, with a chalcedony cement. Some fine fyecimens of filiceous fandftone are found in Salifoury Craigs at Edinburgh, containing thells which have afluned the nature of chalcedony. It dues not appear to contain metals.

## Sket. XXII. (iypfum, or Plaflcyfone.

This is native fulphate of lime, and it appears in fe Gypfun veral forms. Six varictics are ufually cnumerated; com-

* 7゙か: ~

$5: 3$.

81
Lenti, u'ar. feems peculine to Montmartre near Paris. In one of the banks in this mouatain. fpecimens of it are fromd cont ining litile lenticular bodies, ditinct and difilminated tirough the flony matter, fo as to form a great prot of it mads. A fpecimen of this kind is figured by Putin, in lis natual hiltory of minerals.
3. The crupallizd gytum is ato found chiety in
 frows evpum, fubuctuic gyfun, and gypfeous alabacker.

1. Cownen rythom is a compar, granulated fore, commonty of a grayih colour, and mised with inpuritics, centining a comberable quartity of carbonate of limi. Its texture is teldom laminated, but it appears like courfe lo:if fug...t. This hind is very abundant, many hills being eatizely formed of it. Of thefe the molt remarkable are the platerbills in the neighbourLord of Pari, the in the can'on of Bern in Switzer:. . , and chaces among the Alpw. Hills of gypfum gocur aifo in $S_{\mathrm{t}}$-in and Puland; near the White fea; i.. Ans, where they are moitly is horizontal flrata; in the noth Archipelago, between Afia and America. Swhite tound a mountain in Sivitzerland compofed of Eyphen, hand, and cliy *. This kind fometimes contams feriractions, and often abounds with the impref. funs of atimal was regetable matters ; fome very curious examyles of which will be mentioned in a future fecion. it contans fex metals, although copper is fome imes found in it, as are rock-falt and fulphur. the environs of Patis, in cryituls that are decaedral, or Conetimes like a rhomboidal oqaedron, with the pyramins truncated near the bafe.
2. Fïr rous Zyffum, compofed of fhort brittle thrcads difpuled in buncles, is found in Derbyihirc, and near Riom in Auverghe. A very beautiful varicty of a filly fell, and reticulated texture, is defribed ty Patrin, as found in Poland, in the falt mines of Wielitfka; in Kufin, near the juntion of the river Oka with the Wolga; in Spain; and in China.

* Inginat A varicty of gypfum with the aprearance of vecetade Mower tion is found in caverns near the baths at Matluck in tom mp. Derty haire. A teautifal ficeimen of it is figured by as. fides and roof of caverns in the form of flaactites, a tranfverfe fection of which thews their internal itructure to be radiated. This variety is commonly called fchloit.

6. Gupfous aldibafer is very fimilar to the tlabafler, except that it does not, like that, elfervefce with acids, and is in gencral not fo Atrong. It is found in great abundance in D rbythire in larye mathe, flling up cavities in arghlue us git. It acerer forms a ifratum, but is gercally atended with gravel, itilclay, and Shells. Mi Mawe reprefonts the lower portions as being very illong and compact, fo as to toren columns \$ Mitreatal and pilaters $\ddagger$. This kind io alfo tonnd in luarclee
 p. 84
at Lastiy.

Thongh from the ealmary form or liturtion of sapfum, and the ongrai remains lo commoriy found in it, there can be wo doubt of its being ia matales a tecuadary ruh; get hom its having ben fardmined
with mica in St Gothard, it is enmerated ly fore Arrange. among the primary compounds.
Sect. XXIII, Fluor Siar.
$\underbrace{\text { the Earth. }}$
$\$ 6$

Trus beautiful lubitance, which is mative fluat of Fhor fpar lime, is found either in large unformed mafies or blocks, , frrived. or cryitallized in cubes or octaedrons. It is of different colours : but the moft prevailing varicties are that in parallel zones or bands of green, blue, yellow, and white ; and that in which a white ground is veined with a reddih brown. Some ipecimens are fo fhaded as to reprefent a geographical map; but thefe are very rare. It is fo foft as to be ealily turned in a lathe into thofe vafes and other omaments which are fo commonly feen on chimneypiecs.

Fluor far is found in feveral countries of Eurepe, whe but efpecially in France and Britain. According to found. Patrin, there are mines of it in the primitive mountains of Gyromagny, in the Vofges, in the neighbourhoot of Langeac in Auvergne, and at Forez near Ambierle, that are inexhaultible $\S$. It is allo found in the $\S$ Hif. Naf. mountain of Pilat not far from Lyons; among the de Miner. rocks that ikirt the valley of Chanouni in the Alps; in tom. isti. F the Altaifchian mountains of Afia ; and in Greenland.

The moft productive mines of this lubftance in Britain are in a mountain near Caftleton in Derbythire. Here there are two mines producing the beautiful compact iluor, called Blue yohn, which is found in pipe veias running in various dircetions. The fluor commonly rells upon limeftone, and it frequently has this fone for a nucleus, round which it appears to have cryftallized. Frequently, however, the centre is hollow. In feveral parts of the mine the fluor is found in detached maffes, in caves filled with clay and loofe adventitious matter, having the appearance as if it had been broken off from the limeilone on which it had been formed; for every piece, in one part or other, feems as if it had adhered to fomething, and been broken off.

Some of the pieces of fluor are a foot thick, and have four or five different veins or zones: fuch large picces are however very rare, and in general they are only three or four inches thick *.

Saintfond, who has given an interefting account of Mineral. the curiotities near Cattleton, fays, that fluor fpar would fict. vii. be the moft beautiful fubftance in nature, if it were but a little harder.
It is ailo found in Northumberland, in a vein among the granite mountains of Aberdeenfhire $\dagger$, and in + Famfon's one of the Shetland itles, in a vein of bafalt $\ddagger$. Min of the
Fluor appears in fome cafes to be primitive. Thus $5 / \mathrm{lcs}$, vol i. . Hansary.

## SEct. XXIV. Chalk.

Chulk is too well known to require a defription. Chas It is not alway, whine, but is frequently coloured. It is difpoled in torizontal beds that are often many yaads in thicknets, a:ad which always eepufe on layers of other calearevus fone of a harder flrucute. Thefe beds are cfien of contiderable extent, and very common-

## Sict. LXV . Clay.

Cely is found in varioes fates with iti? ef to bardnofs on lilidity, from the foft cuctile clay ved by the putiers and pipenake:s to the pertc. t ilite (clay itate, or argillive ous (evijus) already deforibed.

Soti chay is fund it: beds of vatious degrees of thicknef, commonly not fir bcion the furface, and alternatigg wit? hirder clay, 1 lates, fand, or limetuone. It is generally very abundant, eracially in thoie place, where coal or rock-fa't is found.

Clay of a harder confitence, commonly called indu= rated clay, or in the language of the miners clunch, is unally found below the fofter clay, or there is fometines a flratum of liate or fimilar argilliceous matior interpoied. It often alternates with limellone, fanditune, or aphim. Petrifations and fhells are often found in it, as are quartz, fulphur pyrites, marial ochre, common falt, vitrol and alum.

A harder fate of clay forms that fubfance which is called by mincralogifts lithomarga (1tone clay.) This is found in beds or ftrata ofien alternating with the former, with flate or with limeitone, cfpecially in con mines. It alfo forms nefts or balls in tonditone and fimilar rock. It fometimes bears the impretions of reeds and other vegetable bodies. (Goe next degree of hardened clay, forms liate clay, (focitif thon of the Germans.) This fubitance, however is not very hard, but is eafly broken into angular tabular fragments. Its internal appearance is ufually dull, but fometimes glimmering foom a cight interainture of feales of mica. Its colour is ufwilly a ghlowith gray, with fpots or clouds of a pearl sray, or a cherry red, but fometimes it inclines to bladi. It ufarlly lies between beds of fandfore, and almoil always below the fofier clays.

A kind of clay, of a tlill harder comititence, ferms Rate or fchitus. This is ufivaly of a dark brown or hhackih colour, and a laminated texture. It lice in beds, fometimes of immenfe thicknets, ufually belo": kandone, or akernating with this and limetlone. It often contains imprellions of crganic temans, and thete are fometimen form in it veim of lenet ere. It is a very common fratum in the conl coantries.

## S:CT. XXIII Argillacious IrGentige

This is fometimes called metal fronc, an is we: cummon in the coal countific. It is vers dowje: compact, and uf various coloure, from a duhe prosmet i* 10 a blood ted; the liter forms the hemarizes or bloontoone, are of the richeit irua ors. It ofico cont mias in it fherical talls like iron bulicts. It is wit pofed i: firata alternating with indurated clay, luts che, marl, or landitone, fetdun far below the furian It dehdom dorms very extenfive bech, but is vien cor. fined to particular foots.

Hompone is found in grent abundance in Cumber land, *id moll parts of scotlond. It may be fen in the clifi all along the coall of Fife, from $\mathrm{D}_{\mathrm{y}}$ ian: St Audiews.

## Secr. XXVIII. Hacke and Bafalt.

We have already faten of foveral honas under t": what nume of taps, that are fowd beth amons, minitive ath fecondary comp unds. The two fablance which we ne now to netice are nearly allied to the trap), what haten clated with them undir the gemeral n foce of w? this is a farourite term amons the mineralogids of Smuland, of whom Sir dames $\mathrm{Ha}^{11}$ cmpluy it is. ace neric teme to dennte trap, bafalt, vacke, yrumbie, and ${ }^{\prime}$
 Janefon and others of the Whenerian fehool ubjeet to it $F$ :. 7 as too rague and indecinite.
Wache, or wackon, difion for trap only in heing ano
 very how, in an witen the strike bie with ficel; it is duti and ophous, and beak with an eve: frature. It cubur is uically a reddith bison of gray of wathen

Atrar. \&
"e: \& \& seriale of the batt.

Ahades, and ionctimes it has a greenith call. It has ufitilly an earthy fmell, when breathed on. It is fornctinues highly impregnated with iren, and often contains cryitals of hornblende, and very comnonly thofe of hexagonal black mica.

It often forms a confiderable part of mountains, either in vaft blocks, as in the hill on which Edinburgh caflle ftands, or in ftrata lying above limeftone or fandfone, or alternating with thefe. A great part of the Caltonhill, of Salibury craigs, and Arthur's feat at Edinourgh, is compofed of Brata of this kitd; and fimilar appearances take place in the bed of the water of Leith near the torn, and in the cliffs on the coaft of Fife, efpecially at St Andrews. To the eye of the volcanic Saintfind, all thefe beds appeared to be lava. We arc difpoled to think, with Mr Playfair, that the curious infance of alternate flrata of bafalt (as Saintfond calls it) and limettone, near Villeneuve de Berg, defcribed and figured by that author, affords an example of whinftone alternating with limettone, fuch as are feen in
4 Rethercher Scotland + . Several varitites of wacke are found in Jur les Volu, the hills near Edinburgh, and are defcribed by Dr p.i2s. Townfon 7 . Mr Jamefon obferved wacke alternating Taunf.
Trada, p. 304 with porpyhry in Skye.

Bafalt has a finer grain, and is more compart, than even wacke, and is the molt denfe of all the whins or Eafolt. traps. It is found either in large blocks, covering the other ftrata, fometimes in the form of tables, or in regular prifmatic columns, either ftraight or bended. We have already treated fo fully of the nature, properties, and chief habitats of bafalt (fee Basaltes), that little remains to be added here.

It is principally diftinguifted from wacke, where it is not in regular prifms, by very rarely containing cryftuls of mica, which are fo common in the latter.

Saintfond in his fplendid work Sur les Volcans eteints c'u Vizarais, \&c. has figured fome examples of bafaltic pillars which rival thofe of Staffa and the Giants Caufeway. A more romantic fituation is fcarcely to be conceived than that drawn in his eleventh plate, of a village placed in the front of a bold hill covered with bundles of fmall pillars lying in every direction, and iaving detached perpendicular columns ftanding at each end, with a lirge cave directly behind the houfes. Large maffes of bafalt are feen in the north of Shetland, tanding infulated, and affuming a very grotefque appearance. Mr Jamefon defcribes one of thefe in the The of Jura, that forms a natural arch. We remember fecing twn curious infulated rocks on the thore at the fout of Kinkeld braes at St Andrews, but do not resollect whether they are of a bafaltic nature.

Several other fubllances, as fand, gravel, peat, \& \& c. might here be noticed, but their ftructure and lituation are too well known to render a particular notice ne ceflary.

Many of the ftones which we have defcribed among the primitive rocks, are alfo fometimes found among the fecondary frata, as argillaceovs fchiftus, hornfone, hornblende, jafper, and efpecially pudding tone; but they are not fo important as to require a fecond examir:ation.

Before we conclude this gencral account of the maicrials which compofe our globe, we muft brietly notice ?o of the moft waluable mincral productions, viz, sook
falt and coal, and mult fay fomething of fofilis and petrifactions.

Sect. XXIX. Rock Salt.
Rock falt or fal gem, (the Aeinfal of the Germans) Ior is the purelt muriate of foda that is found in nature, it Rock falt being much lefs impregnated with foreign matters than defcribed. what is procured from fea water. It is very hard, and generally very tranfparent, being fometimes as clear as cryfial. It is ufually white, but often yellowifh, blue, red, or violet, and now and then it is quite opaque. This falt forms in the bowels of the earth horizontal beds or banks, more or lefs thick, from a few inches to many hundred fathoms; and fometimes extending feveral miles round. It commonly alternates with clay or gypfum. The beds are fometimes without any break for a great extent. It is generally found a few fathoms below the furface, and in fome places is found continued to the depth of 1000 feet.

It is found in fome mountains; and in Algiers, near wher the lake called Marks, there is a mountain almolt found. wholly compofed of it. The famous falt mine of Wielitika in Auftrian Poland, about eight miles to the fouth-ealt of Cracow, is in the northern extremity of a branch of the Carpathian mountains. The falt found here is of an iron gray colour, intermingled with white cubes; and fometimes large blocks of falt are found imbedded in marl. This famous mine has been worked ever fince 1251 , and it is pretended that its excavations extend more than a league from ealt to weft *. About five leagues to the fouth-eaft of Cra-*Townfon', cow are the falt mines of Bofchnia, the depth of which Travels in is nearly equal to thofe of Wielitika ( 1000 feet); but Hungary, the falt procured from them is lefs pure + . Mines of + fourn des falt, in horizontal undulated beds, occur at Thorda in $M I$ nes, Tranfylvania, and in Upper Hungary. In the fide of $n^{\circ} 47^{\circ}$ a mountain, about two leagues from Halle, on the banks of the Inn, to the north-eaft of Infpruck, rock falt is found imbedded in layers of a flaty rock; but there is one part of the mountain in which there occurs an immenfe body of falt, without any mixture of rock, to which they pafs by a gallery 260 toifes in length, clofed at the end with a locked door. This falt is very impure $\ddagger$. There are three important falt mines in $\ddagger y_{i r}$ ’ $V_{0} y$. Spain; the firf near Mingranella, in a mountainous tom. iii. p . tract, between Valentia and Caftile, imbedded in lay- 328. ers of gypfum; the fecond in Spanifh Navarre, in a ridge of hills compofed of limeftone and gypfum; and the third that of Cardona in Catalonia, about 16 leagues to the north-eaft of Barcelona, which is one of the moft curious natural productions with which we are acquainted. It confilts of an immenfe folid rock of falt, elevated 500 feet above the earth, and extending to a depth that has not been afcertained. It is without crevices or clefts, and has no appearance of ftrata, and is near a league in circuit. There is no platter or gypfum found in the neighbourhood, and the falt rock is as high as any of the adjacent hills \|.

Rock falt is found in feveral places in England, par- Nat. Hij. ticularly at Northwich in Chethire, at Droitwich in of $S_{p}$ ain. Worcefterthire, and near Wefton in Staffordthire ; but the mines in Northwich are the minec, in this fituation, were kuown to the Romans; at North-

## Chap. I.

GE O
Arrange- but the principal mine that is at prefent wrought, was met, sec difovered in the beginning of lat century. It forms et the A1?- immenfe quarries, extending over feveral acres, which, the Earth. with their huge cryltal pillars and glittering roof, prefent a molt beautiful fpectacle. The fat found here is of a dark-brown colour, like brown fugarcandy, and is fo hard that it is blatted with gunpowder to get it from the mats. It is difpofed in beds, alternating with bed of clay, gypfum, and platy Atone. Salt is procured at the greateft depth hitherto explored ; and wherever a that is funk in the neighbourhood, there is a certain-- Mare's ty of finding fat *.

Mineralogy Befides thefe extenfive mines, rock fat is found in of Derby /ko the canton of Berne in Switzerland, in Siberia, in $A$ rabia, in Tibet, and even in New Holland. It is alto found in many parts of America, at a great height in the mountains, especially tho of Peru.

## Sect. XXX, Coal.

## ${ }^{104}$ <br> Coal.

Wee have already, in the articles Coal and CoalERY, treated of the nature of this fubfance, of the ftrata that are usually found connected with it (according to the phrafeology of thee miners), and of the metho of procuring it from the pits; and, in Minerslogy, we hall give a particular account of the feveral varicties, and the ditinguifhing characters of each. A few observations reflecting the principal collieries, with the appearance of the coal found in them, and the correfponding firatification, fall to be made in this place.

There are certain general circumfances that attend the depofitions of coal in almost every place where it is found, and which we muff mention before noticing the particular collieries. Thefe are as follows.
General 1. The beds in which coal is difpofed, ufually have circumtan their extremities near the furface of the ground, from es attend- which they bend obliquely downwards, the middle part
ing coal ing coal rata.
of the bed being nearly horizontal, fo that a vertical fection of the bed nearly refembles the keel of a boat. This figure is well expreffed in the furl and third plates to Mr Jamefon's Mineralogy of Dumfries. The lowell part of the bed is ufually the thick eft (D).
2. A bed of coal is feldom found fingle; but, in general, feveral ftrata occur in the fame place, of various thicknefs, the upper being usually very thin, and the lower very thick, with feveral tony itrata between each two. Where there is only one bed, this is generally of very condiderable chicknefs. At Whitchaven there are found at leaf 20 coal frat below the furface; and at Liege, in France, there are no lefs than 60.
3. The ftrata that feparate the layers of coal are nearly the fame in every colliery, and will be feet by referring to the table given under Coalery, and by thole which will immediately be added. Thofe ftrata which are in immediate contact with the coal, are cithere whintone, or more commonly an argillaceous duty mails; and near this is fanditone, in layers that are feparated by flat clay, mixed with particles of coal.
4. It is an oblervation which hold, ambit :wholhout exception, that the flaty Itrata, and efpecially tho fe next the coal, bear the impretion of vegetables, and often of exotic or unknown plants.

Coal, in a greater or left quantity, but of very di:ferent qualities, has been found in moll countries, and Where perhaps exifts in all. It is found in France, Holland, turd. Britain, Germany, Saxony, Portugal, Switzerland, and Sweden ; in China, Japan, and in New Holland; and much of it is worked in Virginia in America. But France and Britain may be confidered as the fayourite feats of this invaluable commodity, which may jutty be put in competition with the treasures of Pototi and Peru.

It is lated by Buffon, that there are no fewer than Coat mines 400 collieries worked in France; and yet Saintfond re- of France. grets that his countrymen are not fo far advanced in the ufe of this mineral as the inhabitants of Britain *. Sairtfors: The molt confiderable coal mines in France, are thofe Travels, in the Lyonnais, at Fores, Burgundy, Auvergne, rom. it Languedoc, Franche Comté, and Liege.

The mines in the Lyonnois, and thole of Cores, ar. among the mont important in France. They are dituated in a valley, extending from the Rhone to the Loire, in a direction from north-ealt to fouth-well, between two chains of primitive mountains, and they occupy in length a face of dix or leven learucs, from RivideGie to Firmini. In one part of the valley, in the neighbourhood of Saint-Etienne, the Strata are nearly horizontal, and the medial thicknefs of the coal firatu:n is from three to fix feet; and near the Loire there are from 15 to 20 of thele. At Rive-de-Gier the strata are almoll vertical, and their thickness's is very unequal, being feldom left than three feet, and fumetimes amounting to 40 or even 60 . All the coal produced by the fe mines is of an excellent quality, and its quantity is immense. Patin fates, on the molt unduabted authority, that there are in the neighbourhood of Rive-de-Gier, no Refs than 40 mines at work, which produced in ene year $1,600,000$ quintal of cos $1+$.

The next in Nit $N_{\Delta t} d_{e}$ The next in importance are the coal mines of Liege. Miner.tom,
The beds of coal in that country have a direction from v. p. 223 . taft to weft; they commence about a league to the eat of the town, and extend to about a league and a half to the weft of it. Here, after meeting with tome interruption, they extend for feveral leagues farther. Their breadth, from north to fouth, is about three-fourths of a league. At Verbios, which is to the north-weit of the city, there are, according to Jars, more than 40 Itrata of coal, which are feparated from each other by beds of different kinds of fandifone, of from 30 to 100 feet in thicknefs $\ddagger$. Gennetè has counted 61 of theme beds, $\ddagger$ furs $i_{j}$ : placed one above another; and he is of opinion, that Metal. the lowell penetrates to the depth of foo feet perpen- hera. x. dicular. 'Though thefe mines have been wrought from the 12 th century, they have not yet reached to more than the twenty first bed, at the depth oi a little more than 1000 Englifts feet.

[^27]
都

$\qquad$

$\qquad$
+ Hipaita
v. p. 2 z .

$\qquad$
(D) Saint fond, in the fection which he has of the coal frat at Newcalle, defcribes them as if they were con*ex towards the upper furface. (See p. $13 \%$ of l, i, of the English Trandation of as Travels in England, \&ce.) surely this is a mistake.
belk, which c:nntt, at pref be tible.

The frata fuperincumbent on the large beds of coal are, itt hed, bine llatc. 2d, Gray freetone. 3 , Hud, white frecllanc. 4th, Blue flate, Rriated or
fpeckled with freelloac. ${ }^{\text {th }}$, Gray flate. 6th, Hard, white freefone.

The firata inmeliately beneth thefe large beds of coat, are from one and in half to fix inches thick, and confits of a fpecies of argillaceous earth, or flate. As this earth is of a very foft or friable nature, the weight of the fuperincumbent itrata preffes the pillar of coal through it. If the pillar defcends a few inches, the roof not equally yidding at the fame time, cruthes, or breaks into fmall pieces. When, under thefe circunitances, the thicknefs of the bed does not exceed fix foct, nor the depth 30 fathoms, the furface of the earth is fenfibly affected *.

There appear to be two principal belts of coal in this Lifoum ly: iland, extending from the eaften to the wettern coaft ; Enowerrigs ore from Newcaltie to Whitehaven; the other from the p. 107. ealt coalt of Scotland, acrofs the vale of forth and Clyde, to Ayrffire. Coal is indeed found in many other parts of the ifand; but the quantity is very trifing.

The fimilarity of lituation, and the fimilar nature of the coal at Whitehaven and Newcafle, would naturally lead us to infer, that the coal at both places is from the fame feam. But this is placed beyond difpute, by a comparative examination of the frata in both fituations. We flall here give two tabular views of the ftrata, one taken from Saintfond's Travels, and the other from Dr Jofhua Dixon's account of the Whitehaven mines, in bis literary life of Dr Brownigg. Allowing for the different names given by different miners to the fame fubHances, and Dr Dixon"s greater minutenefs, there is a wonderful fimilarity between the two tables.

Table I. Strata in Reftoration Pit, St Anthon's Colliery, Newcaftle, to the depth of 135 fathoms. From Saintjond.

## Chap. I.

Arrange oxen, horfes, and mean. Similar examp'es occur i.t ment, Ne many places: but human bones are, we beliewe, never of the Na- found in a fortil ftate.
the Eath. Folil tl.ells are found on the $\Lambda 1$ ps, on the top of Mount Cenis, on the Avennines, on the monntains of Genoa, and in molt of the puarries of thone and marble in Italy; in mont parts of Germany and Ilungary, and indeed generally in all the elevated places in Europe. We alfo find them in the 1 lones whereof the monk ancient edifices of the Romens were contrated.

In Sivitzerland, Alia, and Africa, travilies have obiewed petrified fith, in many places; for imtance, on the mountains of Cattravan, there is a bed of whice laminated itone, and each lamina contains a grent number and diversity of filhes; they are, for the molt part, very flat, and extremeiy compreffed, in the manner of foffil fern; yet they are fo well preferved, that the minutett marks of their fins and fcales are ditinguilable, and every other part, whereby one fpecies of tiih is known from another.

There are likewife many echenter and petrified fill betseen Iver and Cairo, and on all the hills and heizhts of Barbary, mont of which exactly correfpond with the like ipecies taken in the Red fea.

The long chain of mountains which extend from eait to wett, from the lower part of Portugal to the molt eaftern parts of China, thofe which Iretch collaterally to the north and fouth of them, together with the mountains of Africa and America, which are now enown to us, all contain / lra'a of earth and itone, full of thells.

The illands of Europe, Afia, and Amcrica, wherein Europeans have bad occafon to dig, whether in mountains or plains, all furnilh us with bells, and convince us that they have this particular in common with their a fiacent continents.

The glofiptra, or the teeth of ipats and other fifles, are feund in the jaws, polifhed and wom frooth at the extremities, confequently mult have been made wie of during the animal's life; and in thells the very pearls, are found, which the living animals of the fame lind produce.

It is well known that the purpura and pholades have a lonz-pointed probofcis, which ferves them as a hind of gimb'et or drill, to pierce the thells of living filh, o: whofe fiefh they feed. Now, fhells thus pierced are found in the earth, which is another inconteltable proof that they heretofore inclofed living filh, and that thefe fitl inhabited places where the purpura and pholades pered on them.

In Holland fea lhells are found tos feet belons the furtace; at Marly-la-Ville, fix leagues from Pariv, at 75 ; and in the Alps and Pyrenean mountains they are found under beds of fone of 100 , nay even 1000 feet.

Shells are likewife found in the mountains of $S_{\text {inai:n }}$, France, and Englans, in all the marble quarrics of Fianders, in the mountains of Guelders, in all the hills romd Paric, in thofe of Burgundy and Champagne; and, in fhort, in all pleces where the bafe of the foil is reither freeftone nor fanditone.

By fiell- we would be underftood to mean, net only thofe which are merely whaccous, but the relics of the crataceous filles alfo; and even all wher marine production: and we can vcriure to wffrt, that, in the ge-

 mater shereloy das are matiad.
 oybur, there are fow more extrandiany that that immone bed which MT. de Remmur erives an ucorat of, which contain $1: 2=0,0,0,200 \mathrm{cu}^{1}$ bic t.thom. Whis wat
 wath of 35 leagues from the fea. Som: of thete thents are tusuil) entire, that their cifitent feries ate very dithernibable.
brane of the fame fpecies are foud recent on the conlt of Prictuu, and otiners are hown to be nation of more dititant parts of the woild. Ammy them are likewile blended fome tragments of the more flrong parts of fea plants, luch as madripores, fans. inerinh, \&c. The canton of Tourame contains full nive fquare leagues in farface, and faninhe thele fragment, ot thells wherever you dig.

Near Reading in Berkhire, a continued body of oyiter thells has been found: they lie in a tiratuin of greenilh fand, about two feet in thicknefs, and $c$ stend over five or livacres of ground; they are covered by Itrath of faad and clay, upwad of $1+$ fiet deep. Several whole oyiters are found with bot's theis vilves or Wells lving together, an opters before they are opened; the theils are very brittle; and in divener then u?, one of the valves will frequently drop from its fellow. Several are dug out entise; ny, fime doable oyters with their valves united.

In a quarry at the eall end of Prougl ton in Lincolnfaire, innumerable fragments of the thats of thell fith, of vaitous forts, are found under a itratum of fone imbedded in clay, with pieces of coral, and fonctimes whole fhell fih, with their natural thel!s and colom: fome are mot mierably cracked, bruifu, and brolsen; wher totally fiueezed that by the incumbent weifht of earth.

Sharks tecth are dug up in the ille of Sheprey, retaining their natural colour, not petrifed.

The teah of tharks have likewif been takea out of a rock in Minderthelf park, near Malton in Yurkmire.

In the ine of Caldey, and chiesbere about Tenby in Pembrokethre, marine foriis have been frund in fold marble, on the face of the broken fat clifis. 202 f.ithoms below the upper lurface of the ro ks. Nor were they ouly offerved upon the face of theie rochs, but even more of lets throughous the whole mals or eatent of them. This is manitell from divers rocks hewn don: by workmen for making of lime, and other pieces cafually fathen from the clitis.

Thoufands of foffil tecth, evactly anfwering to thofe of diver, forts of fea fith, have been found in quarties and urisel pits about O vord.

At Tame in $O$, fordthite, the belenanite or or thanlerholt honer, are foum in a ifratum of blue clay, which thill retain the ir mative theily fubtance.
'1 lie lacmmes futuad in grach pits, have fuffered mach, by their being rubbed agand each other in the flucturtion of waters.

The naatili and tilmmite are frequently fourd at Gorting near Oxforl *. *Pbia

One of the moll catraordinary collecitions of thenls is Tranf. vol.

Arringe thentitely i. seeed by Ramond on the fummit of T. nt, whent Perdu. the ligheit of the Pyrences, where there Uo.... ©ound vall quautities of fa theils and other marine the Eare.. IToils, and cven Neletons of animals, is a fothil ilate.
-- Wiale ficeletons of very large aunals have been dif. concol in a foffil tate. Thote of elephant, have been found buried in the plaius of Sibcria; and bones of the whimoctros, the hipropotamus, and the tapir, have been found in other places. A very large ikeleton, nearly -ampletc, of an immenfe animal, fimilar to the rhinothus, is perefacel in the eatimet of Madrid. It was Nus up at Par. Ruay in Suuth America, at the depth of 10 feet, in a landy hed, on the banks of the river de la Plata. 1 defeption and engraving of it are gisen by Cirier, in the Amals of the National Mufem, No so. I: appease to be at leait 12 feet lung, and the inmes are of ta immente tize.

A prodigious fuantry of foills, both of marine aniwhe, and of quapeds, are found in the plafter liblls of Montnatte nesr Paris. An aecount of thefe ha, ituly anvered in teveral numbers of the Amals of the A tiont Muferm, by MI. Lamarck, accumpanied with the as tumin 1 illuffrations of Cuvier. Thefe papers wre enteme: wrims, and contain engravings of mot of the foffils datcribed, fome of which are the remains of unknora animuls. Our limits do not permit ue to prefent our readen with even an abitract of thefe accounts. We thall therefore felect only one example.
Fig. I 2 . ieprefents a block of gypfum, on the furface of which is the Releton of an animal refembling a monif, or, according to Cuvice, one of the opollum
tribe. The fkeleton is nearly entire, and the head, the neck, the fine, the pelvis, one of the fore and hind legs, and part of the tail, are very dillint. There were two pieces of gyptum found together, which appear to have divided the ikeleton between them. The animal feems to have been cruihed or in. bedded in his natural fituation *.

We have now enumerated the principal materials that compole the external cruft of our earth, and have mentioned fome of the moft material circumftances refpeeting each. The metallic ores thil remain to be confidered, and they thall be noticed in defcribing metallic veins.

## Chas. II. Gemeral Difrribution of the Materials of the Earth.

The uppermofl ftratum of the earth, in low fituations, is, for the moll part, compofed of fand or clay, or a mixuture of thicic, forming beds that are either compoted of the fame mixture, or of alternate layers of the two fubtlances. Thefe beds vary in thicknefs, in dilferent places; but, in the fame place, they ufually preferve nearly the fame thicknefs for a confiderable extent. Sometimes thefe beds of clay, fand, and carth, with thells, extend to the depth of fome hundred feet. See the amexed table, I. (E).

This table exhibits a view of the arrangement of Atrata in Ceveral countries of Europe; and, with the tables of coal ftrata, in the lalt chapter, will give the reader more infurmation on this fubject than an elaborate detailed account.
(E) The following works are referred to in the table of ftrata.

## Sect I. Of Mounains.

Thfre are no obiects on the furface of the cart's which are fo well calculated to excite the attention oit manhind in gencral, and that of geologits in particular, as thofe Ifupendous elevated maker which we eall nountains. The term mountain has in general been applied to thofe parts of the earth which are elevated tin a very confiderable height above the level furface; and a mountain is in common language ditinguilhed fiom a bill only by its fuperior elevation. But as it is found neceflary in a fcientific point of view to render this diflinction more accurate and precife, various geolozits have given more correct detinitions. By Pini and Mitterpachter every elevation whofe declivity makes with the horizon an angle of at leait $13^{\circ}$, and $n$ hofe pervendicular height is not le's than one-fifth of the declivity is called a motr:tain. Werner dillinguihes mountains according to their height, into high, middle. fiacd, and lou. A high mountain according to him is that who'e perpendicular height exceed, 6000 feet; Then the height is not above 6250 nor below 3050 he calls it middle /jzed; and when its height is below 3000 fect, he calls it lose.

Alountains are either fingle or in groups; and thefe groups either confit of feveral mountains tlanding near eachother fo as to occupy nearly the centre of a certain Space of ground, or they follow each other fo as to turm a ridge or chain running acrofs a country, or atong its fhores. Sometimes thefe chains run in a longitudinal direction, as is the cafe with Mount Caucafus and the Uralian mountains in Afa, the Cordilleras in Gouth America, \&c. but often they run in a curvilineal direction like a crefcent, as the Carpathian mountains, which feparate Hungary from the relt of the Autrian territories. It has beenfuppofed by fome theoretic writers, that chains of montains always rom in nearly the fame wirestion, which has been concrived to be from eaft to welt; but this is by no means exact, as later obfervations have hiewn that they aflume different directions according to the form of the country where they are fituated. Some writers have laid it down as a general rule, that chains of mountains always extend in a direction nevrly jarallel to the length of the country; but to this there are aifo many exceptions. Thus the Uralian mountains, the Carpathians, the Pyrences, the Grampiars in Scotland, and many others, run rather acrof the country. It often happens that mountains occupy nearly the central parts of a country; and the land generally ilope, with a gentle declivity tonards one fide of the chain, while tuwards the other it is confiderably ileep©T. Tlis circumllance of one fide of a chain of mounrains being feeper than the other, has been lately extended to mourtains and hills in general; and Dr Kirwan ha writton an excellent paper on the fubjeit, from which we lhall here extract the moit important obferations.
'. That one part of almon erey hisis momain or weneral linl is lieeper than another, could not have efcaped Ditrobutienotice of any pertion who had traveried fuch moxn- ton of the tains; but that nature ia the formation of fuch declivicies had any regard to different afpects or points of Lie compafs, leems to have been firit remarked by tl:e cecemra:ed Swedith geologit Mr Tilas, in the 22d vol. Kirwan of the Nemoirs of Stockholm for 1-60. Neither Va-htuan's revius, Lulo!ph, nor Duffon in his natural hitory pub-tions on the lifsedia $174^{3}$, have noticed this remarkable circum-dechrities hasce.
of nowai:-
" The offervation of Tilas, however, relates only to tains. the evtreme ends, and not to the flanks of mountains ; The tteep with reipezt to the former, he remarked that the flecp-de paces eff declivity always faces that part of the country where tine iow the land lies lowett; and the gentlett, that part of the evmur. country where the land lies bigheit: and that in the fouthern and eatern parts of Sweden they confequently face the ealt and fouth-ealt ; and in the northern the wert. The effential part of this obfersation extends therefore only to the general elvation or depreffion of the country, and not to the bearings of their declivities. 116
" The difiovery that the different declivities of the Weftern flanks of mountains bear an invariable relation to their fide the different afpeets, feems to have been firft publinhed by tteepeft. Mr Bergman in his Phyfical Defcription of the Earth, of which the fecond edition appeared in 1773 . He there remarked, that in mountains that extend from north to fouth, the wellern tlank is the feepef, and the eaitern the gentlff. And that in mountains which run ealt and weit the fouthern declivity is the Ileepelt, and the northern the gentleft. Vol. II. § 187.
"This afiertion he grounds on the obfervations related in his if vol. \$ $3^{2}$, namely, that in Scandinavia, the Suevoberg mountains that run north and fouth, feparating Siredes from Norway, the we:tern or Norwegian fides are the ileepeit, and the eatern or Swedilh, the mofl moderate; the verticality or fleepnefs of the former being to that of the latter as 40 or 50 to 4 or 2 .
" That the Alps are Aeeper on their weftern and fouthern fides than on the eaftern and nurthern.
"That in America the Cordilleras are fleeper on the wollem fide, which faces the Pacific ocean, than on the ealtern. But he does not notice a few exceptions to this rule in particular cafes which will hereafter be mentioned.
"Buffon, in the firf volume of his Epochs of Na-Remarks of ture, publihed in 1778, p. 195. is the next who notices Euffon. the general prevalence of this phenmmenon, as far as relates to the eaftern and wettern fides of the mountains that extend from north to fouth; but he is dilent with refpet to the north and fouth fides of the mountains that run from calt to wef ; nay, he dues not icem to have had a juit compreheafion of this plenomenon; for he confiders it conjointly with the general lip of the regions in which thefe mountains exiat. Thus he tells us, vol. i. p. 185 , that in all continents the general declivity, taking it from the fummit of mountains, is always mone rapid on the wellern than on the eafiem fide ; thus the fummit of the chan of the Co-dilleres is mel ch nearer to the wefern flore than to the catern; the chain which disides the whole length of Africa, from the Caye of Good Hope to the mountains of the

 to the fia on the cat than ư: the weit; he probably menot the controry, as ala int i. cialunt'y fo, and to l.enertes it in vol. il. p. 20; ; the than the tell, us may be colerved in ilimds and pembitula, and in motntains.
" T"his remandate cincumbance of motntatas was ronsithanding to little noticul, that in $179^{2}$ the author of an excellent accomit of the territory of C aifbad in Bohemin, tells us lie had mate an obhersation, which he had never met vith in my phylical dotiontion of the earth, nume's, thes the louthern declivi'y of all mountains was much liceper than the northem, which he proves ly imtoncing the Lugebirge of Saxony, the Pyrenecc, the mont ims of Switcerland, Sawy, Cartathin, Tyrole, Moravit, the Catponhian and Mount Hemus in Turkey. 2. Dergon. Four. 1792. 1. 355 , in the note.
"Herman in his reclogy, fuhblihed in $1-37, \mathrm{p} .90$. has at leat partial's mentimed this circuathence for he fays that the callera decinities of all monatains are much gen:ler and more thickly covered with fecondury Ilata, und to a greater height than the weltern thanbs, which he intancer in the Swedih and Norverian mountains, the Alps, the Casation, the Appenime, and Ouralian mountai - fort tie ceclivitie? bearing a fouthern or nothern affect he does int mantion.
" Lametheris, in vel. i.. of his theory of the earth, of which the fecond edition appeared in 1597 , a work which abounds in excellent oblervatinns, p. 351 , produces numerousindances of the inequality of the eattern and wettern declisties, but fearce any of the northern and hout.enth, viofe difference he does not feem to have noticel ; but he makes a remark which I have not feen elle: here, that the coalts of diferent countries prefent fimilar declivities.
"With regard to eaftern and weftern afpects, he thinks thint a different lats has obtained in Africa from that which has bee: obferved in other eountries; for in that valt peninfula he inagines the eatern declisities of mountains are the dteepe.t, and the wetern the gentlet. O: this, however, he adduces no ot er preof, but that the grea eat rivers are foum on the welkern file : this proof feems infollicient, as, if mountains be fizuated far in land, creat rivers my yow indiferminately from any ide of them, and fomitime- few rivers fow cven from the bide whw befent in mont muleate; ior

The theory according to which Dr Kirwan attempts = Nichorf. to explain the appenrances of mo:atains which are enu- Tourn. soo. merated above, will be given in the next chapter. vol. iv.
We have already, under the article Baiourter, ${ }^{\text {p. }}{ }^{2} j_{125}$ $\mathrm{N}^{\mathrm{O}} 4$. thewn the method of compating the height of Height of mountains by means of that inftrument. The following mountaias, table fhews the he:ght of the principal mountains in the globe, chiefly according to this computation.

In this table the fecond column flews the height as eftimated by the barometer, and the third the fame by geometrical calculation. Where the numbers are placed in the middle of thefe two fpaces, it denotes an uncertainty by what method the computation has been made.

Table of the Heights of Mountains, according to the lateft computations.

The coure of maxame is that dircezan of then lea, in whin trey delcend and g.on lower; or if a ris-rans parollei to them, they are hil to have theng conis in the direstion of the itream of the river. The c.ar cof momatins is feidun uniform. It ha been 1:N don at a genal maxim by Butfon, that when thete are two fatalel chain of mourtant, the filent at ale of une of the ci mas alway correciponds with the interal angle of the other: Lat hater geolugits have alcertaired thet this circumtance dues not generally hold, except when a rive nums between the two

I: stam, haneq, thet one particular :n-mbin, mountail b. or chan of notut is $:$, is cone fed of thofe thon ma. terims wh: we have denominaed primitice; whiie the rett is mat? un at the focmaner compounts. The primitive futaluon urnopy the late and central parts of te mamutail, when fertend to its very fummit : the focudary enerthele and are generaily found on Se ?ark or fiden of the mantain, though fometime, they rover the top of the mountain. In a chain of mount ans these are romnomly thee, and often he parul.el nidge, of which thic central ridge is compofed of primitive cornound, and thofe on each fide ne it, thetly or entitly $e^{*}$ facondeny compounds. Hance montains aice dially diwide! into primary or primetal, and fecondary or epizentic : the later term being cuiven to the fecudary mountairs from their being replee with fle!?, and other remain of animal being. The fecondary moneains are alio fometimes divid $\&$ into originel and denivative, for a reafon that wiil $\therefore$. pear hereaticr.

 and fecut- mey encraliy be difinglabed by the ruggedeof and
 taito and herme's of the funbatuen of which thry :te come Fobed: the ourt\% ont hardor graite $r$ hining the at-
 lemo for eradealiy decay, and leave the harre'e in the firm oflateo and angle. Whete, lowever, ti.e flamive rinsound have been rantctily conered Tith fiontiaty Itrana, thefe angular appearanci feldom thike race ; and the mountain is only tol.e diffinguisied by its polition atw the flructure of its internal parts. The fecondary mountains gencrally have their tops
rounded, and much fmoother than thote of the pimaty mountains.

In fome cafes a number of mountains appear witel at their tops into an extentive phin or piatirm, from which they feem to diverse and brameh in every directim. The mott remarkable imance ", thin hind oce. cuts in Tibet. (See Gfography, N• 4 .)
It is difficult to acquife a hnowledge of the intrior Ifructure of mountains. The greater part of them is hid from cur view, and nature chly eapofes them in a foll points by means of fillure, catems, and ithermediate valleys.
" The matcrials of which mountains corthit are dif. pofed either in irregular heay, or pile variouly in. terfected by rific, or in beds or itrata feparated froms eich other by rifis, often horizortal, or varying from that direction by ala angle of fro:a 5 to + degrea, mal fometimes much more confiderably, approaching even to a vertical pufition. The frata of mountains are mott fequently in the direation of their declivity, yot fometime their courle is direstly upponi.", of comercurrent: the beft manner of detemining the angles of the in couric is by dicovering that of thrir rifis. It chiedy depends on the unevennefs of the fundamenal grount thist fupport, them. Accorling to 1 San I. Fu2. unot? of the clevated granitic mountais, in bwhictland are formed of immenfe vertical pyramidal hamine, parikiel to eacli wher, that is, pifies funsershat inclining from the uneyual dultributhnof their weight, a dirpontion the tay well be expected from collneral crytallization s: but this difurition is not univerfal, for they hase been tound in Saxeny, and i:s the Pyrenees, horizent:lly Itratited; much ect can i: be faid, that this verical pention is F acen, for the dratz of gneff are generally hariontal, ad commaly very regular, dicuvering an thaces of a violes: thook. Mhosit Rofa, eat to Maunt Dlanc, tith lishen in Eurape, conth, alfo of g..if, which Ai. S:uflute found horiz atally ifratifed.
". shangin, who lately (1786) travelled over the Attithatn mua utain, being confulted by Pallac, whether lie foumd any vertical hayers or ilrata therein, anfivered, le had not; but that he found them perfuetly larioroal on the banks of the niver Tichary.
" 11 watairs of zrimitive limellonc are frequently in inregular pilse, but o'ten allo hosizontally itratified. suliceos chiftus is alfo often horizontally ftratifed. 4.

## Chap. II.

General nortia the Rhine, the Eibe, the Ojer, th: Vidul., Ditrina- the Oby, the Jemilei, the Lema, the Indisicke, am: tion of the the howyma, are difinarged iato the nothera referof the wit
Earth. Jadging from thofe mountans the lieight of whens - has been calculated, and from the immenfe chains with which we are arquainted, we may infer that the highett mountans are to be found in this clevated belt. The Alps of Swiferland and Siwoy exiend throagh the 43 th , the $46: \mathrm{h}$, and the $+7: h$ degrees. Among them see fod $S:$ Guthard, Furca, Brunieg, Ruf, Hothggis, Scheiden, Gungels, Galands, and lutly, t'at beanch of the Swifs Al which reaches 'liad by tiee name of Arleaberg and Arula, In Savoy, we meet witi Mont Blanc, the Penk of Arsentiere, Cornero, Great and Little St Butnard, Great and Little Cenis, Cosveline, Servin, and that branch of the Suword Aips which proceeds tow 1:ds Italy throwh tee duchy of Aoft and Monientat. In thi, vat hes? of elevated peaks, Mount Blanc and S: Gotha:d are particulatly ditinguihed. The $\mathrm{Al}_{\mathrm{p}}$, leaving Swilienand and Savoy, and paling through Tirol and Camiola, traverle Saltzbourg, Stiria, and Autria, and extend their branches through Moravia and Bohemia, as far as Poland and PrufliaBetween $t^{\text {bee }} 4^{\text {th }}$ th $4^{4 \text { th }}$ degrees, we meet with Grimming the highert mountain of Stiria, and Priel which is the higheit in -1utria. Between the $46 \%$ and $;^{\text {th }}$ degrees, the Bacher and the Reintchnicken, furm two remarkable chains. The upper one, which traverfes the counties of Irencin, Arravit, Scepus, and the Kreyna, feparates Upper Hungary from Silefia, Little Poland, and Red Ruilia; the inferior one traverfes Upper Croatia, Bofnia, Servia, and Tranfylvania, feparates Lower Hungary fiom Turkey in Europe, and meets the upper chain behind Moldasia, on the confines of Little Tartary. In thele mountains are fituated the rich mines of Schemritz.

To furm a general idea of the great height of this Alpine belt, it is necelfary only to remark, that the greateft depth of the wells at Schemnitz is 200 trifes; and yet it appears, from the barometrical calculations of the learned M. Nola, that the greateat depth of thefe mines is 286 toifes higher than the city of Vienna. The granito-argillous mountains of Schemnitz, and of the whole of this metallic dillrict, are inferior, howcer, to the Carpathian mountains. Nount Krivary in the county of Arrava, and the Carpathian mountains lietween Red Ruffia and the Kreyay, apfear by their gieat elevation to rule over the uhole of the upper Apine chair. In the inferior chain we likewifo meet with mountaino of an entraordinary height; umorg others, Mount Medieduik, which gives it name to a chain extendine far into Bonia ; and Mount Hesou, celebrated even among the ancients. In hort, this cosenfive chain reachesinto . Lia, and is there confounded with another chain no lefs famous, which, Eollosing eanctly the 5 th degree of latirule, rans throw, h' the whole of Atia. This chain of mountains i, d -feribed by Dr Pallas in the work above mentioned; sud vee hall now trace its courfe in curapany with this intellisent ubferver.

This author places the head of the monentanc of Oural, between the fources of the Yuik and the bieLain, about the $53 d$ degree of latitude, and the 47 hav

TO $O T$.

 the Eleuth, foltu: the conte of the iven Irta,
 pro e: the fame fyiten of mountans ath ice 1 taic chain. There they ase rice to the $\Theta$, the 1tis, and the lemili, which berin their coune ind. the 5 ath derge of north latitute, and thll intu the Fiozen ocem.

The Altaic chain, after hasing embract and wited all the rivers which fupply the doniti, is coutin ued under the name of Saiane, without the findici mer. ruption, as far as the Baikal lake. The "s aniont of this chain to the fouth forms that immenfo .nn! edc wated plain which is loit in Chinefe thatere, which may be compared with the only plain in (luto, :at nhich is ealled Gobi or Chamo. The Alta atesward interpofing between the foutce of the Tclikoi and at the rivers which fupply the Araur or Sagnlecen, til towards the Lena, approaches the city Inlocki beyond the 6oth degrce of latitule, runs from tha: :o the fat of Kamtichatha, turns round the Ohnckoi and 1':afink gults, joins the great marine chain of tie ke: rile illes near Japan, and forms the ficep hoses of Kamt Chatha, between the $55^{\text {th }}$ and 6 ath dezrees of latitude. Arter running in the lame parallil, and giving sile to the Obio, we Rivicte Longu:, the river st Lawrence, and the Minftipni, they are lot in Canada. From the eatern thorts of Amesica to the weitern hores of Eumpe, we find a vai interruation.

The European Alps produce three piaciral (haira, At: i which run towards the equator, and fome fmaller ones ratiming towards the pole. The firt fouthem chain is fent out through Dauphine; traverfes Vivarais, Lyonnais. Auvergne, Ccvennes, and Languedoc; and, atter joi ing the Pyrences, enters Spain. There it divides into two or three ramifications, onc of whir ha runs through Nwarre, Bifcny, Arrazon, Callice, Nrache, and Sierra Mrena, and extend into Portugat. The wther, after traverfing Anchlufia and the kinsdom of Grmada, and there forming a 1 unve: of mountains, again mahe its appearance, beyond the Atmit, of Gibraliar, in Alfica, asd coats aloms its northers flares under the same of $M$ an an The fecond principal chais of the Alps furv ow: through S:woy and lidedne.t; fipead, is rowhonti wre: the Rates of Genos an! Parma, form the belt of the Ayemines; and after frequently (having it name, and cividiut l:uly into two pars, trmimat, in the hing dom of Naples and in Siciil, pt alaning v. Ienne in every patt of its coufe. The thin I chain is fent wif from Hunquy, and featters inmumarle mountains over all 'Tukes in Eurove, as far ats the Mores and the Archipela. o at the bues om of the Mr-
 at hall, we no kels clearly defncel; and fome of them own ext thd their ranificut:ons as tate as the Frozen ocem. An Alpine branch, inhing from Samoy throuk the comatry of Cir $x$, precoi- though Francle Come.

Another inte fersa the tersitory of Salizbourg, prafis Lom: 1 han is, eaters Poland, fends ofl a ramitiction
 Hasing patid through Refia is lot in the govemant: - Itchatisel.
' 1 ne Diatic Alps fond forth in like maner leveal brambes toth to the foulh and woth. The Oundic mourtans, botween the foumen of the Bielain and the Jaik, preduace thee primeipal braches; the firl of whid, itsceding the Cafion lea in one or its diviivas, enters Circulfia throust the rovemament of Aftakar, paii , trouag Georcia uader the name of Carequar, fatis a suft number of ramifutions to the wet into Alatic 'Turkey, and there produces the roountins 'itchibes, Ararat, Pumu, Arée, and many others in the three Arabian; while the other divition, paifi.g beiwe the (afpian fa and the lake Aral, penctrates through Cawafan into Peria. the fecond branch, taking a more eaterly direction, leaves the cometry of the Eienths; reaches Littie Buchatia; and forms the ramports of Gos and N1agos, and the celofrated mount ains formerly hiown bs the tame of aff, which II, B-ill: lia made the feat of the twar between th. Dins ant the Peris*. If traverfes the kne !ow of Calgar and Turhestan, enters through thet of Lanor into the AIs ul tervitry, and, after civing rife to the elcuated delert of Chamo, forms the weitom $1^{\text {th ninitia }}$ of India. Whale thele two bronches run tuwards the fouth, the thin 1 branch of the Our lic chain riles towards the torth, following almol the 7 gh degree of lonsitude, and torm a nstura! boundary between Europe and Afa; withm, however, bounding the inmone cmpite of Rumb. This chain, after coming oppolite to Nova Zembla, divides into two confiterasle branches. The one, running to the northectt, Ialles along the Arctic thores; the other, moceding towards the north wett, meets the northern European chain, traverfes Scan linaria in the blape of a hode. inve, covers the low lunds of Finland ith rocks; and, as is obterved Ly Ir Palas, appars to be continued from the $X$ wh Cape of Norway through the marine chain of byizbergen, fottering inlads and thelves perhans thanghout the northem ocem, that, pating throwh the pole, it may juin the northem and eartm rui:ts of Alia and Nort! Amenica.

Tine Ouralic, whech in the country of the NIonguls become, the Altac chain, proceeds tonads the eguator. After forming the mountains and caverns wherein, as we are whd, the athes of the Mongol emperors of the race of Cengis K n ate derolited, together with the vait plain of Chamo, confliting of arid fand, and the frightial rocks and precipices of Thibet, which form the myterinus and deiert retreats of the Grand Lema, it cruffes the sivels Ava and Menan; contains in its fubdivinons the kingdoms of Ava, Pegt, Loo, Tonquin, Cochanchina, and Siam; Supperts the penintula of Malacca; and overffreads the Indi:n ocen with the illes of Sunda, the Moluecss, and the Plailippines. From the berders of the B.ikat lake and of the province of Selinginkoy, a tranch is detiched, which fpeeads over Chinefe Tartary and C hina. is continued into Corea, and gives rifa to the illands of Japan.

The great chain having extended to the north, near the city of Jakuck, upon the banks of the Lem, fends
of one of its brancles to the north-wen, which paffing between the lwo Tungufta, is lolt in mathy grounds lying in the northern purts of the province of dennfitiluy. The fame clanin, atier $i$ las reached the cattem part of Alia, is loth in the icy resions of the worth about No-licialathoy, or the I'y Pomrontory, and Cap) (zaczalay.

It will be more dificult, perhaps, to trace the elc- Gouthern vated belt in the fuwthern hemiphere beymd the tro chratione. pic of Capricorn, than it has twen to ditinguint that towards the nort't. An immede extent of ocean foems to oceapy the whule Anmartic, pant of the ghbe. The greated fouth latutude of the ohl continent is not more than 34 degrees, and Buth America farcely catends to the $55^{\mathrm{h}}$ derree. In vian his the enterprition, Cuok attempted to dilcover re ions tuwards the pole: his progrefs was conftanty interrupted by tremendurs moustans and fields of ice. Boyond the 5oth degree no land and no hantations are to te fomd. The illans of Now Laland ane ti rantheit land in the e deent fess; and yet the fonth cape of Tamal. Poctameo extents only to the 480 h degree: We do not wention Sanduich-land, which is fituated in the sSth deguce, ixceare it is two trall and too low. It muit be recultected, however, that acconding to the declations of tavellers, the Cordilieras become higher is they advance futhwad to the trants of Maschan; and that Terma del Fuego, whach lies in the latitude of 55 , is whing tivt a nafs of rochs of protigiven elemtion. Imerica, homever, crhibits to our view elevated piants, whence chans of mountains are ditributed in different directions over the whole furface of the new continent. There mult likewife le great reforvirs, whare the mon remarkable rivers thke their rif, and fom which they neceflarily defeend towards their mowhs. In the fouthern hem:fphere, this clevated belt is reater the erquator; and thourh it does not extend to the $5^{\text {oth }}$ degree, it is evidently to be met with, and mas be accurately trared, between the 20 th and 3 oth degrecs. The high mountains of Tucum and of Paraguey, which interfeet Suuth ismerica about the $25^{\text {th }}$ degree of latitude, may be conidered as the American Alps. I: we look into the map of the work, we thall be able to ditinguils an elevated belt all along this parallel. In Africa, Monomutaya and Caffraria are covered with vely high monntains, frora wlich pretty large rivers defcend. In the Pacific ocean, we find New Holland, New Caledonia, the Nuw Hebrides, and the Friendly and the society iflunds, under the fame 1:arallel. We may, therefore, with futhicient propriety, dillinguith this parallel by the name of the Southern Aps, as we have alrouly diainguihed the clevatud be't of the joth deg!ee of noth latitude by that of the Northern Al'ps. In Amenica, the Rio de la Plata, which after a coute of 5 oo leagres fatts into the ocean it the $35^{t h}$ degree of fouth latitude; the Pavana, which rites from the mount ins of the frapes, and Gis into the Plata at Coniente; the great number of rivers which florv into that of the Amazons, fuch as the Paraba, which recectes in its courle the tribute of more than 30 other rivens; the Aadera, the Cuchirara, the Ueayal, \&ic. \&ac. all defcend from thefe fouthera Alps, From thefe Alps tikewife three confiderable branches of mountains are detached, which

 I mumetains of this chain are Ben Lavers, Ben Dore,
 $\because$ Na: Ber: Lawers is Ben Nevis, the highect Aubtuin in Pritary, and tw the wortherent of this lear Ii: In an : is the long hill of Comi Alluk. A$\therefore$ at se milu to the eaft of this is the high mountain of Chimguran, timous for the fecimens of quatzofe Sores found there. Nimorous momutains lic in the $f_{c}$ -- U. Ution if the Hirhlands, beyond Loch Linue, ?"u Lach Nef, erpecially on the weftem hore, whih $\therefore$ croided with tille. Fuw of thefe are confulerable. To the wet of Roforire are feveral hi!'s, among which Een Clat, Bea Chafher, and Ion Gelich are the noft rewarkabie. Nore inland Rands the high mountain of Ben Wevis, neatly equal to Ben Neris. In moft of t.eele mountains the primitive rocks prevail, and granite is wfen very abundant. Few mincrals, however, exce diren ore, are found.

Ireland comains but few motntains, and none of any confiderable importance. They generally form flecet
lincs, or appear in detached groups, one of the higheft of "!lich is that on the well and fouth of the lake of Killarney, in which is the monntain of IIangerton. A fmall line of hills called Shecky mountains runs on the north-weft of Bantry Bay, palfing towards the eath. To the northward of this ilands Sliblogher and Nigles, and towards the eafl are the hill of Knockemdown. In the county of Leinfter is a mountain of the fame nome, and to the fouth of Dublin are the Wicklow hi!l, from which there were lately fuch great expectations of golden treafure. In Uliter fland the mountains of Mourne, the highett of which, Donard, is haid to be nearly the keight of Mangerton. The mon mountainous part of Ircland is the wettern peninfula of That illand, toward which, in the county of Mayo, itands Dephin, one of the ligheft in the kingdom, On the foath eafl of Clewbay is the mountain of Croagh Patrick, allo in the county of Nayo, which is the lat Inih hill of any importance.

We cannot here with proprict: enter on the theory of the formation of mountains. The hypothefis of the principal geological writers with refpect to this fubject, will be feen from the general view of the theories to be given in the neat chapter. We may in this place only remank, that all the fyllemis which have been of $n$ frucked, tu explain the formation of the primiti e mountain, with refpect to which there is the moft dipute, may be reduced to three.

In the first of thefe, mountains are fuppofed to have $\therefore$ ecn formed fuch as we now fee them, except that they Aave fuffered lome degradetion and modifications, from certain accidents polterior to thicir onimal formation, ant that thele mountains owed thair clesation above the Fhaces which furnowid them, to one firgle accidental accumulaton of mose materiab in one place than in anwher; an aceumalation which might have taken plase without that great precipitation which preceded and occafoned ise confolidation of the aruf of our globe.

In the fecond hypothef, w? the pinitive mountains

Ni.n. No. d.14. P. 422 .

We have defribed dykes ( $\mathrm{N}^{\circ} 15$. ) to be thofe in Hitory of terruptions of the flrata which are formed by perpendi-dyles. cular fillures filled with ttony lubfances. As thefe Nony matters are frequently of that kird called whinfone, thefe dykes are commonly called whin dykes, and the hiltory of thefe is very important, as they form one of the principal fubjects in the principal theories of the earth.

Dykes have received different denominations, defcrip-Names ${ }^{143}$ tive, in fome meafure, of the nature of the fubilances of which they are compofed; or of the feeming effects they have produced on the interfected horizontil ftrata. They are called bafaitic vcins, trap dykes, whin dykes; and in the coal countries of Scotland they are called gaws, from the idea that thiey have occafioned the feparation of the coal, and contiguous frata, through Whis! they ron.

Thefe dy hes have been more atteatively obferved in coz! countrics, than where they occur elfewhere; becanfe on the accurate knowledge of their courle, inchination and thicknefs, depend, in a great reeafure, the julicious and fucceisful operations of the miner, when his workings approach the dike, or render it necefory to cut through it to reach the ilrata of coal on the other idde. But, though lefs attended to, they have been obferved and traced in other places, where a great extent of the horizontal itrata have been expofed ia the beds of rivers, as in the bed of the Water of Leith, ajove St Bernard's Well, wear Edimburgh, and on the fea ihore, etpecially on the weftern conits of Siotland, where the rocks are more abrupt and precipitous, and where the violence of the Atlantic ocean has removed part of the horizontal Atrata, and left the vertical ftrata remaining, like immenfe walls or dykes. Hence proba'ly the origin of the name; and as they often confite of the fecies of tone called whm/on', this enithet has been added.

The courle, however, of th:e greates number which Counit. ne have had the opportunity of examining, gencrally lic lietueen the points of the conmis S. and S. E. and N. and N. N. This is moft fiequently the courle of the whin dykes of Illay and lurat ; it is the courle of a pemarkabie dyke which traverfs the coal Atrata at the sillage of Stevention, near Saltcoats, in Ayrnife ; part of which is feen en the furface, not many handred yards to the north of the welt end of that vif-

## Sbet. IH. Of Alatalichems.

Tue hikony of aict. hic veing, although far fom be-ntuthe ing to full and fatisfactory as could be witind, is mure vens. complete than that of whindyes. The later veenctent no farther attention than as objects of cenimity to the besiogit, or as fingular facts in eitablihiug a therory, atd when thoy come in the way of the opratiuns of tide miper, to difouser their comevion with the rontiguous Atrata; while the wants atid luvuries of man have rouled ingenuity and exertion in expluring the former, on account of the precious and ufful metals with which they are tored. Thus, the folindour atd beanty of fonce metallic luefomes, and the utilly of othere, inave made them in all ages be eflecmed and valued by mathind; and cond onenily they have been the contant objects of parfuit and inveltigation. It is ofvi us that the beauty and utility of metals, on account of which they are fo much wahed and fonghtitfer, excite greater intereft in procuring them; on the one hand, the setearche and obfervations of the philologter in furnilhing the hiflory and general principles, and, on the other, the irnmediate application of this knowledge, and of thele pinciples, in the mactice and operations of the miner.

The liatory of whin dykes is, in generat, puite analogous to metallic weits; but, of the latter, from what has been fated, we en feak with more eettinty and precilion.

Three difaent kinds of metallic veins have been de-Ditmition foribed by geongical writers; the perpenticular vein, of veits. the pipe vein, and the flat or ailene! vein. We fuall condider each of thefe in their oder.

1. Of the perpendicular veitn.--This !and of metallic perperdice. vein oreurs moit frequently. As may be expefted. it lar veias. $i$ varines in its courle or direstion, thicknels, and inchation. Metallic veins are found ruming in very direction; hut, in generat, the mot powerful veins, that ic. the mont protuctive, are oblemed to run from nouth io fouth, or at kat a few points deviation from that courle; and whem any deviation happens, it is winally to the calt of north, and to the welt of fouth. ${ }^{r} 53$
The coufe or difection of a vein is called in toloni- Cource of

## Chap. II.

G E O L O G Y.

General callangu o its $i_{i}$ arg. Tise cxtent of a veinin the line Daftribs- of bearing, we beliave, rarely excceds the range of tion of the Materinls of the Larth. mountains in which it is difcovered. This is the cafe with the principai veia at Leadhils. It is limited to the cluan of mountains in which the uperations are now carried on; and although the mines of Wanlockhead are not a nile difant, new weino appear with galena or lead ore, of quite a different quality, and all the accompanying minerals, whether forming part of the vein, or found in cavities, are alfo quite different from the lead o:e aad other minerals found i: the veirs at Leadhills.

The inclination of veins is various. Sometimes they are nearly perpendicular ; fometimes they deviate confiderably from a perpendicular line; fometimes the fame win in its courle downward, inclines to one fide; fometimes it is perpendicular, and fometimes it inclines to the other fide. When the deviation from the perpendicular does not exceed $10^{\circ}$, the vain is ftill confidered as a perpendicular or vert:cal vein. When a veia is inclined, the two fides which include the metallic fubflances are in very different pofitions, and have confequently received from the miners different names. That ide which fupports the metallic ore, or on which it feems to lean, is called the ledger.fide, or fimply the ledger. The oppofite fide which covers the ore, or which overhangs it, is denominated the hanjing.ide, or fimply the hanger. From the inclination of the vein being varied in its courfe downwards, it mutt appear that the fame fides, according as the inclination varies, muft change their pofition and denomination. This will perhaps be more intelligible by the fection at fig. 5. in which AA reprefents the vein ; BB, CC, DD, EE, the frata interfected by it ; 1. the hanger ; 2. the ledger; 3. the hanger; and, 4. the ledger.

The thicknefs of veins, and indeed of the fame vein, is alfo extremely various. Sometimes they are only a few inches thick. From this they increafe to the thicknefs of feveral feet. The veins which were wrought it Leadhills, about feven years ago, were from two to fix feet within the fides; but fome years before that time the principal vein in thofe mines, by the addition of two ftrings or fmall veins, affumed the extraordinary thicknefs of $1 ;$ feet of pure ore. This unufual appearance, both on account of its richisefs and grandeur, excited fo much attention and admiration, that the countefs of Hopetoun undertock a journey to the'c inferior regions, not lefs than 150 fathoms below the furface of the earth, to witnels the fplendour and brilliancy of this fubterraneous apartment. The uncommon thicknefs and abundant riches of this vein are ftill talked of at Leadhills with enthufiaim. But a thicker vein was once wrought at Slangunog in Wales. Fifteen feet of clean ore were for fome time dug out of this vein. Thefe are, however, far exceeded by the copper veins in the Parys mountain in Anglefea, which are defcribed by Mr Pennant in his Wellh tour. The thicknefs of one of thefe veins is 21 feet, and of another 66 fet.

The broadeat metallic vein, of which we have any accu:nt, is, we believe, that of the Ecton copper mine, in Derighire. In thi mine there was worked, at one - Wawe's time, a heap of ore, of the attonilhing extent of 70 Derbygire, ywd from fide to fide *.
p. in. The extent of veins domwards bas in many cares V 1 ! IX. Dan! !
been afcertamed. To the segret and difuppementient of the miser, they have been frequenty inerseptel and eatircly cut off by the horizontal frata. The rich veis of lead ore at Slanguagog in Wale, which we have already mentioned, was intercepted in this manner by a firatum of black fchiftus or thiver, the nature of which is not defcribed by Williams, pho liates the fate *. Their refearches to recover their loft wealth, which were profecuted for icveral years, proved altogether fruidefs. pa The fmalleft trace of this unufually productive vein was never aticrwards difoovered.

Two kinds of perpendicular mineral veins have been Two kint, obferved and defcribed. In the one cafe the relative of peripendipolition of the itrata which contain the metallic fubfances is exactly fimilar to that of the coal flrata when they are interfected by a whin dyke. On one fite of the vein the flrata are clevated or deprefled from their former plane. This is illutrated by fig. 5 . where the letters BD, CC, DD, EE, mark the correfponding Atrata which have been deranged or difplaced. In the other kind of vein the mineral fubitances containing the metallic ores are merely feparated withont any clevation or depreflion ; for each fide of the filure ftill remaining in its former plane, the oppofite lides of the divided itrata exaetly correfpond to each other. The mines at Strontian in Argylethire are of this latter d .. fcription.

Veins of this kind have frequenty finaller veins, $n$, as they are called in the language of the miners, Aringr, which run off at an acute angie, preferve their cours for fome diftance, not, in general, very great, gradual. ly dimininh in thicknef, and at latt are entirely lot among the conticuons itrata. At the place of $j$ matio: the principal vein is always thicker, as has been already noticed with regard to the unufual thickne.s of the: principal vein at Leadhills.

To this account of perpenöicular veins we may add, that fome veins are found crofing each other, and that whin dykes have alio been difcovered interfeding metallic vein. Examples of the latter orcur in the illand of Ilay.
2. Of the pipe vein.-The perpendicular vein latt de- Pipe veir. foribel, interfected or cut the ilrata actofs. What has been denominated the pipe vein is eatremely limited i a the line of bearing, but having the fame inclination as the frata which include it. It m:y be conndered as in fome meafure of a circular form, extremely irregular, and always following the courfe of the itrata between which it is included, lihe the perpendicular veins; fonetimes as it dips downward, it is enlarged; fumktincs it is diminilhed, and fometimes it is fo much contideted, that the including hata come int, clofe contact. In a word, this kird of vein is fubject to all the inregularities of the veine fomerly deferined, only that its inclination i, invariably the fame with the accompanying ftrata.
3. The fats ailacel vern.-Thi, kind of metallic Fht ver. vein, after what has been faid with regard to other veins, will require hat a ilort deffription. It is exactly fimilar to the pipe vein, only that it is more extend. ed in the line of be ring. It is included between the horizontal ftrata; and therefore its inclination or dip, mant be the fame as the including tra:a. A vein if this kind might with more propriety and accuracy be regarded as a metallic horizontal ilratum, were it tot 4 E

General that it is simats found varying in its dimenfions, and 1sitritur uct of the Material. of the Litth. equally irregular as the perpendicular veins which interfect the horizontal itrata.

It is almoll needlefs to add, that the flat or horizontal viins are fubject to the fame derangement as the coal frata, when they are interfected by a whin dyke. The vein, along with the including ftrata, is either elevated or depreffed, and the fame thing takes place when they are traverfd by a metallic vein.
To finim the fiet ha of the hiltory of metallic veins, We have only to enumerate the different metallic ores that occur in them, and to mention the places where thefe are found in greatelt abundance. In this enumetation we fhall follow the arrangement of metals given by Bochant, in the fecond volume of his Traité Elestertaire de Mineralogie.

In naming the feveral fpecies, we fhall adopt the nomenclature of Kirwan, adding the French and German $f_{y}$ nonyms to each. As it would far exceed our limits to give even a curfory deficription of the feveral fpecies, we refer the reader for that to the article MineraloGy in this work, or to the elementary treatifes of Kirwan or Brochant, or the more extenfive treatife of Haüy.

## I. Platina

Has been found hitherto only in its metallic or native frate, and it has as yet only been met with in South America, cifecielly at Choco in New Grenada. It is found in the land of rivulets, and probably comes from the primitive mountains.

## II. Gold.

Native gold-This is found principally in primitive mountains, fometimes in veins, and fometimes diffeminated through the itony matter. The fubflances which moft commonly accompany it are quartz, feldfpar, calcareous fpar, heavy par, pyrites, red filver ore and vitreous filiver ore, and galena. Gold is fill more commonly met with in the fand wafhed from centain rivers. The countries where gold is chiefly found in rocky fubtrances, are Hungary, Tranfylvania, Peru, Mexico, Siteria, and Sweden. It has alfo been found in France, near the town of Uifans, in the department of the leere; Lut not in fufficient abundance to render the working of the mine profitable. Among the rivers whofe fands furnih gold, we may enumerate the Rhine, the Danube, and the Aranioich in Tranfylvania.

Gold has been found in feveral parts of the Britinh dominions, efpecially at Sillue in Bedfordnite, in the Wicklow hills in Ireland, and in the neighbourhood of T.eadhills in Lanarkhire. It is faid that a jewellcr, who died lately in Dublin, often declared that gold, to the value of $30, \mathrm{coc}$. had paffed though his hand, which was brouzht from the Wicklow hills. This hine is now in the hands of government, but we beiiese does not anfwer the expect:tion thar was firlt formod as to its produce. General Dirom in 'roms us, that in the reign of Jomes V. of Scotland, 300 maen were empluyed if $r$ feveral fumners in walhing the fand rear Leadhille, for gold, of which they are fiid to have cellected to the amount of $100,0=0$ !. Ateritis. It is faid that piece of yold, an ounce in weicht, have been found at Lecrailis. and that Lorch Hor tuca ha a

III. Mercury.

Specics 1. Native Mercury, or ${ }^{2}$ ucickinver. Le Mercure natif. Gediegen Quecktilber.-This is found at Idria in the Auflian territories; at Almaden in Spain, at Stahlberg and Mofchellandfeerg in the Palatinate, and a few other places.

We are told by Mr Jamefon, that a quantity of quickfilver was difcovered fome years ago in a peat mofs, in the illand of Ilay, and he thinks it probable that veins of it may be fill found there *.

Species 2. Natural Amalgama. L'Amalgame na- thc Ifas, vol. tif. Naturaliches Amalgam.-This confifts of mercury ${ }^{\text {i. P. }} 153$. and filver, in very variable proportions. It is found at Saldberg in Sweden; at Rofeneau in Hungary, and efpecially at Modchellandfherg in the duchy of Deux Ponts, where it is found mixed with common ferruginous clay, and with other ores of mercury.

Species 3. Mercury Mineralifed by the Sulphuric and Muriatic Acids. Mercure Cornée ou Muriaté. Queckfilber Hornerz. - This fpecies was difcovered about 30 years ago, in the mines of Mofchellandfiberg, and at Morefeld, in the duchy of Deux Ponts, by M. Woulfe, mixed with ferruginous clay, quartz, lithomarga, native quickfilver, and cinnabar. It has alfo been found at Almaden in Spain, and at Herfowitz in Bohemia ; but it is very rare.

Species 4. Native Cinnabar. Le Cinnabre. Zinno-ber.-This ufually forms a gangart for the other ores of mercury. It occurs in the ftratiformed mountains, pretty near the furface. This ore is found in a great many parts of Europe, efpecially at Almaden in Spain, Idria in the Aultrian territories, at Mofchellandiherg, in Bohemia, in Saxony, in Hungary, in Tranfylvania, in the Palatinate, and in France; but in this laft it is found but in fmall quantity.

## IV. Silver.

Species i. Native Silvcr.-A particular variety of Sitver ores. this fpecies, mixed with gold, is very rare. It is principally found in Conigfberg in Norway, and Schlangenberg in Siberia. In the former of thefe places it is found diffeminated through calcareous fpar, fluor fpar, and rock cryital, in a vein running through a rock of hornblende llate, and accompanied with blende, galena, and pyrites. That of Siberia is found diftributed through a mals of heavy for.

Common native filver is found in confiderable quantity in Nexico and Peru. It is alfo met with in Siberia, Saxony, France, Sweden, Norway, in the Hartz, and in Bohemia. It is principally found in the primitive mountains, difributed through maffes of heavy fpar, quartz, calcareous fpar, fluor fpar, pyrites, blende, cobalt, galena, red filver ore, and vitreous filver ore.

Silver has been found in feveral parts of Britain, ofpecially near Alva in Scotland. It is confidently affirmed, that a mals of capiliary filver, weighing $\mathbf{s} 6 \mathrm{oz}$. was found in the lead mines at Garthoncfs in the ile of Way, mixed with galena + .

Species 2. Antimo riated Native Silver. I'Arsent fics, wit. io Antimonial. S ifef las Silber-This feecies has hi- F . 13.3 therto been oriy fund in the mine at St Wencelas at Altwoifach, and in the duchy of WutemLerg, in a win mixed with calcareous fatr, beavy foar, cative filves, mind ruartz

## Chap. II.

General Deft:1u. tion ot the Mucrial
of the
E.rih.

G E O
 fenical. A fenik Silher.-This is alfo rare, having been found only at Andreafberg, in the Hurtz, an at Kumala in Spain. In the Hartz it is mixed with native arfenic, rel hiser ore, galena, blende, mind calcarenws fpar. Confiderable quantities of filser, probably of this ipecies of ore, are obtained from the lead ore of Leadhills.

Syecies 4. Corneour Silior Ore, or Muriated Silver. L’Arcent Cornèe out Myriaté. Hora Erz. - This has been found in Peru, Mexico, Saxony, France, Siberia, and, as is affirmed, in Cornwall in England.

Species 5. Sooty Silver Dre. L'Argent Noir. Sil-berflewarze.-This is found in Saxony, France, and Hungary, mixed with other ores of filver, and fometimes with native filver.

Species 6. Vitreous Silver Ore. I'Argent Vitreux. Silberglaferz.-This is found in Bohemia, Saxony, Norway, Swabia, Siberia, and in Hungary, mixed with other filver ores, and ufually accompanying calcareous fpar, heavy fyar, and fluor fpar.

Species 7. Red S:Iver Ore. L'Argent Rouge. Roth-gittegerz.-This is found in the Hartz, Bohemia, Saxony, France, Swabia, and in Hungary, accompanying native arfenic, realgar, vitreous filver ore, galena, calcareous fpar, and heavy fpar.

## V. Copper.

Species 1. Native Copper.-This is met with in Siberia, the Uralian and Altaifchan mountains, Kamtfchatka, Japan, Saxony, France, Sweden, Hungary, Palatinate, and near Redruth in Cornwall, in England. It ufually accompanies other ores of copper, efpecially malacbite and copper azure.

Species 2. Vitreous Copper Ore. Le Cuivre Vitreux. Kupferglas.-This is found in Siberia, Hungary, Sweden, Norway, Rulia, Saxony, Silefia, Heife, and in Cornwall.

Species 3. Purple Copper Ore. La Mine de Cuivre Violette. Buntkupfererz.-This is always found in the neighbourhood of other copper ores, efpecially with the feecies lait mentioned, and with copper pyrites. It is found in Sasony, Bohemia, the Bannat in Tranfylvania, the Hart, Norway, Ruffia, Sweden, Hungasy, He 价, and in Derbyfhire in England, efpecially in the famous Ecton copper mine.

Species 4. Tellow Pyritcs, or Tellow Copper Ore. La Pyrite cuivreufe. Kupferkies.-This is the mof common fecies of copper ore, and is found both in primitive and fecondary mountains, fometimes in beds, and Sometimes in veinc. It occurs moft abuadantly in Bohemia, Saxo:1y, Hungary, Sweden, France, Spain, and efpecially in Britain, where it forms one of the principal varieties of copper ores, found in the famous Parys mine in the ille of Auglefea.

Species 5. White Copper Ore. La Mine de Cuivre Blanche. Weifshupfererz.-This fpecies is very rare, but it has been found in Saxony in the mines of Freyberg, in Hefle, in Wirtemberg, and in Siberia, with uther coppet ores.

Species 6. Gray Copper Ore. Le Cuivre Gris. Fahlerz. - This again is a very common fpecies, and is found ia all thofe countries that poffers mines of cop. prr.

Sresies 7. Black Copper Orı. Le Cuivze Noiz

## $\mathrm{L} \cap \mathrm{G}$

hupferfhwarze.-This is found mixed with malachite and with green and blue copper otes in Saxony, Hangary, in the Pannat, in Silelia, in Norway, ia Rutlia, in Swahia, in Siseden, and in Sixcris. It atfo occurs in the I'rys mine of Auglefea.

Gtrerai

nithe
Fitth.
Specits 8. Fiorid Red Cbosnct Ore. Nine de Cuivt * Rouge, Ro.th kupfererz.- This uhally accompanies native copper, malachite, and brown eartly iron ore. It is met with in Saxony, in the Bannat, in the Hartz, in Norway, in Siberia, near Cologne, and in Corn wall.

Species o. Brick-red Copper Ore. Le Mine de Cuivre couleur de Brique. Ziegclerz.-Found in fimilar fitu. ations with the preceding.

Species 10. Blue Calciform Capper Ore. L'Azur de Cuivre. Kupperlazur.-Found in the Bannat, in H.fr, in Saltzburg, in Poland, in Siberia, in Thuringia, and in the Tyrolete. It is ufually imbedded in flaty mari, or in fandfone, not far below the furface of the errth.

Specios 11. Malachite.-This is always found mixed with oiber copper ores, and occurs in moit of the cop. per mines that have been enumerated.

Specics 12. Mountain Gireen. Le Vert de Cuivre. Kupfergun.-This commonly accompanies ipecies 4 , $6,9,10$, and 11. It is found in Saxony, in the Hartz, in Norway, Silefia, Siberia, Hungary, Wirremberg, and Britain, as at Leadhills and in Derby Alure.

Species 13. Olive Cofper Ore. Mine de couleur Olive. Qweatz.-This pecies is extremely rate. It has been found chienly near Karrarach in Cornwall, where it is accompanied by pecies 11 and 12, and brown iron ore in a gangart of yellow lithomarga mixed with quartz. It is faid to have been found alfo at Jonibach near Ruftelitadt in Silctia.

## VI. Iron.

15:
Species I. Setive Iron.-This fpecies is very uncom- I.on uct: mon; but it has been met with in feveral places, eipecislly at Kamfdorf and Eibenftock in Saxony, at Kranfnajarlk near Jenifei in Sibecia, at Olumba near St Jago in South America, and Oulle near Grenoble in France, The two moit remarkable fpecimens of mative iron are thofe found in South America and in Siberia. The former of thefe forms a mafs weighing at leaft 300 quintals, or 15 tons. It is foft and malleable, and in every refpect like the pureft iron. That of Siberia is a foheroidal maf, weighing about 14 ๆuintals, relting oa the furface of the earth, near the fummit of a mountain. Its texture is cellular, and its cavities are filed with a tranfparent, grecnih, vitreous matter. No mines or veins of iron are in the neighbourhood of either.

Species 2. Martial Pyrites. Pyrite Martiale. Schwc-felkies-This fpecies is one of the molt common ores of iron, and is foun 1 abundantly in every c uwery where there are any other ores of iron. I'bere are three varietics of it decribed by Brochant, which are lefs common, but thefe are alio found in many places.

Species 3. Mapnetic Pyrter. La Pyrite Magtietique. is metkies.- This has been found only in primitive roch:, efpecially in micacenus fehiftas, accompanied Ey cuarts, hornblende, Sic. and witally lying in beds nimed with other pyritur enlena, and magnetic iron-

General floné. 1. is fuund in Sazuty, Bavaria, Norway, and Diteram- Silcia.
ton of the Species 4. Magnetic Ironfore. Le Fer Magnetiquac. of the Easth. Magnetifcher Edenfein.-Of this there are three varietits, the common magnetic ore, which is very com-
non in primitive mountairs, efpecially thofe that are compofed of greifs and micaceous fchillus. It is often in great abundance, forming large beds, or even whole mountains. It is found in greatef quantity in Saxony, Bohemia, Italy, Corlica, Silefia, Siberia, Norway, and efpecially in Sweden. The fecond variety, called frbrows magnetic ironfone, is uncommon, but is found at Bibourg in Sveden. The third, which Kirwan calls mognt:ic fond, is found in the banks of fome rivers, paricularly of the Elbe, as alfo in Sweden and Italy.

Species 5. Specular Iron-ore. Le Fer Speculaire. Eifenglanz.-This is found in many places, often in confiderable quantity, efpecially in Saxony, Bohemia, France, Normandy, Prulfia, Sweden, Siberia, Hungary, Corfica, and the iftand of Elba. It is generally found only in primitive mountains, fometimes in beds, fometimes in reins, accompanied with quartz, hornfone, martial pyrites, and magnetic iron ore.

Species 6. Redfcaly Iron-ore. La Mine de Fer Rouge. Roth-Eifonflein.-This is rather rare, but is found in Several parts of Saxony, in the Hartz, in Naflau, in Thuringia and Hirgary. Another variety of the fame species, the compact red ironftone of Kirwan, is much more common, being found in Saxony, Bohemia, the Hartz, Hcfie, Siberia, and in France, fometimes in veins, and fometimes in beds, commonly mixed with the two following fpecies, ard with argillaceous ironftune, quartz, hornftone, and calcarcous fpar.

A third variety, the common hematites or bloodfone, which is one of the molt productive iron ores, is always found accompanying the laft variety, and is of courfe met with in moft of the fituations above enumerated. It is procured in abundance in feveral parts of England, as in Derbyfhire, but more efpecially at Ulveriton in Lancalhire, where there is one perpendicular vein of it 30 yards wide, in a rock of limeftone. Large quantities of it are carried to Carron, where it is fmelted with the common Carron ironftone.

Species 7. Brown Iron ore. La Mine de Fer Brune. Braun-eifteutein.-Of this there are feveral varieties, of which the compact brownirontone, and the brown hæmatites, are very common; but the brown fcaly iron ore is rather rare. The laft is found at Kamfdorf in Saxony, at Klaufthel, in the Hartz, at Lauterick in the Palatinate, and at Nasla in the principality of Bareith.

Specics 8. Calcarenus iron ore. Le Fer Spathique. Spathiger eittentein.-This is found both in primary and fecondary mountains, and there are few veins of iron which duno: contain it in greater or lefs quantity.

Species 9. Black Iron, ione. La Mine de Fer Noire. Schwarz eitenfein.-This is found in the principality of Baresth, in the Mariz, Saxony, Heffe, and Palatinate.

The common argillaceous iron ore of Kirwan, is ranked by Đrochant as a variety of this. It is very common in moft iron countrics, and much of it is found in Britain, efpecially in Colebrook-dale, Shropthire, and in D an forct in Glousefterfhire. The Carron o:e is principally of thi kind.

Species 1o. Lowhat iron ore. La Mine de Fer de Gazon. Rafen-cifmatein.-Therc are leveral varieties of this, all of which are found in 1 cw , humid ntuations, in very extenfive beds, alternating with faidfione, clay, \&ic. This fpecies is much more abundant in the north than in the fouth of Europe, efpecially in the duchy

Gencral Diftribution of the Haterials of the Earth. of Brandenburg, in Courland, Lithuania, Livonia, Pruffia, Pruflian Polahd, and Luface.

Epecies 11. Blue Martial Earih. Le Fer Terreux bleu. Blaue-cifenferde.-This is found imbedded in clay and fimilar earths, and often accompanies the laft fpecies. It occurs in Saxony, Silefia, Swabia, Bavaria, Poland, Siberia, and the Palatinate.

Species 12. Green Martial Earth. Le Fer Terreux vert. Grun-eifenerde.-This fpecies is uncommon, having been found only at Braunddorf, and Schneeburg in Saxony, in veins, accompanying quartz and fulphus pyrites.

Species 13. Emery. L'Emeril. Schmirgel.-This is found in Saxony, diftributed in a bed of hardened fteatites, in fanditone. It is alfo found in Italy, Spain, Peru, the ifle of Naxos in the Archipelago, where there is a cape called by the Italians, Capo Smeriglio, or the Emery Cape. It is often mixed with particles of magnetic iron ore, whence fome have fuppofed the emery to be magnctic.

## VII. Lead.

Species 1. La Galéne Commune. Gemeiner-Blei- Lead. glanz. -This is the moft common and abundant ore of lead, and is found both in primitive and fecondary ftrata, in beds and veins, accompanied with quartz, fluor fpar, calcareous fpar, fparry iron ore, barytic earths, blende, pyrites, and feveral ores of filver. It is found in great abundance at Leadhills and at Wanlockhead in Dumfriesthire, in Derbyfhire, Strontian in Scotland, and in the Nendip hills in Somerfetfinire. A variety of this, called compact galena, is found in the fame fituations, efpecially in Derbyfhire. It has often been confounded with graplite, or plumbago.

Werner enumerates nearly 20 formations, as he calls them, of galena, but Mr Jamefon thinks the galena formation in Dumfriesfhire is difierent from any of the fe,

Species 2. Blue Lead Ore. La Mine de Plomb Bleue. Blau-blei-erz.-This feccies has as yet been found only at Zfchopau in Saxony, accompanying fluor fpar, barytic fpar, white and black lead, and malachite.

Species 3. Brown Lead Ore. La Mine de Plomb Brune. Braun-bleierz.-This fpecies is alfo very rare, but is found at the fame place with the laft, and alfo in Bohemia, Britanny and Hungary.

Species 4. Black Lead Ore. Ia @Mine de Plomb Noire. Schwarz-bleierz.-This is found in Saxony, at Freyberg, at Zfchopau, in Cumberland, in fome parts of Scotland, in Poland, and Siberia.

Species 5. IVhice Lead Ore. La Mine de Plomb Blanche. Weifs-bleierz.-This is not a very abundant Species, but it is found in feveral lead mines, efpecially in Bohemia, Saxony, the Hartz, France, Siberia, Hungary Carinthia, and in fome of the Britifh lead mines ${ }_{k}$ efpecially at Leadhills.

Species 6. Gircen Leal' Ore. Phofphorated lead ore of Kirwan. La Mine de Plomb Vert. Green-bleierz. -This is found in veins, more commonly in the primitive mountains. It is met with in Bohemia, Saxony, Bavaria,

## Chap. II.

G E O L O G S
black: are found in mofe of taefe places, shd beades in France and England, efpecially in Derbyhire.

Specics 2. Catamine. La Caldmine. Galmel.-Of this there are two varieties, compact and friated. Both occur only in particular itratiform rocks, ofien forming entire beds with indurated clay, and calcareous fpar. The later is ufually found in the cavities of the former. Both occur in Bohemia, in Carinthia, and in moft of the German lead mines. They are allo found in Britain, efpecially at Leadhills, Warlock-head, and in Deibyhire.

## Xi. Ampmovy.

Species I. Native Antimony:-This is very rare. It was difcovered at Sahlberg in Sweden, in the year $17+8$, in a gangart of fome calcareous ftore, and it was alfo found fome years ago at Allemont in France, accompanying other ores of antimony and of cobalt.

Species 2. Sulplurated Antimony. L'Antimoine Gris. Grau-fpies glas-erz. - There are feveral varietic, of this, as the compact fulphurated antimony, found at Braunfdort in Sasony; at Goldgronach in the principality of Bareith; at Maguria in Hungary, and Auvergne in France: foliated fulphurated antimony, fould at Braunidorf and Goldgronach, and in the Hartz, and Tranfylvania: ftriated fulphurated antimony, found in Saxony, Hungary, France, Swabia, Tufcany, Sweden, the Hartz, Spain, and in England: plumofe antimonial ore, found at Freyberg in Savony, at Braunfdorf and Stahlberg, and at Chemnitz in Hungary. All thefe varieties are ulually found in a quartzofe rock.

Species 3. Ked Antimomal IOre. L'Antimoine Rouge Roth- $f_{p}$ eis glas-erz.- This is found at Braunfdorf, at Masaika and Kremnitz, in Hungary, and at Allemont in France. It ufually acrompanies the firit and fecond fpecies, efpecially at Allemont, or the nest fpecics, which is the cafe at Rrauafdorf.

Species 4. Murriatcal Antimony. Antimoine blane Weies-fpeis glas-erz.-White antimony is extremely rare ; it is principally found at Frzibran in Bohemia, 17 quadrangular, filinitg tables, difpoied in bundles upon galena. It is faid alfo to have been found at Braunforf and Malafka.
Species 5. Antimunial Ochere. L'Ocre d'Antimoine. Spies g'as-okker.-This apecies is allo very rare; it is found at Braunfórf, near Freyberg, and in Hungary, always accompanying the fecond and third fpecics.

## XII. Cobillt.

Species 1. White Chall Ore, Le Cobalt blanc. Cobato:... Weifier fpeis-kobolt- - This is found in Norway, Sweden, at Anaberg in Sasony, in Swabia and Stiria; but it is very rare. In Saxony and in Norway, it oceurs in beds of micaccous fichinu, whong with the $7^{\text {th }}$ lipecies, and with cquartz, homble ide, mil pyites.

Species 2. Dall Gray Liblait ore De Cobalt gris. Grauer-fpeis-kooolt.-This is found in Saxony, Bohemia, France, Norway, Swabin, Hungary, Stiria, and in a few mines in Eugland. It is foncetires mised with ores of filver.

Species 3. Brig he White Colalt Ore. Le Cobalt Eflatant. Glanz-hobolt.-This is the mot common of all the ores of cobalt, and almott always accompanie: the ores of nickel, and of filver, lo found in Bo.

590
Genert hemia, Suxony, Silefa, ha Matz, Hede, Sweden, Swa-Ditrou- bia, Norway, Stiria, Spain, Thuringia, and in England. Ma erit. It it found in beds in the primitive rocks, and in veins R f the in the fecondary.
Euth. Species 4. Batk Cabat Ochere Le Cobalt Terrak noir. S-hwarzer erd-kobolt.-This is found in Sas. onv, in Thuringia, Swabia, Hefre, the Palatinate, Satizburg, and in the Tyrol, accompanying other ores of cobalt, and feverai orcs of niver, copper, and iren.

Speciec 5. Bruwer Cobalt Ochre. Le Cobalt Terreux brun. Brauner-crd-kobolt.- This is found in confiderable quantity at Saalfeld in Thuringia; at Kamedorf in Saxony, and at Alperfpach in Wirtemberg, accomganying other nes of cobalt.

Species 6. Meilow Colal: Ochre. Le Cobalt Terreux jaunne. Geber-erd-kobolt.-This is one of the rareat ores of cobalt. It is fousd at Saalfeld in Thuringia, at Alperfpach in Wirtemberg, and at Altcmont in Dauphine in France.

Species 7. Red Cobalt Ore. Lee Cobalt Terreux rouge. Rother-erd-kobolt. This is found in Saxony, Thuringia, Heffe, Swabia, Bohemia, Allemont in Erance, and in Norway.

## XIII. Nickel.

〇V'2ces. Species 1. Sulphurated Nickel. Le Kupfer Nikel. Eupfer Nikkel. - This is found in veins, both in primitive and fecondery mountains, almolt always accompanying fume of the ores of cobalt, to which it feems to bear fome geological relation. It is allo found in fome filver mines. It is met with in Bohemia, Saxony, Thuringia, the Hartz, in Swabia, Heffe, Allemont in Fance, Stir:a, and in fome parts of Britain. Its ufual gançart is quartz, barytic and calcareous faar.

Species 2. Nickel Ochrc. L'Ocre de Nikel. Nik-kel-okker. - This is found in the fame tituations with the laft, from a decompoittion of which it appears to be produced.

## XIV. Manganese.

Seccies 1. Gray ore sf Manganefe. Le Manganefe. Grau braunfeinerz.-There are feveral varieties of this, but they are all commonly found near each other, in veins or in mafles, commonly in the primitive mountains.

They are found in confiderable quantity in many mines in Saxory, Bohemia, Bavaria, and Hungary. They are aifo met with in France, and in feveral parts in Britain, as in Derbyfhire, Leadhills, and Wanlockhead; in the Mendip hills, and the ifle of Jura.

Species 2. Red Manganefe ore. Le Manganéfe rouge. Roth-Cronftein-erz. This is very rare, but is found at Katnick, Offerbanya, and efpecially at Nagyag in Tranfylvania, at which laft place it is found in 3 gold mine.

## XV. Molybdena.

Le Molybdere fulphure. Wafferbley.-This is found in Bohemia; at Ceveral places in Saxeny; in Sweden; at Tillot in France, and at Chamouri at the foot of Mont Blanc. It is commonly found in primitive rocks, effecially in tin mines.
XVI. Arsexic.

Species 1. Nasive Arjonic.-This is found in Bo-
hemi?, Savony, the Hartz, Carinthia, Swahia, Tranfylwa, and in France. It is always met with in veins, in pritnitive mountains, accompanied by realgar, galena, the orcs of cobalt and nickel, and feveral ores of filver.
r.

Species 2. Arfonical Pyrites, or Marcafite. La Pyrite Arfenicale. Arfenik-kies. This is found in Bohemi?, Susony, and Silefia, accompanying the common tin itume, and galena, with fome other minerals.

Species 3. Realgar. Le Realgar. Raulchgelb.This is found in the Bannat, Bohemia, Saxony, Swabia, the Hartz, the Tyrol, Hungary, and in the neighbourhood of volcanoes, efpecially AEtna and Vefuvius.

Orpiment, which Brochant makes a variety of realgar, is found in feveral of the above places, and alfo in Natolia, in Servia, Tranfylvania, and Wallachia, ufual. ly accompanying quartz and clay.

Species 4. Native calx \&f Arfenic. L'Arferric oxidé natif. Naturlechur-arfenik-kalk.-This is very rare, but is found in a fmall quantity in Bohemia and Joachimfthal, in Saxony, at Rafchau, at Salatna, in Tranfylvania, and in Hungary.

## XVII. Tungsten.

Species i. Tungfen. Le Tungfténe. Schiverftein. Tungttea -This is a very rare mineral, but is found at Schlack-ores. enwald in Bohemia, at Ehrenfriederdorf in Saxony, and at Riddarkytten, Bifburg in Sweden, ufually accompanying quartz, mica, talc, and tin ore.

Species 2. Wolfram.-This is allo pretty rare, but is found in Bohemia, Saxony, and at Poldice in Cornwall.

## XVIII. Uranium,

Species I. Sulpharated Uranite. L'Urane noir. Pe-Uranura cherz.-This is found at Joachimfthal in Bohemia, and ores. at Juhann-Georgen-Stadt, and Schneiberg in Saxony, accompanying the two following feccies, and lead and copper ores.

Species 2. Micaceous Uranitic ore. L'Urane Micacé. Uran-glimmer.-This is found in the Bannat, Saxony, Wirtemberg; near Autun in France, and near Karrarach in Cornwall.

Species 3: Uranitic ochre. L'Ocre d'Urane. Uranokher. This has been found at Joachimfthal in Bohemia, and at Johan Georgen-Stadt in Saxony, but it is uncommon.

Species 1. Menakanite.-This has been found chiefly T

#### Abstract

ores.

Species 2. Titanite. Le Ruthile. Ruthil.-This is found at Boinik and Rhonitz in Hungary ; in New Caftile in Spain; at Afchaffenbourg in Franconia; at St Yrieux in France, and in Mount St Gothard, and

Species 3. Titanitic Siliceous ore. Le Nigrine. Ni-grin.-This has been found near St Gothard in the Alps, at Ohlapian in Tranfylvania, \&c.

Species I. Sylvanite. Le Sylvane natif. Gedie- Teling gen Sylvan.-This is found chietly at Fatzetorg in Tran- Tellurium fylvania, but is now become extremely rare. It occurs

Chap. III. (; E O) Theoric, of in beds of gray wacke and fecoadary (or trantition) the Earth. limeitone.

Species 2. $\qquad$ Le Sylvane graphique. Shrifterz. -This is found at Offenbanya in Trantylyaniz, in a bed of porphyritic fienete, and granular limettone.

Species 3. - Le Sylvane blanc. Weifs-Syl. vanerz. -This was brought to Brochart from Freyberg in Saxony.

## Chap. III. Of the naja Remarkable Itecries of the Earth.

: 80 Object of theories of the earth.

A late writer confiders the proper object of a theory of the earth, to be the tracing the feries of thofe revolutions which have taken place on the furface of the earth ; to explain their caufes, and thus to connect together all the indications of change that are found in the mineral kingdom. He juftly obferves, that the formation of fuch a theory requires an accurate and extenfive examination of the phenomena of geology, and that it is inconfifent with any, but a very advanced ftate of the phyfical fciences. There is perhaps no refearch in thofe lciences more arduous than this; none where the fubject is fo complex, where the appearances are fo diverfified, or fo widely fcattered; and where the caules that have operated are fo remote from the fphere of or-
$\rightarrow$ Playfuir's dinary oblersation *.
2lisfirutions. With fuch requifites, and under fuch difficulties, it is not furprifing that fo many who have aimed at conftructing theories of the earth, have failed in the attempt, It certainly requires a prodigious accumulation of facts, together with a talent for obfervation, and for arrangement, which are feldom found unitcd. We fhall prefently fee how far thofe theosies which have hitherto been framed to account for the changes that the earth has undergone, have been fucceffful.

It is not, however, to be fuppofed, that a correct theory of the earth is impoffible, though fome may think it an arrogant, if not a prefumptuous undertaking, to attempt explaining how the prefent fate of the globe and the revolutions which it has undergone, were brought about. The time is perhaps not far diftant when the prefent prevailing hypothefis will be imfroved into a rational, and fo far as is confiftent with the knowiedige and acquirements of man, a perfect fyftem.

Dr Kirwan has laid down certain laws of reafoning; which fhould be adhered to inviolably in inveftigations of this kind. The firt is, that no effect fhould be attributed to a caufe whofe known properties are inadequate to its production. The fecond is, that no caufe thould be adduced, whofe exiftence is not proved either ty actual experience or approved teftimony. Nany na:urel fhenmena have arifen or do ariie, in times of pheces fo diflant, that well conditioned teftimony corceming them camot, witheut manifer abfurdity, be reiecte.t. Thas the inhabitants of the northom parte of Eurupe, who have never felt earthquakes, nor feen vol. eaver, mant neverthelers adrit, from mere teitimony, that the fit thave been, atal that the ferond do actually exits. The thard is, that no poser, thouid be afcribed to an alledeed reme, but thofe that it is hnown by
 Atunces $\dagger$

The firf who formed this amulemert of earth-making r! ${ }^{151}$ is of into a fyltem, was the celebrated Thomas Burnet; a Burvet. man of polite learning, and rapid imagination. His facred theory, as he calls it, deicribing the changes which the earth has underaone, or fhall hereafter undergo, is well known for the warmth with which it is imagined, and the weaknels with which it is reafoned; for the elegance of its style, and the mannefs of its philofophy. The earth, fays he, before the delure, was very differently formed from what it is at prelent; it was at firf a fluid mafs; a chaos compofed of various fubftances, differing both in denfity and figure; thofe which were heavieft funk to the centre, and formed in the middle of our globe a hard folid body ; thonfe of a lighter nature remained next ; and the waters, which were lighter ftill, fwam upon its furface, and covered the earth on every fide. 'The air, and all thofe fluids which were lighter than water, tloated upon this alfo, and in the fame rmanner encompalied the globe; fo that between the furrounding body of waters, and the circumambient air, there was formed a coat of oil, and other unciuous fubftances, lizhter than water. However, as the air was fill extremely impure, and mult have carried up with it many of thofe earthy particles with which it once was intimately blended, it foon began tc. defecate, and to depofe thefe particles upon the cily furface already mentioned, which foon uniting, t:ci earth and oil formed that crutt whiel foon became an habitable furface, giving life to segetotion, and divell ing to animals.

Thisimaginary antediluvian abocie was very dirieren* from what we fee it at prefent. The earth was lighit and rich, and formed of a fubflance entirely dapted to the feeble ftate of incipient vegetation; it was a uniform plain, everywhere covered with verciure, withous mountains, without feas, or the fmalleit incrualities. It had no difference of feafons, for its equator was in the plane of the ecliptic, or, in other worcs. it turned d. reetly oppofite to the fun, fo that it enjoved one perps. tual and luxuriant fprins. However, tinis denghtici face of nature did not long continue in the fame thate, for, after a time, it began to crack and open in fili..re. a circumftance which always fucceeds when the fun e. hales the moifture from sich or mariny ituatiors. Thie crimes of mankind had been for fome time preparing te draw down the wrath of heaven; and they at iength induced the deity to defer repairing thofe breaches in nature. Thus the chafms of the earth ciery day be came wider, and, at length, they penetrated to the great abyfs of waters, and the whole carth in a marres fell in. Then erified a total diforder in the wifform beauty of the firit creation, thic terrone fortae bite brcken down; as it fank, ble water galiend ut is it.
 cept eight perfons, wele defirayed, wht their watrity condenmed to toil upen the rains of defolated nasure.

It remains to mention the manner in wind he re lieve the eath from this wniverfal wech, whin would ...... to be as difficult av even its fort forn"tior Thefe great mafies wiearth falling into the aty fo used duen with them wat quantities of air ; ard ly: dall. ifg againt coci sobre and beaking into fmall ...nt

Y the vi...: ut tice thock, they at length lett beWcea thom harse cavities filled with nothing but air. [hiefe cavitios naturally officed a bed to receive the inflect waters; ard in proportion as they filice, the fare of the earth became once :ore vifible. The histhez parts of ite broken furface, now become the tors of hountains, were the fret that appeared; the plains thon ater came forward, and at length the whole globe was deliveed from the :aters, except the places in the thent cruations; fo that the ocean and the feas are fill a part of the ancient abyis that have not had a place to return to. Ilands and rocks are fragments of the earth's former crult ; kingdoms and continents are jayger mates of its broken fubflance; and all the inequaluties that are to be found on the furface of the prefent esth, are owing to the accidental confufion into which Loth earth and watess were then thrown.

## Sect. Il. Theory of Wooduard.

The next who attempted a theory of the earth was - Voodnart. Mr Woodward, who in his eflay towards a natural hifory of the earth, erdeavoured to give what he confidered as a more rational account of its appearances than had beea given ly any preceding writer. He was indeed much better qualified for fuch an undertaking than any of his predeceflors, as he was one of the molt indultrious naturalits of his time. Hence though his fyitem mut be confidered as weak and untenable, his work contains many important facts relating to natural hithory.

Woodward fets out by afferting that all terreftrial fubfances are difpofed in beds of various natures, lying horizontally, one over the other, like the coats of an onion, and that they are replete with thells and other marine productions; thefe fhells being found in the deepeft cavitie, and on the tops of the highef mountains. From thefe obfervations, which were warranted by the experience of naturalills at that time, but which we now know not to be univerfally correct, he proceeds to remark that thefe fhells and extraneous folfils are not Froductions of the earth, but are all actual remains of thofe animals which they are known to refemble; that all the beds of the earth lie below each other in the c:der of their fpecitic gravitics, and that they are difFofed as if they had been left in this fituation by fubfiding waters. All this is affirmed with much earneftneff, although many of the circumftances are contradicted by daily experience. Thus, we not unfrequently meet with layers of thone above the lighteft foils, sind find the foftet earth below a itratum of hard itone. Woodward, however, having taken for granted, that All the Itrata of the earth are arranged in the order of their fpecific gravities, the lighteft at the top, and the heavicit near the centre, he deduces as a natural confequence, that ath the fubflances of whic! the earth is compofed were once in an actual shate of folution. This univerfal folution he conceives to have happened at the time of the Hood. He fuppofes that at that time a bosly of water, which was then in the centre of the earth, uniting with that which was found on the furface, fo for feparated the terrene parts as to mix all together in one fluid mafs; the contents of which after. wards fimking accurding to their refpective gravities, rroduced the prefent appearances of the eareh. Being
avave, however, of an objestion that foffil fubtances Theories of are not found difiolved, he exempts them from this the Eartho univeral dillulution, and for that purpofe, endeavour t) thaw that the paits of animals have a itronger cohefion than thofe of minerals; and that, while even the hardett rocks may be difolved, bones and hiel!'s may itill continuc entire.

$$
\text { Sect. III. } T^{\prime}
$$

OF all the theories of the earth that have been $\mathrm{Th}^{\mathrm{IS}_{3} \text { es }}$ os formed, previous to thofe of Hition and Werner, none Whifton. has been more applauded or more oppofed than that c " Whilon. Nor is this furpriing; for this theory being fupported with all the parade of mathematical calculation, confounded the ignorant, and produced the approbation of fuch as defired to be thought learred, fince it implied a conaderable knowledge of abftact fcience, even to be capable of comprehending what the writer aimed at. It is not eafy to divelt this theory of its mathematical garb, but the refult of our philofopher's reafoning appears to be as follows.

He fuppoles the earth to have been originally a comet, and he confiders the hifory of the creation, as given us feripture, to have its commencement juf when it was, by the hand of the Creator, more regularly placed as a planet in our folar fyitem. Before that time, he furpofes it to have been a globe without beauty or proportion; a world in diforder, fubject to all the vicifitudes which comets endure; fome of which have been found, at different times, a thoufand times hotter than melted iron; at others, a thoufand times colder than ice. Thefe alternations of heat and cold, continually melting and frezzing the furface of the earth, he fuppofes to have produced, to a certain depth, a chaos entirely xcfembling that defcribed by the poets, furrounding the folid contents of the earth, which ftill continued unchanged in the midft, making a great burning globe of m:ore than two thoufand leagues in diameter. This furrounding chaos, however, was fas from being folid: he compares it to a denfe though fluid atmofphere, compoied of fubftances mingled, agitated, and hocked againit each other; and in this diforder he defcribes the earth to have been juft at the eve of creation.

But upon its orbit beirg then changed, when it was more regularly wheeled round the fun, every thing took its proper place, every part of the furroundins fluid then fell into a fituation, in proportion as it was light or heavy. The middle or central part, which always remained unchanged, fill continued fo, retaining a part of that heat which it received, in its primeval approaches towards the fun; which heat he calculates, may continue for about fix thoulard years. Next to this fell the heavier parts of the chaotic atmoliphere, which ferve to fuftain the lighter; but as in defcending they could not entirely be feparated from many watery parts with which they were intimately mixed, they drew down a part of thefe alfo with them; and theefe could rot mount again affer the firface of the carth was confolidated; they therefore burnound the heavy firit defending part, in the fame mannor as thefe furround the central glone. Thus, the entire body of the carth is compofed internally of a great burning globe, nex: which if phoed an heary terterc tibltonce that encon:-

## SECt. IV. Thory of Buff?

Liss abstracted and more popular than the theory ut 1. in : it Whinton, but equally fanciul and ponpuls, was the anas. hypothens of Eufton. This iyllen, which is is receiv. ed with great admiration, depends principally on two tacts which, though generally true, wate by Butfon extended much too far.

It had been long obferved, that fuch tinity ur filiceous buaies as form it pert of the compoition of antls, are amung the moit abundant materiais which compole the earth, and that many of them nearly retermile glafs in colour, tranfparency, luicre, hardaers, and fperifis gravity. As glafs is produced by fulion in a ilunnz heat, it was inferred by Butlon, that the nint $y$ bontiee found on the earth derived their origin from a funilas fufion ; and as no heat tufficient to produce to great a. effect, could be found on our globe, the aut ior his recourle to the fun as its fource. He fuppofes tlit planets, and the earth mong the number, to have on: ginally formed a part of the body of the fun. In thijituation a comet falling in on that grest body, migl.t have given it fuch a lhock, and to thaken its whole frame, that fome of its particles micht have been diven off, like freaming fparkles from red hot irar; and each of thofe ftreams of fire, though very fmail in comparifon of the fun, might have been large cnough to fo:m a planet much greater than our eath, or any other of the planetary fyllem. In this manamer the planets, together with the globe which we inl: doit, miol:t have been driven off from the body of the fun by impultion; and in this way they would have continued to recode from it for ever, had they not been arreite. 1 Ly thic fo. perior power of attraction, exerted on them by the fun . and thun, by the combination of the cc:itritumal and centripetal fonces, they were whirled round in ise or bits which they now deforibe.

After efiving a mamber of reatons for the crecibibity, or at leat poitibility of the foregning fupmofitio: , the author concludes that it is evident, that the carth affumed it? prefent figure when in a naeled itate. It is natural to think, fity he, that the earth, when it ivired from the fun, had no other form but that of a torment of meited wind inmanned remtter ; that thes torrent, by the mutual attraction of its parts, took on a glubular $\mathbf{f}_{5}$ ure, which it. diurnal mution changed into a fpheroid; that, when the carth cooled, the vapours, which were expanded likee the tail of a conset, gradually comdenfed, and fell down in the form of water upon the furface, depofiting at the fitme time a diray fubblsnce mixed with fulphur and dalt, Hort of which wav carricd by the motion of th-- 4'er into the perpendicular fiffures of the ftrata, and $+\mathrm{F}$
projucet

The fo s frefuce metal, and the rett remaned on the furface, the $b, \quad t$ and gue riie to the vegetable mould which abounds i: dificmat places, with mere or lefs of animal or vege. tulide paticle, the organization of which is not obrious to the lenfe:

Thes the inserior parts of the giobe were criginally connofed of vitrified mater, and probally they are fo ot prefent. A pove this wre placed thrie bodies which lad been reduced by the heat to the fmalleft particles, $\therefore$ fald. which are only portions of glaf, and a hove theie tumice itures, and the licorise of melted mater, from whith wise afterwards produced the feveral kinds 'iclu. The whole mafs was cuvered with water to the deatis of five or ix. hundred feet, arifing from the confenfition of the wapours when the earth began to cool. This water deponited a flratum of mud, mixed with all thofe fubitances which were capable oo leint thimed, or exhated by fire; and the air was formed of the matt fuetile vapours, which, from their fmall ipucific gravity, thated atove the water.
Sush was the condition of the eath, when the tides, the winds, and the heat of the fiur, beran to introduce chanyes un its furfice. The diurnal motion of the eath, and that of the tids, elcyated the waters in the cquatoris regions, and necellarily tranforted thither great çantitics of thine, clay, and fand ; and by this elevating thofe parts of the eath, they perhaps funk thole unde: the poles about tso learues, or a 23 oth yrart of the whole; for the waters would eafily reduce ato porder pumice fones, and other fpongy parts of the witified matter upon the furface; and by this means excavate fme places and elerate others, which, in tines, werald produce infonds and continents, and all thoce inequalities on the furfacc, which are more confidesajoc tunards the equator than tuwara the poles. The highall mountains lie betweu the tropics and the misifle of the temperate zones, and the lowell from the polar circles tow ards the poles. Indecd, both the land and tea have muti inamalities hetween the tropics, as is twident from the inctedible number of illands peculiar tu ti.pfe re jimen.
the otince circumfane whicla forms a principal pat oi the batis of this the ery, is derived from the componitiva of fica flecls. It is well hnown, that thefe fhells cuant chicily of an enth like that which conflitu:es the principal port of limellone or marble ; and it was i.ence inferred that, nter a feries of ages, thefe thells being broken down into minute paticles, produced thute inmence mafic of calcareous fubtunces which ate row fuald either in will mountains, or in ftratifed phai:s, in alawit crery part of the carth.

Bu:fo: conceive very naturally, that the furfare of the earih :mut, at the lagiming, have been much lefo Fulill than it is at prefert, and confequently the fance causes which at this day produce but fioght changes, mult tien, on fo yitlding abody, have teen attended with very cultideraile effects. There is, be think, tevey reafon to fuppuif, that the carth was at that time coverd with the waters of the fea; and that thefe waters were abore the tops of ont higheft mountains, fince, aen in furh clevated hituations, we find fle?!s and cther warine productions in very great abundance. It appears alfo that the fea continued for a confalerable time apen the fare of the earth; for as thefe layers of thelle are found fo very frearently at fiche greet depths, mus
in iucia prodigious quantitics, it lecms imponible for Theoties of fuch numbers to Lave been fupported all alive at one the Eath. time; fo that they mult have been brought there by fiscelfive depoftious. Thefe thells alfo are found in the badies of the lardett rocks, where they coald not have been depolied all at once, at the time of the delluce, or at any fuch inatant revelution; fince that would be to iuppole, that all the rochs in which they are found were, at that infant, in a tate of cillolation, which would be aburd to affer:. Ti.e iez, ihertfore, defonted them wherever they are now to te found, and that by now and fuccellive degrees.

- It will apteir alfo, that the fea covered the whole earth, from the appearance of its layers, which lying reoulurly one atove the other, feem all to refemble the fedianent formed at different times by the ocenn. Hence, by the irregular furce of its waves and its currents, driving the bottom irto fand-banks, mountaias muft have Leen gradualiy formed within this epiverfa! covering of waters; and thele fuccellively raifing their heads atove its furtace, muft, in time, have formed the higheit ridges of mountains upon land, together wi:h continents, iliands, and low grour.tc, all in their turns. I his opinion will receive auditional weight by confidering, that in thofe parts of the earth, where the power of the ocean is greatelt, the inequalities on the furface of the earth are highelt ; the oceas's power is greateft at the equator, where its winds and tides are moft conftant; and in lact, the mountains at the equator are found to be higher than in any other pants ot the world. (Vid. $\left.N^{\circ} 129.\right)$ The lea, therefure, has produced the principal changes in our earth; iivers, volcaroes, earthquakes, ftorms, and rain, having made but hight alterations, and only fuch as have afiected the giobe to very incontiderable deptis."
"In the fomaticn of this theory, fars Mr Kirwan, genius (I mean genius in its primitive fenfe, the fuWhme talent of faicinating invention, and not the ener, g. tic power of patient, proour , and fagacious inveltig.tion, unhapfily prefided. Yet dazzled by the fplendid but delutive feenery, prefented by an ardent imagination foaring to the fource of light, and rending from its flaming orb the planetary mafles that furround it; then maring with daring and overweening confidence, fancied fuccellive epocls of the confolidated fabric of the terraqueous globe; the public attention was long ariefed by the magical renretentation, and the underllanding nearly betrayed into a partial, if net a total, aftent to it.
"This proud figantic theory was, however, like another Goliath, foon demolihed by a common thint or petbe, the very fublance it irmg fron. Common glais eltemially contains an alkalise falt, to which alons it owes its fufbility ; filicenus fubtances contain none, and are ablowtely infutible when unaflociated with any. Maczuer found them infuntie not only in furnaces, but in tice fill incomparably faperior heat of inflamed oysetn. Hence the hypothetis grounded on the affunned identity of thefe fubflances and common glafs, vanimed like the uncmbodicd vitions of the night. With refpect to limeftone, the other pilhar on which this theory rells, Cronfed, Ferber, Born, Aıdaini, and Bergman, demonitrated the exiftence of numerous and imacule mountains, in which not only no vetiges of laells could be traced, but whofe intcinal atructure of poltion

Chap. III. G E O L O G I.

Whon the componast p arts o : the chans hat teen Turo-... of thus progrelively feparated, and coliceted irte atifinct the E Er mafter, the following confurners ate forpoe 1 to tave enfued. The folids could not maifuraiy inaide fom every part of the lusface, and the e fully covered I: water; for, as the-fin and mom were cuesal with the chaos, in proportion as the feparation of the filids -ud fluids increated, to, by the action of the'e bocies wa he fea, the tides becars greater, and remorad the fulit, f. om place to place, without any orler or renularity. Hence the fea becane unequaily decp; and the ine inequaitios daily increating, dry land gradually appared, and divided the waters which had hithetto been uniseratly diffufed over the eath. The primitive illurds being thus formed, gradually became firm and dry, and hit for the reception of animals and vegctables.

The atmofphere, the fea, and the land, being thu: formed, Mr Whitehurft proceeds to confider the orace in which animal and vegetable bodies were teverally created. He firit fuppofes that, as the ocean became pure, and fit fur amimal life, before the formation of the primitive illands, filh were the firft animals produced, and he fupports this opinion by many ingenious argaments and facts. He obferves, that in every iallance upon record, the fragments of fea-thells are intinitely more numerous than the bones and tecth of tih. 1 he latter, too, are but rarely depolited in any other matter than in beds of fand and gravel, and not in the folid fubitance of limeftone, as the thells of fill generaliy are, even to the depth of nany hundred yards, and difperfed throughout the whole extent of the fecondary itrata. Hence it is prohable, that hiell-filh were produced in prodigious quantities, fooner than any other kind of animal. The ocean being thus tocked with inhabitants, previnus to the formation of the primitive illands, many of them became enveloped, and were buried in the mud by the action of the tides; and this would happen more particularly to the fhell filh, as they were lefs able to extricate themfelves. Since the remains of marine animals are thus imbedded at various depths in the earth, there is fufficient proof that thefe marine bodies were entombed at fuccellive periods of time, and that they were likewife created before the primitive illands, and confequently befure any terreftrial ithonds.

That the earth has, at diffirent times, fuffered very violent convalions, producing extenfive ruptures of its folid part:, may reafonably be concluded from the rugged and uncriuth appeatance of many of the mounthinous parts of the world. We fee rocks in fome places torn afund $r$, or appeating as if cet with a law, and we fin?, in various pats, fubtances both mincral and organized, which are not generally met with, except in very dillant regions. Moft of the irreçularities of the eart's inface are attributed by Mr Whitehurft to the general deluge. This would, in fome inllances, have the cffect of reducing large mafes of matter to 3 lecond Ifate of folution; many eminences would be levelleel, and fome of the vallers would be filled ap, while home parts which were before covered with wa'er, might receive fuch an acreflion of matier as to fill up the ir caritis, and on the fumbling of the waters brcome a vait level plain. On zhe wiler hand, thofe elevated recions which were ehichis compoied of the hardett Pours, by having the lighter portions of earth wathed ヶよ
*) wy

Tisertios the E.asti..
away from thcir bans, would appear confiderably increaled in height. Mr Whitehurlt attributes the production of pit-coal alfo to the deluge, as it is difficult to arcount for the depofition of fuch a quantity of vegetaille matter (fuppofing pit-coal to be of vegetable arigiv) below the furlace of the earth, on any other byputhefis. The animal matters found in a fofil fate, sfitcially thoe remains of anmals which are not now :und unon the carth, can only be accounted for, on the upontion of a deluge.
Mr. Whitchurn, however, is mot content with attriGuting ro the celuge mot of the changes which have taken place on the furface of the earth, but he derives fom the fame fource the curtailed longevity of man, and many of the evils incident to mankind. " At that Ireadful era, fays he, an I not before, the year became divided int funmer and whiter, fping and autumn, and the fipontamenus products of the earth no longer fufficed the calls of human moture without ant and labout; whercfore he who tosed would expeit to reap, and tee who lnitt an hut for his protection, would n'2turslly exp.a t: enjoy the fruits of his own labour; atectivy, incerore, was the parent of property, and property created a thouland imaginary wants, which its pricilurs culeavoured to gratify, and their example excited fimilar idese in thole who had it not, but neverthelefs itudioully endeavoured to gratify their artificial wants y utjutimble means. Hence the recelfity of laws, dominiun, and fubordination, which had no exitt. ence in the antedituvian wotll."
" Tothat great revolution in the natural world, we may therefure afcribe many of the evils incident to mankind; forexperience lievs, that men who are born in rude and favage climates are naturally of a ferocious difpofition; and that a fertile foil, which leaves nothing to wifh for, foftens their manners, and inclines thes to humanity."

The above is a general outline of Mr Whitehurft's theory, fome parts of which are very ingenious, and are corroborated by obfervation, while others are not a little tanciful and improbable. In his fuppoition that the earth was originally in a thid ftate, he agrees with most other theorilts, as this is a circumbtance which admits of little doubt; though, as Kirwan has hewn, it is nut secellary to fuppofe that the whole mafs of the earth was fluid, but only thofe parts of it which are reear the furface. In his play of affinities, and confequent feparation of the materials of the erth into homogeneors mafies, Whitchurlh has been followed by Dr
t Kirwan's
Geotoriaal
ETMys,
E:Tay 1.

Kirwan, who has framed a beautiful and ingenious fpeculation on the fuccellive changes that took place from the action of the materials on each other $\ddagger$.

Mr Whitehurit has been betrayed by his fondnefs for a favourite theory, into feveral errors refpecting the ftratification of the earth, wlich require to be mentioned. Thu, though the arrangement of the itrata, efecially where it has not been diturbed by fome evilent and violent caufe, is evtremely uniform; he hos, bow ever, extended this regularity farther than it really otains. He tells us that the itrata invariably follow each other, as if it were in an alphabetical order, or a feries of numbers, whatever be their denomination. N , that they are alike in all the different regions of the earth, enher in quality or in thichnels, but that cheis order in each particular par:, howeve: they may
differ in quality; yet they follow each other in regular Theories of fucceffion, both as to thicknefs and quality, infomuch, the Earth. that by knowing the incumbent itratum, together with with the arrangement thereof in any particular part of the earth, we may come to a periect knowledge of all the inferior beds, fo far as they have been previoully dicovered in the adjacent country. With refpect to the itrata that accompany coal, fome inftances are apparently, but not really, contradictory to this rule.

We now know, however, that Mr Whitehurf's obfervations do not univerfaily apply. In the old mines in the valley of Planen, in Saxony, the ftrata, though they are near each other, vary confiderably in thickn?ts, from that of a few inches to feveral feet, and the ftratum of coal, in particular, varies from two to thinty-two feet. Again, in Mount Salive, the ftrata of coal, though in a calcarcous mountain, vary confiderably ; and Mr White. hurt himfelf informs us, that at Benfal moor, thofe firata which are in other places the lowelt, are found at the furface. Lven in Derbyhire, to which Mr Whitetum'l's oblervations chicrly apply, we are informed that even when the arrangement is the fame, the thicknels of the itrata varies confiderably.

## SEGT. VI. Theory of Dr IIutten.

THE next theory which we have to confider, is that Thicory of pronofed by Dr James Hutton, which has becone foHutton. much the ohject of inquiry and debate, as to give name to one of the two principal fects into which geologifls are now divided.

The leading priaciples of the Futtonian theory, as concifel: laid down by one of its greatelt admirers ard fupporters, are the following.

1. The firt circumitance which Dr Hutton has comidered as a genersl fact is, that by far the greater part of the bodies which compofe the exterior crult of our globe, bear the marks of being formed of the materials of mineral and organized bodies, of more ancient date. The poils or the wreck of an older world are, he thinks, everywhere vilible in the prefent, and though rot foum in every pitce of rock, they are diflufed fo generally as to leave no doubt that the ftrata which now compofe our continents are all formed out of itrata more ancient than themfelves.
2. The prefent rocks, with the exception of fuch as are not ifratified, having all exitted in the form of loofe materials collected at the bottom of the fea, mut have been confolidated and converted ints fone ly virtue of fome very powerful and general agent. The confolidating caufe which he points out is fubterraneous heat, and the objections to this hypothetis have been attempted to be removed, by the introduction of a principle new and peculiar to himelf. This principle is the compretion which mutt have prevailed in that resion where the confulidation of mineral fuhitances was accomplithed. Under the weight of a fuperincunbent ocean, heat, however intenle, might be unable to volatilize any part of thofe fubilances which, at the furface, and under the lighter preflure of our atmofphere, it can entirely confume. The fane preffure, by forcing thofe fubftances to remain united, which at the furface are eafly feparated, might occafon the fulion of fome todis which in our fires are only culcined.

Thaties fander the infuence of thit heat, all thefe more fufble the E furthones thould be melted as well as the quartz. But in fome atones in which molt of thefe ingredients meet, as in the granite of Purtiny, there is every reaton to Guppofe that fome of them have been in a thaid itate, white the others were fol:d or lef thuid, as ceytuls of the later are imprelled or a bed of the furmer, siz. in the inflance cited, erythals of feldpar in a mals of quartz. A it is certain, according to the advocates of the Huttonian theory, that at leal the quartz was Ind when it was moulded on the feldfar, how hapened it that this comparatively fuffle fone was not alio melted, ant blended in one compart mafs with the $\mathrm{q}_{\mathrm{m}}$ mats ? We alfo frequently find crydals of quartz pe:actrated by fechrl and chlorite, which is a proof that the litter muth have been hard while the former was in a fuid ftate. Hence it is cvilent that thefe appearanees could not have been the effect of fution by heat. Asain, we find feams of coal penetrated by thin laminee and cryittls of quartz, an effeet which, according to this theory, mult have taken place while the quartz was in a fitate of fufion. But, in this cafe, the flrata of thate above and below the coal fhould alfo have been fufed (thaie being mueh more fufible than quartz, and thus the whole thould have a:quired a flaty texture; and befides in this intenfe heat, the eoal thould have beet entirely charred and loft all its vegetable impref. fions.

The very exitence of fuch a fubtervanecus heat, that conflantly maintains it felf without fuel, ready to at on any emercency, when a quantity of the old world bas been abraded and tranflated, fufficient to furnih the matecials of a new one, is avowedly hypothetical, as we have no proof that it exiits. Nay, we have disect proof, as far as rational induction can carry us, to the contrary. It was long ago obferved, by lrving and Forffer, that the heat of the fea diminilies in proportion to the depth to which we proceed in examining it, and the fame has been more lately proved by Peron, by f Yurn de various trials in many different latitudes *. Now the costrary of thi ought certainly to happen, (unlefs this [ubterraneous heat is entirely unlike common heat) if there conflantly exited in the bowels of the earth a heat eapable of fufing quartz and limeftone.

The trature of whin dykes, detailed in Section H1. of lay Chapter, affords additional arguments in oppofition to the Huttenian theory.

The evidence which Dr Hutton has adduced to prove the fubterraneous cruption of dykes, is drasn from the apparent derangement of the horizontal ifrata at a place where they are interlected by a dyke, and t'e peculiar appearance of the coal in their immediate vicinity, which he furpofes to be in a tlate of calcination, fron having been in contact with the ejected matter of the dylee in fufion. Let $u$ f firil attend to the effect of this eruption of a dyke, the apparent derangement of the :'rata; and let us confider for a moment, what muft be the mechanical operation of a mafs of this liquid matter burling upwards throunh the eoal ftrata. Stpofe a coal f.ld of a mile fquare in extent; fuppore that the coul and concomiont trata are perfectly reGut, lanig a moderate ${ }^{\prime} p$ or inclination to the fouth; and fuopofe that this cral ficld is to be inter fected lay a dyke, cjectul in a it.te of fufion from the

which ufually accompany coal, fuch as fandfone, lime- Theories of Stone, iroaltone, \&cc. which are very hard and compact, the Eurah. we mult allow, that the refitance from tuch fubitances would be very great. In this previous itate of circumftances, then, what would be the effect of the eruption oi a dyke in the middle of the field, in a direcion from nortia to fouth? Con it even be imagined, that this liguid mals in its progrefs upwards through the fuperincumbent ffrata to the furface of the earth, would meely dellroy the contincity of thece ilrata, and not in its irreittible courf, carry along with it part of all the fubilances compofing that lirata through which it palfed? But farther, one of the moft obvious confequences of fuch an eruption, would be the elevation of part of the whole range of the fteata on both fides of the dyke, and the estent of this elevation will be in proportion to the power or thicknefs of the dyle; and, not only is it natural to expect this elevation of the flrata to a certain extent, but from the operation of an agent fo tremendous and irrefitible, that the whole itrata hould be broken, disjointed and confufed. But does this tiatement correfpond with the phenoniens? From the hiItory of dykes traverfing coal ftrata, we know that it does not. On the contrary, the whole of the frata, in moft cafes. preferve the fame thickncf, the fame parallelim, and the fame inclination to the horizon on both fides of the dyke. It is true, the half mile of ccal feitd, interfected by a dyke, as we have fuppofed above, will on one fide of it be elevated or deprefied. If the dyke, which runs north and fouth in its courfe upwards, inclines to the weft, the weltera divifion will be elevated. But this is not a partial el catation on'y in the immediate vicinicy of the dyke. It extends over the whole field on the welt fide of the dyke, and the ftrata continue fair and regular, in all refpeets correfponding to thofe from which they have been detached, till they are interfected by another dyke.
from this reafoning, we think the conclufion fair and obvinus, that dykes interfecting coal ftrata have not been formed by fubterraneous eruption, and therefore, that the clevation or deprelion of the frata is not owing to this caufe. Dr Hutton's theory, in this refpect, is oppofed by the facts which it profelles to explain, and conlequently it is untemable.

Let us now conider the argument drawa from the fuppofed calcination of the coal which has been in contait with the matter of the dyke in a ftate of fufon. Here Dr Hutton feems to hive overleaped the bounds of his own theory, and loll fight of his own principles, which furpofe, that all the flrata and flony maters of which the glube is compofed, have been confolidated by means of heat; that the exhibition of the common or ordinery phenomena of heat is not to be looked for in the grand procefies of nature ; becrufe thefe operations have taken place at great depths in the bowels of the earth, or uader immenfe peffure at the bottom of the faa; and this is the renfon that coal, and lime frate, for inflance, which have been fuljected to this intenfe degree of heat difcover no marks of calcination, the one being deprived of :ts carbonic acid, and the other of its Litumen. Now, granting this hypooletical argument to be wetl foraded, what is the reaton than the coal, which is in contact with a dyk ", has undergace the procefles of calchiation, when t lis coal is at as great a depth in the bowels of the earth, under as immenfe preflure, and as much

Theo.... much cacluced fom atmontheric air, as my coal at its $\underbrace{\text { tice E W }}$ original fomatica. Hut al the coal in cuatad with a dyduc, in not in this ilate. C'ena cual fumetimes fund in impodete conat; and, in man thees, cle..n coal is al:o fornd interceptod hetwean c. ular ranges of balatie colam:s, and this con diterere not the imment mars of cahiation. On the uthes hand, coat in this fuypored atate of calcination, has beea frequenty dilcovered, at a great ditance from any dyke or baintic fubtance whaterer. Maile, of this ful con dean oce cur, to the regret and diapomement of the miner, in the tuish of fata otherwile periectiy clean and regu? r. This int fact hews us, that ve mul look for the caure of this fangular plienomenon elfewhere than in the circumfance of the coa! having been in contact with a dyke while in tmion; for it appeass that the effect woes not always follow in the fine circumanees, and that the fane chect is produred in wary uificent circumttances.

Thele olforvations are probably fufficient $t$ h hew that the asove argument in proof oi the fubterrancous eruption of tyse, is equally unlatisfactury in explining the phemomena, and coniequently equally witnable with the Euanci. Buth, therevive, matit fall to the

O Servativ: hat ilow: the frata of which the carh is compoled, may lic dividd into . certain number of congerie: e wh of which is cumpoed of a cet-

Thereerits, it fonefals that are nearly the fame in whatthe E, eve fart fhe world the ew gerie is found. To thefe $\longrightarrow$ conerm. Werner has given the name of formations, of :3 :ce dillinguithes fix kinds or clanies, four uniretfi., beiss found all over the globe, ard two partial, find culy in particular di ricts. Thefe formations he Shes arrmed according to the order in which he concare. tien on have been produced, begianing with thet formatio. whith lies sext the folid nucleus of the tarth, and wich may therefore be conceived to be the oldel, and enting with the moft fuperficial, which is costidered as the neweft formation.

The furit of thefe clafies is called by Werner that of prinizite formations, which confit of a number of formations lying above each other, being thofe which are fuppofed the oldent, as in thefe no organic yenazins have been difcuvered. The fubf ances conftituting this clafs are granite, gneifs, micaceous /chifur, arsillacious fotifus, primitive limefone, primitive trap, fienise, and porphyry. Ot thefe the granite is the Dowe.t, and therefore is connidered as the oldet; and neat this follow the othes in the order in which we have enumerated them, except that the primitive limeItone, and primitive trap, are found in an uncertain order, alternating with gneifs, argillacecus fchifus, or micaceous fchiftus; and are therefore confidered as fubordinate to the fe tormations.

When the waters had fubrided, and the fummits of the p:imitive mountains had been uncovered, organized bodies were produced; and part of theefe being in:erceptel among the chemical precipitations which were filll going on, and the mecharical precipitations which row began to take place, were carried with thefe to the flanks of the primitive mountains, and the valleys between them. Hence were produced a fecond feries of formations, which are called by Werner tranfition furmations, or rocks of tranftion, as he conlidered them to be depofited during the period when the earth was palting froma an uninhabited to an inhabited Aate. Among thefe formations, however, the organic remains are Eut tew. The fubtances compoling this clafs, are :-anfive limefone, gray wacke, gray wacke flate, tranficon trap, Jilicecus fedilus. Ot thefe the two laft are Cubordinate, alternating with gray wacke and gray wacke ilate.

The third formation is what Wemer calls, foetz, firmation, of that, in which the beds or ftrata lie nearly torizontal, appearing as if they had been depofited from water. This formation comprehends moft of what ase witally called fecondary fitrata. It is divided by Werncr into three fubformations, named from the va:Aty or fituation of the fandtone, which forms a principal part of each; as 1. Old red fandfone formation, comporid of floetw limefione, old red fandfone, and fosaxed sypfim. 2. Second fand tone formation, compoEd ef fuallonc, fle eta limefone, and fibrous sypfuth.
3. Third fandane formation, compred of fardycor, Theories of $\%$ wollone, and clalk, Kc. Of the e, as tefore, the firlt the Euth. mentioned is the oldef, and in this, fumewhere s.eas: the pyrium, there is ufually found falt or fuiphur. In this formation, otganic remains are firt Scen in ary great quantitie:

The fouth formation is called indiperdio at coll for mation, becaute in this cual is firs found, and becante it is not univerfally fpreat over the earth as the three preceding, but is colleited in inlulated maffes, independent of each other. This is alfo divided into three, each fuccellively more recent than the preceding. The frit feries of itrata confiit of fate clay, listejione, marl, foft fandfone, areen/ionc, argillaceous iron/icne, foale, and coal; the fecond of indurated clay, marl, hmefone, porphyritic fone, and coal; and the third of los/e fand Jone, conglomerate, (a variety of fanditone), fate clay, and coal.

The fith is called fuetz tran fumation, fo called becaule the beds of which it is cumpoled, contift of materials that are mofly of the nature of trap, or whinftone. The fubitances that compofe this furmation are gravel, fondfore. filicious fandfone, clay, wacke, baSalt, greenfane, ichithe porphyry, pitchfine, and grayPone. Conl is alto found in this formation, fomewhere among the beds of aiticesue fanditone, clay. wacke, and bafalt, to which it is therefore conidered as lubordinate ( F )

The fixth and laft formation is the alluvial formation, or that which has arifen from the action of lakes and rivers, walhing down part of the older ftrata, This is divided into two fc.ies of Afrata; the firlt being thofe that have arifen from the action of lakes newly drained, comprehending marl, fand, clay, and coal; and the fecond, thofe which have been produced from the action of rivers, comprehending mud, irompone, fant, peat, \&c. This formation is the mut recent of any, but, like the fourth, it is only partial.

The above is an outline of Werner's geognofy, which is confidered as an improvement of what is called the N.puntion theury, or that which explains geological appearances by the action of water, in oppoition to what is called the volcanic theory, or that which attributes thefe appearances to an igneous origin.

Ore of the principal objections to the Neptunian objection: theory is drawn from the infolubility in water of many to the theof the fubitances which compofe our globe; but this ory of Werthe Neptunians endeavour to explain, by fuppofing that at the very commencement of their exiftence the fe fubftances were in that flate of minute divifion which aqueous folutions require, but which no known exilting quantity would be able to effect, atter the fubflances hat acquired their utmoft confolidation, as it is well known, that a folid fubitance may be kept in folution, at leatt for a thort time, in a lefs quantity of thuid than was originally requifite to diffolve it.
(f) We may here notice Werncr's opinion with refpeit to the formation and fituation of bafalt; as this is the aly theory of importance refpecting it, that has not been mentioned under the article Basalufs. "I amperfeetly convincel ( fays Werner in a late memair) that all the varieties of bafait have been produced in the humid :ay, and that they are of a very recent formation; tha: they formerly compofed a great bed of immenle extent, uovering both the primitive and fecendary frata; that ,me has anew deftroyed a confiderable part, and has lefanly the bataltic canances, which we now fee." Vid. Jamefon's Mineralosy of Dumfries, p. ist.

Theorie of A fecord cct. $\quad \therefore$ inom t'. Aiticulty oit the Earth. fuppofing thas thefe fa' me coul have becon contididated below water, er that the water coobld completely fhut up the pres of a hoty, to the entire exclubion of it felt; fo that had the minesal fundane been comblidate? as hate fuppoted, the folvent ought citler to remain withen them in a liquid tate, of. it ena"orated, flonid lave lett the pores empty, and the body fervinue to water.

Mr Playtir argues itrenuoaly againd the notion of the fe fublances being orecipiand inom the cinotic Huid, which has bern fo ingconwty furported bo Kirwan, who afcrives the tolation of all bublames in t!e chatic tiuid to their being fince? pulverifid, of crated in a tate of the molt rimutt divition: and ine fulvent keing then inforficiost m yuntity, he fupjutes that, on ihat account, the precimation tool fhace the more $1 \mathrm{a}-$ pid'y.

Illufiration' Werner's theury of dykes and veins requires a more fert. 101. particuldr condideration.
Werneis
theo's of
dykrsand
ve:i.5.

This theory funfofes, th at the fpaces which are now occupied by vertical frat? or d.kes, including alio metallic vein:, were oricinaliy hffures, formed by the operation of different caules.

1. The unequal heicit and denity of mountions, are confidered as the moit general caufes of fiffures. When the mountains wote in a foft and humid tate, that fide which was leait fupported not only feparated ly its own weight, bit the whole ftrata of the file gave way, and furk below their furmer plain. 'Tlis alfo feems to be the opinion of Saufure. with rega:d to the formation of fifures. It is not to be expected, that events of this kin l liould be of trequent orcurrence, now that mountains have acquited fufliciont firmuels and fability to renituthe force of gravity, oferating in confequence of the inequality of wetioht ind divertity of the rater...'s of which they are compoked. luftances, however, of the oferation of fis is caufes are not alogether wanting, esen in modern times. Ateer a ficafon of excellive rinc, in the year 1707 , fimalar dflures were formed in muv tans in Fohemia and Lufatia.

When the waters corered the furfice ot the Fath, the uneypal weight of the mountains wats tupforted by thir prethite; but vhen the waters retreat ed, this preflare wa. removet, the equilibrium was de. firoyed, the unfupported fide of the n: untatin Separatod and turh; and in this mathere a folure wan fornied.
3. The cvaporation of the moiflure, fier the re"rat of the waters, and the confenuant diminution of

 ed with this mest atcodiu. of all calamion anith vi. : the earth, mountam- Were livatated, c...inatioz mimer , fimilar to thote wlich ace in is occratel i y val in 17rata.

The fecond part of the lacory is employed in proting that the empty fpaces, accafioned by tha operat on of oze or ctice of the cantes which have been entamerated, wate filled from above; that the diferent fillflances, of which the verlical fitata are compefod, were held in folution by the waters which cotered the earth; and that they vere procipitated, by different chemical agents, accorting to the order of chemical atfinity, and depoited in the places which they now occupy. In fupport of the opinion, that thefic fiffues were rilled from above, Werner adduces facts of angular and rounded frasments of ftones of various feccice, and urganized bodics, as marine fhells and vegetablcs, luaving been found in vertical itrata, at the immenfe depth ot 150 and 200 fathoms. It my be dou'sted, on guod grounds, whether this theory, fupported by all the in genuity and experience of its author, will account, in a fatisfactory manner, for that regularity of polition ars arrangement which are difcovered in the vertica? itra. ta; for, notwithtanding the leeming diforder which a luperficial vein may exhibit, they are not lefs regulaz and uniform than the horizontal itrata. And when our relearches are extended beyond the narrow bounds within which they are at pretent limited, when we are beiter acquainted with their rebative pontions and con nexions, this miformity and regularity will becount more confpicuous. It may be doubted whether the iurtaitous operation of fuch canfes as have been itated, be equal to the effect of the formation of the vertica! firata, as they now appear.

But, fuppoing that filures were produced by fome of the caules which have been mentioned, few of thefe caules could operate till the retreat of the water; lef tice mountains uncovered. It was only then, that the mountain, by the inequality of height aidi denfity, being left unfuphorted, fiparated, and liunk from their former fituation; it was then only that the procets of evaporation could take place, fucceeded by diminu thon of bulk and confequent contraction. In thort, none of the cantes which have been atated, could have any efficil before the waters had reireated, excepting earthquates's of the operation of which there is no proof previus to that period. The materials which compufe the vertical ftrata, it is faid, were furmed by depolition from the waters which covered the mountitins, holdirig them in fulution. But before the fifures coridd be formed to receive thete materials by precipiation and depofition, the waters had retired. A fecond deluge mull therefore lave happened, from the water of which the various fubllances which enter into the compolition of vertical ftratar have been depolited This the theory does not fuppote to have taken place, and, without fuch a fuppolition, it teems to be attendes with confiderable dillicul:y. But another dificuley itill s:mains. If doe I. 1 appear how the pecubarity of $1^{6}$ fructure.
 the E.OM doke. S . Ih. of the lat chapter, can be accounted for hy the princiules of this theory. If it be granted, that :he borizontal itrata were formed in the humid wov, the materials of which they are compofed mult have ben precipiated from thee waters which held them in foluthon, by the !aw of chorrical atenity. But the vertical Arata ave fur, fo to the bien fumed in the fame manner, and according $t$ the time procels. Now, this being the cie. What is the reafon that the vertical ftrata thund cabilit a peculiarity of ftrmeture and armaceact:, fincent fiom the horizontal frata? Some of the whin dyk which have been already defiribed, are very remark fole for in fingular itucture, efpecially thofe whi h alume the form of prifmatic columns. The ecelumns are in the horizontal poition, and, excepting the latter circumfance, the fe dynes, in cvety rupect, remble a bafahic itratum, in which the columns are perpendicular.

More argunents might be adduced in oppofition to the theory of Werner; but we mat? hatien to conclude this chapter, with mentioning a few of Dr Kirwan's Deculiar opinions.

Among thefe, the marner in which he accounts for the unequal declivities of the lides of mountains, forms one of the molt confpicuous objects; and to this we flall principally confine ourfelves, and thall give it in lis own words, as extracted from his ellay on the deciitities of mountains, to which we were obliged in the fist Section of Chap. II.
"To athign the caufes of this almont univerfal allotment of unequal declivities to eppofite points, and why the greatefl are directed to the wefl and fouth, and the gentleft, on the contrary, to the eaft and nortin, it is necefiary to confider,
"I. That all mountains were formed while cowered with watcr.
" $\therefore$ That the earth was univerfally covered with water at two different cras, that of the creation, and that of the Nuachian deluge.
" 3. That in the farl cra we muft diftinguili two different periods, that which preceded the appearance of diy land, and that which fueceeded the creation of fith, but bufore the fea had been reduced nearly to its prefent level. Du.ing the former, the primeval mountains were formed; and suri:ig the latter, moft of the fecondary mount ins ant ftrata were fomed.
" 4. That all mountains extend either from ealt to vith, or from north to louth, or in fome intcrmediate direction between theie cardinal points, which nee 1 not be particulatly mentioned here, a the fame feecies of reafoing mult he arpli 3 to them, as to thofe to whofe affert they approach molt.
" 1'. cfic preliminary citcumfances being noticed, we are next to obferve that, during the firit era, this valt mafs of water moved in two general direction, at right wngles win each other, the one from eaft to wen, which meds not be proved, being the courle of tiles whinh ahil continue, but were in that orean neceflarily It: merer and higher than at prefent; the other from roctio twouth, the water temting to thefe vall abyfies the is furmed in the vicinity of the fouth pole, as miess in wo former eflive before either niution could be Erofated, a conderable time mut have elapled.
"Now the primeval mountains forme at the com-
metcement of the f.fi cra, and before this double di-Theries ci ration of the waters took place, mut have oppofed a the Earth, ce. Seratle offacle to the motion of that tuid in the fore that croficutiat of the ditection of thefe mountains. Thus the mountains that firetch from north to fiouth mut have oppold the motion of the waters from eaft to well; this oppoftion diminihing the motion of that Aluid, difpoled it to Cufer the earthy particles with which in thofe early periods it mu't have been impresnated, to crytallize or be deponted on the fe eatcra flanks, and particularly on thrie of the hioheft mountains, for over the lower it couid eafly pals; thele depontions being inceflant'y repeated at heights gradually diminithing as the level of the waters gradually lowered, muft have rendered the eaftern declivities or defcent, gentle, gradual, and moderate, while the weltern fides receiving no fuch accelions from cepofitions, muit have remaine?! Reep and caggy.
"Again, the primeval mouatains that ran from eat to weit, by oppoing a timilar refilance to the courie of the waters fr m north to fouth, maft have occafoned fimilar destitons an the northern fides of thefe mountains, againit which thefe waters impinged, and thus finoothed them.
" Where mountains interfed each other in an oblique dircction, the north-ealt fide of one range being contigucus to the fouth-weft fanks of another range, there the intlux of adventitious particles on the north-eaft fide of the one, muit have frequently extended to the fouthweit fide of the other particularly if that affux were firong and copious; thus the Eragclirge of Saxony, which run from well to eaft, have their north-eatt fides contiguos to the fouth-weft fide of the Riefengebirge that ipparate Silefia from Bohemia, and hence thete later are cosered with the fame beds of gneifs, \&c. as the wurthern fides of the Saxon, and thereby are readered fmonth and gentle, comparatively to the oppoite tide, which, being theltered, remains theep and abrupt, which explains the feventh obfervation.
*. The cautes here atigned explain why the covering of adventiious Alrata on the lighett mountains is generally thinnelt at the greatell height, and thickelt towards the font of the mountain; for the buik of the water that contained the adsentitious particles being proportioned to its depth, and the mafs of earthy particles wilh which it was characd being proportioned to the bulk of the water that contained them, it is plain, that as the height of water gradually decreafed, the denolitions from it on the higher parts of the mountains mult have been lefs copious than on the lower, where they muft have been often repeated.
$\because$ Hence, 2. grarite mountains, generally the moft ancient, frequently have their northern or eatern fides cuvered with frata of gncifs or micaceous fchiftus, and this often with atgillite or primeval fandalone, or limefione, thefe leing either of fomewhat later formation, or longer fupendible in water.
" Hence, ?. different fpecies of fione are often found at different hichts of the fame flank of a mountain, according as the water which conveyed thefe feecies, happened to be differently impregnated at different heights. During the frit era its depolitions formed the primitive ftomy mafics; after which the creation of fif, lince 'one, landione, (pudfingretone) and fecondary argillites, in which pifcime remains are fuund, were depon-

Theorres of ted. But during the fecond era, that of the $\therefore$ rachim the Earth. deluge, by reafon of the violence and irrezalarity of its
aggrethon, the depofitions were more mifechaneous, ard are found at the greateft heights; yet in general they may well be dittinguithed by the remains of land atimais, of of vegetables, or of both, which they prefent in their ftrata (or at leaft by the imprefions of regetables which they bear) as thefe mult have heen conveyed ater the earth had been inhabited. Bat momtains regulariy ilratified bearing fuch remsins, for in flance the carboniferous, cannot be deemed to have been formed in a period fo tumultuous. During this deluge the waters alfo held a different courle, proceding at firf from fouth to north, and atternards is both op;osite directions, as fhem in treating of that catafrople in my fecond ellay.
"Hence, and from various contingent local caufes, as partidi inundations, earthquakes, volcances, the erotion of rivers, the elapfon of itrata, diintegration, the dif: ruption o the lofty mounds by which many lakes were anciently hemmed in, feveral changes were produced in particular countries, that may at firf fight appear, though in reality they are not, exceptions to the operations of the general caufes already flated.
.. Thus the mountains of K amtichatha had their eaftern fianks torn and readered abrupt by the irruption of the general deluge, probably accompanied by earthquakes. And thus the Meifener had its ealt and north flanks undermined by the river Warre, as Werner has thewn; thus the eighth and fixteenth obfervations are accounted for, as is the thirteenth, by the vait inundations fo frequent in this country, (1. Pallas, p. 172), which undermined or corroded its eaft lide, while the wefter: were fmoothed by the calcareous depolitions from the numerous rivers in its vicinity.
"Hence, 4. we fee why on different fides of lofty mountains different Ppecite of itones are found, as Pallas and Saufure have obferved, (2. Saut 7.98 i.), a circumftance which Saufure imagined almolt inexplicable, but which Dolomieu has fince happily explained, by flewing that the current which conveyed the calcareous fubitances to the northern, eaftern, and north-eatorn fides of the Alps, for inftance, was stonped by the height of thele mountains, and thus prevented from conveying them to the fouthern fides, and thus the north-eaftern fides were rendered more gentle than the oppolite, (3. New Roz. p. 423.), conformably to the theory here given.
"Hence, 5 . where feveral lofty ridges run parallel to each other, it mut frequently happen that the external thould intercemt the depofitions that do not furround them, and thus leave the internal ridges ficep on botin nides.
"Hence, 6. low granitic or other primitive hills are freguently uncovered by adventitious itrata on all fides, as at Phanet in the county of Donegal, or are covered on a!l fides; the impregtated waters either eafly pal fing over them, or ftagnating upon them, according + , the greater or lefs rapidity of its courfe, and the obltacle it met with."

1) r Kirwan's theory of the formation of whin dykes, is a follows.

He fuppofes that the dyke exilled in the fixt where it is found previous to the furmation of the horizo t.al frata ; that, during the formation of the 'atter by de-

L O O I.
pofion, therir ermat citenfion not ty it ie of :
nas obttructed by its heigh: preventing l:se p. : of the current of waters; that the Arout: us tha: ./ of the dyhe which were firlt formed, accaid ...... an :...is nore conderable prefluse than un the a.! wa whe': the elrata of latter formation atpot, as ! mat: bowe pulled the upper and more movertle ext:mics the ilip gradually towark the fide or which there i.... .e in preflure ; on that fide is mul thereiore whathe : ti. i preflure being of earlier date than ca the op-unte if is, mult have had a more connderable chect in dupelin: each particular itratum, and forcing th ir ins Wm: particles into chofer contatt, than co: 1d have fown duced in thole of latcr formation; atad cotit, shith the itrata muft be lower. The ingenious author ha added, with good reafon, that he is not hationd with this explanation. It is undoubtedly quite inc.enpotih! with the phenomena which it attemp.s to expiain. $f=$ it has been already obferved, that the coal and conta guous itrata are, in every relpect, the fanm on both fides of a dyke, to whatever dillance they may have been elevated or depreflied, which demontrates cleariy. that their formation mult have been coesel. Beat, befides, the fame derangement takes phace in a filp whe. there is merely a folution of contigury of the horizontal Itrita, one fide being enly elevited or derrehed abore or below the correfponding fide from whitit is has been detached without laving a vertieal ftratum of dyke interpoted.

## Chap. IV. Of Earthquak's ant V'icanses.

Is the preceding chapters we have given a thort account of the materials which conatitute the globe of the earth; we have taken a vies of the rclatire pofition and connexion which fuifitt amorg thefe matatish, fo far as they are known, and we have confidered fome of the changes which are fuppoled to have taken place in their arrangement and diltioution, and fome ot the theories which have been propoled to account for thete changes. We have hither:o contemplated na ure in a ftate of feeming repofe, conducting her operstions ty a gradual and tlent procets, and accomplithing the nont beneficial and wonderful effects, wheeded at:u unoblerved. We are now to take a view of thot more terrible and fudden changes which are exhibited in the devaltation and ruin which accompany the earthquake and the volca:o;-changes awful in the contemptition, but dreadful and terrible in their tremendous etfeets.

Miny of the phenomena which accompany earth. quakes and volcanoes, are common to bu:h. Earthquakes are fiequently the forerumers, and fometimes the attendarts, of volcanic eruptions; but carthpunkes have offon cesited, and their terible tife ts have been feverely fett, where no volcano was ever knuwn.

In the prefent chapter, we propofe to contider the phenomenat, hiftory, and cau'es of earthquakes and wolcunoes, which will form the fubjects of the two fullowing fections. In the firft we thall treat of earthenw.i.es, and in the fecord of voluanes.

Eartine:akf have been foit in molt countries of ofore the world. There are, however, fartichiar placescombankes $4 \mathrm{G}_{2}$ nhachpora.

Fatth quakes ant: Voleances
whi h feen to be more fibiect to this dreadful calamity than others; and this does nut feem to depend on any local circumllances, with regard to particular regions of the earth. It may be obferved in general, that earthquakes are more ficquent within the tropics; but there are places within the torrid zone, which are more rarely vifited by carthquahes than fome of the more temperste, or even the celder regions of the earth. In the illands of the Weat Indies, and in funce pats of the Amcrican continent which lie between the tropics, the eardiquake is more frequently fcit than in moft obher recions of the carth, But the northTh Ahores ot the Mediterranean, the kingdom of Portugal, and fome obicr places without the tropics, have been oftener the rene of defolation, by the effects of the earthquasie, than many of the inands and extenive continents within the torrid zone. From this circumHance in the hithoy of carthquakec, it would appear that they are not linited to particular regions, on account of proximity to the erpator or diflance from it, on account of infitar fituation or estent of contment. Particular itlands, howeve:, and particular farts of continenis, have undoubtedly been oftener vifited by fartiquakes than others. Of all the illands of the Weit Indie-, Jamaica has molt frequently experienced their dreadial effects. Indect, fearcely a year pafles, with. rut feveral hocks of an eartlqual.e being felt in that inland. Mexico and Peru in South America, are more fanject to carthquakes then the other regions of the Amencan contirent. Portugal has been often ihaken to the very foundations, by terrible earthquakes, while Spain, immediately adjoining, or it inay be faid, including it, is, comparatively, almoft exempted from theit effiects. It has been obferved, that earthquakes have been lefs deftructive in Italy than in Sicily, which are in the immediate vicinity of each other, and are both volcanic countries.

Obfervations on phenomena fo awful and terrible, can fearcely be expected to be very numerous. The eperation of the caufes which produce them is too rapid, the effects are too fudden and unexpected, to be residered the fubject of accurate or attentive philofophical inveftigation ; or, perhaps, we might acknowledge at once, that they are too extenfive and too obfcure for the powers of man. They are beyond the gratp of the h.uman mind.

It has been already obferved, that earthquakes are more frequent in volcanic countries than in any others. In thefe regions they are oftener dreaded and expected than in other places. Where a volcano exifts, and when it has ceafed to throw out flame and fmoke for any long period, fhocks of earthquakes begin to be dreaded. This has been very generally the cafe with the primcipal volcanoes of the world, the events of whofe hiftory have been recorded. An earthquake is often the forerumer of an eruption, and the very firit

200
Phenomena
which prec-
edede and
secompary warning of its approach.
Earthquakes are often preceded by long droughts. The carthquake, however, does not immediately fucceed the ceilation of the drought, or the fall of rain. some electrical appearances are obferved to take place in the air, before the earthquake comes on. The auwora borcalis is frequent and brilliant, and bright meecors are uften leen darting from one region of the
heavens to another, or from the atmofphere to the Earthearth.

Before the fhock comes on, the waters of the ocean appear to be unufually troubled; without the efiect of wind, or any perceptible caufe, it fwells up with great noifc. Fountains and fpriags are alfo greatly difturbed, and their waters are agitated, and become muddy. The air at the time of the fhock has been obferved to be remaikally calm and ferene, but afternards it becomes dark and cloudy.

The noife which accompanies the flock of an earthquate is fomctimes like that of a number of carriages, driving along the pavement of a freet uith great rapidity. Sometimes it is like a rufining noife, fimilar to that of wind, and fometimes it refembles the explofions occationed ly the fring of attillery. The noite which accompanied the earthquake, which was pretty generally felt over Scotland about three years ago, we recolleet, referubled that of a hedvy $\mu$ rion walking rapidly, and bare toted, through an adjoining room.

The tfect of carthquakies on the furface of the earth. is vations. Sometimes it is intantaneoully heaved up in a perpendicular direciion, and fometimes affurues a Lind of rolling motion, from five to fide. Sometimes the flock commences with the perpendicular motion, and terminates with the other.

Great openings or fiflures are made in the earth by the fhock, and thefe in general throw out valt quantities of water, but fometimes fmoke and tlame are alfo emitted. Flame and imoke are oftcn feen ifluing through the furface of the earth, even where no chafm or fillure has been produced.

The effects of an carthquake on the ocean are not lefs terrible than thofe on land. The fea fwells up to a great height; its waters fometimes feem to be entirely feparated, and from the place of ieparation, currents of air, fmoke, and thame are difcharged. Similar effects have been obferved to take place in lakes, ponds, and rivers. Their waters are thrown into great agitation, and are formetimes fwelled up. Places in which there was a confiderable body of water, have become dry land, and dry land has been converted into an extenfive lake by the fhock of an earthquake.

The moft terrible earthquake that has yet vinited the earth, has never been felt over its whole furface. Their effects, however, extend to very diftant regions, from the centre or principal fcene of defolation. The exiftence of an earthquake is indicated much more extenfively by water than by land. Where it effects have not been at all perceived on dry land, the agitation produced on the waters in the ocean, or in likes and rivery, has been often communicated to a very gieat diftance.
The duration of the fhock of an earthquake rarcly exceeds a minute, and perhaps very few continue for near that length of time. But the flocks are fometimes repeated in rapid fuccefiion; and perhaps from the effect on the fenfss, and the dread and alaim which are thus occafioned, it is fuppofed that their duration is much longer than it really is.

But as no general account of the phenomena which accompany an earthquake, fron the difficulty or fcantinefs of obfervation, can be complete, it will be rendered much more intelligible and interefting, if we enter a little

 wier, and wo years only had chapled from the tinic the $t$ a imilar event had weflien Etha. Tiis nuuntair, in deed. at the very time, threw sut a great body of imoke, wnich fexed to cover the whole i.had, and entizely concened the invors in an siew. ithe air ofer the fea at a littie diatance sias calm and lecere, and the furfece of the water was periecily foneth. Seemingly withe ot any calut, it beyon to be fightly agituted, as bappens to the trian of wate in a heavy thower of rain. A dreaciui noife fuccueded, and the fractlo of fulphureous vapours was purceived. The moife, like the rattiong of chariuts, grew more frequent and loud, and the thock at lait was teril y folt, when tiee earth :3.4s heaved up, or rolled in the tirm of waves.

I his erathquake is particularly defribed by Kircher, the ceiebratad geographic. "On the 2 th of March, (fays be), we departed in a fmall loat fiom the harbour of Mefina ia Sicily, and the fame day arrived ot the promontory of Pelorus. Our delitination was for the city of Euphemia ia Calabria, but unfavourable weather obliged us to remain at Pelorus three days. Weanied at length with delay, we deter mined to proceed en our voyage, and although the ita feemed unufually agitated, yet it did not detcr us from embarking. As we approached the gulf of Charybdis, the waters feersed whiried round with fuch violence, as to form a large hollow in the centre of the vortex. Turning my eycs to Mount Ætna, I law it throw cat hage valumes of fimoke, which entirely covered the ifland. This awful appearatice, with the dreadful noi.e, and the fulphureous fratl v. hich accompanied it, filled me with flong apprehenfins that fonue te:rible calamity was approaching. The iea itielf exhisited a very untifal appearance, its ugitation refembling that of the waters of a luke which is covered with bubbles, in a vioient fhower of rain. My furprie was fall increated by the calmnefs and ferenity of the weather; not a breeze Alireti, not a cioud obfcured the face of the iky, which might be fuppofed to produce thefe dreadful commotions. I theretore nared noy companion, that the unuftal phenomena which wic cierved, were the forerunners of an earthqualle. Soush after we flood in for the fhore, and landed at Tropica; but wee had farcely arrived at the Jeluits ccllace in that city, when a horrid found, which refembled the rattline wheels of an infinite number of chariots, driven furioufly along, ftunned our ears. Soon ater a wrrible flakiny of the earth began; the grouad oas which we ford feemeil to vibrate, as if we were in the fcale of a bziance, which continued waving. The motion foon grew more violent; I could no longer keep nyy lege, but was thrown proffrate upon the ground. Aher! me time had elayfed, then I hat recuvered
vivient commotion. Fige ere had tcarce'y rewhed te inn when we wer- ageina chliged th retur: to tie ot. In abont haif an hour we faw the greatelt pat c: the
 with the grand, and mot of we inlat tat th heoci ins it. rumbe As we proceeded unwarl, "e lende a at Lopeifum, which is a cathe shout ha : way couect Trepa and Eupheniz, to which we we wo.ed: ata, here, wherever I looked, not'ing but feenes ran an 1 hourst prefented themfelves. Tuwns and calties w. . levelled with the grozad, and Stromboli at the ditance of $\sigma$ milh therew out an: immenfe body of flames, accumpanied with a noife which could be ditinetly heard. But cur attention was quickly drawn from more remote to prefant danger. The rateling found which immediwely precedes an carthquake, again alarmed us; every baveri: it femed to grow louder and louder, and to appecach nearer the place on which we ftood. A Geadful llaking of the earth now hegan, fo that being uable to ftand, uy companions and I caught hold of whetcver thrub was next us, to fillport ourfelves. Aiter fome time the violent conmotion ceafed, and wo ftood up, and propofed to profecuse our von:age to Euphemia, which lay within hight, but in the meantime, while we were preparing ourfelves, 1 tarned my cyes towards the city, but could foe nething but a thick, black cloud, which feemed to relt on the place. This appeared an extraordinary circumitance, as the iky all reund was calm aid lerenc. We waited :an the cloud paffed away, and then turning to look for the city, it was totally fank, and whete ? formesly food, nothing remained but a difmal and putrid lake."

In the year 1693, an eart'?quake happened in Sicily, $\mathrm{r}_{\mathrm{n}} \times \mathrm{xa}^{2} y$ in which not only thonk the whole illan l, but alfo reached ${ }^{1673}$. to Naples and Malta. Previous to the thock, a black cloud was feen hovering over the city of Catania, which was defteyed at this time. The fea began to be violently agitated; the thochs fucceeded like the difcharge of a great number of artillery; the motion of the earth. was fo violent, that no perfons could keep their leg. Even thofe who lay on the ground were tofed itm file to fide, as on a rolling billow; high walls wree razed from their foundations, and were thrown to the ditance of feveral pacec. Almot every buildiny in the countries which it vifited was thrown down; it citie, and towns, befiles a great mumber of vilha". were either greatly damaged, or totally deftroyed. A. mong thrie which te have already mentioned, was the city of Catania, one of the moil ancient and tlowihns 5 in the kingdom. After the thick cloud which rennithed after the carthquake had distipated, no renozins of this magruificent city could be feen. (Of 18,0 oว inh1. bitants, not fewer than 18,000 perilied by this dra.s. ful calanity.

The terrible eathquake which viined the inme: Jamaica in $169^{2}$, :ffords us anther example of aln the whole of the plectom wa when were enumens:

Earth- as the forertumers or attcodents of cartlicquakes. It Gekesan was on the $\mathrm{g}^{\text {th }}$ of June, in that year, that this dreadVutaio.
ceeded, which in a thort time fwept off not fewer than 3000 perfons.

But of all the earthqualies, the hiftory of wheh is on record, that which happened at Libbon, in the year
quakes and
Volcanoers. 2:4 ${ }^{1755}$, was by far the moft extenive in its effects, and. At L ftors fro:n its recent occurrence, will probably be deemed in : $755^{\circ}$ the m-nt interefting. In the year 1750 , feveral hocks of earth fuk kes had been fentibly felt. The four following years were remarkable for exceffive drought. The fprings whicin firmerly yielded abundance of vater, were totally dried up and loft; the winds which chielly prevailed were from the north and north-eaft. During this period alfo there were light tremors of the earth; the feafons in 1755 , were unatually wet, and the fummer, as the confoquence of this, proved unufually cold. But for the fpace of 40 days before the earthouake happened, the flyy was more clear and ferene. On the lait day of October the face of the fun was confiderably obfeurel, and a general gloom prevalied over the atmofphere. The day fullowing (the ift of November) a thick fog arofe, but it was foon dilipated by the heat of the fun. Not a breath of wind was flirring ; the fea was perfectly calm, and the heat of the weather was equal to that of June or July in this country. At 35 minutes after nine in the morning, whout any previous warning, evcepting the rattling noife refernbling that of diftant thunder, the earthquake came on with flort, quick vibrations, and fhook the very foundation of the city, fo that many of the houfes inftantly fell. A paufe, which was indeed juft perceptible, fucceeded, and the motion changed. The houfes were then toffed from fide to fide, like the motion of a waggon driven violently over rugged fiones. It was this fecond fhock which laid great part of the city in ruin, and, as might be expected, great numbers of the inhabitants were deftroyed at the fame time. The whole duration of the earthquake did not exceed tix minutes. When it began, fome perfons in a boat, at the diftance of a mile from the city, and in deep water, thought the boat had flruck on a rock, in confequence of the motion which was communicated to it. At the fame time they perceived the houfes falling on both fides of the river. The bed of the Tagus was in many places raifed to the very furface of the water; flips were driven from their anchors or moorings, and were toffed about with great violence; and the perfons on board did not for fome time know whether they were alloat or aground. A large new pier with feveral bundreds of people upon it, funk to an unfathomable depth, and not one of the dead bodics was ever found. The bar of the river was at one time feen dry from fide to fide; but fuddenly the fea came rolling in like a mountain, and in one part of the river the water rofe in an inftant to the extraordinary height of 50 feet. At noon another fhock happened; the wall of fome houtes that remained were feen to open from top to bottom, near a fcot wide, and were afterwards fo exachly clofed, that farcely any mark of the injury remained.

But what was the molt fingular circumftance attend-The ${ }^{205}$ ing this earthquake was, the prodiginus extent to which of this its clects reached. At Colares, 20 miles from Lilhon, earthquake and two miles from the fea, the weather was uncom-it at Coand two miles from the fea, the weather was uncommonly warm for the featon, on the lall day of October. Alont four o'clock in the afternoon, a fog arofe which,
proceeding

## Chap. IV.

G E O $\quad$ O G Y.

 lected over its iurfface, and became veay thich amb dark; and ..s the fog dijeice, the fea was viviently agita:cu. and wid cuct ruit. Con the sinit of November, at the darn ctuyy tho foy was fir o.sd leane; about nime oolcok the han was operclow alal, an! be. came lim. Haf an hour after, the rattling noife like that of chariots was head; and this foon motcaft 1 : fueh a dogree, tiat it refembled the explotions of tie lageat artillery. The thock os an eatila...tace wis inmodiately felt. and was quilly foreco 1 by a dicond and a third. I: thele finchs it was oblervet, that the walls of buildiug= ryved trom catt to sett. From fome of the mountia, inmes were teen iliturs, fomewhat reiembling the kinding of charcoal accompanied with a girat idal of tilick black fmunc. The fmoke whin arole from one mountain was at tic fame time accomparied with soife, which increwed vih the quantity of fmoke. Whon the place from which the fmoke i.unt was aterwards examined, no nigno of 206 fire con'd be perctived.
At Oporto. At $U_{\text {porto, }}$, ear the ar outh of the river Dours, the earthquake buyan it 40 niaus:s pathine. The $\mathbb{L s y}$ was quite fertae when the hollow rotiilag noil was heas, and it was inmediately aten fed with a commotion of the earth. In the fiace of a minute or $t w o$, the river rofe and fell tive or fis feet, and continued this motion for four l.uurs. In fome places it feemed to open, and dicharge geat quantites of air. The fea was alfo vioientiy agitaticd, and indeed the agitution was fo great, to the diftance of a league beyond the ba:, that it was fuppofed the dicharge of air from that plave nuft alfo have been very coniderable.

St Ulees, a fea-port town twenty miles fouth of Libon, was catitely fwatlowed uo by the repeatud fhocks of this earthquake, and the immente furf of the fea which was produced. Large mafico of achk were detached frum the promontury at the extiemity of the town. This promentory conlifts of a chain of mountains compofed of a :cry lerd ilone.

Tle fame eartla autie was felt in almor every pait of Spain. The only places whish efcajed from is effeets were the provinces of Arragon, Cathonia, at! Vilchcia. At Ayanoulte, which is nc.n the flace where thee Guadiana falis int) the bay of Cadiz, the earthquake vas not feit till a little before ten oolock. It was bere alio preceded by the holow ratilitg node, The fhocks continued with interva's, for $1+0$. 15 mirutec, and did very confderabie camage. Surcriy hatf an hour ind elapfel from thic time that the commotion frot begar, when the foe, the siver, and conml, onle viulont!y uver their batics, and lail every phace near them unter water. The feareiledian hage mowntane, and caricu every thing before it.

The enrthquake begat at Cadiz fome rinutes after aine in the mormisg, and latiti a cut tiee rinutes. The water in the cillerns uncer gound was fis murh agiated, that it rofe in the form offoth. Abont ten minute after eleven, a hugh wave was tetn of wing from the fa, at the ditance of eight mites, bach wis
 upor the city. The water returned with tef fate who

 the iret. 'lae whoe time did nut cyosed two minates; the cath 1. A an undwatines mo:ive; fome wi the gun on the bateries were itat io rife, and others to tiak. MIMy penjte, hiac.! with dichre?s mat giduncf, foll downt Some who :here waking or rilim, felt ne thock, but we.e attored wi:h ichore. Ita fea hat an extrordimery in an and radx ; is c'sul and flowed cvery 15 mirthes ; it refolit fect, and than fell fudeleniy fo los, that a great atany finh ahs fanall boats were leti I It the horc.

The look was fett at Modrid reerly at th: fome time as at Gibraltar. It continued for fix mimies, and the fane ficknefs and giddinefs prevaind. It was not felt by thofe who whiked fmartly, or who were in carriages, and no accilent happened excepting two perlons who weec hil ?ad by the fall of a gone croff frum the porch of a church.

Millaga, a fea-port tom on the Moditerranean, e:perienced a violent thock; the bells were fet a ringing ia the ftecples, and the wher of the wells overfowed, and as fudkenly retired. St Lucar, at the mouth of the Guadalquiver, furrucd much from a fimilar thock, as well as from on mundation of the foa, which broke in, and did great damage. At Seville, 16 leagres above this, a number of houes was thown dusu; the celebrated tower of the cathedral, called La Grialho, cpmed in the four fides; the waters vere thrown into wient agitation, and the veffcls in the river were driven on i.ure.

In Atrica this earthquake was felt nearly as feverely in Atmes, as in Euroce. Great part of the city of Aigiers was dettroyel. This lappened about ten in the morning. Ahout the fame time at Arzilla, a town in the hing$\dot{c} \mathrm{~m}$ of Fez , the fea iuddenly rofe with fach inpetuofiy, that it Mites up a werl in the bay, and torced is on more with fuch viulance that it was broken : fices. I boat wis :Ifo found within land, at the diAlnce of two muket thots from the fia. At Pea and Meguine. many houles were thrown dons, and nur. bur of perions were i uried in the shins.

Many feople were defryed at Morcco by the fal i.es of houfes. Eight leagus fom the city tie corth orach, and foalloined up a vill.ge with ali its inla! : t. . . . : : , the number of $8,0 \geqslant 0$ or 10,000 , as well in a! thas eante. st the to:sn of Funcin in Madira, the ferf Aock of this carthquake was fe't at so minutes fat nime. It i as preceded by the rattling noife, which feemed to be 1. Inced in the air ; the thuch, it was fuppoled, contianed for more than a minute ; the earth moved with a vilretory, undulating mon, and fime of the viorati, 5 s incteafed greatly in force. The noike in the air which are mpanied the thocks, lated fome feconds after the motion of the earth had cealed. At three quarters Falt eleven, the day being calm and ferene, the fea retired fuddenly, then, without the leat noife. rofe with a great fwell, overilowed the thore, and entered the city. It rofe 15 feet perpendicular a ove high-watesmant. Having thus tluctuated fous or five times, it at latt fubfoded, and refumed it, former ftillneis. In the northern part of the illand, the inundation was fill more violent. It firlt retired to the diftance of 100 fisces, and fuddenly returning, overflowed the thore, troke down walls of magazines and ftorehcufes, and in Li Lehind it great quantities of filh in the ftreets of a village. At this place the fea rofe only once beyond the high-water mark, although it continued to hlu uate much longer before it entircly fublided than at Func!al.

Sah wert the eftects of this earthruake, in thofe flaces where it was accompanied with comiderable danage. It wac, however, perceptibly felt to a great diftance in every dircction, either, by a flight motion of the earth, or by the agitation of the waters. At the illand of Antigua the fea rife to fuch a height as had never been before knows, and afterwards the water at the wharts, which ufed to be fix feet deep, was not more than two inches. About two in the afternoon, the fea ebted and tlowed at Babadoes in a very unufal manser. It oventosed the wharf, and rubed into the Alrcets. This shox and rethux continued till so at night.
Shucks were difinctly foll in oifferent parts of France, as at Bayenne, Bourdeaux, and Lvons. The waters were atio oblervel to be asitated in different places, as at Argoaleme, and Havre de Grace, but with a lefs dergree of violetac: than fome which have been mentioned. At Argoulene, a fubterraneous noife like ti. uncer was heard, and foon after a torrent of water, mixed :ith red fanl, was dicharged from anopening in the tant h. Muft of the fprings in the neighbourhood funk, 212 and continued dry for forme time.
2.. Gu:- The effects of this carthquake were alfo very persmary. ceptille in mary plices of Germany. Throughout the duthy of Hohlein, the wates were greatly agitated, particul riy the Llye and Trave. The water of a lake, alled Libife, in brandenburg, ehbed and flowed ix times in half an lour, and aithough the weather was then perfectly calm, this mation was aceompanied with - great noife. A fimilar agitation tock plare in the

of Mitan in Italy, and ite neighournood. Tuinin Sa- Eith voy eaperienced a very imart thock.

Many of the rivers of Swizerland tecame all at tolkanoes. onice ni ddy, although there had been no rain. The 213 1.ke of Nutchatel rofe to the height of two feet above In Switzere its ufual level, and contirued at this heigh: for a fewlind. hours. The waters of the lake of Zutich were allo greatly agitated.

214
The commotion of the waters in Holland was fillia Holard. more remarkable. In the aiternoon of the ift of November, the waters of the Rhine at Alphen, between Leyilen and Woerden, were fo violently agitated, that the buoys were broken from their chains, large veitels parted from their cables, and imaller ones were $t^{\prime}$ :rown upon the dry lend. At 11 in the forenoon at Amfterdam, when the air was perfeetly calm, the waters in the canals were thrown into great commotion, fo that boats broke loofe from their mourings, chandeliers were obferved to vibrate in the churches, although it is faid no motion of the earth was perceptible. In the forenoon at Haarlem, not only the watet in the rivers, canals, \& c. but, it is alferted, fmaller quantitits of tuids contained in vefiels, were greatly agitated, and fometimes dathed over the files of the veffels. This continued for about four minutes. Between 10 and 11 in the forenoon, in fome of the canals at Leyden, the waters rafe fuddenly, and produced very perceptible ur:dulations.

The effects of this earthquake extended as far northin ${ }^{215}$ iowas, as Norway and Sweden: many of the rivers and lakes 3 sco. in Norway were greatly agitated; thocks were felt in feveral of the provinces of Sweden, and commotions of the waters, with the rivers and lakes, elpecially in Dalecarlia, were obferved. The river Daia fuddenly overtlosed its banks, and as fuddenly retired; and at the fame time, a lake which is a league diftant from it, bubbled up with great vilience. Several fmart fhocks were felt at Fahlun, a town in Dalecarlia.

In many places of Great Britain and Ireland, the Ia Bitaio agitation of the waters was very perceptible. At Eaton bridge in kent, near a pond of an acre in extent, fome perfons heard a iudden noife, which they fuppofed was oecafioned by fomething falling into the pond, for it was then a dead calm, and ran to the fpot, where they faw the pond open in the middle, while the water dathed over a perpendieular bark two feet high. This notion was repeated feveral times, and ftill accompanied with a great noife.

At Cobham in Surry, between 10 and 11 o'clock A. M. a perfon wae watcring a horfe at a pond, the waters of which were derived from fprings. At the moment the animal was drinking, the waters retired from his mouth, and 1 fft the bottom of the pond dry. It then returned with great violence, and when it retired, its progiefs was towards to the fouth. About the fame time at Butbridge, in the fame countr, while the weather was remarkably caim, the waters of a canal 700 feet long and 58 broad, were greatly agitated, and this was arcompanied with an unufual noife. The waters rofe betwicen two and three feet above the ufual lavel, in the form of a heap or ridge, extending 30 rard in lengeth. Thir ridge then heeled towards the moth fide, and flomed sith great impetwofity over the g.... walk; it then re 'ur ed to the canal, again heaped in in the middle, and then hecled to the foutb lide

The waters of the lakes in S oothand were alfo great-I. ly agitated from the lame caute. Half an hour site: nine in the morning, without the leat |reatin of aind, the water in Loch Lomond rote iuddenly and viniens? aqainft its banks. It immediately fell very low, "tam returned to the thore, and in five minute, role as histo as at hitit. This commation continued till 15 minutas after 10 , with an alternate flux and reflus oven fise minutes. From this time, till 11 o'lock, time heignt th which the water role gradually diminilhed, till it res mos its former tranquillity: But each flux and rellw: ... timed for a period or five minutes as at firti. Hurs the violence of the thock was fuch, that a larese fio:, lying at lome cintance from the hore in 1h:a!lu:s w.it wats inoved from its place and carried to dry lond, iea: ingr a deep furrow in the ground along rihich it how moved.

About the fante time the waters of Loch Nefo in $t$. . north of Scotland exhibited alfo a very umufual agita tion. About ten o'clock the river (Vich, which foll, into the head of tine loch, fisclled very much, and ran upwards from the loch with a high wave two or thre feet above its ufual level. The motion of the wave war in a direction contrary to that of the wind, and it pro ceeded with great rapidity up the river for the fpace ot i=2 yards, broke on a fhallow, and overtiowed the banks. It then returned gently to the loch. Ihas eb ling and Howing continued for about an hover, the beight of the waves gradually diminhing. till, abour II w'clock, 2 wave higher than any of the former broke with tuch violence ou the bank on the fide of the river, that it ran upwards of 30 teet from the bank.

remarkable. On the aftemoon of the 3 Ift of Oetuter, the water of a fount din at Colures was oblerved to be greatIy dimimilacd. On the muring of the ift of Novernbur, the day on which the carthquake happened, it become thick and muddy, but afterwards recovered its u ual quantity and limpidity. In fome places frrings appeared where there had been formenly no water, ard continued afterwards to flow. At Varge, on the ritcr Mac:anc, many fprings of water burlt forth at the time of the earthquake, Atd fome threw up their waters mixed with fand of varinus colours, to the height of 18 or 20 feet. In Barbary, a flream of water, which was as red as blood, burit forth from a mountain, which was fplit in two. it Tangier all the fountans were dried up during the whole of the day on which the carthquake hapoened. The mineral waters of Toplitz, a village in Bohemia, which have been celebrated fince the year 1-62, experienced a very remarkatle change. The principal hot furing bad continued to flow from the time it was difcovered, of thie fane temperature and the fame in quantity. On the monning of the earthquake, between 11 and $120^{\circ} \mathrm{clock}$, the waters of this 1 ring increafed fo much in quantity, that all the baths ran o:er in the fpace of half an hour. A fhort time before the water increaled, it floned from the foring thick and muddy; and then having entirely ftopped for about a minite, it burit out with great violence, carrying before it a great quantity of reddih ochre. It afterwards became limpid, and fowed as formerly ; but in larger guantity, and of a higher temperature. At Angouleme in Fratace the earth opened in one place, and difcharged a great body of water, which Na4 mixed with reddich fand. Molt of the fprings in the neighbourhood fank fo low, that for fome time it was fuypofed they had become ruite dry.

Such were the extraordinary effees.s of this terrible eathquake, which extended over a face not lefs than four millions of fquare mile:. Other earthquakes, althouch of more limited extent, have produced effects nut lefs dellractive, and particularly fome of the earthquakes which have vilited Italy and Sicily in modern times; accounts of which have been drawn up with accuracy and attention. Some of thefe we fall now detail.

One of the molt calamitous cantiquakes was that Earthwhich befel Calobria in the year 1783 . Of this carthquake Sir Wiiliam Hamiton, who, foon after the carthquake happened, vifited the feenes of defolation which it le!t behind, has drawn up a particular account. He obferves, that " if on a map of Italy, and with your compaf on the fcale of Italian miles, you were to meature off 22 , and then fining the central point on the city of Oppido, which feemed to be the foot where the carthquake had eserted its greatell force, form a circle, the radius of which will be 22 miles, you will then include all the toms, villages, \& \& c. that have been utterly ruined, and the fots where the greatelt montolity happent d , and where there have been the moit sibibie alterations on the face of the earth. Then extend your compats in the fame fale to 72 miles, preferving the fame centre, and form another circle, you will include the whole country that has any mark of having been afiected by the earthquake. A gradation was Ilainly obferved in the damage done to
Chap. IV
Earth- the buildings, as affo in the degree of mortality, in pro-
quakes and portion as the countries were more or lefs dillant from volcaroes. this luppoled centre of the evil."

This earthquake, it has been remarked, differed very confiderably from others in one circumitance, which was this. Whe:e it happened that two towns were dituated at the fame diltance from the centre, one of which was placed on a hill, and the other on a phain, it was found that the town on the lowett fituation always futained the greatell damage from the thocks of the earthquakes which are alluded to above.

That part of Calabria which moft feverely felt this dreadful calamity, lies between the $3^{\text {th }}$ and 39 the degrees of latitude, and the force of the earthquake extended from the foot of the Appenines called Mionte Dijo, Monte Sacro, and Monte Caulene, as far to the weltward as the Tyrrhene fea. By the thock of the 5 th of lebruary, every town, village, and farm houte neareft to the mountains, whether fituated on fome part of the elevated ground or on the plain, was left a heap of ruins. In proportion to the dillance from the centre, as has been alieady hinted, the damage futtained was more or lefs coniderable. But even the more ditant towns and villages fuffered greatly from the fhocks which happened on the 7 th, 26 th, and 28th of February, and on the itt of March. From the time the firit hock came on, the earth continued in a conltant tremor ; the thocks were felt with difierent degrees of foree in different parts of the provinces which were the frene of this terrible calamity ; and the motion was either in a whirling direction, as in a vortex, or horizontal, or pulfatory, the beatings proceeding from the bottom upwards. The apprehentions and alarms of the miferable inhabitants were terribly increafed by this variety of changing motions, dreading that every moment the earth would open under their feet and fivallow then up. That part of Calabria which fuffered from this carthquake, was allo drenched with long continued and heavy rains, accompanied with frequent and furious fqualls of wind. Thefe rains prevailed particularly on the weftern ide, where many fiffures had appeared in the mountains. Some mountains had been lowered greatly, and others had been entirely fwallowed up. The roads were rendered impaffable by the deep chafms which were left by the thock; valleys were filled up by the parts of mountains which were fylit afunder; the courfe of rivers was changed; liprings were dried up, and new fprings burit out where none exitted before.

At Laureana in Farther Calabria, two houfes, furrounded with extenfive plantations of olive and mulberry trees, fiturted in a valley, were removed by the force of the earthquake, with all their trees, and carried to the diftance of a mile; and on the fpot where they formerly ftood, hot water burlt from the earth, and was projected to a confiderable beight into the air. The water was mised with fand of a reddilh colour. Sone countrymen and thepherds, who were employed in rural affiars near this fpot, were fivallowed up, with their teams of oxen, and their whole llocks of goats and theep. The number of inhabitants who loft their lives in this calamity, exceeded, according to tome calculations, 32,000 ; but it is fuppofed by others, that, including itrangers, the number was not leis than $42,0=0$.

The imhabitants of the twess of Scilla, on $\therefore$ : fint f:Jck of the carthquake on the 5 th of Februry, had Ald along with their primee to the feal hor ine thete, and remmed either on the ftrand or in ! ants nowr ! thore. In the right time a tremendous wave overtomed the land to the didance of thace mile trom the ithu: and, in its return, ivept off near 3020 of the imbabitant. among whon was the prince. Thi, wate was thid by fome to have been boiling hot, fo that many of the peo ple we:e fuppoled th have been fo ded witl it. A mountan, it is afierted, of 500 paims in heght, and 1300 palms in cireumference at its baic, was detached from the place where it thood, and cartied to the dithance of fou: miles. It was about the fame time that the hill on which the town of Oppido ft vod, and which extended three miles in length, was fiplit in two, and filled up on each fide the bed of a siver. Two great 1dkes were formed by the current of the rivers bein itopped; and, as they increafed in extent, infected the air with their putrid and noifome exhalations.

Sir William Hamilton, who was then refident at Niples as ambaffador from Britain, was indefatigable in obtaining every kind of information with regard to the effects of this earthquake. With this view he made an extenfive sur over thole parts of the country which had been vifited by this calamity. Some of the accounts which were firt publifhed feemed to have been fomewhat exaggerated, either from the love of the marvellouv in thofe who framed them, or from the escellive alams of the furviving fufferers. On the $2 d$ of May following Sir William landed on the coalt of Nether Calabria. The effects of the earthquake were firlt perceived at Cedraro. The inhabitants had quitted their houfes, but it did not appear that the town had fuifained any material damage. Molt of the inhabitants of St Lucido were then living in barracks, and the baron's palace, as well as the church theeple, had fufered greatly. He afterwards landed at the town of Pizzo in Farther Calabria. This town itood on volcanic tufa. It fultained great injury from the fbock of the 5 th Fc bruary, but was completely detroyed by that of the 28ith. Here he was informed, that Stromboli, a volcanic mountain which is nearly oppofite, and in full view, but so miles diftant, had ejected much tefs matter, and had thrown up lef's fmoke, during the time of the earthquakes, than it had done for many years before. Even at this time flight thoeks of earthquakes were occationally felt. One indeed happened the fame night. The boat in whis h he llept received a fmart thock, and feemed to be lifted out of the water; but this thock was unaccompanied with noife.

The town of Moriteleone is fituated on a hill which overlooks fome fine rich plains and the fia below. Thefe plains, formerly covered with numerons towns and viliage now exhibited a gloomy frene of utter defilation. The tuwn of Monteleme iticlf had not hiffered materially from the firt thack on the 5 th of leebruary ; but it was comiderably damaced by fome of thofe which took phace afterward. It was encrally obferve l, that the fhocks of the earthpuke came on with a rateling noife, which feemed to proced from the "eltard. They ufually began with a harizontal motion, and terninated with a whirling mentios, during which moit of the buildings in the frowe were thrown ciown. It was geneenly obterved roo, that previcticto a diwork the $\rightarrow \mathrm{H}_{2}$ c!uth

## Eanh-

 1,uakt-ant $\underbrace{\text { Vulcarons }}$ clotads feemed to be anufially ftill and motionlefs, .nd that a hock quickly fucceeded a heavy thower of rain.Approaching the plain, it was obferved, according to the general remark made above, that the towns and villuges were more or lefs defolated in proportion to their viciniry to the plain. Of the town of Mileto, whish itocd in a bottom, not a houfe remained. Sori..no and the noble Dominican convent prefented a heap viruins. According to the fame general remark, all the buildin;s which toon upon the high gromds, the thil of which is a grity fandfone, fuftained lets damase than thofe fituated in the plain, for the later were aniterlaly thrown down. The foil of the plain is a iandy clay of various colours, and full of fea thells. It is fequent!y inerfected by rivers and torrents which have tormed wile and deep ravines. Palling through it Wietro, a luwn in ruins, Sicily was feen and the fumnit of Mount Etna, which at this time threw out a condiderable quantity of lmoke. In a fwampy plain through Which he patied, Sir William examined a number of on'il frules in the earth, of the fhape of an inverted 1 Na. I!ete hules were covered with land as well as - Autus iis.g foil. Dering the earthquake of the gin c! Fetrony, water mised with fand it oried up to a confldable height fiom each of thete opening. The rive:, it was oblerved, before the fe fountains burtt cot, was cisie $\pm w$; bat foon after the waters returned, and eventyrel their bank. It appeared from more extenive nolervetion, that the fame thing had uniformly happened to all the other rivers in the plain during the thock of the 5 th of February. This has been afcribed to the firl impulie of the earthquake proceeding from the bottom upwards, and this feemed to be the general opinion. The furface of the plain then rifing fuddenly, the rivers which are thallow naturally difappeared; and the plain returning with violence to its former level, the rivers returned and overtlowed from the fudden defretion of the boggy grounds, which would naturally force out the water under their furface.

The town of Rofarno, with the duke of Monteleone's palace, was a heap of ruins; fix feet high of the walls only remained. It was fomewhat fingular, that the only building which efcaped uninjured was the public jail. At Lateana Sir William alcertained the trath of the circumslance of the two tenements which were faid to have been removed from their fituations. Thefe ftood in a valley funounded with high grounds. In the fame valley were obferved hollows in the form of inverted concs fimilar to thofe which he had formerly examined. Between this place and the town of Poliftene he did not fee a fingle houlc, after travelling four days through a rich and beautiful country. Every thing prefented the mont indefcribable mifery : the violence of the earthquake was fo great that all the inhabitants were buried in an intant alive or dead in the ruins of their houfes. This town was fituated between tho rivers that were occafionally fubject to overtiow their banks. Of fix thoufand inhabitants, more than two thouland toft their lives iy the lhock on the sth of Eebruary.

The priacefs Gerace Crimaldi, with four thoufand of her fubjects, perilhed at Cafal Nuova on the fame day; fome perfons who were dug alive out of the ruins obicruel, that they felt their boufes fairly lifted up whout any previos narning. An inhabitant of this
town, being at that moment on a hill which overlooked Earththe plain, when he felt the fhock turned round towards quakes and the town, but he could fee nothing excepting a thick white cloud of duff. So completely was this town deilroyed, that no veilige of houfe or flreet remained; all lay in the fame confufed heap of ruins. Other towns had fuffered in the lame manner, and now exhibited the fame fcene of defolation.

Terra Nuova fuffered feverely from the fame earthquake. It is fituated between two rivers which had furmed deep and wide ravines in their courfe; one of thele was not lefs than 500 feet deep, and three quariters of a mile broad. In confequence of the great depth of this ravine, and the violent motion of the carth, two large maties of the foil on which a great part of the town, contifting of fome hundred houfes, had been thrown into the ravine at the diftance of half a mile from the place where they formerly food. Many of the innabitants who had been carried along with their houles, weie dug ont of the rains alive, and even fome of them efoaped unhurt. Ot 1600 inhabitant , +00 only remamed alive. In ather places in the fame neighbourhood, great tracts of land had been removed and carried to a confiderable ditance, with all their plantations and crops, which contimued to grow and thrive in their new fituation as well as formerly. The river here difappeared at the moment of the earthquake; but foon after returned, and covered the bottom of the ravine to the depth of three fect. This water was obferved to be falt life that of the fea.

The whole town of Molochi di Sotto lad been thrown into the ravine, and a vineyard of many axics lay near it in an inclined fituation, but had not fuffered any other injury. In feveral parts of the plain, the ioil, with all its trees and crops of corn, to the extent of many acres, had funk eight and ten feet below the level of the plain; and in other places it had rifen the fame height. The foil of this plain, it is to be obferved, is compofed of clay mixed with fand, which readily aflumes any form.

Sir William next proceeded to Oppido, which, it will Detruction be recollected, was confidered as the central point on of Oppido. which the greateft force of the earthquake was exerted. This city ttands on a mountain of gritftone of a reddifh colour. It is furrounded by two rivers, which run in a deep ravise. It had been reported, that the mountain on which the city flands, had been iplit in two, and ftopped up the courle of the rivers; but it appeared on examination, that huge maffes of the plain on the edge of the ravine, had been detached into it, and had io far filled it up, as to thop the courfe of the rivers, the waters of which were collecing, and forming lakes to a great extent. Part of the rock, it was found, on which the city itood, was feparated, and uith feveral houfes upon it, was thrown irto the ravine. Great tracts of land, with plantations of vines and olives, were tranfported from one fide of the ravine to the other, to a dilance exceeding half a mile.
"Having walked, (lays Sir William,) over the ruins of Oppido, I defcended into the ravine, and examined catcfully the whole of it. Here I faw, indeed, the wonderful force of the earthquake, which has produced exactly the fame effects as thole deferibed in the ravine at Terra Nuova, but on a feale infinitely greater. The eno:mens maffes of the plain detached from cach fide

Earthquay : ‘.... Vobanoes. of the ravine, lie fometimes in confuled heap, sorming real mountaizs, ard hawing itopped the co... ot two rivers (me of which is very consile rable , "ent are alreuly formed; and if net allizesl by 1 atere az wt
 be the caute of a general infic:ion in tiac noint arhood. Sonsetimes I met with a det:cheal pace of ! I wrtace of the plin or mamy neres in evtcan) wid the large whis and vive trees, with corn or lypins mmber : iem, growing as sucli and in as soot order at the loutton of the ravine, as their ormanions from whence licy were feparnted do on the ir mative foil, at $1 \cdots$.at $5: 0$ feet ingher, and at the dilance of nhout tirce cuirters oi : mile. I met with whole vinevards in the Game order in the bottom, that had likewile taken the fame jutney. As the banks of the ravine from whence thete pieces cone are now bare and perpendicuiar, I perceived that the upper foil was a reddilh earth, and the under one a fasdy whitc clay, very conpuct, and like a foft tone. The impulfe thele huge mathes rereised, either from the violent motion of the eurth alone, or that atinted with the additional one of the volcanic evhalations fet at liberty, feems to have acted with ereater force on the lower and more compact fra. tum than on the binper cultivated crult : for I conitant$l y$ obferved, whore thefe cultivated lands lay, the Hitier ftratum of compact clay had been driven fome hundred yards firther, and lay in confufed blocks; and, as I oblerved, many of thefe blocks werc in a cubical form. 'The under loil, having had a greater impulie, and leaving the upper in its llight, naturally accounts for the order in which the trees, vineyaids, and vegetation fell, and remain at prefent in the bottom of the ravine.
"In another part of the bottom of the ravine there is a mountain compoled of the fame clay foil, and which was probably a piece of the plain detached by an earthquake at fome former period: it is about $2 ; 0$ icet high, and 402 feet diameter at its bans. This mountain, as is well atteited, has travelled down the rovine near four miles; having been put in motion by the earthquake of the $5^{t h}$ of February. 'The abuncance of rain which fell at that time, the great weight of the frem detacled pieces of the plain which I law leeaped up at the back of it, the nature of the loil of which it is compoled, and particularly its fituation on a duclivity, account well for this phenonsenon; whereas the reports which came to Naples of a mountain having leaped four miles, had rather the appcarance of a miracle. I found fome ingle timber trecs alfo with a lump of their native foil at their roots, flanding upright in the botom of the ravine, and which had becn detached from the bottom of the plain above mentioncd. I ubferved alfo, that many confufed heaps of the Joofe loil, detached by the earthquake from the plains on acaclu fide of the ravine, had actually run like a volcaric lasa (saving probably heen affited by the heavy rain), and produced many eftects much refembling thote: of lava during their courfe down a great part of the ravine. At Santa Chritina, near Oppido, the like phenomena have been exhilited, and the sreat force of the enrtiquake of the 5 th of Feoruary feems to have been eserted on thefe parts, and at Cafal Nuov", and Herra Nuova.",

 feveral montla eacamned in the firlds. or ia var:

If aving examined the diferent plaree on the Gab bian cosut, which had fuffered finn this t"rritble eath quake, Sir William $H$ milron faled tor Mellina in $S_{i-}$ cily, to be info:med of is effecti there. He found tibs: the hock had been very violent, but far tels fo than ons the opponite fhores. Many of the houfes, even in the lower part of the town, wese Itanding, and fome of them liad futlained little damage; but in the more elevated fituations the fhocks feemed to have had fearcely any effect. This itill correfponds with the ; eneral remark, which was already made. A ftriking intance of this appeared in two conventc, which are stunted on elevated places, and had luffered nothing from the earthquakes which had aiflictel the country for tous. months. It was faid that fire had been feen iffuing from fiffures of the earth near the hore. Whe thock of the earilquake on the 5 th of February, feemed to proceed from the bottom upvards; but the fucceeding flocks came on with a horizontal or whirling motion.

A remarkable circumftance with regard to fih, was taken notice of at Menina, and indeed the fane thing was obferved along the coalt of Calabria, where the effects of the earthquake had been moit fevere. A fmall fih, fomewhat larger than the Englih white bait, but refembling it, and which ufually iies at the bottom of the lea, buried in fand, had remained for feveral months after the commencoment of the eartlupuater, near the durface, and was taken in great abundance to be the common food of poor people. Before the earti:quake, this fih was extremely rare, and was contiderel as a great delicacy. Aiter the earthquake, indeerf, it was obferved, that fih of all kinds were found in great er abundance.

Thefe earthquakes, of which we have now given fo detailed an account, contimued for many months afterwards ; tremulous motions of the eartl continued to be felt, and they were not pertecily lettled even in the year 1784 .

The fouthern continont of $A$ merica is often vilitel E.reliby carthymakes. In the year 1797 , Peru was athictudyuthes... with this dreadful calamity, which perhaps in the ex 1tru. tent of furface which experienced the dreadiul huch, exceeds that of any earthquake, the history of whick is on record. The following is a thort accoum wi th is earthquake, by M. Caranille'. "1: the midit, 1t " he), of the most profound caim, there is ficuluen : heard a dreadful bellowing noife, the for- : acr of earthquakes, to which this part of the warit is : : it
 ly heard in the nei,hbourhous! of the mandint
 turalits cmploved in ther expedition foumd tic wi:. when examining the declivity of this wolcano, the I : of which had been hartened mow by the intemmat tim

Wata iy tir andour of the fu, were fruck with terror anken by the homible found which they hear!, and the hat Y! which they experienced. Pised, that valuable memHee of fociety, whofe promature death is fill deplored by the friends of fcience, foretold that a terrible erapSton was preparing in the mountain of Tunguragea; ant his conicetures were contirmed by the event. On the \&th of lebuary 1797, at three guarters paf feven in the morning, the fummit $c^{c}$ the volcano was more frec from vapours than winal ; the interior part of the momtain was agtated by frequent thocks, and the adfacent cluins burf in fuch a manner, that in the frace of four minutcs an immente tract of country was conralied by an undulating movement. Never did hiatory relate the effects of an earthquake fo extraordinary, and never did any phenomenon of nature produce more misfortunes, or deftroy a greater number of human beings. A number of towns and villages were dettroyed in a moment: fome of them, fuch as Riobamba, Quero, Pelileo, Patate, Pillaro, were buried under the ruins of the neighbouring mountains; and others in the jurifligions of Harnbata, Latacunga, Guaranda, Riobamba, and Alauf, were entirely overthrown. Some fulained prodigious lofs by the gulfs which were formcd, and ly the reflux of rivers intercepted in their courfe by mounds of earth; and others, though in part luved, were in fuch a fhattered flate as to threaten their total ruin. The number of perfons who perifhed during the firf and fucceeding flocks is eftimated at 16,0c0. At ten o'clock in the morning, and four in the afternoon, the lame dy, (February 4.) after a dreadful noife, the earth was again agitated with great violence, and it did not ceafe to thake, though faintly, for the whole morths of February and March; but, at three quarters paft two in the morning of the sth of $A_{\text {ril }}$ the villages already ruined were again expofed to fuch violent flocks as would have been fufficient to dcflroy them. This extraordinary phenomenon was felt throu hout the extent of 142 leagues from eaft to weil, from the fea as far as the river Napo; and withcut doubt farther, for we are little acquainted with thefe diftricts which are inlabited by the favages. The dillance north-eat and fouth-welt beiween Popayan and Piuna, is reckoned to be 170 leagues; but in the centre of that dillrich, I degree 16.6 from thefe places, is fituated the part totally defroycd, and which comprehends 40 leagues from north to fouth between Guarandam and Machache, and twenty leagues from ealt to weft. But, as if an earthquake alone had not been fofficient to ruin this fertile and populous country, another miffortune, hitherto unknown, was added. The earth opened, and formed immenie gulis; the fummits of the mountains tumbled down into the valleys, and from the fiflure in their fides there ifficed an immenfe quantity of fetid water, which in a little time filled up valleys a thoufand feet in depth and fix hundred in

O G Y.
breacth. It covered the villages, buidings, and in labients; choaked up the fources of the puret forinos, quakes and and teing condenfed by deficcation, in the courle of a few diys into an earthy and hard pafte, it intercented the coufe of rivers, made them How backwards for the fpece of 87 days, and converted whole diftricts of dry lad into lakes. Very extraordinary phenomena, which will doubtlefs be one day montioned in hittory, occurred during thefe earthquakes; I hall, however, content myfelf with mentioning only two of them. At the fane monent that the earth thook, the lake of Quirotoa, near the village of Infiloc, in the jurilditaton of Latacunga, took fire, and the vapour which rofe from it fuffocated the cattle and tlocks that were feeding in the neighbourhood. Near the village of Pylileo, a large mountain named Moya, which was cverturned in an initant, threw out a prodigious flream of the before-mentioned thick fetid matter, which deftroyed and covereat the miferable remains of that city. Nuturalits will one day find, in thefe ravaged countries, objects worthy of their refearches. Fragments of the minerals and eaiths of Tunguragua are about to be tranfported to Spain : but it is not in fuch fragments that we ought to fearch for the caufe of thefe furprifing phenomena; we muft vifit the country itfelf, where this condict of the elements took place, and where the ruins it occafioned are fill to be feen (G.)"

To the hittory of earthquakes now given, we fhall In $\mathrm{S}^{22.1} \mathrm{cotland}$. only add the following account of the eartliquakes which have taken place at Comrie in Perthfhire, in Scotland, which was communicated to the Royal Society of Edinburgh, by Dr Finlayfon, in a letter from Mr Taylor.
"The earthquakes which have lately (January 1;90) taken place at Comrie ( $H$ ) and its neighbourhood, are certainly very deferving of attention. I fhall therefore cheerfully comply with your requeft, and give you as particular a defcription as I can of fuch of them as have been moft remarkable. To give a particular account of all the noifes or concuffions which, during the laft half year, have been heard or felt at Comrie, and within a thort difance to the north, eaft, and weft of that village, is beyond my power, and would indeed be of little ufe. With regard to thefe fmall concuffions, it will be fufficient to fay, that many of them have fometimes been oiferved to fucceed one another in the face of a few hours; that thicy take place in all kinds of weather; that they are thought by fome people to proceed from north-weft to fouth-eaft, and by others from north-eaft to fouth-wefl ; that they have not been obferved to affect the barometer ; that they do not extend in any direction above three or four miles from Comrie ; and that towards the fouth they are bounded by the Earn, which is in the immediate vicinity of the village. The fame perfon, though bellowing the minuteft attention, is often uncertain whether they proceed from the earth
(c) The volcano of Tunguragua oce afioned an earthquake in $155 \%$
(i1) Comric is a village about 22 miles weft of Perth, fituated in the valley of Strathearn, and on the north fide of the siver Earn, about four miles below the place where it iffes from the lake. The remains of a Roman camp on the oppofte fide of the river, hape made the name of this village very w.ll hown to Scottiflantiquaries.

 tively, that they heard unutal anating mowes in the month of Jray ; but the imprellon which thefe notios made was fo :ant, thet they would + rooshly have butn foon forgot:en aito rether, hod they not bect luscectud by concublions of a lels equivocal nature. Muwats ibe eidd of Augult, two or three boces are taid to have benfelt at Dundum, Dumira Lutge and Comric ; but I lave mot been able to learn the pecite $\operatorname{lag}_{\mathrm{y}}$ or he ur on which anv of them hoppened. The trutb is, the concuffions hitherto offerved were fecule; and the minds of the peorle fem not to haic been runtid to particular aticition till the $2 d$ of Septembre. About eleven o'clock that evenitis, a fmart huch was telt at Comrie. Imsielf hearl hore, for the firt time, a rombling noide, which I took for that ot a lurge table, cragced aboig the thour above fairs, atd whit i I probably would rever have thought of again, with nive attention had been turned to it ly the alam valich it had excited in the mighboumoud. Nany other feeble abiles or concumions are fuid to have box oblertad in Gien Leadnach and about Conric dution the montis of September and Oetoner. At that time, huweier, I confets I was eipoled to dout the wumarous repots of earthquakes with which the country was fillcul, and to aticribe them to the workings of an imagination, un which the a'arm of the $2 d$ of September flitl continued to be imprefled.
"On the 5th of November, a conculion took place two or three minutes betore inx o'clock P. .N. which was too violent to be min then. Some compared the noite which aecompanied it to that of heavy loaded wasgo:s, dragged with grest velocity abony a hard road or pavement, atd tevoighte, that it palled under their feet. To me it feemed as if an enormous wei hat had fallen from the roof of the houfe, and rolled with impetnofity along the foos of the rooms above; and it muit have made a imilar imrrelion on the lervents, for fome of them inftantly ran up thats to difcuver what had wipuned. Oihers reare fenfible of at tramous motion in the eartl, perceised the flames st the cand!es to vibrate, and oberved the mitiors and kitehen-ntenfis placed along the walls to thake and clatter. There is allo reaton to believe, that the wetcrs in the lueh of Moniviad, in the near neizbbcuriond of Oilitertyre, fuffercd unufarl :gitation, is the wild fowl then upon the lech vetre lewed to fircam and llutter. 'lhe noile on this occation, as far as I con judres, dil? not latt above ten or tache feconds. During the ecorife of the d.ay, the mercury in the barometer rote and fell 〔everat simes, and ar fix v'eloch it stood at $28 \frac{\text { ' inc ines. 'I he }}{\text { sin }}$ iky was then perfect? leatene, and hardly a broath of wind vis to be fent; but nost morming, aboat fix o'chork, a violent tempen roie, which rarred without intermi:bon for $2+$ hours.
" It Gicu I.e.tinach, Comric and I awors, this concuffion wa much more siclent, and the noie that accompanited it much more alarming. . I he inlabitants o: thede plac: , ind of I cruchill and Dunisa, dechare,

 stes. He:cs wete tamblines fom their houfos, and many of !lemen in wat in the greatelt trepidation, from the wo:b, that the wots were fitlines in. Lsen the dorac. ic atimats were alarmed, and sontrit oted, by theis hoals ...d introm, to increate the icrous of the puple. 'Therigh I have not bean able to dicuber whether Looch Lasia was ever agritital hy there concultans, there is lit le dosht, that tise river isear Comrie was affected on thi wecalin, :s two men then on its banks heard the d.ahiog uifts whters. Ithis great hock was faceceded by : mumber of thofe thighter rumbling noile which 1. ve Leen alrea'y montiunce. Nut lets than 30 of then were conented in ihe fuace of two hous atter it lippined; but the $\because$ did not extend above two miles to the cath, noth ath ueft ot Coniric.
 we had lese another ihook of much the lanie longih. viclence and exient, as that on the jih. The mercury in the barometer on this day was mure thationy tan on the former, and at the time of the cantiouake was a) inches hi, h. The weather was caim and hazy. It was a mathet day at Comrie; and the neople, who were aitembled from all jats of the country, fell as if the mountains vere to tumble inthantiy upon their heads. The hard-sare capuled for fate in the lhops and booths thook and clattered, and the horfes crowded to ether with fign of unutual terror.
"About one o'clock P. M. of the 29:h December, we had another pretty imatt hook, during a viulent form of wind and rain, which comtimued the whole day, and ribich was at its height during the time of the earthquake. Indeed, as hes been remarked already, thefe concutions feem to have no dependence on the weather. According to the accounts of thole who live nearest to the centre of the phetomena, rumbling wolies, like thole above deforibed, may be heard in all itates of the atmol?here.
" I hough I mention no more of there cartlatuakes, you are rot to conclade, that many more have not taken place, and lone of them perhaps equally violent with thoie of the 5 has stid 1 ath of November. Several thocks have hapneted daring the fhilincts of the night, which, even at t'is ditame trom Comtic, where the ir centre feem, to be, bae been abumbatly terifivins. But the great remblanes, or rathor the pertiet womlarity of their effecte, atal of the impretion they matie on our mind: rande is ambectlary for me thou'de you with a particular deretiquen of ewh of them.
" Jhe direstion $c i$...ll the miles or concutions I have obferved, gicet at weit as fmahl, ippored to be in the tame line from N. Vi. to S. I.. ( eners deteribe them as fometimes purecelins in thot ditection, and formetimes ts comion from $N$. $\ell$. to ti. IV. I have nos heate sang othr, line of dmontor atimed to them.

* L'pan the fulk it enquiry, I fand, tan incio custh-

 head, about Fibins, ata it Ardanich, on the fouthera bitrix of Joch lisy. 'They do nut apfone to have catended farther callward on that bake: and, what is were renwakible, they hatio nut been the in Gien Al-

 road from Criefr to $\widehat{T}$ dy Eridce palles. The former at Aachnafree, (which lies at the head of Glen $A 1 \mathrm{~m}$ ond, and is feparated from Glen Leacnach on'y by the mountam Benechori, over the nurthern Ade of which his the pherds daily trave'), has affuch nie, that :cither be, nor any of his per pie, have been at any, tione thaSUie of the leaft extraordinary noise or cumomition. Jowards the eaft, the tuo frit great thool : $\cdots \cdots n^{\prime} e d$ to Monzie, Cultoquhey and Dollary, about fever mies difant from Comrie. The thock of the 5 th $t$ No vember reached till farther, and was felt, though b: faintly, at Ardoch and Drummond Catle towards the S. E. In the direction of the fouth, however, the bank of the Earn feem to be its gencral boundary, as the noife of the moft violent concuilions was heard but faintly at the manfe of Comric, and along the tlrath on the fouth fide of the tiver. The limits of the leffer concultions, I am confident, do not extend above three miles in any direction from their centre. They are commonly obfersed at Lawers on the eaft ; throu hout the whole of Glen Leadnach, at Dunira, Dolchonzie and Aberuchill, on the north and weft ; ani do not reach fo far as the manfe, which is about three quarters of a mile on the fouth of Comrie (i)."

In another communication, dated in $5_{793}$, from the faine gentleman; he obferves, that " there is no reaton to believe that thefe phenomena are vet come to an end. After temporary intermiffions, fometimes of feveral months, they have returned, ever fince their firf aplearance in 1789 , without any apparent difference in their extent or force. The rumbling noifes or flishter concutions, as ufual, are obferved at Comrie, in Glen Leadnach, and the places in their near neighbourhood; the more violent extend to much the fanse dillance as formerly defcribed. Having been only occafonally in that country fince February 1 791, I have not been able to afcertain dates. On the ad of September 179 t , at five minutes palt five in the afternoon, a tlight fhock was felt at Ochtertyre. The barometer was not in order, on which account the weight of the atinofphere could not be afcertained. Its electrical ftate was tried by Sauflure's electrometer, but no indication of any thing uncommon was perceived. Since that period, fhocks have been oblerved at different times till within thefe few weeks paft.
" From this account, it will be obferved, that all the greater thocks have taken place in the featon of auturn "r the beginning of winter; that this las been now re-
peated for more than four years; and that thofe greater Earththeck, have been fucceeded at thort intervals by rumbity neiles or more fecole concufions. It has alfo bern remarked, that they have in general been preceled or followes of great rains or bointerous weather ; but variations in the weat er take place fo frequently in cur climate at that featon of the year, that the connectuon between them and the phenumena above defcribed, is prooably altogether accidental."

After the view which we have given of the phenomena and hifory of earthquakes, we now proceed to the conderation of the caufe, by the operation of wich, according to the fpeculations of pinilofophers, the terrible convuifions of nature, which fpread ruin and defolation in tome of the faitelt portions of the earth, are to be accounted for. Various opinions lave been formed, and various hypotheies have betr propoled, for the explanation of thefe dreaded phenomena. Acco.ding to fome of the ancient plillo ophers, fubterraneous clouds exitted in the internal cavities of the earth, and thefe butititg into lige tning, thock and demolifhed the vaults which contained them. 'Tinis was 226 the opinion of Anaxagoras. It was fuppofed iy others, aecouding that earthquakes were owing to the talling in of im- ${ }^{\text {t }}$ the atimenfe arched roofs, which confmed fubterrancous nires; the vaults or atches being weakened by the contant burning of thefe fires. Some alcribed earthquaies to the vapour of water which was produced, and greally raretied, by means of internal fires, while others, among whom was Epicurus and fome of the peripatetic philofophers, fought for the explanation of the phenomena of earthquakes, in the exploion of certain inflammable fubitances, which were exialed from the internal cavities of the earth.

Some of the modern pirers as Gin ${ }^{227}$ cher, Varenius, Des Caites, and others, have adopted denso. the lat lyppothefs, accorling to which it is fuppofed, that there are immenle cacities in the earth, communicating with each other. Some of thefe cavities contain water, and others contain vapours and exhalations, ariang from bitumi:ous, fulphureous, and other inHammable fubitances. Thele combutible materials being kindled ty fome fubterraneous fparh, or by fome actual name, procceding through narrow fiflures from "ithout, or by the heat evolved during the mixture of different fubliances, and the formation of new ones, produce commotions on the furface of the earth, according to the evtent of the cavitics, and the quantity and active nature of the intamed matter. Thofe who fupport
(1) "The tract within which the concuffions defcribed in this letter appear to have been confined, is a fpace of a rectangular form, which exterds from eaft to weft along the north fide of the Earn ahout 22 miles in length, by a litie more than fice in breadth; reckoning the utnoft length from about Monzie to the head of Loch Tay, a.d the hreadth from a little fouth of the Earn northward to the ridge which feprates the branches of that river fom thofe of thic Almond. The whole of this trat is mountainons, except toward the eattern extremity, where it jins the low country, and on the banks of the river Earn on the fouth. It is interfected by narrow gleus or vallev, the mon corifiderable ©? which is Gien Leadnach, where the centre of the conculiens feems to be placed. the mine ralogy of this fart of t'e country has not hitherto been accurately examined; but it is $\mathrm{k}, \mathrm{o} \sim \mathrm{n}$ in general, that the Done is the primary finituc, and in fome places gramite; that no mineral veins, nor any hot foringe, have seen fourd in it, and that ro wolsanic appearances have been obferved. In the valievs, among the mountains, irun ore, of the kind that is called bag cre, in faid to abound. Dr Hutton has remarked, t : : the line which erminates this trak on the futch caf, feems to be nearly the fame with that where the primary itrata fink under xe furfacr, end are cuvered by the fecondary or horizontal ftrat?. Note by Mr Playfair."

Chap. IV.
G E O L O G I.

Earth- fupport thi, hypothefis think, that it receivesillultration quakes in from a common experiment of mixing together iron
$\underbrace{V}$ tiings and fulplar, and burying them in the carth; and in confequence of the chemical action of thefe tubitances on each other, and the clatic vapours thus produced, the thaking of the earth is effected.
$2: 5$
A difierent hypothefis has been propofed by De oflluot- Woodward. According to this hyotheds, water is ward. continually raifed by means of fubtcisancous heat, from the abyls which he fuppofes to occupy the cenere of the earth, to furnin rain and dew. Obfructions may t.the place in this procels of nature, $2: 3.1$ whenever this happens, a ficelling and commotion are occationed by the heat in the waters of the abyfs. This force is at the fame time exerted againtt the incumbent itrata, and thas the agitation and concuflion, with the other phenomena which accompany earthquakes, are produced.

Another hypothetis, different from any of thefe, hes been propofed by M. Amontons, of which the following explanation is given. The atmofphere being taken at 45 miles high, and the denfity of the air increafugg in proportion to the abfolute height of the fuperincumbent column of fluid, it is thewn that at the depth of 43,528 fathoms below the furface of the earth, the air is but one-fourth lighter than mercury. But this depth is only about one feventy-fourth of the femidiameter of the earth. The immenfe fphere beyond this depth, the diameter of which is $6,451,53^{9}$ fathoms, may perhaps be only filled with air : this air muit be here greatly condenfed, and heavier than the heavielt bodies with which we are at prefent acquainted. It is found by experiment, that the more air is comprefied, the more do equal degrees of heat increafe its elaitic force, and the more capable it becomes of producing violent effects. As, for inftance, the temperature of boiling water increales the elafticity of the air beyond its natural force in temperate climates, by a quantity cqual to one third of the weight with which it is prefled. Hence it is concluded, that a degree of heat which on the furface of the earth produces only a moderate effect, may occation violent convulfions by the rarefaction of the denfer air at great depths; but if it be conifdered that this condenfed air may be expofed to much higher degrees of heat than that of boiling water, the elartic force of the air thus produced, and athited by the great werkht of a high column, may be more than fufficient to convulfe and break up the folid orb of $+3,528$ fathom, the weight of which, comparing it with that of the included air, would be trifing.

Thefe hypothefes, however infufficient they may appear for explaining in a fatisfactory manner the phenomena of earthquakes, were generally adopted till about the middle of the 1 Sth century, when the knowledge of electricity began to be cultivated and extended. This principle was applied fuccefively in the explanation of many natural phenomena, and, among other, the phenomena of carthqุuzkes were afcribed to the fame principic. An earthquake which was felt at London in the math of March, $: 749$, directed the at 230 tention of piwsophers to this explanation. The firl Oi Stuke. who made this artmpt, ue believe, was Dr Stukeley, bey.
getrerut cef like fermentation, in which elallic tluids are tom. inalin ed and diknzared, to which fuch ofreet could lie aCuilud. Ife is of epinion, that noo criunce has yet been brought to efablifh the mobabiaty of the caitte:'ce of extenfive ravities within the eath. On the contray, he thinhs there is good reaton to pretume, that it is in a great meature folid, So that there in litt!e fipace for thofe changes which are fuppoted to be cffec? ed within the cavitics, to take place. Coal pits, lic adds, which have been frequently hoovn to be on fire. and for a great length of time, never exhibited any : the phenomena which accompany an earthquake on the furface of the ground above.

The earthquake which vifited London and other places of Britain, in March 1749, was felt in a cirruit of 30 miles diameter; but there was no eruption of fire or vapour, and it was unattended with finoke or fmell. From this confideration alone, of the extent of furface which felt the effects of the earthquake, he fuppofes that it could not be afcribed to the expanfive force of fubterraneous vapours; for, he obferves, fnall fire-balls which are exploded in the air, emit a fulphureous fmell to the ditance of feveral miles. Now, it cannot be imagined, that io prodigious a force, acting intantaneoully, on fo great an extent of ground, thould neither break the furface, nor indicate its prefence either by the iight or fmell. But if this effect is to be afcribed to fermentation, this procefs is not inilantancous; it continues many days, and the evaporation of fuch a quan. tity of inflammable matter would require a long tpace of time. Such an cffect, therefore, can only be accounted for on electrical principles, the operation of which is always inflantaneous.

If earthquakes were occafioned by vapours and fubterrancous fermentations, explofions and cruptions, fuch procefles would entirely deflroy fprings and fountains, wherever they had once exilted. This, however, is contrary to $u$ hat happens, for although ferings are ftopped, or otherwife changed, previous to an earthquake, or about the time it happens, they very oiten recover theis former thate. In the great earthquike which happened A. D. ${ }^{17}$, in Afa Minor, and which thook a mats of earth 302 miles in diameter, and deftroyed 13 great cities, neither the fprings nor thee face of the country received any injury.

If it be confidered, that a fubterrancows power capable of moving 30 miles in diameter, as in the earthquake mentioned above, which happened at Londur, mult exift and operate at lealt 15 or 20 miles under the furface, the hypothefis of eartlaguakes being occafioned by the force of vapours will be found totally inapplicable, becaufe this force munt move an inverted cone of folid earth, the bafe of which in 30 miles in dinmeter, and the axis 15 or 22 . This is an effect whicis is impofible to any known natural foner, excepting that of electricity.

But befides, no fubterraneous explofion ca:a account for the fingular effects of an earthquate on thip that are far out in the ocean. It ha been: Ireaty cifersed, that they feem as if they flruck rua roch, or as if lonie folid body frock tganh their bottom. Fien Ghes, it is found, are particularly affected ly the thock of an eathquake; but a fubterraneous exploion conld ouly produce on the water a gralual fucll. It could not +1 communicit.

Euth- communicate to it that impulfe by which it produces efquake and feets, as it it were a itone projected with great force 2Vulisnoes gaint folid bodies.

From the confideration of all thefe circumanances, De Stukeley is of opinion, that the phenomena of earthquakes can only be fatisfactorily explained on electrical principles. He was particularly led to this opinion by directing his attention to the phenomena which acconspanied the earthquakes which took place in England in 1749 and 1750 . For five or fix months previous to this time, the weather had been unufually warm; the wind was from the fouth and fouth-weft, and there had been no rain, fo that the earth was particularly prepared to recive an electrical hock. The that country of Lincolnthire had fuftered greatly from extreme drought, and hence, as dry weather is favourable to clectricity, earthquakes and other fimilar phenomena are more freguent in fouthern regions of the world. Before the earthquahe at London, all vegetables had been unufually premature, and it is well known how much electricity quickens vegetation. About the lame time the auroma borealis had been very frequent. A very fhort time befure the earthquake, it had exhibited unufual colours, and its motions were to the fouth, contrary to the urdinary direction. From thefe circumftances an earthquatie was predicted by Italians and others who had been accuftomed to the appearances which precede them. During this year, too, meteors of different kinds, as fire-balls, ighenings, and corufcations, had been comnon ; and particularly it was obferved in the night preceding the earthqualhe, and early in the morning on the day on which it happened, that corufcations were very frequent. In.thele circumftances nothing was wanting to produce an earthquake, according to this hyputhelis, but the touch of a non-electric body. This budy mult be derived from the air or atmofphere; hence it is inferred, that if a non-electric could difcharge its contents upon any part of thie carth, in this prepared and highly electrical ftate, a violent commotion or earthquike muft produced; and as the difcharge from an excited tube produces a fhock on the human trody, to the difcharge of electric matter from an cxtent of many miles of folid earth, muft produce an earthquake. The rattling, uncouth noife which attends it, is to be afcribed to the fnap which is occafioned by the contact.

Before the eartloquake alluded to came on, a black - lous fudcenly covered the atmofphere to a great extrnt ; the difcharge of a thower, according to this hyfuthecte, probably occafioned the thock; and as the elect:ical thap precedes the thock, a found was obferved to roll from the Thames towards Temple-bar, before the mation of the l.cufes cealed. This noife, which is gencrall: the forerumer of carthquakes, it is fuppofed can only be accounted for on the principles of electricit:. The coltrary to thin would take place, were thete phenomena oning to fibterraneous eruptions. The Aames and fulphumous firells which accompany earthquanes, might, it is thought, be more eafily accounted for in the fatme principles, than by eruptions from the bowis of the earth. The fudden concufion, too, feems to be produced by a notion which could only be excited by electacity, not proceeding from any convaltion ia ll e interior parts of the earth, but from a uniform vinsation along ius furface, like that of a mufical
ftring, or like the vibratory motion of a glafs, when farththe edge is rubbed with the finger. From the circum-quakes and flance that carthquakes are chiefly fatal to places near $\underbrace{\text { Volcanoes. }}$ the fea coalls, along the courie of rivers, and elevated fituations, a farther proof is derived, that they depend on the operation of electricity. The courfe or direction which the earthquake above alluded to took, atfords an illufiration of this point. Another argument in favour of the electrical hypothefis, is drawn from the effects of the earthquake, or the flate of the weather at the time, on perfons of weak or nervous conftitutions. To fome thefe diforders proved at that time fatal; and its effects, in general, were fimilar to thofe of artificial electricity.

A fimilar hypothefis was propofed by Beccaria, to $0{ }^{2}{ }^{23}$ ? account for the pher unt for the phenomena of earthquakes. He fup-ria, pofes that the electric matter to which thefe phenomena are owing, is lodged deep in the earth, and that it is this matter dilcharged from the carth, to reftore the equilibrium or deficiency which the clouds in the atmofphere have fuftained during thunder forms, by giving out their electrical matter to another part of the earth. This, he fuppofes, is confirmed by the noife refembling thunder, and the tlathes of lightning which are perceived during earthquakes.

Dr Prieftley propofes to conftruft, on the princi- ${ }^{2}{ }^{232}$ ples of Stukeley and Beccaria, an hypethefis which he ley. thinks will explain the phenomena in a more fatisfactory manner. For this purpofe he fuppofes the electric matter to be fome way or other accumulated on one part of the furface of the earth, and on account of the drynefs of the feafon, not eafily to diffule itfelf. It may, as Beccaria fuppofes, force its way into the higher regions of the air, forming clouds in its paffage out of the vapours which tloat in the atmofphere, and occafion a fudden ftower, which may farther promote the paffage of the fluid. The whole furface thus unloaded will receive a concuftion like any other conducting fubftance, on parting with or receiving a quantity of the electric fluid. The rufhing noife will likewile fiseep over the whole extent of the country; and upon this fuppofition alfo, the fluid, in its difcharge from the country, will naturally follow the courle of the rivers, and alfo take the advantage of any eminences, to facilitate its afcent into the higher regions of the air. In making fome experiments on the paffage of the electrical fluid over water, he obferved that it produced a tremulous motion, and therefore he concludes that it muft receive a coaculion refembling that which is given to the waves of the fea by an earthquake. To try this ftill farther, he immerfed his hands in water, while an electrical flafh paffed over its furface, and he felt a fudden concuffion, like that which is fuppofed to affect thips at fea during an earthquake. The impulfe, which was felt in different parts of the water, was ftrongeft near the place where the explofion was made.
"Pleafed with this relemblance of the earthquake, lie oblerves, I endeavoured to imitate that great natural phenomenon in other refpects; and it being frolty weather, I took a plate of ice, and placed two tticks about three inches high on their ends, fo that they would juit ftand with eale; and upon another part of the ice I placed a bottle, from the cork of which was fufpend. ed a brafs ball with a fine thread. Then making the clectrical flafh prafs over the furface of the ice, which it

Earth. did with a rery lowd repast, the nearer pillar fell down, Guakes and while the more remote hood, and the ball which had
 tion: about an inch in 'ength, and near!y in a rig!t line from the place of the Hat?.
"I afterwards dise:tifid this apparatu, creating more pillars, and fupending more pendulum, fometimes upon bladees firctclied on the mouth of open vefiels, and at otlicr times on wet boards fwimming in a veflel of water. This latt method fuemed to antier the beit of any; for the board reprefenting the earth, and the watur the fea, the phenomena of them both during an earthquake may be imitated at the fame time; pillars, \&c. being erected on the board, and the elec-

 fuh or wir an! water, it give them maturnidio. ©x
 candele of overominy the geatelt reatoncos. The apper the only mans which nature could cmpl-y: operate the check we fpeak of: rat in all Cohat an these So no veltige of a vilano; nothin!, (1) peint as any interior combunion; the froc conceald in the chate of mountin, or unde their baic ; a lite which coull not exit without fome external Egnt. The vapours dilated, the air rarcfied by a heat comtantly alive. mult have efcaped through fome of the crevices or clefts formed in the foil ; they mult there lave formed curents. Both hame and fmoke mult have illued by tome one or other of thefe pafinges. Thefe once opened, the preffire would have ceafel ; the furce not mect. ing with any more refiftance, would have loft its effect, and the earthquakes could have no longer cominued. None of thefe phenomena took place: we nust then renounce the fuppofition of a combuftiona cting direitly under Calabria. La us fee whether, having recourfe to a fire ar lome diftance from this province, and act. ing upon it only as an occafion caule, we thall te able to evplain all the phenomena which have acompanied the tliuchs. Let us take for example Ж.tna in Sicily, and fuppofe large cavities under the mountains of Ca . labria; a fuppointion which cannot be refufid. It is ccrtain that immenfe fubterraneous cavities do exitt, fince Ætna, in elcrating itfelf by the accumulation of its explofons, muft leave in the heart of the earth cavitie: proportioned to the greatnefs of the mafs.
"The autumn of 1,82 and the winter of 1783 were very rainy. The intenior waters, augmented by thofe of the furface, may have run into thute caverns which form the focus of Æena : there they mull have been converted into vapour capable of the highet degree ot expanfion, and muft have prefled forcibly againt ever: thing which oppofed their dilatation. If they found canals to conduct them into the cavities of Calabria, they could not fail to occafion there ail the calami: ies of which I have given the defcription.
"If the firft cavity is feparated from the fecond by a wall (fo to fpeak) or fome dight divifon, and this feparation is broken down by the force of the elafic vapour, the whole force will act againt the bottom and fides of the fecond. The focus of the flocks will appear to have changed phace, and become weaker in the fpace which was agitated moft violently by the firlt earthquake.
"The plain, which was undoubtedly the molt flender part of the vault, yielded moit eafly. The city of Meffina, placed upon low ground, experienced a ihock which the buildings on higher grounds did not. The moving furce ceafed at once as fuddenly as it ached violently. When, at the periods of the 7 th of Fc bruary and the 28 h of March, the focus appeared changed, the plain fcarce fuffered any thing. The fubterraneous noife, which preceded and accompanied the fhocks, appeared always to come from the fouthweft, in the direction of Mellima. It fecmed like thunder under ground, which refounded beneath vaults.
"If Etna, then has been the occafional caufe of the earthquakes, it has alfo prepared, for fome time, the mi fortunes of Calabiia, by gradually opening a patfage along the coaft of Sicily to the foot of the Neptu-
E.rihe 1atymuntams: for during the earthquakes of $1>80$, $6 n^{3} \cdot n^{1}$ whicudith.ricsi Ml ina the whole fommer, they felt, for Vouzanoo. the "hole lengti, of that coalt, from Taormina even to 11. - Faro, coniderable thocks; but near the villages of Aili :ad Fiume de Nifi, which are fituated about the riddle of that hne, ihocks fo violent were expenienced, that they dreaded lett the mouth of a volcano thould men. E-ch thock refembled the effort of a mine that hidnot ilrength to make an explofion. It appears, thit then the weano opened a free paffage for the exparfion of its vapours, and that they have fince circulated without rellraint; fince in the year 1783 the eartl quake was almoft nothing upon that part of Sicily, at the time that Mellina buried under its ruins the

## 234

A inribed to t. - . .rce of fteam.

By others the phenomena of earthquakes have been afcribed to the force of vapour or ileam, which, no doubt, is an agent fufficiently powerful, if it is con- fined fo, that its prodigious elattic force may be exerted ; but it is denied by thofe who oppofe this hypothefis, that earthquakes, though very frequent in regions where fubterranean fircs are really known to exift, as in volcanic countries, always happen in fuch places, and therefore water cannot be converted into vapour. But, belides, it is well known, that this vapour, even admitting the poffibility of its production in fubterranean cavities, would be re-converted into water, the moment it came in contact with a cold body, which wonld deprive it of the principle of heat, in combination with which water affumes the form of vapour.

Many objections might have been made to the hypothefes which have been propoied to account for earth. quakes. Many of thefe will probably occur to the attentive reader, who is a little acquainted with the nature and properties of the agents by which they are fuppofed to be productd; but whatever may be the caufe of thefe extraordinary phenomena, it appears that it is very far from being clearly afcertained. Perhaps all the agents which have been ftated as the caufe of earthquakes, may have fome influence in contributing to the effect, and may operate at different times, and in different circumilances.

## Sect. II. Of Vulcanues.

vile anoes in every pare of the vurid.

235 Number of :tem.

Volcasoes exill in almoft every part of the world, from the north to the fouth pole. Hecla in Iceland, and a volcano which has been obferved in Terra del Fuego, at the termination of the fouthern continent of America, nearly cumprehends the extremities of the globe ; and having mentioned thefe boundaries, it is unnectiflary to oblerve, that they exill in all climates.
The number of volcanoes at prefent known, is not lefs than 100. The volcanoes of Enrope are well known : thefe are Vefavius in Italy, Ætna in Sicily, and Hecla in Iceland. To thefe may be added the volcanoes in the Æolian or Lipari illands on the coatt of ltaly, of which Stromboli is remarkable for having thronn out flames, without the eruption of other volcanic matter, for more than 2000 years. In Afia there is a volcano in Mont 'Taurus; five in Kamtfchatha, 10 in the illands of Japan; one in the peak of Adam in the illand of Ceylon; four which have been obferved in Sumatra; and fome others in different parts of the Afatic continent or illands. There are alfo torme vuleanoes on the African cumtinent, as well as in
fome of the illands. Volcanoes exit alfo in the Ame. Earthrican continent, and in many of the illands which have quakes and been difcovered in the South feas.

Almott ail volcanoes are in the immediate vicinity of the lea. Mount Taurns, in the interior of Afia, and Are ${ }^{231}{ }^{3} 7$ fome of the volcanoes in the Andes, are the only ex- near the ceptions to this.
fea,
Another general remark which may be made with ${ }_{\text {and }}{ }^{238}$ in the regard to volcanoes is, that they always occupy the cops of tops of mountains. No volcano was ever found burit-mountains. ing out in plains. The exillence of volcanots at the bottom of the ocean feems to be an exception; but it is to be obferved, that thefe are alfo in the peaks of mountains, which have been raifed up from great depths at the bottom of the ocean.

The firl fymptom of an approaching eluption is an Symptoms increafe of the fmoke, if fmoke has been emitted, in of an erupfair weather. This fmoke is of a whitilh colour ; but, after fome time, black fmoke is obferved to thoot up in the middt of the column of white fmoke. Thefe appearances are ufually accompanied with explofions. The black fmoke is then followed, at a fhorter or longer diftance of time, by a reddilh-coloured flame. Showers of flones are afterwards thrown out, and fome of them are projected to great heights in the air, which thews that the force by which they are impelled is very great. Along with thefe, afthes are likewife ejected. Thefe phenomena, which daily increafe in frequency and violence, are alfo ufually preceded and accomprnied by earthquakes, and hollow noifes from the bowels of the earth, fomething like thofe that precede earthquakes unaccompanied with volcanic eruptions. The fmoke, flame, and the quantity of llones and afhes, increafe, and the ftones are at laft thrown out red hot.

The fimoke which iflues from the crater has been obferved to be fometimes in a highly electrified flate. The aftes are ftrongly attracted, and carried up along. with the fimoke to great heights in the atmolphere, forming a denfe black column of valt height and fize. Flathes of lightning are feen darting in a zigzag direction, through the column of fmoke and afthes; and this lightning is fometimes attended with thunder. But from fome oblervations which have been made, this thunder and lightning are feemingly lefs intenfe than atmolpheric electricity. When thefe terrible appearances have continued for four or five months, or for a longer or fhorter time, according to the nature of the enuption, the lava begins to tlow. This is a current of melted matter, which fometimes boils over the top, and fometimes, when the mountain is high, as is the cale with Ætna, burils out at the fide, and makes a paffage for itfelf. The period of the duration of the eruption is very different. Sometimes it continues to fow, ar intervals, for the face of feveral weeks.

The matters ejected from volcanoes are lavas, which Matters are either more or leis confolidated ; ahes, flags of dif. thrown oot ferent kinds, and itones which have undergone little ${ }^{0+\text { ot volca- }}$ or no fufion. For an account of the nature and properties of volcanic productions, fee Mineralogy. Stones have been projected into the air from Mount ※tra, to the height of 7000 feet. A ftone which was ejected from Vefuvius, meafured 12 feet long, and 45 feet in circumference; and even larger mafles have been thrown out from Ætna.

Water has been frequently ejected from volcanoes

Chap. IV.
G $\quad \mathrm{E} \quad \mathrm{O} \quad \mathrm{L} \quad \mathrm{O} \quad \mathrm{G} \quad \mathrm{l}$.

Enth- This water is fonctirie cold, and fometimes hot. Equaker and ruptions of water have taken place, both from Vefu$\underbrace{\text { vocanoes. vius and Fitna. At one time falt water was ejected }}$ fromi Mount Vefusius. Different opinions have been beld concerning the origin of this water, or its eonnevion with the voleano. This is founded on the circumftance already taken notice of in the general remark which was made, that almolt all volcanoes are in the vicinity of the fea.

It feems to be a fingular circumitance in the hitory of volcanoes, that when once eruptions have commenced, they follow each other in rapid fuccelfion; and at other times that they ceate for a long period. From the year 1447, Ætna ceafed to throw out any fire till the year 1536, when a terrible eruption took place, accompanied with fmoke, tlame, athes, and burning ftones. This conflagration continued to rage with great violence for many weeks. The following year a river fwelled and overflowed its banks to a great ditance; furious fquulls of wind fucceeded, after which there was a terrible eruption from Ætna. The torrents of flaming and fufed matter which flowed out, deltroyed towns, sillages, and vineyards, to a great extent. After the conflagration, the fummit of the mountain fell in with a dreadful cralh. For 100 years after this period, the eruptions feemed to obferve fome kind of regularity, returning periodically every 25 and 30 years. From the year 1686 to 1755, the fame year on which the earthquake at Liibon happened, for more than half a century, Ætna enjoved profound repofe.

The firft confiderable eruption of Vefuvius, the account of which is recorded in hiftory, happened in the year 79 of the Chriftian era. It was this eruption which deltroyed Herculaneum and Pompeii ; but this was not the firft eruption of this mountain, for the ftreets of thefe cities have been fince difcovered to be paved with lava. Since that time, 30 different eruptions have taken place. . There was a very remarkable

It would appear that volcanoes feem to become quite extinct, and are rekindled. Some of the Roman writers, as Diodorus Siculus, Vitruvius, and others, fpeak of Vefuvius only as having been a volcano. After this period it burnt for 1000 years, and again became extinet, from 1136 to $15=6$. Pools of water had colleeted in the crater, and woods were growing on its fides, and erea in the crater itteif. Vefuvius has now burnt for three centuries pait, as farioully as ever; but particularly, during the 1 18th centary. Of 29 eruptions which have taken place from Vefuriuc, fince the reign of Titus, half of the number have happened in the 18 th century.

Befide the volcanoes, the hiltory of which we have now briefly detailed, volcanoes are knnwn to exilt at 242 the bottom of the ocean. Thefe are dittinguilhed hy Submarire volcanoes.
land. The illand of Santorin, formerly called Thera and St Irene, was denominated by the Greeks, in al-quikes arid lafion to its origin, Kxatwos, or "burnt." According to Volcanoes: Pliny, there is a tradition that it rofe out of the fea, at a very remote but unhnown period.

Without going far back into hiltory, to inquire concerning the early eruptions of this volcano, we thall mention tome of a later date, the exiltence of which is better afcertained. In $\mathbf{x}+57$, an eruption took place, at which time athes and red-hot rocks were ejected, with a great quantity of lava. This event, with the date of it, is recorded on a marble ftone, erected near the gate of Fort Scarus, in Santorin. An eruption allo took place in 157 . . This produced a new illand, called the Little Kaminoi. In 1650, the agitations of the volcanoes continued for the greater part of a year. Smyrna and Conftantinople were incommoded with the athes, which ruthed from the ocean in whirlwinds of flame. The fame volcano opened again in 1707. The Little Kaminoi, mentioned, was increated, and it is now more than three leagues in circumference. A violent eruption took place in 1767, which fhook the earth greatly for fome days, and raifed the fea in fuch a manner, as to excite apprehemions of the deltruction of the illands in the neighbourhood. A thick black fmoke darkened the air, which was fo infected with a ftrong frimell of fulphur, that many perfons and animals were fuffocated by it. Black athes refembling gunpowder were difperfed around, and torrents of tlame ilfuing from the fea, and waving above it, to the height of feveral feet, lighted, at intervals, the horrid fcene. At the end of 10 or 12 days the eruption began to be more moderate; and a new iland which had been thrown up was difoovered. When it was examined, many parts of it were till burning; but the next day ${ }_{2}$ thofe thom curiofity had drawn to the fot, were conspelled to betake themielves to Hight. They felt the new foil moving; in fome parts it rofe, and fuak ia others. The earth, fea, and $\mathbb{k y}$, foon refumed their formidable appearance; the boiling fea changed colour ; tlames in rapid fucceffion iflued as from a furnace, bat accompanied with ahes ant parmice. The trightful noife of fubterranean thunders was heard; it feened as if enormoay rocks, darting from the bottom of the abyr, beat againt the vaults above it, and were alternateiy repelled and thrown upagain. The repctition of their blows teeraed to be ditinatly heard. Some of them finding a paliage, were feea flying up red hot into the air, and aymin falling into the fea from which they had been cjected. Malles were produced, held together for fome days, and then difappeared. In this general diforder, larse portions of the Little Kiminoi were fivallowed up. Menwhile the labour of the solcano took a larger furtace. It cjections became prodigiouly abundant, and a new iliand was feen forming. By fuccefive additions continued for near tour months, it made a junction with that prolaced in June. From the colour of its fuil it wa named the Black $!$ iand. I: is larger than the Little Kammoi, and is feparated from it hy a narrow itrait. After frequent alurms for feveral monthc, the volcano opened again on the 15 th of April in the followig year ; but the cruption was only for a moment, when it threw out a multitude $u$. burning roch, which fell at the ditance of (ins mil:",

Eas : - Similar fulntarime volcanocs have been obferved near 0भthes atd the illand of St Michael, one of the Azores or Weften inlands in the Athantic ocean. In the year 1638 , near the illand of St Michael, where the fea vas known to be $1=0$ feet dcep, there arote, after an agitation of feveral weeks, an illand about fix miles round. It was again fuallowed up in about the fame face of time 1lat had clapied durino its fornation. In the year I 501 , this volcano was in great agitation for a month. It convulied the whole illand of St Nichael, and by the heat and violent commotion of the fea, as well as by the eruption of dames, afhes, and pumice, occationed great damage ; but in this cafe no ifland appeared. Similar eruptions were known in 1720, and in 1757. During the latter eruption, fome of the illands were fhaken to their foundations.

After this account of fubmarine rolcanoes, of their effeets, and of the iflands formed by them, it would he unneceffary to enter into any detail of the fubmarine volcano which threw up an illand off the coaft of Iceland, in the year ${ }^{1783}$. This ifland, the exiftence of which feemed to be fully afcertained, was again fwallowed up in the ocean, and was fcen no more.

Volcanoes of a very different kind have been defcribed. The volcanoes to which we allude, have re-
ceived the name of mud zolcanves, from ejecting a great quantity of mud. Thefe, however, are fimilar to thofe which have been already defcribed, in having volcanic motions and convulive cruptions. The firft volcano of this kind which was difcovered is in the illand of Sicily, near a place called Maccalouba, between Arragona and Girgenti. It is in a hill of a conical nape, truncated at the top, and 150 feet high. The funmit is a plain, half a mile round, and the whole furface is covered with thick nud. The depth of the mud, which is fuppofed to be immenfe, is unknown. There is not the flighteft appearance of vegctation upon it. In the rainy feafon the mud is much foftened; the furfice is even, and there is a general ebullition over it, which is accompanied with 2 very fenfible rumbling noile. In the dry feafon, the mud acquires greater roniffency, but without ceafing its motion. The plain aflumes a form fomewhat convex; a number of little cones are thrown up, which rarely rife to the height of two feet. Each of them has a crater, where a black mud is feen in conftant agitation, and inceffantly emitting bubbles of air. With thefe the latter infenfibly rites, and as foon as the crater is full of it, it difgorges. The reliduc finks, and the cone has a free crater until a new emiflion.

This hill is fometimes fubject to alarming convulfions. Earthquakes are felt at the diftance of two or three miles, accompanied with internal noifes, refembling thunder. Thefe increafe for feveral days, and terminate in an cruption of a prodigious fpout of mud, earth, and fones, which rifes two or three hundred feet into the air. This explofion is repeated twice or thrice in the courfe of 24 hours. Some years pafs over without any eruption, but it generally happens that the eruptions continue yearly for five years fucceflively. An eruption from this mud volcano took place in 1777.

Phenomena fomewhat fimilar have been defribed by Pallas, which he obferved partly in we peninfula of -he Kerrha, the boundary of Europe to the fouth-ealt of

Little Tartary, now Taurida, and partly in the ifland Earthof Taman, which is feparated from Kercha only by quikes and one of the months of the river Cuban. The illand of Volcanoss Taman is fituated in Alia. Thefe places, he obferves, ate in fat ccuntries where there are few hills, and thofe yory little raiied above the level of the fea. The whole i, covered with beds of llime, mixed with fand, with fome beds of marl and fea-ftells. From this lie conclules that no real volcanic pit can c ift herc. Copious fprings of petroleum are found in icveral places, and alfo pools or fyphons of various dimenfions, through moft of which a briny mud is difgorged in bubbles. Pallas obferved feveral of thcfe pools, both in the peninfula and in Taman. The laft eruption which took place, he obferves, was in 1794. This was the greatelt and moft copious that had been known. It proceeded from the top of a hill at the north point of Taman. The place where the new gulf opened was a pool, where the fnow and rain water ufually remained for a long time. The explofion came on with a noife Jike that of thunder, and with the appearance of a mafs of fire in the form of a theaf. This latted only for about half an hour, and it was accompanied with a thick fmohe; but the ebullition which threw up part of the liquid mud, continued till the next day, after which the mud ran flowly in ftreams down the hill. The mud difcharged was of a foft clay, of a bluilh afh colour, every where of the fame nature, and mixed with brilliant fparks of mica, with a fmall quantity of marl, calcareous and fandy fragments of ichiftus, which feemed to have been torn from their beds.
Pallas fuppofes that a very deep coal mine had been for ages on fire, under Kercha and Taman, and that the fea having accidentally broken into the burning cavities of the mine, the expanfion produced by the water converted into fteam, and the ftruggle of the different aeriform fubflances to get free, forced the upper beds, broke them in pieces, and formed a paflage to themfelves. The vapours, as they efcaped, carried the mud along with them. But others have fuppofed that thefe phenomena are not produced by fire; that the appearance of the fheaf of fire mult have been extraneous, or, that it was only a quantity of inflammable air, which exploded when it came to the furface; or, perhaps it was altogether an ilhuion, from the appearance of the vapours which were emitted.

An account is given of a fingular phenomenon, fomewhat fimilar to the above, which was obferved in 1711, at Bofely near Wenlock, in Shropftire. After a great hurricane, the inhabitants were a vakened in the middle of the night by commotions of the earth, which were accomparied with noife. Some perfons went to an eminence from which the noife proceeded, and they faw water oozing through the turf, while at the fame time inflammable air was emitted. The water was not hot. This continued for fome time, but at laft-it ceafed to throw out any inflammable air for fome years, previous to the year 1746 , when a fecond eruption took place, attended with fimilar circumftances.

We thall not dwell longer on the hiftory of volcanoes. For a particular account of the moft remarkablc eruptions of the principal volcanoes in the world, the reader is referred to the hiftory given mender Ætwa, Hecla, and Vesuvius. We thall now proceed to ftate fome of the orinions and conjectures of philofo-
phers,

Earth－pliers，with regati to the curde of theice extraordinary Quakes ard phenomena．
$\underbrace{\text { Volcances．Volcanic eruptions have heen aferibed to the action }}$ of the waters of the lea，buriling in upon an immenfe Caufe of quantity of fufed or burning matter；to the action of vucances．central fires，and to the decompofition of differcnt fub－ ftances，by which a great quantity of heat and inflam－ nab！e fatitances is produced．

Water，according to fome philofopherz，is abfolutely necefiary for the formation of volcanes．This opinion is fupported by the circumatance of almont all volea－ noes being near the fea．According to this opinion，they were all formed under the furtace of the waters of the ocean．The firlb explotion at the formation of a volca－ no，it is fuppofed，was preceded by an earthquake． The firit eruptions would be extremely violent，and im－ menfe qquantities of matter would be ejected．Torrents of lava wouk continue to be ditcharged for a long ferics of ages，and thus the foundations of the burning mountain are laid in the bottom of the ocean．But it becomes a quettion，in what way the internal fire was preierved from extwation by the incumbent waters of the ocean？To this M．Houel replies，that the fire having difpofed the fubltances in fufion to make an eruption，nevt laid open the earth，and emitted as much matter as it could difcharge，with a force lullicient to overcome the refiftance of the column of water，which would oppofe its afcent ；but as the itrength of the fire diminifhed，the matter dicharged was no longer ex－ felleal beyond the mouth；but，hy accumulating there，foon clofed up the orifice．Thus，only imall orifices would be left fulficient for giving went to the vapours of the volcano，and from which only fmall buo－ bles of air could afcend to the furtace of the water，un－ til new circumfances，fuch as originally give occation to the eruption of the volcano，again took place in the bowels of the earth，and produced new eruptions，either through the fame or othes mouths．The appearance of the fea over the new formed volcano，in its liate of tran－ quillity，would then be fimilar to what it is bet vixt the ihands of Bamlizzo and Pariaria．Culamms of air bub－ bles are there aticending at the depth of more than 32 feet，and burft on their arriving at the furface．This air would continue to difengage itfelf with little difturb－ ance as long as it infues forth only in fmall ruantity， until，at the very initant of explotion，when prodigious quantities，generated in the burning focus，would make their way at once，and the fame phenomena which originally took place would again matue their appear－ ance．＂

A volcano，while under water，cannot ant precitely as it does in the open air．I＇s eruptions，thongh equal－ $3_{i}$ itrong，cannot exiecis to io great a ditance．The livz arramulates in greator geantity rul：d the cra＊er； the［ond，alles，and pozzoinna are urt canted awny ty the wiad，but rateromited amond it meres，and jowent the marine fablaten，which ere cuvel，that waly tise water，formenelise．Thus they anelume－
 formed of at the matetial together．

 if ！＇sa，\＆C．at every eruption，and that the caveri of the volean，was gradually enlarged，the lava ！eene dri－

setion of the flones when tise voicano is comatatly throwing up；that it was there fuled，and at latt thrown out at the top of the mountain to accumulate on its lides． M．Houel＇s opinion about the volcanic tire we thall give in his own words．
＂We cannot form any idea of fire fubfiting alone， without any pabulum，and unconnetted with any other principle．We never behold it but in conjunction with Iome other body，which nourihes and is confumed by it． The matter in fufion，which illues from the focus，is but the incombuilible part of that which nouriflues the fire， and into the bofom of which that active principle pene－ trates in farch of pabulum．But as the fire acts only， in proportion to the facility with which it can diffolve and evaporate，I am of opinion，that it is only the bot－ tom of the volcano on which it acts；and that its ac－ tion extends no farther than to keep thefe fubfances which it has melted in a conftant itate of ebullition． That futible matter being difcharged from the muuth of the volcano，and hardening as it is gradually cooled by the action of the air，produces that fiecies of thones which are difinguitied by the name of lavar．This lava，even when in the focus，and in a flate of fluitity， muit alio poffels a certain degree of folidity，on account of the gravity and denfity of its particles．It there－ fore oppoles the fire with a degree of refatance which irritates it，and requires，to put it irto a hate of eibul－ lition，a power proportioned to the bulk of the mafs．
＂＇I hat quantity of matter，when diffolved by the ac－ tion of the fire，muit confantly refomble any other thick fubitance in a llate of ebullition．Sinall explotion are produced in various parts over the furface of every fuch fubitance while in a itate of ebullition；and，by the burting of thefe bubbles，a great number of fmall paticles are fattered around．This is the very pro－ cci carried on in the focus of a volcano，thonk on a trale immenfly more large；and the vall explofions there produced expel every budy which lics in their way with the utmoil violence；nor is there any piece of lava which falls down from the upper purt of the arch，of weight fullicient to redift this violent centrifu－ gat furce．

The pabulam by which the internal fire is fupport－ ed，M．Houct thinks to be fabitances contained in the mountain iticlf，wgetlor with hitu：nen，fulphur，and other intlammable material，which may from time $t$ ， time thow into the foras of the voleano in a melted alate through the fubteraneous ducts，and the explotions he ：feribes to water making its way in the fime maner． The water in converted into tlem，which tills the casern and puthes the molted law out at the crater；this ori－ tion is corroborated by the copions fanke which alway piccedes an erup：ion．But，rombined with the wan－， there is always a quantity of other fumbances，whe tec ellects precede，accompay，or follow the eruftions，mi produce all the variom plenomena which they diplay． The eruption of water foum Atta in the wer 1,75 proceded undoubtedly frum this catuic．The in，（a． lome of the refervors in Aim or the adjucent anom． tairs，by lome mests difehened a von quantity of Woter into the fircus of the buicano．That witer wes indamly relulul into vapore，whis fillel the whece csens，and illued thom the mouti of the cr＂． A．henes as it made it－way into the open anotphese，i

Volcanoes
$\xrightarrow{\square}$
Others have attempted to account for the exittence of volcanic fire, on the fuppofition that it is derived from central fires, and to thefe it is fuppofed that volc.noes act the part of climneys; while others are of opinion that they are owing to the chemical decompofition of different fubllances, by which intammable matters are evolved, with a great deal of heat, and by means of the latter the combutible naterials are kincled, and exhibit the phenomena which are thus propofed to be accounted for.
M. Patrin is one of the lateft naturalifts who, with the affilanse of modern chemiltry, has attempted to ascount for the phenomena of volcanoes on the principles of this fcience. For a full vicw of his theory, or rather of his fanciful conjectures on this fubject, we
of the electic fluit, combines with the oxygen, and Earthforms fulphuric acid, which decompofes the fea fult. quakes and
6. The mecallifirous fluid. This forms the iron in lavas. It is the origin of metallic veins, and the colouring principle of organized bodies. This fubftance in its undecompofed liate afords iron, but by decomputition it produces other metals. It is conjectured to be one of the principles of muriatic acid, and it contributes, along with pholphorus, to fix oxygen under an earthy form.
7. The lait of the volcanic fluids is awotic gas. To this gas is owing the formation of the maffes of carbonate of lime which ${ }_{2}^{3}$ are ejected by Vefuvius, and of the calcareous earth contained in lavas.

Such are the materials with which the author propofes to form the different fubitances $x$ hich are produced in volcanoes, and by the operation of which he propofes to explain the phenomena of volcanic eruptions. Our readers will probably agree with us in thinking, that the prelent itate of chemisal fcience, even with the affiftance of fuch hypothetical fubftances as the metalliferous fluids, is yet inadequate to give any degree of fupport to fuch opinions, even in the form of conjecture. We fhall therefore difmifs it without farther remark.

We fhall now conclude this fubject with fome inter- Obferva- ${ }^{245}$ efting obfervations by M. de Luc, on the nature of the tions on the ftrata in which volcanic fires exift.
"Volcanoes, he obferves, have been more numerous on the furface of our continents, when they were under the waters of the ancient fea; and as this clafs of mountains, raifed by fubterranean fires, manifelt themfelves fill on the fhores of the prefent fea, and in the middle of its waters, it is of importance to geology and the philofophy of the earth to obtain as juft ideas of them as poffible.
" I have attended a great deal to this fubject from my own obfervations; and I have fhown, at different times, the errors into which feveral geologits and naturalifts, in treating of it, have fallen.
"This clafs of mountains, in particular, requires that we fhould fee them, that we fhould behold them during their eruptions, that we fhould have traced the progrefs of their lava, and have obferved clofely their explofions; that we fhould have made a numerous collection of the matters which they throw up under their different circumitances, that we might afterwards be able to ftudy them in the cabinet, and to judge of their compofition according to the phenomena which have been obferved on the fpot.
"This ftudy is highly neceffary when we apply it to geology and the philofophy of the earth, in order that we may avoid falling into thofe mittakes which make us afcribe to fubterranean fires what does not belong to them, or which leads us to refufe them what really belongs to them.
"We read in the Guurnal de Physique for January 1804, under the title, On the caufe of Volcanoes, the following affertions:
-What is the nature of the matters which maintain thefe fubterranean fires? We have feen that Chimboraço, all thefe enormons volcanoes of Peru, and the Peak of Teneriffe, are compofed of porphyry.
' The Puy-de-Dome is alfo compofed of porphyry, as well as the Mont d${ }^{\prime} \mathrm{Or}$ and the Cantal.

" Mitna, Sulfatara, and Sefuriac, arealf of the por. Auakes an ! plyry kind.
Vomes, : Thefe facts prove that 'he mot comiterable vulcis. noes with whith we are ac funintal are of ponplyry.
"'This opmion, that the fres of voleanoe late their centres in luch or fuch a rock, and thot theis law are produced from thete rorke, har aldays appeared to me rot to be founded on ans cert.tn data. (pinions alio on this futboce have ration; fome heving placel the crigin of 1 .va in korn recli, others in gratute or tchiti, and at prefent it is ablioned to porphyry.
" I have always been of opinion that nothing ceatain could be determined in segard to this puint. It ever remains uncertain whetlies the feat vi the matters of Which lava is formed te in compet rock, or in fiata in the fate of foitncfo, putverulent, and mudd.
" Thote who foc lava ifue from a volcano in its !?ate of fution and incandetence, and in its cooting, wre convinced that the noture of every thing iv elaenged, that it exhibits a pate in which rothing con be hoow, evcert the fubtiances which the solcaric fires bate not seduced to fution.
" But thefe fubflances contained in the pafte of lava, and thofe which are the moft numerous, thow ui, that the trata from which they procee. cannot be fimilar to thofe expofed to the iifw, nor even to the mut profound ftrata to which we can penetrate.
"Adniting the hapothefis, that the frata from which the lava proceed are in a pulverulent and muddy itate, containing clements of all thefe fmall cryitals, one may conceive how they are formed there, inlulated, prouped, or folitary, and are found then in the lava in that tlate of infolution.
"The fragments of natural rocks thrown up !y Vefuvius are not of the fame kind as the matters of which the lava is compofed. Nolt of thefe fragments are micaceous rocks, with lamine of greater or lefs lize, and of a hind of granite called formite. I have found fome compred of white quartzy rock; it is found tometimes of calcareous rock.
"The molt probable idea that can be formed in regard to the origin of thefe fragments is, that they have been carried from the borders of the trata through which the lava, that comes from gieat depthe, has upened for itfelf a paffage. Thele fragments are cartied to the furface of the lava as far as the bottom of the chimney of the crater, whence they have bern thrown out by explofons, mi:: wh whagments leparated, or sather torn, from the lava; fir it in not by the lava that they have been brought forth to viev, bit ty explonon.
"Some of thefe fragments of natural rocts have not l.een attacked $1, \%$ the fire; others bave noure or lets; - Ifich devend, rio doutt, on the place which they orwipet ir the voleano, and on the time wheh tley remaned is it. The mont of the latter bave retaned ar thein futace a cruit on lasa, and this crest contain lubthances $w$ hich are not the lame as that of the fiagment it covers.
"On Ve iu:ius the ftrata piereed by eruptions are lower than the furface of the foil; in Auvergne and feweal flaces of Germany they ate above; for this reawh there are feen there in their place fichitsour granites, Yas. IX. Part II,
whech tie eruption blote broken of form for tient ! : 5 patio..

 They have teen anard by eruptions, whach, proctetiong fonn geredophs, bue :trman them up though the uffer itata. ithea it is taid, therefore, them the volcanic mountains of duver, ne reft on granie, this in a miatahe, und an incorrect expredtion his bren wied by thote who hase not formed a juft idea of the phenometon. Lava may have fowed upong granite or any other rock, and retted upon it : but this is never the cal"ith the vobono itcief: its cate, ate below all the roch, vishle.
"It is from the boirm even of the lave, when in a At te of fation in the intorior of the volcans, that all the exptotions proced. In that itate of fution they contant al! the matters which produce femmentationis, and the difengagement of expmible tluid.
" I have been emabled to alcertain this on Vefuviur as far as was pollible. The continual noite which was heard through the two interior mouns of the crater thich I had before my eyes, was that of an ebullition, accompanied with inimmable vapours, and the genhes of burning matter which they thres up at intervals were feparated pieces of the lava in its itate of futiom. I faw feveral of them in the air change their form, and fometimes become flat on the bodies which they flrurk or embraced in falling. And among the moft apparent of thefe fragments there are always a multude of inall ones of the lize of peas and nuts, and aill fmaller ones, which thow at their furface, by thair alperities, all the characters of laceration.

- The name of feorie has been given to thele fracments, to ditingruil them from compact lava, though, their compofition be the fame as that of the hardeit lava; and it is for want of retlecting properly on this point that it has been faid that $i$ is the compact prast only that we mut oblerve, in order to judge of thei: in ture. 'I he pieces which 1 tock from the fiowing bat with an iron hook, have at their furtace the tame lacerations and the fame atpenties is the fragments thrown up by explotion, and both contain the tame filiftancer.
" Thi, leparation, by tearing off the parcels of the lava effected by fermentationsand explofion, which proceed fiom their bofen, ferves to explain thole coluran, fometimes prodigious, of volcanic fand, which rite from the principal crater. When feen with a magnifying khfs, this land exhibits nothing but lava reduced very fmall, the particles of which, rough with inequalitic, have the bright blach colour and the varnilh of recent lava.
" Parecls of fublances which exit in our frat:a, fuch as fiagments of quarts, fales of mica, and cryftals of feldfar, are found fometimes in lava. Similar matter, mutt no doubt be difleminated in the compolition of our globe, withon there being reafon to conclude that the ftrata from which they proceed are the lame as the ev. terior itrata, It is neither in the granites, the porphy. + K
ric: 1

E. rh-Gu.ke-qn? Y:......en.
ries, nor the horm rock, and Alill tef in the fchins and çloweous rocks, that the finorls of volcanoes, the leucites, and perhaps olivine, will be found. Theie inall cryatals are brougint to view by the lava, otherwite they would be unknown to ns.
* Thefe lavas contain a grent deal cfiron, which they acquire neither from the granite nor porphyries. Wight not one ke in the ferruginous fand which is found in abundance on the borders of the fea near Saples, and in the environs of Rome, fpecimens of that hind of pulverulent itrata irom which lava proceets?
- I have hers offered enough to prove that it cannot be determined that lava proceeds from itrata fimilai to thole aith which we are achuainted. The operations of volcances, thole val lahoratories of nature, will always remain unknown to us , and on this fubject our conieztures will always be very uncertain.

Winat is the mature of that mixture which gives birth to thele eruptions, that produce lava and throw un momatains? What we obforve as certain is, that the intradution of the water of the fea is neceflary to ewite thefe fermentations, as containing marine acid and cther Galts, wnich, united to the fulphuric acid, * bufes of which are contained in abundance in the fubterrancan firata, determine thele fermentations, which produce the difengagement of fire and other fiuids, and all the grand cffects that are the confe-- wance.

* Soveral naturalifs have believed, and ftill believe, Thet frefh or rain water is funncient for this purpule; but they are mizaken : this opinion is contradicted by every fact known. To be convinced of this, nothing is neceliary but to take a fhort view of them. I have cone it leveral times, as it is necellary to confider them often. I thall here enumerate the principal ones : Nu burning monntain exits in the interior part of the earth; and all thofe which itill burn are, without exception, in the meighourhood of the fea, or furrounded Ly its waters. Anong the deliquefcent falt, depoited Ly tic imoke of volcanoes, we dillinguilh chictly the marine falt, united to difierent bates. Several of tive velcanocs of Icoland, and Hecla itlelf, fometimes throw up eruptions of vater, which depolit marine folt in abundance. No estent of freh water, however vaif, gives birth to a volrano. Thefe facts are fulficient to prove that the concutrence of fea-sater is ablolutely necelfary to excite thofe formentations which produce volcanoes.

6 I hall here repeat the diltinction I have already made botween burnt-out volcances and the ancient volcanoes, that I may range them in two feparate claffes.
"When we cimpiy give the name of burntout or ex6. $7 \mathrm{~g} u i / b$ d volcanoes to volcanic mountains which are in
the middle of the contincnts, it is to reprefent them as having lumt while the land was dry, and inhabited as it is it prefent; which is not a jult idea. Thefe vol. canoes have burnt when the land on which they are ritied was under the waters of the ancient fea, and none of them have burnt fince our continents became dry. It is even very apparent that moft of them were estinct before the retreat of the fea, as we find by numerous examples in the prefent fea.
"Thole which I denominate extinct volcanoes are fuch as no longer burn, though furrounded by the fea, or placed on the borders of it. They would ftill burn, were not the inflammable matters by which they were railed really exhaufted and confumed. Of this kind is the volcano of Agde, in Languedoc. Of this kind alfo are many of the volcanic illands which have not thrown up fire fince time immemorial.
" M. Humboldt, in his letters written from Peru, fpeaks of the volcanoes which be vifited, but what he fays is not fulficiently precife to enable us to form a juit idea of them. He reprefents Chimboraço as being compoled of porphyry from its bettom to its fummit, and adds, that the porphyry is 1900 toiles in thickneis; afterwards, he remarks, that it is almolt improbable that Chimboraço, as well at Piçinincha and Antilana, fhould be of a volcanic nature: "The place by which we afcended, (fays he,) is compoled of burnt and fcorified rock, mised with pumicettone, which refembles all the currents of lava in this country.'
"Here are two characters very different. If Chimboraço be porphyry from the top to the bottom, it is not compoled of burnt and forified rocks, mixed with pumicetlone ; and if it be compofed of burnt rocks, it cannot be porphyry. This expreflion, burnt and forifiod rocks, is not even exact, becaufe it excites the idea of natural rocks, altered in their place by fire, and they are cortainly lava which has been thrown up by the volcano. But the truth muft be, that Chimboraço, and al! the other volcanoes of Peru, are compofed of volcatic matters, from their bafe at the level of the fea to the fumn:it.
"I lase juit read in the Annales du Muféum a'HiNoire Naturelle *, a letter of the fame traveller, written from Miexico, on his return from Peru, where, fpeaking of the volcanoes of Popayan, Pallo, Quito, and the other farts of the Andec, he fays, 'Great mafies of this fotill (ob/idian) have iffued from the craters; and the fides of thefe sulfs, which we clofely examined, confill of purphyry, the bate of which holds a mean between of fidian and pitchriune (pech/jein).' M. Humbodd therefore confiders offidinn, or black compact glats, as a natural fotili or rock, and not as volcanic glaf.."* stats.

## G E O M E T R Y.

INTRODUCTION.

Intraduc-
tion.HERE is realon to believe that geonetry, as well as moit of the other fciences, was tirt cultivated in Egypt; and, according to fome acthors, it had its ori cin in the necellity there was of afligning to the inhabitants every year their particular thares of lend: for as the country was annallly overfowed by the Nile, it has been taken for granted (perhaps withuut goud reafon), that the land-marks would be obliteated, and the pofefions rendered undiatinguiliabie from one another. Such is faid to have been the origin of land-meafuring, the form under which geometry was firit known, and from which it has taken its name; for geometry literally fignifies the meafuries of the carth.

The hillorian Herudotus refers the origin of geometry to the time when Sefultris interiected Egypt by numerous canals, and divided the country among the inhabitants; and this account of the beginning of the fcience has been confidered by fome as very probable.

From Egypt geometry was carried into Grecce by Thales of M:letus about 600 years before the Chrittim erra. This celeorated philotop her is faid to lave made numerous difcoveries in geometry; and in particular to have firt obferved that any angle in a femicircle is a right angle; a difcovery which gave him great jus, and for which he thanked the mufes by a facrifice.

Among the difciples of Thales were Anaximander and Anavagoras: the firft of thefe wrote an elemen. tary treatife or introduction to geometry, the earlieft of which there is any mention in hitury; and the late is faid to have at'cmpted the quadrature of the circle, a problem which has baffed the ikill of mathematicians of every age.

Pythagoras followed Thaler, and had the merit of difcovering one of the mot beautiful and important propofitions of the whole fcience, namely, that the fquare of the hypothenufe of a right-angled triangle was equal to the fquares of the two other fides. He is faid to have been fo tranfported with joy at this difcovery, that he fecrificed a hundred oven to the gods as a tellimony of his gratitude. The truth of this ancelote has however been doubted, on account of the philofopher's moderate fortune and rcligious opinions concerning the tranfmigration of fouls.

Zonodorus is the earlieit of the geometers vhofe writings have reached modern times, a part of them having been preferved by Theon, in his commentary on Prolemy.

Hinpacrates of Clios cultivated geometry, and dif-- inguithe 1 limflit by the quadrature of the curvilineal
face contained between hati the circumtirence of Intwin:one circle, and the fourth ant of the circumsenc: of another circle, their concarinion being noth thanel the fome way, and the ratiun of the former the of the latter as I to $\sqrt{2}$. He alio wrose elements of geometry which a e now lott,

The founding of the ichond of Pato forms one of the earielt and mont important ciucins in the hitory of qeonetry; for to that phiofopher we are lid to be indebte i for the difoovery of the Gimarical Amalys, by which the fcience has been greatly extended, and which is indeed ablolutely neceffary for the reiodation of problems of a certain degree of dificuitr.

The Conic Sections, and the theory of Gomerca! Laci, are commonly reckoned among the improsemant ; which geometry received from his difiples; and there is reafon to fuppofe that thefe, as well as many oth: important difcoveries which we have not room here to enumerate, were firf luggefted by the attempts of the geometers of the Platonic fchool to refulve tiso celebrated problems, namely, to trifict, or diside into three equal parts, a given anyle; and to conlruct a cube which thould be the double of another culse; which latt prohlem Hippscrates had thewn to be equa:valent to the findine of two mean proportionals 'eeterem two given lines. The ettem in which Plat, hatd the feience of geometry is funty evineed by the folloning infeription over the door of his ichool: Lit no whe cnorr here that is ignorant of se:n: : 17.

The feience of geometry wis linewile cultivated in all its branches by the phifofore of the Nleamblam fchool, among whom liuc/d cham, in a pattculat manner our attention. This celehrated mathematicinn lived about 300 yeatrs before the chillinu am, .an l probably fludied geometry at Thens under the difi, ina of Plato. From Greece he went t . Alexan ai:, athered thit er tw doubt by the fance of thece. on at I choul of that city, and by the finvors cust :a.ll 1 ? the firlt Polemy upor learned men. Il: c.a.n il elements of geometry in a filicmatic fornd, compre hending in them fuech propotitions betneniog to tion 1 ... princtples of the diface $n$ ! at been ditante! \% mathematicians prewime to lis time. Iai ... ? . is

 has been caltivated, am! it has leved an the woon..... work of in umerable ahter 11 . ites, ko "whis', it
 writean on it, and it ham becta trablate 1 into alm ni
lere'ee the Europeon and Oniental lenguages. Evclid is likewife krown to have written other works on genmetry :
of thele we have his Dara, which may be *gatded is a continuation of his elements; and an account of a worl: of his on frims (fee Porisu:s) preferved in the writings of $P a \neq$, , but which has fuffered to much f:on time as to be almoll uminte!ligible.

- Ifer Eucill, lived Ara kinedes, who cultivated and improved all the branches of the mathematics known a: that period, and in a proticular manner gecmetzy. He was the firlt that found nearly the ratio of the diameter of a circle to its circumference, and he fquared the parabola. He likewife wrote westile on the Sphere and Cyinder, an Spiral, on Convids and Sphervids, Levidev uthers on mixt Mathematics. He alfo extended and improved the Geometrical Analyth, the princinles of which had been eltablithed in the fohool of Fia. . Many of the writings of Ahchinedes hase been lot; Eut fuch as remain prove him to have been one of the greatelt geometers that ever lived, and indeed the Nıwтov of antiquity.

Ap untur of †erga was nearly contemporary with A.chimea's, that is, he tlourifhed about the end of the dennd centuar before the chrifian ara. He fudied deometry in the Alesandrian fhool under the fuccefors of Eucis., and he greatly extended the theory of the conic fections (fee introduction to Comic Sections). He alo compofed treatifes on dimerent parts of Geometice! Andyfi, tut of thele only one bas come down to ventire; it is entitled $d x$ /edime rationt, and was dicovered in the Arabic tonque, from which it has been trauflitedinto Latin by Dr Mall': Such acoounts however are preferved in the mathenaitical collezions of Pozons of his other treatiles, that feveral of them have heen refored by modern mothematicians. We may mention in particular his treatifes de Locis Planir, de Satione Spatii, de Scclione Deierminata, de Tafionibus, each of which is divided into two books.

Havine mentioned Archimedos and dpolloniur, by Far the moll illutrious mathematicians of the period in which they lived, we inall pals over feveral others who conmibuted nothing to the improvement of the feience, and therefore are but little known to us. We thall however, briefly notice Thedofius, who lived about 50 vers 1. C. and who is the author of a work on Smherice, which is confidered as one of the moll valuable of the buoks on the ancient reometry.

Pafpus and Theon of Alexandria delerve to be mentioned as among the moft celesited of the commentators :nd annotators of the ancient geometry. We the particulariy indebted to Pappus (who lived abo:it t'se nididie of the fourth centurs) for our knowledge of virious difioveries and treatifes of the ancient geomet:rs, wheb, but for the account he has given of them is his mathematical collestions, would have been for cier lont to mathematicians of modern times.

Procius, the head of the Platonic fohool at Athens, ultivated mathematics about the midule of the fith con.av; and although it does nut apperar that he made ats dikuveries in the fience, yet he rendered it at arvice ly his comple ard instraction. He urote $\therefore$ fencent on the finl tork lucliu, which com$\therefore$ intomy into:s ohforn tions refueting the hiftory ... (1) $n=0$ rifes of motlematio.

Dh have now lrietly wotice d the :fincipal emochs in

## E T R

the hiflory of geometry, and the mont celetrated men Ietr ducwho have contribused to its inspovement from the earlieit period, of litiory to the end of the fifin century; but long before this time the ara of difcovery feems to have been fatt, and the fcience un the decline. Sill hawer the Alevandrian fohon exitie?, and it was patible that a E:clid or an Apolionius might acain aric in that leminary. But the taking of Alexandria by the drabs in the year $6 \not+1$ gave a death-blow to ties scierce not only in that caital, but throughout the whole Greek empire. The hibrary, a treafure of intinite value, was burnt, and the fores of learning which had been accumulating for ages were annihilated for ever.

Alhough by this unfortunate event the fciences fuffered an irreparable lors, it mult be attributed to the fanaticilm of the new religion which the conquerors had adopted, rather than to national ignorance or barbarity : for before that period, the fciences, when on the decline in Greece, had found an afylum among tifm, and about 120 years after the death of Mohammed they again took them under their protection.

The Arabs tranlated the greater part of the works of the Creek geometers, and chietly thofe introductory to aftronomy. They even began to fludy the more fullime geometry of the ancients; for Apolionius's Conic Sections became familiar to them, and fome of the books of that work have only reached we in an Alabic verfion. They gave to Trigonometry its preferit fimple and commodious form, and greatly fimplified its operations by the introduction of lines inftead of the chords of donble arcs, which had been formerly ufed.

After geometry, as well as its hindred mathematical fciences, had remained for leveral centuries under the protection of the Arabs, it was again received into Spain, Italy, and the reit of Europe, about the year $1+\% 0$. Among the earlient writers on the fubjeet after this period, were Leonardus Pilanus, and Lacas Pacilus or de Burgo.

The limits within which we muit neceffarily confine this faetch of the hifory of the fience, will not, however, allow ws to enumerate all the improvements which it has received fince the reftoration of letters in Europe; for a lift of the names of thofe who have contributed more or lefs to its extenfion, would include almoll every mathematician of note from the time of Leonardus Pianus to the prefent day.

The writings of the ancient geometers have been afiduoully fought after, and held in great reptite; for it appears that an far as they carried fome of their theorie, they left but little room for improvement, and of this remark we think the writings of Euclid, of Archimedes, and of Apullonius, afford remarkable inflances. Euclid's elements of geometry have been confided, at leatl in this country, as one of the beft books that could be pitt into the ba ds of the mathematical fudent, particularly that edition of its firt fix and elcventh and twelfh books which was given to the world by the late Dr Simpon. An excellent fytem of fomemery, come rehending the fift fix books of the ill.an an ient, tugether with three fuplementary Lounc, has of lateyarsleon publthed by Mir Profefer P'aytair, of the Univerfity of Edinburgh. We believe no modorn fylem has evelled that of Cuclit

## G E O M E T R Y.

Fin (: extored to it criginal purity ty 1)r Simen) in $\underbrace{P_{n}}$
 There is one loverer, which we naut futwolarly mention on aecurit of its greas cencoilence, and the
ure we have mate of it in the fyttem we are now to pre fent to cur reacler. It is that of Mr Legardre whi ho we watider av the noth complete and extenfive that !as yet inpared.

## SLCT. I. THE FIRST PRINCIPLES.

## Defixitions.

1. Geomersy is a fience which treats of the profertics and relations of fuantites hasing extenfon, and which are called marnitules. Extemion is dilinquith ed into lensth, breadth, and thickneis.
II. A Puint is that which has polition, but not mag. nitude.
III. A Lige is that which has only leneth. Hence the extremities of a line are points, and the inturlectons of one line with another are alfo points.
IV. A Sirgizht or Rigle Line is the thomeft way from one point to a wher.
V. Lecry line which is netlier ftriqht, nor onpoled of teraight lines, is a Curem I re. Thun Ab is a Atraigh: line, ACDB is a line made up of firaight line, and $A E B$ is a curve line.
VI. A Surtuck or Sorfoc, is that u'iish has uriy length and breadth. Hence the extemities of a fiperficies are line-, and the intendetums of one fuperticies with :thother are allo lines.
VII. A Piane Superseces is that in which any two poirts being saken, the traight line between then lies wholly in that fuperficies.
VIII. Every fuperficies which is neither plame nor conmoled of plane fuperacies, is a $C$ burue $S$ a, perfice.
IX. A Suld is that which has length, breatith, :m? thishnels. H nee the butudaries of a lulid are fuperneies; and the boundary which is commos to two thlid, which are conti_uou, is a luperficies.
A. A Plane Remianeal Ang'e is the inclination of two fraight limes to one another, which meet tugether, $t_{-1}$ are not in the fome ftraigh: liae. The point in ablich the lines meet one another is called the lorite of the angle.
Fig 2.
If hen there is only one angle at a pint, it may be exprefled by the letter pinced at that puirt; thas the an:'e contaned hy the lino EF and EG may be: ralle? the angle E: if, howevar, there be foriul mank, as at B, tlien each is coprefled by tliree letiers, one of witich is the 1 -tter that itands at the veriex of the an rhe, and the others are the letser, that iodid iomewhere unum the I:.es containing the ancle, the leter dt the vertex brine fraced betweet! the athor two. Thes the askis coritain 1 by the limes B.I and Bi) in called tixe angle $\mathrm{A} D \mathrm{D}$ or DAB .

Angles in common with otlee quatiti a almit of adjtion, fatration, makipuicatims, and davian. Thus the (omi of the ar, -r- $1 \mathrm{~h}, \mathrm{D}$ and DibC is the amol. AB ; :h-difference of the angle - $1 B C$ an I A SDD in the ane !. 1) CC.

to it. Thus, if $D C$ meet $A P$, and make the anglus ACD, DCB equal to one mother; each of them is a right anzle, and DC is a perpendicular to AB.
XII. An obtu/t Alng/6 is that which ingreater than a feg. e. right angle, and an soute Alnghe is that which in lefs than ati fit angle. Thus A BC leing luppoted a right angle, DBC is an obtufe angle, and EBC an acute angle.

Xill. Parazi' Smaigit Lines are fuch as are in the Fig. s. fon:- plane, and rhich being produced ever fo far both ways, do not meet.
XIV. A Plave Fure is a plane terminated every where by lines.

If the lines be fraight, the face which they en-Fig , clole is calied a RuFincal figure, or a Pulyson, and the lines themsincs connitute the Perimeter of the polygon.

AV. When a polygon has three fides (which is the fro llath number it can have) it is culled a Triangle: wher it is has fole, it is called a Nunkilateral; when it bas five, a Pentogun; when lix, a Hexagon, Sce.
XVI. An Equlateral triangle is that which hasfic.7.8. thece equal indes (fig. 7.) , an $I \cdot 3$ ceins triangle is that which has only t:o equal lides (ing. 8.); and a Sealone triangle is that which has all its hides unequal (部.9.).

X1II. A Ri-l: anylat triangle is that wnich has fig. $\mathbf{1 0}$ on ne th an ie; the hile owotite to the right angle is cohid the H. Wi/cma/c: Thus in the triangle AICC, thang the angle at Ba right angle, the lide $A C$ is the F: riberat.

 get in that whinh i.. thers An'e angles (1g. !1.).

X:X. Ofqu.drit.. © . ! forme, aforar, is that whith

 u: . r: fu hi- AC.

Frat the feroud che of de ctise; the third to the third, and Pumato in The fame is to be underftuod of two polygons whidh sere squanzular between themfelves.

$$
\text { Erphonciz } n \cdot f T_{c r m}
$$

In Ahsm is a propofition, the trath of which is exideint it dirftiyht.

1 Thorem is a truth which beromes evident by a proces of reatoning called Demon//ration.

A Problem is a queltion propoled, which requires a folution.

I Lemma is a fubfdiary truth employed in the demontation of a theorem, or the folution of a problem.

The common nanse of Propsfition is given indifferently to theorems, problems, and lemmas.

A cirollary is a confequence which follows from one or fiveral pronofitions.

1. Scholium is a remark upon one or more propofitions that have gone before, tending to thew their connesion, their rettriction, their extenfion, or the manner of their application.

A $H$ yfuthefr is a fuppofition made either in the enun. ciation of a propofition, or in the courfe of a demonfration.
Evplanation of Sisns.

That the demontrations may be more concife, we nall make whe of the following fisn borrowed from Algebra; and in employing them we thall take for granted thet the reader is acquainted with at leatl the mannes of notation and firt priaciples of that branch of mathematics.

To expref that two quantititsare equal the fign $=$ is put between them; thus $A=B$, fignifies that the quantity denoted by A is equal to the quantity denoted by B .

To espreff that $A$ is lefs than $B$, they are written thus; $\mathrm{A}<\mathrm{B}$.

Io expref that $A$ is greater than $B$, they are written 1吅; $\mathrm{A}=\mathrm{B}$.

The fign + (read p/irs) written between the letters Which denote two quantities, indicates that the quantities :ace to be added together; thus $A+B$ means the $1 . m$ of the quantities $A$ and $B$.
'like lign - (read minur) written between two let: ? , means the excels of the one quantity above the (thrr; thus A-B means the excels of the quantity denoted ty $A$ above the quantity denoted by B. The fign + and - will fometimes occur in the fame exfrethon ; thus $1+C-1)$ means that D is to be fubtracted from the fum of $A$ and $C$, allo $A-D+C$ watn the fame thing.

The fign $\times$ put between two quantite means their pasuct, if they be contidered as numbers; bat if they be contidered a lines, it fignifies a rectangle liaving whete lines for its length and breadth; thus $-1 \times P$, Wen"; the product wi two numbers $A$ and $B$; or elie a reet ingle having $A$ and $B$ for the lides about one of it riybt am, 'es. We thall likewife indicate the prodaet of two qumtities, in forne cales, by writing the heress chofe tineticer; thes $m$ A will be whed to exprets the product of $m$ ind $A$, and fo on with other expreffion, agrecable to the common notation in algebra.

E T R $\quad$ I.
Scet. I
The expreflion $A^{2}$ means the fotare of the gandity Fint $A$, and $A^{3}$ means the cube of $A$; allo $P Q^{2}$, $1 P()^{3}$ Princoples. Pow, the one the fquare, and the otlier the cube, of a line whote extremities are the puints $P$ ani $O$.

On the other hand, the figi, indicates a mot to beextrated; thus $\sqrt{\sqrt{x}} \overline{1}$ me.ns the huare root $u^{i}$ the prodact of $A$ and B .

## Avious.

2. Two quantitics, each of whish in equat to a third, are eqtall to one another.
3. The whoie is greater than its pare.
4. The whole is cqual to the fum if thl its garts.
5. Onty one traight line can be drann beween two points.
6. Two magnitutes, whether they be lines, furfaces, or tolids, are equal, "hen, beng apulied the one to the other, they cuincide with one another entirely, that is, when they evelly fi!! the fime face.
7. All right angles wre equal to onc anotier.

Note- The references are to be underRood thens: (7.) refers to the $7^{\text {th }}$ propofition of the fection in which it occurs; (4.2.) means the th $^{\prime}$ propufition of the $2 d$ fection ; (2. cor. 28. 4.) mean the ad curollary to the 28th proponition of the $4^{\text {th }}$ fection,

## Theoren I.

A itraight line CD, which meets with another Fig ${ }^{17}$. AB , makes with it two adjacent angles, which, taken together, are equal to two right angles.
At the point $C$ let $C E$ be perpendicular to $A B$. The angle $A C D$ is the fum of the angles $\triangle C E, E C D$; therefore, $\mathrm{ACD}+\mathrm{BCD}$ is the fum of the three angles $\mathrm{ACE}, \mathrm{ECD}, \mathrm{BCD}$. The firt of thefe is a right angle, and the two others are together equal to a right angle; therefore, the fum of the two angles ACD , BCD , is equal to two right angles.

Cor. 1. If one of the angles is a right angle, the other is alfo a right angle.

COr. 2. All the angles ACE, ECD, DCF, FCB, Fig. 18 at the fame point $C$, on the fame fide of the line $A B$, are, taken together, equal to two right angles. Fur their fum is equal to the two angles $\mu \mathrm{CD}, \mathrm{D} \subset \mathrm{B}$.

## Theorem II.

Two ftraight lines which coincide with each other in two points, alfo coincide in all their extent, and form but one and the fame ftraight line.
Leit the points which are common to the tiso lines be A and B ; in the firit phoce it is evident that they nuft coincide entircly between A and B ; otherwife, two flraight lines could be drawn from A to B , which is impotible (axiom 4.) Now let us fuppofe, if poltible, that the lines when produced feparate from each other at a point C , the one becoming ACD , and the other ACE. At the point C let CF be drawn, to as to make the angle ACF a right angle ; then, ACE being a itraight line, the angle FCE is a right angle (1, cor. 1.) ; and becaufe ACD is a ftraight line, the

## G E O M

Firt angle FCD is alio a night angle, therefore the angle $\underbrace{\text { Principles. }} \mathrm{FCE}$ is equal to $\mathrm{ICD}^{(C D}$, a part to the whole, which is impollible; therefore the ftedight lines which have the common points A, B cannot feparate when produced, therefore they mutt form one and the fame traight line.

## Theorem III.

Fig. 20. If two adjacent angles ACD, DCB make together two right angles, the two exterior lines AC , CB , which form thefe angles, are in the fame ftraight line.

For if CB is not the line AC produced, let CE be that line produced, then, $A C E$ being a thaight line, the angics $\mathrm{ACD}, \mathrm{DCE}$ are together equal to two right angles (1.); but, by hypothefis, the angles $\mathrm{ACD}, \mathrm{DCB}$ are together equal to two right angles, therefore $1 C D+D C B=1 C D+D C E$. F:ons thefe equal take away the common angle ACD , and the remaining angle $\mathrm{DCB}, \mathrm{DCE}$ are equal, that is, a part cequal to the whole, which is impollible, therefore $C B$ is the line $A C$ produced.

## Theoremiv.

Fi. 27. If two ftraight lines $\mathrm{AB}, \mathrm{DE}$ cut each other, the vertical or oppofite angles are rqual.

FOR fince DE is a ftraight line, the fum of the angles $\mathrm{ACD}, \mathrm{ACE}$ is equal to two right angles (1.), and fince $A B$ is a itraight line, the fum of the angles $A C E, B C E$ is equal to two right angles, therefore the fum $A C D+\therefore C E$ is equal to the firm $A C E+$ BCE; from each of thefe take away the fame angle $\Lambda C E$, and there remains the angle $A C D$ equal to its oppofite angle ECE.

In like manner, it may be demonftrated, that the angle ACE is equal to its oppofite angle BCD.

Cor. I. From this it appears, that if two ftraight lines cut one another, the angles they make at the point of their interfection are, together, equal to four right angles.

Cor. 2. And hence all the angles made by any number of lines meeting in une point are, together, equal to four right angles.

## Theorely V'.

Fig. 22. Two triangles are equal, when they have an angle, and the two fudes containing it of the one equal to an angle, and the two fiden containing it of the other, each to cach.

Lex the triangles $\triangle B C, D E F$ have the angle A equal to the angle D , the fide AB equal to Dl , and the fide AC eriual to DF ; the tiamgles thatl be equal. For if the triangle $A B C$ be applied to the tiingle DE.F, fo that the point $A$ may be on 1), and the line AB upon DC., then the point $B$ thall coincide with F ., becawle $.1 \mathrm{~B}:=\mathrm{DE}$; and the line IC thall coincide with J)F, lecaufe the angle BAC is equat to I.I)F : and the point $\mathbb{C}$ thall coincide with $\Gamma$, betanti $A(=$ BF : and tince B coincider with k , and C with F , the line BC flall coincide with EF, and the two triYoz. IX. Part H.

## E T R Y

angles flall coincide exactly, the oate with the other ; therefore they are equal (av. 5.)

Cos. Hence it fulturs, that the bales, or thed files BC, EF of the triandes are equal, and the remsinion angles $\mathrm{B}, \mathrm{C}$ of the one are equal to the remaina? angles E, F of the other, eath to can, name.y, thone to which the equal ideo are oppolite.

## Theorlin Vi.

Two triangles are equal, when they have a bide, Fs: 2.. and the two adjuent angles of the one equal to a fide, and the two adjacent angles of the other, each to each.

Let the fide BC be cqual to the fide EF, the ancle $B$ to the angle $E$, and the angle $C$ to the angle $F$, the triangle $\triangle B C$ thall be equal to the triangle DEF. For if the triangle $A B C$ be applied to the triangle DEF, fo that the equal fides $1 \mathrm{CC}, \mathrm{EF}$ may coincide; then becaule the angle B is equal to E, the iide BA thall coincide with ED, and therefore the goint .1 If ... be fomewhere in E1); and becaule the ans le C in erqual to F , the fide C. 1 thall coincide with ID, a:.j therefore the point A thall be fomewhere in VD ; :n 0 the point $A$ being fomewhere in the lines ED, and FD , it can only be at D their interfection; therefine the two triangles $A B C$, DEF muit entirely coincide, and be equal to one another.

Cor. Hence it appears that the remaining ande. $\mathrm{A}, \mathrm{D}$ of the triangles are equal, and the remaininfides $A B, A C$ of the one are equal to the remaining fides DE, DF of the other, each to each, viz. thec to which the equal angles are oppofite.

## Theorem Vit.

Any two fides of a triangle are together greater $\mathrm{F}_{\mathrm{s}}$. 2 : than the third.

For the fide $B C$, for example, heing the thurteft way between the points $B, C,(w e f .4$.$) mult be lets$ than $\mathrm{BA}+\mathrm{AC}$.

## Theorfa VIll.

If from a point $O$, within a triangle $A B C$, there $\mathrm{F} g$ : $z$ be drawn ftraight lines $\mathrm{OB}, \mathrm{OC}$ to the extremities of BC one of its fides, the fum of thede lines fhall be lefs than that of $\mathrm{AB}, \mathrm{AC}$ the two other fides.

Lra BO be produced to nucet C. 1 in D ; becaufe the ftraight line $(O C$ is lefs than $O D+1) C$, to each of thele add BO , and $\mathrm{BO}+\mathrm{OC}<\mathrm{BO}+\mathrm{OD}+\mathrm{DC}$; that i. $\mathrm{BO}+\mathrm{OC} \angle \mathrm{BD}+\mathrm{DC}$.

Again, fince Bl) $<\mathrm{Bil}+\lambda \mathrm{D}$, to each of thefe add DC :ad at have $B D+D C<B A+A C$, but it has been thewn that $\mathrm{BO}+\mathrm{OC} \angle \mathrm{BD}+\mathrm{DC}$, much more ther $i ; B O+(O \subset B A+A C$.

## Theorim 1X.

If two fides $\mathrm{AB}, \mathrm{AC}$ of a triangle ADC are equal Fi : is to two fides DE, DF of another triangle DEF, F each to each ; but if the angle $B A C$ contained 4 L
by the former is greater than the angle EDF contained by the latter ; the third fide BC of the firll triangle fhall be greater than the third fide EE of the fecond.

Suprose $A G$ crawn fo that the angle $C A G=D$, the $A G=D E$ and join $C G$; then the triangle $G A C$ is equal to the triangle EDF, (6.) and therefore CC=EF. Now there may be three cafes, according as the pint $G$ talls without the triangle BAC, or on the fide BC , or within the fame triangle.

Cisf: I. Becaufe $\mathrm{GC}<\mathrm{GI}+\mathrm{IC}$, and $\mathrm{AB}<$ $\mathrm{AI}+1 \mathrm{~B}$, (7.) therefore $\mathrm{GC}+\mathrm{AB}<\mathrm{GI}+\mathrm{AI}+1 \mathrm{C}$ $+1 B$, that is,$G C+A B<A G+B C$, from each of thefe mequal quantitics take anay the equal quantities $A B, A G$, and there remains $\mathrm{GC} \angle \mathrm{BC}$, therefore $E \Gamma \angle B C$.
C.ase II. If the point $G$ fall $u_{p}$ on the fide $B C$, then it is evident that GC, or its equal EF, is lefs than BC.
Fig. 26.
C.sse. III. Laltly, if the point $G$ fall within the triangle BAC , then $\mathrm{AG}+\mathrm{GC}<\mathrm{AB}+\mathrm{BC}$, (8.) therefore, taking away the equal quantities $\mathrm{AG}, \mathrm{AB}$, there remains $\mathrm{GC}<\mathrm{BC}$ or $\mathrm{EF}<\mathrm{BC}$.

Cor. Hence, converiely, if EF be lefs than BC, the angle EDF is leis than BAC; for the angle EDF cannot be equal to BAC , becatile theri (5.) EF would be equal to EC ; reither can the angle LDF be greater than BAC, for then (by the theor.) EF would be greater than BC .

## Thlorem X.

F:g. 22. Two triangles are equal, when the three fides of the one are equal to the three fides of the other, each to each.

LET the fide $\triangle B=D E, A C=D F$, and $B C=E F$; then thatl the angle $-1=\mathrm{D}, \mathrm{B}=\mathrm{E}, \mathrm{C}=\mathrm{F}$.

For if the angle A were greater than D , as the fides $A B, A C$, are equal to $\mathrm{DE}, \mathrm{DF}$, each to each, it would follow, (9.) that BC would be greater than EF, and if the angle A were lefs than the angle D, then BC would be lefs than EF ; but BC is equal to EF, therefore the angle $A$ can weit er be greater nor lefs than the angle D , therefore it mutt be equal to it. In the fame manner it may be proved, that the angle $B=E$, and that the angle $\mathrm{C}=\mathrm{F}$.

## Scholivis.

It may be remarked, as in Theorem V. and The.OREM VI. that the equal angles are oppofite to the equal fides.

## Theorem XI.

Eg. 2\%. In an ifofceles triangle the angles oppofite to the equal fides are equal to one another.
I.tit the fide $\mathrm{AB}=\mathrm{AC}$, then thall the angle $\mathrm{C}=\mathrm{B}$.

Suppole a flraigh line drawn from $A$ the vertex of the trangle to D the middle of its bafe ; the two triangl: $A B D, A C D$ have the three fides of the one equal to the chree fides of the other, each to each, namuly $A D$ conmon to both, $A B=A C$, by hypothefs,

E T R Y.
Sect. I. and $\mathrm{BD}=\mathrm{DC}$, by conftruction, therefore (preced. theor.) the angle $B$ is equal to the angle $C$.

Cor. Hence ciery equilateral triangle is allo equian. gular.

## Scholitum.

Fron the equality of the triangles $\mathrm{ABD}, \mathrm{ACD}$, it follows, that the angle $\mathrm{BAD}=\mathrm{DAC}$, and that the angle $\mathrm{BDA}=\mathrm{ADC}$; then fore thefe two latt are right angles. Hence it appears, that a fraight line drann from the vertex of an ifofceies triangle to the middle of its bafe is perpendicular to that bafe, and divides the vertical angle into two equal parts.

In a triangle that is not ifoiceles, any one of its three fides may be taken indifferently for a $l a / e$; and then its verter is that of the oppofite angle. In an ifofceles triangle, the bafe is that fide which is not equal to the others.

## Throrem XII.

If two angles of a triangle are equal, the oprofite Fig. as fides are equal, and the triangle is ifofceles.

LET the angle $A B C=A C B$, the fide $A C$ thall be equal to the fide $A B$. For it the fides re not equal, let AB be the greater of the two; take $\mathrm{BD}=\mathrm{AC}$, and join CD; the angle $D B C$ is by hypothefis equal to ACB , and the two fides $\mathrm{DB}, \mathrm{BC}$ are equal to the two fider $A C, \mathrm{BC}$, each to each; therefore the triangle DEC is equal to the triangle ACB ; (5.) but a part cannot be equal to the whole; therefore the fides AB, AC connot be unequal, that is, they are equa!, and the triangle is ifofecles.

## Theorem XIII.

Of the two fides of a triangle, that is the greater Fig. 29. which is oppofite to the greater angle ; and converfely, of the two angles of a triangle, that is the greater which is oppofite to the greater fide.

First, let the angle $C>B$, then fhall the fide $A B$ oppofite to C be greater than the fide AC oppofite to B. Suppofe CD drawn, fo that the angle $\mathrm{BCD}=\mathrm{B}$; in the triangle $\mathrm{BDC}, \mathrm{BD}$ is equal to DC , (12.) but $A D+D C \rightarrow A C$, and $A D+D C=A D+D B=A B$, therefore $\mathrm{AB} \triangle \mathrm{AC}$.

Next, let the fide $A B>A C$, then fhall the angle $C$ oppofite to $A B$, be greater than the angle $B$, oppofite to $A C$. For if $C$ were lefs than $B$, then, by what has been demonftrated, $\mathrm{AB}<\mathrm{AC}$, which is contrary to the hypothefis of the propolition, therefore C is not lefs than $B$ : and if $C$ were equal to $B$, then it would follow that $\mathrm{AC}=\mathrm{AB},(12$.) which is allo contrary to the hypothelis ; thesefore $C$ is not equal to $B$, therefore it is greater.

## Theorem XIV.

From a given point A without a ftraight line DE, Fig. 3 . no more than one perpendicular can be drawn to that line.

For fuppofe it poffible to draw two, $A B$, and $A C$; produce

Sect. I. G E O M
Firt produce one of them AB , fo that $\mathrm{BF}=\mathrm{AB}$, and join $\underbrace{\text { Principlec, }} \mathrm{CF}$. The triangle CBF is equal to the triangle 1 EC , for the angle CBF is a right angle, as well as $\mathrm{CB} A$, and the fide $\mathrm{BF}=\mathrm{BA}$; therctore the triangles are equal, (5.) and hence the angle $\mathrm{BCF}=\mathrm{BCA}$; but the angle BCA is by hypothefis a right angle; therefore the angle BCF is alfo a right angle; hence AC and CF lie in a ftraight line, (3.) and confequently two fraight lines $A C F, A B F$ may be drawn between tw. points A, F, which is impolible, (ax. 4.) therefore it is equally impolfible that two perpendiculars can be drawn from the fame point to the lame ftraight lise.

## Theorem XV.

Fig. 30. If from a point A , without a ftraight line DE, a perpendicular $A B$ be drawn upon that line, and alfo different oblique lines $\mathrm{AE}, \mathrm{AC}, \mathrm{AD}$, \&c. to different points of the fame line.
Firit, The perpendicular AB fhall be florter than any one of the oblique lines.
Secondly, The two oblique lines AC, AE, which meet the line DE on oppofite fides of the perpendicular, and at equal diftances $\mathrm{BC}, \mathrm{BE}$ from it, are equal to one another.
Laftly, Of any two oblique lines $\mathrm{AC}, \mathrm{AD}$, or AE , AD , that which is more remote from the perpendicular is the greater.

Pronuce the perpendicular AB , fo that $\mathrm{BF}=\mathrm{BA}$, and join FC, FD.

1. The triangle BCF is equal to the triangle BCA ; for the right angle $\mathrm{CBF}=\mathrm{CBA}$, the fide CB is common, and the fide $\mathrm{BF}=\mathrm{BA}$, therefore the third fide $C F=\therefore C$, (5.) but $A F \angle A C+C F$, (7.) that is $2 \mathrm{AB}<2 \mathrm{AC}$; therefore $\mathrm{AB} \angle \mathrm{AC}$, that is, the perpendicular is thorter than any one of the oblique lines.
2. If $\mathrm{BE}=\mathrm{BC}$, then, as AB is common to the two triangles $\mathrm{ABE}, \mathrm{ABC}$, and the right angle $\mathrm{ABE}=\mathrm{ABC}$, the triangles $\mathrm{ABE}, \mathrm{ABC}$ thall be equal, (5.) and $A E=A C$.
3. In the triangle DFA, the fum of the lines AD , DF is greater than the fum of $\mathrm{AC}, \mathrm{CF}$, (8) that is, $2 \mathrm{AD}>2 \mathrm{AC}$; therefore $\mathrm{AD}>\mathrm{AC}$, that is, the oblique line, which is more remote from the perpendicular, is greater than that which is nearer.

Cor. 1. The perpendicular meafures the difance of any point from a ftraight line.

Cor. 2. From the fame point, three equal ftraight lines cannot be drawn to terminate in a given ifraight line; for if they could be drawn, then, two of them would be on the fame fide of the perpendicular, and equal to each other, which is impoflible.

## Theorem XVI.

Fig.jn. If from C , the middle of a ftraight line AB , a perpendicular CD be drawn to that line. Firf, Every point in the perpendicular is equally diftant from the extremities of the line AB . Secondly, Every point without the perpendicular is at uncqual diftances from the fame extremities A, B.
2. Let D be any point in CD, then, bocaufe the two

## E T R Y.

oblique lines DA, Dis are equaly ditaze fon the "ant. perpendicular, they are equal to one another $(15$.$) , 1:$ therefore cuery por it in (D) is anally dulant trom the extremities of $\triangle \mathrm{B}$.
2. Let E be a print cut of the perpendicubar; ;oin EA, EB, one of thefe line mu.? cut the perpendimat in F ; join BF , then $\mathrm{AF}=\mathrm{BF}$, $\mathrm{Ad} \quad \mathrm{AL}=\mathrm{BF}+\mathrm{FE}$; but $\mathrm{BF}+1 \mathrm{l}=\mathrm{BE},(7$.$) thetefore \mathrm{AE} \rightarrow \mathrm{B}, \mathrm{l}$, , that is, E any point o ot of the perpet dicular is at unequal dilances from the extremities of Ab .

## Thiokm: XVII.

Pis
C.C.I.I

Two right-angled triangles are equal, when the fig. as. hypothenule and a fide of the one are equal to the hypothenufe and a fide of the other, each to each.

LET the hypothenufe $\mathrm{AC}=\mathrm{DF}$, and the fide $A B=D E$; the triangle $A B C$ thall be equal to DEF. The propofition will evidently be true ( 10. ), if the remaining fides BC, EF are equal. Now, if it be politble to fappofe that they are unequal, let BC be the greater, take $B G=E F$, and join $A G$; then the triangles $A B G$, DEF, having the fide $\mathrm{AB}=\mathrm{bE}, \mathrm{BG}=\mathrm{EF}$, and the angle $\mathrm{B}=\mathrm{E}$, will be equal to one anchher (5.), and will have the remaining fide $\mathrm{AG}=\mathrm{DF}$; but by hypothefis $\mathrm{DF}=\mathrm{AC}$; therefore $\mathrm{AG}=\mathrm{AC}$; but AG cannot be equal to $\mathrm{AC}(\mathrm{t} 5$.$) , therefore it is impolible that \mathrm{BC}$ can be unequal to EF, and therefore the triangles $\mathrm{ABC}, \mathrm{DEF}$ are equal to one another.

## Theorem XV'II.

Two ftraight lines AC, ED, which are perpendi- Fi , is cular to a third ftraight line $A E$, are parallel to each other.

For if they could meet at a point O , then two perpendiculars $\mathrm{OA}_{\mathrm{A}}, \mathrm{OE}$, might be drawn from the fave point O , to the ftraight line AE , which is impotible (1+.).

In the next theorem, it is necoflary to affume another axiom, in addition to thofe already laid down i: the beginning of this fection.

## ix109

7. If two points $\mathrm{E}, \mathrm{G}$ in a ftraight live AB are Fig :it fituated at unequal diflances EF, GH from another ffraight line CD in the fame plane, thate two lines, when indefinitely produced, on the fide of the leaft dillance GH, will meet each other.

## Theorfm XiX.

If two ftraight lines $\mathrm{AB}, \mathrm{CD}$ be parallel, the per-Fig. 3 : pendiculars EF, G1l to one of the lines, which are terminated by the other line, are equal, and are perpendicular to both the parallels.

For if EF and GH, which are perpendicular to CD, were unequal, the lines $\mathrm{AB}, \mathrm{CD}$ would meet each other (by the above axiom) which is contrary to the fuppofition that they are parallel. And if EF, GH be

Fir!
not perpendicular to $A B$, let EK be perpendicular to EF, meeting GH in K ; then becaufe EK and FH are perpendicular to EF, they are parallel (18.), and therefore, ty what has been juit thewn, the perpendiculars $\mathrm{EF}, \mathrm{KH}$ muit be equal ; but by hypothefis $\mathrm{EF}=\mathrm{GH}$, therefore $\mathrm{KH}=\mathrm{GH}$, which is impolible ; therefore EF is perpendicular to $A B$; and in the fame way it may be thewn that GH is perpendicular to AB .

Cor. Hence it appears, that through the fame point E, no more than one parallel can be dramn to the fame Itraight line CD.

## Theorem XX.

Fig. 36. Straight lines $\mathrm{AB}, \mathrm{EF}$, which are parallel to the fame ftraight line CD , are parallel to each other.

For let HKG be perpendicular to CD , it will alfo be perpendicular to both $A B$ and EF (19.), therefore thete laft lines are parallel to each other.

## Theorey XXI.

F:g. 37. If a Atraight line EF meet two parallel ftraight lines $\& B, C D$, it makes the alternate angies AEF, EFD equal.

Let EH and GF be perpendicular to CD, then thefe lines will be parallel (18.), and alfo at right angles to AB (19.), and therefore FH and GE are equal to ore another (I9.), therefore the triangles FGE, FHE, having the fide $F G=H E$, and $G E=F H$, and FE common to both, will be equal; and hence the angle FEG will be equal to EFH, that is, FEA will be equal to EFD.

Cor. 1. Hence if a ftraight line KL interfect two parallel flraight lines $\mathrm{AB}, \widehat{\mathrm{CD}}$, it makes the exterior angle KEB equal to the interior and oppofite angle EFD on the fame fide of the line. For the angle $\mathrm{AEF}=\mathrm{KEB}$, and it has been thewn that $\mathrm{AEF}=\mathrm{EFD}$; therefore $\mathrm{KEB}=\mathrm{EFD}$.

Cor. 2. Hence allo, if a itraight line EF meet two parallel flraight lines AB, CD, it makes the two intefior angles BEF, EFD on the fame fide together, equal to two right augles. For the angle AEF has been thewn to be equal to H.FD, therefore, adding the angle FEB to both, $\mathrm{AEF}+\mathrm{FEB}=\mathrm{EFD}+\mathrm{FEB}$; but $\mathrm{AEI}+\mathrm{FEB}$ is equal to two right angles, therefore the fun EFD + FEB is alfo equal to two right angles.

## Theorem XXII.

Fig. 35. If a ftraight line EF, meeting two other ftraight lines $A B, C D$, makes the alternate angles AEF, EFD equal, thofe lines thall be parallel.

For if AE is not parallel to CD, fuppofe, if poflible, that fom other line $K$ E can be drawn through E , parallel to CD ; then the angle KEF muft be equal to EFD (21.), that is (by hypothefis), to AEF, which is impoflible; therefore, neither KE, nor any other line drawn through $E$, except $A B$, can be parallel to $C D$.

## E T R Y.

Cor. If a ftraight line EF interfecting two other ftraight lines $\mathrm{AB}, \mathrm{CD}$, makes the exterior angle GEB equal to the interior and oppolite angle EFD on the fame fide; or the two interior angles BEF, EFD on the fame fide equal to two right angles; in either cafe the lines are parallel. For, if the angle $\mathrm{GEB}=\mathrm{EFD}$, then alfo $\mathrm{AEF}=\mathrm{EFD}$, (4.) And if BEF + EFD $=$ two right angles, then, becaufe $\mathrm{BEF}+\mathrm{AEF}=\mathrm{two}$ right angles (1.), $\mathrm{BEF}+\mathrm{EFD}=\mathrm{BEF}+\mathrm{AEF}$, and taking BEF from both, EFD=AEF, therefore (by the theorem) in each cafe the lines are parallel.

## Theorem XXIII.

If a fide AC of a triangle ABC be produced towards $D$, the exterior angle $B C D$ is equal to both the interior and oppofite angles BAC, $A B C$.

Ler CE be parallel to $A B$, then the angle $B=B C E$, (21.) and the angle $A=E C D,(1$ cor. 21.) therefure $B+A=B C E+E C D=B C D$.

Cor. The exierior angle of a triangle is greater than either of the interior oppofite angles.

## Theorem XXIV.

The three interior angles of a triangle ABC taken Fig. 42. together are equal to two right angles.

For if AC be produced to D , then $\mathrm{A}+\mathrm{B}=\mathrm{BCD}$, (23.) ; to each of thefe equal quantities add $A C B$, then thall $\mathrm{A}+\mathrm{B}+\mathrm{ACB}=\mathrm{BCD}+\mathrm{BCA}$; but $\mathrm{BCD}+\mathrm{BCA}$ $=$ two right angles, (1.) therefore $A+B+A C B$ $=$ two right angles.

Cor. 1. If two angles of one triangle be equal to two angles of another triangle, each to each; the third angle of the one thall be equal to the third angle of the other, and the triangles thall be equiangular.

Cor. 2. If two angles of a triangle, or their fum, be given, the third angle may be found, by fubtracting their fum from two right angles.

Cor. 3. In a right-angled triangle, the fum of the two acute angles is equal to a right angle.

Cor. 4. In an equilateral triangle, each of the angles is equal to the third part of two right angles, or to two thirds of one right angle.

## Theorem XXV.

The fum of all the interior angles of a polygon is fig 4 . equal to twice as many right angles wanting four as the figure has fides.

Let ABCDE be a polygon; from a point F within it draw ftraight lines to all its angles, then the polygon thall be divided into as many triangles as it has fides; but the fum of the angles of each triangle is equal to two right angles, (24.) therefore the fum of all the angles of the triangles is equal to twice as many right angles as there are triangles, that is, as the figure has Ledes; but the fum of all the angles of the triangles is equal

Cus. The four fiterios angen of a quadilater al are tiken together qual to four raph anglew

## 

Fig. 42. The oppofite fides of a paralleloaram are equal, and the opponte angles are alfo equal.

Draw the diagonal BD ; the two triangles ADB , $D P C$ have the fide $B D$ common to both, and AB, DC being parallel, the angle $\triangle \mathrm{BD}=\mathrm{BDC}$ (21.) al!o, $\mathrm{AD}, \mathrm{BC}$ being parallel, the ande $\mathrm{ADB}=\mathrm{DBC}$, therefore the two triangles are equal (6.), and the dide $A B$, oppofite to the angle $A D B$, is equal to DC , oppofite to the equal angle DBC. In like manner the third fide AD is equal to the third fide BC , therefore the oppofite fides of a parallelogram are equal.

In the rest place, becaufe of the equahty of the fame triangles, the angle $\Lambda$ is equal to the angle $C$, and alio the angle ADC compofed of the two angles ADB , $B D C$ is equal to the angle $A B C$ compofed of the angles $\mathrm{CBD}, \mathrm{DBA}$; therefore the oppofite angles of a parallelogram are alfo equal.
$\mathrm{E} \boldsymbol{T} R \mathrm{Y}$
Thmorey XXV'H.
It the onnofite fides of a quadrilateral ABCD arefation equal, fo that $A B=D C$, and $A D=B C$; then the equal fides are parallel, and the figure is a parathelogrant.
D. tr the diaqumal BD. The two thangim AlBD, CDE have the thoee fides of the none equal th the $\therefore-$ fidc of the other, each to each, therefore the trimel. are equal ( 12. ) ; and the angle ADB, oppolite is AK, is equal to DBC oppolite to DC, therefore the fide Al, is parallel to BC (22.). For a fimilar reaton AB iparallel to DC ; therefore the quadrilaterat $\triangle \mathrm{ACD}$ is a parallelogram.

## Theorey XXVIII.

If two oppofite fides, $\mathrm{AB}, \mathrm{DC}$, of a quadrilaterai Fis. are equal and parallel, the two other fides are in like manner equal and parallel; and the figure is a parallelogram.

Dr .1 w the diagonal BD . Becaufe AB is paralle? to CD , the alternate angles $\mathrm{ABD}, \mathrm{BDC}$ are equal, (21.) ; now the fide $\mathrm{AB}=\mathrm{DC}$, and DB is common to the triangles $\mathrm{ABD}, \mathrm{BDC}$, therefore thele triangles are equal. (5.) and hence the fide $\mathrm{AD}=\mathrm{BC}$, and the angle $\mathrm{ADB}=\mathrm{DBC}$, confequently AD is parallel to BC , (22.) therefore the figure ABCD is a parallelogram

## SECT. II. OF THE CIRCLE.

## Definitions.

Fig. 43.
I. A $C_{I R C L E}$ is a plane figure contained by one line which is called the circumference, and is fuch, that all ftraight lines drawn from a certain point within the f:gure to the circunference, are equal to one another.

And this point is called the centre of the circle.
II. Every traight line CA, CE, CD, \&c. drawn from the centre to the circumference, is called a radius or femidiameter ; and every itraight line, fuch as $A B$, which pafees through the centre, and is terminated both ways by the circumference, is called a diameter.

Hence it follows that all the radii of a circle are equal, and all the diameters are alfo cqual, each being the double of the radius.
III. An Arch of a circle is any portion of its circumference, as FHG.

The chorid or fubtenfe of an arch is the itraight line FG which joins its extremities.

1V. A Segment of a circle is the figure contained by an arch, and its chord. If the figure be the half of the circle it is called a Scmicirte.

Note. Every chord correfponds to two arches, and confequently to two fegments; but in fpeaking of thefe, it is always the fmallefl that is meant, unlef the contrary be exprefied.
V. A Sector of a circle is the figure contained by an arch DE and the two radii CD, CE, drawn to the extremities of the arch. If the radii be at right angles to each other it is culled a -3nadran:
VI. A ftraight line is laid to be placed or appliad in a circle, when its extremities are in the circumference of the circle as FG.
VII. A rectilineal fagure is faid to be inforibed in a Fig. 115 . circle when the rertices of all its angles are upon the circumference of the circle; in this cate the circle is faid to be circumfcribed about the figure.

VII1. A itraight line is lud to toach a circle, or to be a annont to a circle, when it mets the circumference in one point only; fuch, for example, is BD, fig. 49 . The point $A$ which is common to the Itraight line and circle is called the Point $f$ Conta. 7.
IX. A polygon is faid to be defcribed or circum-Fig. its foribed about a circle when all its fides are tangents to the circle; and in this cafe the circle is fait to be il. firiocd in the polygon.

## Cheorem I.

Plate
(CALI.
Any diameter AB , divides the circle and its cir-fis. 43. cumference into two equal parts.

For if the figure AEB be applied to AFB, fo that the bafe AB may be common to both, the curve line: AEB mult fall exactly upon the curve line $A F B$; otherwife there would be points in the one or the other uncqually diftant from the centre, wheli is contraty $t$. the defintion of a cir le

Exery chord is leis than the diameter.
Let the radii CA, CD be drawn from the centre to the extremities of the chord AD ; then the frraight line $A D$ is lefs than $A C+C D$, that is $A D<A B$.

Theorem III .
A ftraight line cannot meet the circumference of a circle in more than two points.

For if it could meet it in three, thefe three points would be equally ditlant from the centre, and therefure three equal firaight linies might be drawn from the lame point to the fame flraight line, which is impollible (2 cor. 15.1.).

## Theorem IV.

In the fame circle, or in equal circles, equal arches are fubtended by equal chords, and, converfely, equal chords fubtend equal arches.

If the radius AC be equal to the radius EO , and the arch AMD equal to the arch ENG; the chord AD thall be equal to the chord EG.

For the diameter $A B$ being equal to the diameter EF, the femicircle AMDB may be applied exactly upon the femicircle ENGF, and then the curve line AMIDB thall coincide entirely with the curve line ENGF, but the arch AMD being fuppofed equal to ENG, the point D mult fall upon G , therefore the chord AD is equal to the chord EG.

Converfely, if the chord $\mathrm{AD}=\mathrm{EG}$, the arch AMD is equal to the arch ENG.

For if the radii CD, OG be drawn, the two triangles ACD, EOG have thrce fides of the one equal to three fides of the other, each to each, viz. $\mathrm{AC}=\mathrm{EO}$, $C D=O G$ and $A D=E G$, therefore thefe triangles are equal, ( 10.1. ) and hence the angle $\mathrm{ACD}=$ EOG. Now if the femicircle ADB be placed upon EGF, becaufe the angle $\mathrm{ACD}=\mathrm{EOG}$, it is evident that the radius $C D$ will fall upon the radius $O G$, and the point D upon G, therefore the arch AMD is equal to the arch ENG.

## Theorem V.

F. .45. In the fame circle, or in equal circles, the greater arch is fubtended by the greater chord, and, converfely, (if the arch be lets than half the circumference) the greater chord fubtends the greater arch.

For let the arch AH be greater than AD, and let the chords $A D, A H$, and the radii $C D, C H$ be drawn. The two fides $\mathrm{AC}, \mathrm{AH}$, of the triangle ACH , are equal to the two fides $\mathrm{AC}, \mathrm{CD}$, of the triangle ACD ; and the angle ACH is greater than ACD ; therefore we third fide AH is greater than the third fide AD, (9.1.) therefore the chord which fubtends the greater arch in the greater. Converfely, if the chord AH be greater than AD, it may be inferred (cor. 9. 1.) from the fame triangles that the angle ACH is greater than

E T R Y.
ACD , and that thus the arch AH is greater than AI).

Note. Each of the arches is here fuppofed lefs than half the circumference; if they were greater, the contrary property would have place, the arch increafing as the chord diminilhes.

## Theorlm V'I.

The radius CG, perpendicular to a chord AB, Fig. $4^{5}$. bifects the chord (or divides it into two equal parts), it alio bilects the arch AGB fubtended by the chord.

Draw the radii CA, CB ; thefe radii are two equal oblique lines in refpect of the perpendicular CD, therefore they are equally difant from the perpendicular ( 15.1. ) that is $\mathrm{AD}=\mathrm{DB}$.

In the nest place, becaufe CG is perpendicular to the middle of AB , every point in CG is at equal diflarces from $A$ and $\mathrm{B},(16.1$.) therefore, if $\mathrm{GA}, \mathrm{GB}$ be drawn, thefe lines are equal, and as they are the chords of the archics AG, BG, the arches are alfo equal. (4.)

## Scholies.

Since the centre C , the middle D of the chord AB , and the mildle G of the arch fubtended by that chord, are three points fituated in the fame ftraight line perpendicular to that chord; and that two points in a ftraight line are fufficient to determine its pofition; it follows, that a ftraight line which palles through any two of thefe points muft neceflarily pafs through the third; and mult be perpendicular to the chord. It alfo follows, that a pernendicular to the middle of a chord paffes through the conte, and the middle of the arch fubtended by that chord.

## Theorem Vil.

If three points $\mathrm{A}, \mathrm{B}, \mathrm{C}$, be taken in the circum- $\mathrm{Fig}_{8} 47$. ference of a circle, no other circumference which does not coincide with the former, can be made to pafs through the fame three points.

LET the chords $\mathrm{AB}, \mathrm{BC}$ be drawn, and let OD , OF be drawn from the centre, perpendicular to, and confequently bifecting thofe chords. The centre of every circle palling through A and B mult ncceflarily be fomewhere in the perpendicular DO, (laft theor.) and in like manner the centre of every circle paffing through B and C , muft be fomewhere in the perpendicular OF, therefore the centre of a circle paffing through $\mathrm{A}, \mathrm{B}$, and C , mult be in the interfection of the perpendiculars DO,FO; and confequently can only te at one and the fame point O ; therefore, only one circle can be made to pals through the fame three points A, B, C.

COR. One circumference of a circle cannot interfect another in more than two points, for if they could have three common points they would have the fame centre, and confequently would coincide with each other.

## Theorem VIII.

Two equal chords are equally diftant from the Fig 4 . centre,

Seit. II.
Gftine (ircle. cense ; and of unequat chords, that whah is neares the econtre is greater than that whinh is more remete.

Let the chord $A B=D E$, fuppofe the chords biGected by the perpendicutar: CF, CG from the con:re, and draw the radii $(1, C b)$. The tight-angtel triangles C AF, CDG have equal hyputhenule, CA, $C D$; the lide i $F(=A B)$ of the one is allo equal to the dide $\mathrm{DG}(=1 \mathrm{DE})$ of the other, therefore, "eir remaining fides $\mathrm{Cl}, \mathrm{CG}$ (v.lic! are the dilataces of the chords from the centre) are equal (1-, 1.).

Next let the chord AH be grater then IIE; the arch AKH thall be greater than D) DIF. Upon the arch AKH take ANB eoull to D.NE; draw the chord AB , and furpole COF drawn from the centre perpendicular to $A B$, and Cl perpendicular to -111 . It is evident tisist $\mathrm{Cr} \longrightarrow \mathrm{CO}$, and (15.1.) $\mathrm{CO} \Rightarrow \mathrm{Cl}$; much more then is $\mathrm{CF}>\mathrm{CI}$; but $\mathrm{C} \Gamma=\mathrm{CG}$, lecauli: the chord: $\triangle \mathrm{B}, \mathrm{DE}$ are equal ; therefore $\mathrm{CG}=\mathrm{CI}$; that is, the chord nearer the centre is greazer than that which is farther from it.

## Theoreat Ix.

Fig. 49. The perpendicular DD, drawn at the extremity of a radius $C A$, is a tangent to the circle.

For any obiique line CE is greater than the perpendicular C.A, (15.1.) theretore the point E is withost the circle; theretore the line BD has but one point $A$ common with the circumference, and contequentiy it is a tangent to the circle. (Det. 8.).

## Schotitus.

Through the fame point A, orly one tangetr, $A D$, can be drawn to the circle. For if it be pollthe to drav another, let $\lambda G$ be that other tingent; dras CF perpendicular to AG; then CF thall be lefs than CA, (15.1.) therefore F mu!t be within the circle; and confequently AF when produced muf necellury meet the circle in another poiat bendes $A$; therefore it cannot be a tangent.

## Theorlis X .

If BC , the diftance of the eentres of two circles, be lefs than the fum of their radii; and alfo the greater radius lefs than the fum of the diftance of their centres and the leffer ractius; the two circles interfect each other.

For that the circles may interied each other in a point $A$, it is necefiary that the triangle $A B C$ be potGible; thercfore, not only nuil CB be iefs than C.I $+A B$, but alfo the greater radius $A$ is mutt br lers than $A C+C B ; 7.1$ ) and it $i$ evident. then ten as the triangle ABC can be conftuactl. cuniertences defcribed on the centres $\mathrm{B}, \mathrm{C}$, A........... fect cach other in two points $\mathrm{A}, \mathrm{D}$.

Theorim XI.
Kig. 5: If the diftance CB of the centres of tw
E. T $\mathrm{I}_{\mathrm{i}} \quad \mathrm{Y}^{\prime}$.
be equat to the fun of the radii CA, B. A , the circles thall towch each other externally.

Ir as oriont that they have a cosomans paint 1 ; but th: coman have more ; for if they hat two, then
 the fum of the radii.

## T:Conlm Xll

If the diftance CB of the centres of two circlen $\mathrm{B}_{\mathrm{e}}$ : be equal to the difference of the ratii, the two circles inall touch each other intermally.

In the firll place, it is evident that the point $A$ is common to them both; they camon, however, have another; for that his may happen, it is necullary that the greater radius $A B$ be fmaller than the fum of the radios $A C$ atd the distance $C B$ of the centre, (10.) wheh is not the cafe.

Cok. heretore, if tho circles touch each other, either intemally or eatomally, their centres and the peint of contact are in the fame itraig!. the.

## Theorem KIII.

In the fame circle, or in equal circles, equal an- Fag : 4 gles ACD, DCE, at the ceutres, intercept upon the circumference equal arches $\mathrm{AB}, \mathrm{DE}$. And, converlely, if the arches $\mathrm{AB}, \mathrm{DE}$ are equal, the angles $\triangle \mathrm{CB}, \mathrm{DCE}$ are equal.

First, if the angle ACB be equal to DCE, the one angle may be applied upon the other; and as the lines containing thern are equal, it is manifett that the point $A$ will fall upun $D$, and the point 15 upon E ; thus the arch $A B$ will ccincide with, and be equal to the ach DE.

Nat, if the arch AB be equal to DE, the angle $A C D$ is equal to DCE; for if the angles are not equal; let ICB be the greater; and let ACI be taken equal to DCE; then, by what has been already demonthated, the are $1 \mathrm{I}=\mathrm{DE}$; but by hypothelin $A \mathrm{~B}=\mathrm{DE}$; Wherenire, $1 \mathrm{I}=!\mathrm{B}$ which is impolible; therefore the ansle $1 \mathrm{CB}=\mathrm{DCE}$.

## THenLM XIV.

The angle BCD at the centre of a circle is double Fis the angle BAD at the circumference, when Fi : both itand on the fame arch LD.

First let the centre of the circle be within the an- ris. 5 . sle BAD ; dias: the diameter AE The exterior angle ECE of the thangle BC 1 is usual to thoth the inward and opmotite angit. 1 IAC, (CA; (23.1.) but the

- anal." BC R. is dou to of the ande B. 1 C

1 iE, thetefore tie whele angle IC(1) is double 4hnte a:1 1- 1:31).
whe in the $: \begin{gathered}\text { at then that tive ceatre is wath. }\end{gathered}$ I: 13.3D; thet, J.:.ni ig the diameter IE,
in In !onmis...al, as in t'e fist cone, that the an
E(D) i woble of the rable LiMD, and that the

Of Proper-angie ECB, a part of the firf, is double the angle tion. EAB a part of the other; therefore the remaining angle ECD is double the remaining angle $B A D$.

## Theorem XV.

Fig. 57
Iig. ${ }^{\circ} \mathrm{B}$.

Iig. 5\%.

Fig ss.
All angles $\mathrm{BAD}, \mathrm{BFD}$ in the fame fegment BAFD of a circle are equal to one another.

If the ferment be greater than a femicircle, from the centre $C$ draw $C B$ and $C D$; then the angles $B A D$ and BFD being (by lait theorem) each equal to half BCD ; they muit be equal to one another.

But if the fegment $B \triangle F D$ be lefs than a femicircle, Iet $F$ be the interfection of BF and AD ; then, the triangles $A \mathrm{BH}$ and FDH having the angle AHB of the one equal to FHD of the other, (4. I.) and AbH $=\mathrm{FDH}$, (by cafe 1.) will bave the remaining angles of the one equal to the remaining angles of the other; that is the angle $\mathrm{BAH}=\mathrm{HFD}$, or $\mathrm{BAD}=\mathrm{BFD}$.

## Theorem XVI.

¥ig. 30. The oppofite angles of any quadrilateral figtre ABCD defcribed in a circle are together equal to two right angles.

Draw the diagonals $\mathrm{AC}, \mathrm{BD}$; becaufe the angle $\mathrm{ABD}=\mathrm{ACD}$, and $\mathrm{CBD}=\mathrm{CAD}$, (laft theor.) the fum $A B D+C B D=A C D+C A D ;$ or $A B C=A C D+C A D ;$ to each of thefe equals add ADC , and $\mathrm{ABC}+\mathrm{ADC}=$ $A C D+C A D+A D C$; but the latt three angles, being the angles of the triangle ADC, are taken together equal to two right angles, (24.1.), therefore $\mathrm{ABD}+\mathrm{CBD}=$ two right angles. In the fame manner, the angles BAD, BCD may be fhewn to be together equal to two right angles.

E T R r
Thforent XVII.
In a circle, the angle BAD in a femicircle is a $\underbrace{\text { tion. }}$ right angle, but the angle ABD in a fegment Fig. 60. greater than a lemicircle is lefs than a right angle; and the angle $A E D$ in a fegment lefs than a femicircle is greater than a right angle.

Let C be the contre, join $\mathrm{C} A$, and produce BA to F. Becaufe $\mathrm{CB}=\mathrm{CA}$, the angle $\mathrm{C} \backslash \mathrm{B}=\mathrm{CBA}$; (1t.1.) and becaufe $C D=C A$, the angle $C A D$ $=C D A$, therefore, the whole angle $B A D=C B A$ +CDA ; but thefe two laft angles are together equal to DAF $(23.1$.) therefore the angle $\mathrm{BAD}=\mathrm{DAF}$; and hence each of them is a right angle.

And becaufe $\mathrm{ABD}+\mathrm{ADB}$ is a right angle, therefore All D, an angle in a fegment greater than a femicircle, is lefs than a right angle.

And becaufe ABDE is a quadrilateral in a circle, the oppofite angles $B$ and $E$ are equal to two right angles (latt theor.), tut B is lefs than a right angle; therefore the angle E , which is in a fegment lefs than a femicircle, is greater than a right angle.

## Theorem XVIII.

The angle BAC contained by AC, a tangent, and Fig. or $A B$, a chord drawn from the point of contact, is equal to any angle $A D B$ in the alternate fegment of the circle.

Draw the diameter AE, and join DE. The angles EAC, EDA, being right angles, (laft theor.) are equal to one another; and of thefe, EAB, a part of the one, is equal to EDB, a part of the other, (15.) therefore the remainder $B A C$, of the former is equal to the remainder BDA, of the latter.

## SECT. III. OF PROPORTION.

## Definitions.

1. When one magnitude contains another a certain number of times exactly, the former is faid to be a mulsiple of the latter, and the latter a part of the former
II. When feveral magnitudes are multiples of as maS.y others, and each contains its parts the fame number of times, the former are faid to be equimultiples of the latter, and the latter like parts of the former.
III. Betwixt any two finite magnitudes of the fame find there fublifts a certain relation in refpect to quantity, which is called their ratio. The two magnitudes compared are called the terms of the ratio, the firit the aniccedont, and the fecond the confequent.
IV. If there be four magnitudes, or quantities, $A, B$, $\mathrm{C}, \mathrm{D}$, and if A contain fome part of B juft as often as C contains a like part of D , then, the ratio of A to B is fiid to be the fame with (or equal to) the ratio of C to D.

It follows imnetiatcly from this definition, that if A contain B juft as often as $C$ contains $D$, then the ratio of $\Delta$ to $B$ is equal to the ratio of $C$ to $D$; for in that cafe it is crident that $A$ will contain any part of $B$ juft s often as C contains a like part of D.
V. When two ratios are equal, their terms are called proportionals.

To denote that the ratio of $A$ to $B$ is equal to the ratio of C to D , they are ufually written thus, $\mathrm{A}: \mathrm{B}:: \mathrm{C}: \mathrm{D}$, or thus, $\mathrm{A}: \mathrm{B}=\mathrm{C}: \mathrm{D}$, which is read thus; A is to B as C to D ; fuch an exprelfion is called an analogy or a proportion.
VI. Of four propertional quantities, the laft term is called a fourth proportional to the other three taken in order.
VII. Three quantities $\mathrm{A}, \mathrm{B}, \mathrm{C}$, are faid to be proportionals, when the ratio of the firf $A$ to the fecond $B$ is equal to the ratio of the fecond $B$ to the third C.
VIII. Of three proportional quantities, the middle term is faid to be a mean proportional between the other two, and the laft a third proportional to the firlt and fecond.
IX. Quantities are faid to be continual proportionals, when the fril is to the fecond, as the fecond to the third, and as the third to the fourth, and fo on.

X . When there is any number of magnitudes $A, B, C, D$, of the fame kind, the ratio of the firn $A$ to the latt D is faid to be compounded of the ratio of

## Seet. III.

Ot Propin- $A$ to $B$, thi of the ratio of $B$ to $C$, and of the ratio of (in. C tol).

A1. If three magnitudes $\mathrm{A}, \mathrm{B}, \mathrm{C}$ be continual proportionth; that i , if the ratio of 1 to B be equal to the re io of B to C ; then the ratio of the firil A to the thind C is faid to be dup,icate of the ratio of the firf A to the fecond B. Hence, fince ty the laft definition the ratio of $\Lambda$ to C is compounded of the ratio of A to B and of B to C , a ratio which is compounded of two equal ratios is cuplicate of cither of them.
XII. If four magnitudes $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}$ be continual proportionals, the ratio of the firit A to the fourth D is laid to be friplicate the ratio of the firtt A to the fecond B. Hence a ratio compounded of three equal ratios is triplicate of any one of them.
XIII. Ratio of Equality is that which equal magnitudes bear to each other.

The next four definitions explain the names given by geometers to certain ways of changing either the urder or magnitude of proportionals, fo that they lill continue to be proportional.
XIV. Inserfe Ratio is when the antecelent is made the confequent, and the confequent the antecedent. See Theor. 3 .
 fared with antecedent, and conliquent "ith confequent. See Theor. $z$.
XVI. Compounded ratio is when the lum of the an:ecedent and conlequent is compared either with the antecedent, or with the confequent. See Theor. 4

STII. Dividd d ratio is when the difference of the antecedent and contequent is compared either with the mtecedent or with the confequent. See Theor. 4.

## Axionts.

1. Equal quantities have each the fame ratio to the zame quantity ; and the fame quantity has the fame ratio to each of any number of equal quantities.
2. Quatities having the lame ratio to one and the Same quantity, or to equal quantities, are equal-among themferves: and thofe guantitiec, to which one and the fame quantity has the fame ratio, are equal.
3. Ratios equal to one and the fame ratio are alfo aqual, one to the other.

4 If tho quantities be divided into, or compofed of parts that are equal among themfelves, or all of the fame magnitu 'e, then will the whole of the one have the fame ratio to the whole of the other, as the number of part, in the one has to the number of equal parts in the other.

## Theorem 1.

Lquimultiples of any two quantitics have to each other the fame ratio as the quantities themielves.

Lf.t A and B be any two quantitics, and, $m$ being Put to 'enote any number, let $m \mathrm{~A}, \mathrm{~m} \mathrm{~B}$ be equimultiple. of thofe quantitice, $m$ A shall have to $m$ B the jame ratio that $A$ has to $B$.
. Let the ratio of $A$ to $B$ be ecrital to the ratio of ene number $p$ to mother numler $q$, that is, let 1 contain $p$ fuch equal parts as b cuntans of, दon IY. Part II.
F. T R Y.
(.1v. 4 ' then, if : be pat for one of these equal parts, ni Prowne1.c have

$$
A=A x, B=q,
$$

and confinuent?, maltiplying both by the fame number $\quad n$,

$$
m A=m p r, m \mathrm{~B}=m q,
$$

or, which is evidently the fame,

$$
m \mathrm{~A}=p \times m \uparrow, m \mathrm{~B}=q \times m \vee
$$

Hence it appears that $m$ A contais the quantity $m *$ as a part $\rho$ times; and that $m \mathrm{~B}$ contains the fame quantity $q$ times; therefore the ratio of $m$ ito $m \mathrm{~B}$ is the fame as the ratio of the number $p$ to the number $q$ (Av. ..); but the ratio of A to B is allo equal to the ratio of $p$ to $q$, (by hyfuthefis), therefone the ratio of $m A$ to $m B$ is equal to the ratio of $A$ to $B$ (A․ 3.).

Cok. Hence like parts of quarticies have to each other the fame ratio a: the wholes: that is, $\frac{\mathrm{A}}{\mathrm{m}}: \frac{\mathrm{B}}{\mathrm{m}}$ : $A: B$ for $A$ and $B$ are equimultiple of $\frac{A}{m}$ and B

## Theorey 11.

If four quantities of the fame kind be proportionals, they thall alfo be proportionals by aliermation.

Let A, B, C, D be four quantities, of the fame hind, and let $\mathrm{A}: \mathrm{B}:: \mathrm{C}: \mathrm{D}$; then thall $\mathrm{A}: \mathrm{C}::$ B: D.

Let the equal ration of A to B , and of C to 1 , bc the fame as the ratio of the number $n$ to the number $9 ;$ then $A$ will contain $p$ fuch cqual part as $B$ con. tains $q,(\mathrm{~A} \times .4$.$) and \mathrm{C}$ will, is like maner, contain pfuch cqual part, as D contains 7 ; let each of the: equal parts thus contained in A and B be $x$, and k each of thofe contained in C and D be !, then

$$
\mathrm{A}=p x, \quad \mathrm{~B}=q^{*}, \quad \mathrm{C}=f y, \quad \mathrm{D}=7 y .
$$

Now as $A=p$, and $C=p i$; it is manifert that.$A$ and C are equimultiple of : and ! /, therefor tire ratio of A to C is equal to the ratio of $x$ to $\%,(\mathrm{~s}$ ) , mo as $\mathrm{B}=q x$, and $\mathrm{D}=q y, \mathrm{~B}$ and D are in like manner equimultiples of $x$ and $y$; therefore the ratio of $B$ to D is equal to the ratio of $x$ to $y$; therefore the ratio of $A$ to $C$ is equal to the ratio of $B$ to $D$.

Cor. If the firit of four proportionals be geate: than the third, the fecond is greater than the fouth; and if the firt be lefs than the thind, the feond in led than the fourth.

## Thlorlu 111

If four quantitics be proportionals, they are alfo proportionals by inverfion.

Let A: B : C . 1); then thall B: 1. D: C.
For let the equal ration of $\mathcal{A}$ to B , and of C 'o D , be the fane as the ratio of the numberp oto the number q, lacn ax B will contain if fuch equal parts an I con4 M tains:

On Propor tains $\quad(A x, 4$ ), $B$ will be to $A$ as $q$ is to $p$, and as tion. Men will be to $C$ alfo as o to f . therefore the ratio of B to A is equal to the ratio of D to $\mathrm{C}(1 v .3$.

## Theorem IV.

If four qumtities be proportionals, they are alfo proportionals by compofition, and by divifion.

Iet $\mathrm{A}: \mathrm{B}:: \mathrm{C}: \mathrm{D}$, then will

$$
\begin{aligned}
& A+B: A:: C+D: C \text {, and } A+B: B:: C+D: D ; \\
& \text { alfo } A-B: A: C-D: D, \text { and } A-B: B:: C-D: D .
\end{aligned}
$$

Let us fuppofe, as in the two preceding theorems, that the ratios of A to B , and of C to D are each equal to the ratio of the number $p$ to the number $q$, fo that A contains $p$ fuch equal parts as B contains $q$, and C contains $p$ fuch equal parts as D contains $q$; and let $x$ as before denote each of the equal parts contained in A and B, nd $y$ each of the equal parts contained ia C and D ; then, fince

$$
\mathrm{A}=p x, \quad \mathrm{~B}=q x, \quad \mathrm{C}=p y, \quad \mathrm{D}=q y,
$$

Therefore $\mathrm{A}+\mathrm{B}=p x+q x=(p+q) x$;

$$
\mathrm{C}+\mathrm{D}=p y+q y=(p+4) y .
$$

Now as $\mathrm{A}+\mathrm{B}$ contains $x \quad p+q$ times, and A contains the fame guantity $p$ times, and B contains it $q$ times, Sby the $4^{\text {th }}$ axiom),
$A+B: A:: p+q: p$, and $A+B: B:: p+q: q$, and as $\mathrm{C}+\mathrm{D}$ contains $y p+q$ times, and C contains it $p$ times, and D contains it $q$ times,

$$
\mathrm{C}+\mathrm{D}: \mathrm{C}:: p+q: p, \text { and } \mathrm{C}+\mathrm{D}: \mathrm{D}:: p+q: q .
$$

'Thus it appears, that the ratios of $A+B$ to $A$, and of $\mathbf{C}+\mathrm{D}$ to C , are equal to the fame ratio, namely, that of $p+q$ to $p$; therefore (Ax.3.) $\mathrm{A}+\mathrm{B}: \mathrm{A}:: \mathrm{C}+$ D : C. It alfo appears that the ratios of $A+B$ to $B$, and $\mathrm{C}+\mathrm{D}$ to D are each equal to the ratio of $p+q$ to $q$; therefore (Ax. 3.) $\mathrm{A}+\mathrm{B}: \mathrm{B}:: \mathrm{C}$ $+\mathrm{D}: \mathrm{D}$.
In the fame manner the fecond part of the theorem may be proved, namely, that

$$
A-B: A:: C-D: C \text { and } A-B \cdot B:: C-D: D .
$$

## Theorem V.

If four quantities be proportionals, and there be taken any equimultiples of the antecedents, and alfo any equimultiples of the confequents; the refulting quantities will ftill be proportionals.

Let $\mathrm{A}: \mathrm{B}: \mathrm{C}: \mathrm{D}$, and $m \mathrm{~A}, m \mathrm{C}$ be any equimultiples of the antecedents, and $n \mathrm{~B}, n \mathrm{D}$ any equimultiples of the confequents; then as $m \mathrm{~A}: n \mathrm{~B}::$ $m \mathrm{C}: n \mathrm{D}$

The quantities $p, q, x$ and $y$ being fuppofed to exprefs the fame things as in the foregoing theorems; becaufe

$$
\mathrm{A}=p x, \quad \mathrm{~B}=q x, \quad \mathrm{C}=p y, \quad \mathrm{D}=q y,
$$

therefore, multiplying the antecedents by the number $m$, and the confequents by $n$,

$$
m \mathrm{C}=n p y, \quad n \mathrm{D}=n q y,
$$

and hence the ratio of $m$ A to $n \mathrm{~B}$ is vual to the ratio of the number $m p$ to the number $n q$, (Ax. + .) and the ratio of $m \mathrm{C}$ to $n \mathrm{D}$, is equal to the fame ratio of $m \rho$ to $n q$, therefore (Ax. 3.) $m \mathrm{~A}: n \mathrm{~B}:$ : $m \mathrm{C}: n \mathrm{D}$.

## Theores Vi.

If there be any number of quantities, and as many others, which, taken two and two, have the fame ratio; the firft fhall have to the laft of the firft feries the fame ratio which the firft of the other feries has to the laft.

First, let there be three quantities $A, B, C, \overline{A, B, C}$, and other three $\mathrm{H}, \mathrm{K}, \mathrm{L}$, and let A:B:: $\mathrm{H}, \mathrm{K}, \mathrm{L}$. $\mathrm{H}: \mathrm{K}$, and $\mathrm{B}: \mathrm{C}:: \mathrm{K}: \mathrm{L}$, then will $\mathrm{A}: \mathrm{C}:: \mathrm{H}: \mathrm{L}$.

For let the equal ratios of A to B , and of H to K , be the fame with the ratio of a number $p$ to another number $q$, fo that $x$ and $y$ being like parts of A and H , and alfo like parts of B and K , as in the former theorems,

$$
\mathrm{A}=p x, \quad \mathrm{~B}=q x, \mathrm{H}=p y, \quad \mathrm{~K}=q y .
$$

Alfo let $\mathbf{C}$ eontain $q$ equal parts, each equal to $\varepsilon$, and let L eontain $q$ equal parts, each equal to $\approx$, fo that

$$
\mathrm{C}=q v, \quad \mathrm{~L}=q z ;
$$

then, becaufe B:C:: K:L, that is, $q x: q v:: q y$ : $q z$, and $q x$ and $q v$ are equimultiples of $x$ and $v$, alfo $q y$ and $q \approx$ are equimultiples of $y$ and $z$, thereforc (1. \& Ax. 3.) $x: v:: y: z$, hence (by latt theorem) $p x:$ $q v:: p y: q \approx$, that is, (becaufe $\mathrm{A}=p x, \mathrm{C}=q:, \mathrm{H}$ $=p y, \mathrm{~L}=q z) \mathrm{A}: \mathrm{C}:: \mathrm{H}: \mathrm{L}$.
Next, let thefe four quantities, A, B, $\mathrm{C}, \mathrm{D}$, and other four $\mathrm{H}, \mathrm{K}, \mathrm{L}, \mathrm{M}, \overline{\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D},}$ fuch, that $\mathrm{A}: \mathrm{B}:: \mathrm{H}: \mathrm{K}$, and $\mathrm{B}: \mathrm{C}::$ H, K, L, M. $\mathrm{K}: \mathrm{L}$, and $\mathrm{C}: \mathrm{D}:: \mathrm{L}: \mathrm{M}$, then will $\mathrm{A}: \mathrm{D}:: \mathrm{H}: \mathrm{M}$.

For, becaufe $\mathrm{A}: \mathrm{B}:: \mathrm{H}: \mathrm{K}$, and $\mathrm{B}: \mathrm{C}:: \mathrm{K}: \mathrm{L}$; therefore, by the firlt cafe, $\mathrm{A}: \mathrm{C}:: \mathrm{H}: \mathrm{L}$; and becaufe C : D :: L:M, therefore, by the fame cafe, A: D :: H: M. The demonflration applies in the fame manner to any number of quantities.

Cor. Hence it appears, that ratios compounded of the fame number of like or equal ratios are equal to one another.

Note - When four quantities are proportionals in the manner explained in this theorem, they are faid to be fo from equality of difance; and it is ufual for mathematical writers to fay that they are fo, ex aquali or $i$ os aquo.

## Theorem Vil.

If there be any number of quantities, and as many others, which taken two and two in a crof order have the fame ratio; the firft thall have to the latt of the firlt feries the fame ratio which the firt has to the laft of the other feries.

First,

## Sect. III.

Proportions First, let there be three quantities $\mathrm{A}, \mathrm{B}, \overline{\mathrm{A}, \mathrm{B}, \mathrm{C}}$ of Figures 1 C , and other three II, K, L, fuch that $\mathrm{A}: \mathrm{H}, \mathrm{K}, \mathrm{L}$. $\sim^{-} \mathrm{B}:: \mathrm{K}: \mathrm{L}$, and $\mathrm{B}: \mathrm{C}:: \mathrm{H}: \mathrm{K}$; then will A: C:: H:L.

For let the equal ratios of $A$ to $B$, and of $K$ to $L$, be equal to the ratio of the number $p$ to the number $q$, fo that as before

$$
\mathrm{A}=p x, \quad \mathrm{~B}=q x, \quad \mathrm{~K}=p y, \quad \mathrm{~L}=q y .
$$

Alio, let C be fuppofed to contain $q$ equal parts, each equal to $\approx$, and let $H$ contain $p$ equal parts, each equal to 8 , fo that

$$
\mathrm{C}=q z, \quad \mathrm{H}=p z^{\prime} ;
$$

Then, becaufe $B: C:: H: K$, that is, $q x: q \approx::$ $p v: p y$; therefore (1.\& Ax. 3.) $x: z:: v: y$, and confequently (..) $p x: q \approx:: p v: q y$, that is (becaufe $p x$ $=\mathrm{A}, q z=\mathrm{C}, p v=\mathrm{H}, q y=\mathrm{L}) \mathrm{A}: \mathrm{C}:: \mathrm{H}: \mathrm{L}$.

Next, let there be four quantities $\overline{\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}}$. A, B, C, D, and other four H, K, L, M, fuch, that $A: B:: L: M$, and $B: C: H, K, L, M$. $\mathrm{K}: \mathrm{L}$, and $\mathrm{C}: \mathrm{D}:: \mathrm{H}: \mathrm{K}$, then will $\mathrm{A} . \mathrm{D}:: \mathrm{H}:$ M ; for becaufe $\mathrm{A}: \mathrm{B}:: \mathrm{L}: \mathrm{M}$, and $\mathrm{B}: \mathrm{C}:: \mathrm{K}: \mathrm{L}$; by the foregoing cafe $\mathbf{A}: \mathrm{C}:: \mathrm{K}: \mathrm{M}$; and again becaule $\mathrm{C}: \mathrm{D}:: \mathrm{H}: \mathrm{K}$; therefore, by fame cafe, A : $\mathrm{D}:: \mathrm{H}: \mathrm{M}$. The demonftration applies in the fame manner to any number of quantities.

Note- In this theorem, as in the laft, the four quantities $\mathrm{A}, \mathrm{D}, \mathrm{H}, \mathrm{M}$, are faid to be proportionals from equality of diffance; but becaule in this cafe the proportions are taken in a crofs order, it is common to fay, that they are fo, ev aquali, in proportione perturbasa, or ex cequo inverfely.

## Theorem Vili.

if to the two confequents of four proportionals there be added any two quantities that have the fame ratio to the refpective antecedents, thefe fums and the antecedents will ftill be proportionals.

Let A:B::C:D
and $\mathrm{A}: \mathrm{B}^{\prime}:: \mathrm{C}: \mathrm{D}^{\prime}$
(where $\mathrm{B}^{\prime}$ and $\mathrm{D}^{\prime}$ denote two quantities ditinct from thofe denoted by B and D ); then will

$$
\mathrm{A}: \mathrm{B}+\mathrm{E}^{\prime}:: \mathrm{C}^{\prime}: \mathrm{D}+\mathrm{D}^{\prime} .
$$

For fince $\mathrm{A}: \mathrm{B}:: \mathrm{C}: \mathrm{D}$, by inverfion, (3.) $\mathrm{B}: \mathrm{A}::$ $\mathrm{D}: \mathrm{C}$, but $\mathrm{A}: \mathrm{B}^{\prime}:: \mathrm{C}: \mathrm{D}^{\prime}$, therefore (6.) $\mathrm{B}: \mathrm{B}^{\prime}$ $\mathrm{D}: \mathrm{D}$ ', and by compofition, '4.) and inverfion B : $\mathrm{B}+\mathrm{B}^{\prime}:: \mathrm{D}: \mathrm{D}+\mathrm{D}^{\prime}$, and firice $\mathrm{A}: \mathrm{B}:: \mathrm{C}: \mathrm{D}$; sherefore (6.) $\left.\mathrm{A}: \mathrm{B}+\mathrm{B}^{\prime}:: \mathrm{C}: \mathrm{I}\right)+\mathrm{D}^{\prime}$.

Cor. 1. If inttead of two quantities $\mathrm{B}^{\prime}, \mathrm{D}^{\prime}$, there be no number $\mathrm{B}^{\prime}, \mathrm{B}^{\prime \prime}$, \&ic. and $\mathrm{D}^{\prime}, \mathrm{D}^{\prime \prime}$, \&c. which ta-

E T R $\mathrm{Y}^{\top}$.
ken two and two have the fame tatio to the antecedent; Promotions A, C, that is, if

$$
\begin{aligned}
& \mathrm{A}: \mathrm{B}:: \mathrm{C}: \mathrm{D}, \\
& \mathrm{~A}, \mathrm{~B}^{\prime}:: \mathrm{C}: \mathrm{D}, \\
& \mathrm{~A}: \mathrm{B}^{\prime \prime}:: \mathrm{C}: \mathrm{D}^{\prime \prime}
\end{aligned}
$$

then will $\mathrm{A}: \mathrm{B}+\mathrm{B}^{\prime}+\mathrm{B}^{\prime \prime}:: \mathrm{C}: \mathrm{C}+\mathrm{D}^{\prime}+\mathrm{D}^{\prime}$.
For fince $\Lambda: \mathrm{B}+\mathrm{B}^{\prime}:: \mathrm{C}: \mathrm{D}+\mathrm{D}$ (by the theor.) and $\mathrm{A}: \mathrm{B}^{\prime \prime}:: \mathrm{C}: \mathrm{D}^{\prime \prime}$,
therefore, by the propofition,

$$
\mathrm{A}: \mathrm{B}+\mathrm{B}^{\prime}+\mathrm{B}^{\prime \prime}:: \mathrm{C}: \mathrm{D}+\mathrm{D}^{\prime}+\mathrm{D}^{\prime \prime}
$$

Cor. 2. If any number of quantities of the fanse kind be proportionals, as one of the antecedent, is to its contequent, fo is the fum of all the antecedents to the fum of all the confequents.

Let A:B:: C:D :: E : F,

$$
\begin{aligned}
& \text { then becaufe } \mathrm{A}: \mathrm{A}:: \mathrm{B}: \mathrm{B}, \\
& \text { and } \mathrm{A}: \mathrm{C}:: \mathrm{B}: \mathrm{D}, \\
& \text { and } \mathrm{A}: \mathrm{E}:: \mathrm{B}: \mathrm{F} ;
\end{aligned}
$$

therefore, $\mathrm{A}: \mathrm{A}+\mathrm{C}+\mathrm{E}:: \mathrm{B}: \mathrm{B}+\mathrm{D}+\mathrm{F}$; and by altersation,

$$
A: B:: A+C+E: B+D+F .
$$

In treating of proportion we have fuppofed that the antecedent contains tome part of the confequent a certan number of times exacily, which part is therefore a common meafure of the antecedent and confequent. But there are quantities which cannot have a common meafure, and which are therefore faid to be incommenfurable; fuch, for example, are the fides of two fquares: one of which has its furface double that of the other.

Although the ratio of two incommenfurable quantities cannot be exprefled in numbers, yet we can always attign a ratio in numbers which thall be as near to that ratio as we pleafe. For let $A$ and $B$ be any two quantities whatever, and fuppole that $x$ is fuch a part of $\Lambda$ that $\mathrm{A}=p \cdot x$; then if $q$ denote the number of times that $x$ can be taken from B , and $d$ the remainder, we have $\mathrm{B}=q x+d$, and $q x=3-d$; and becaule $p: q:: p x: q$, therefore $p: q:: A: B-d$. Now as $d$ is lefs than $x$, by taking $x$ fufficiently fmall $d$ may be lefs than fry propofed quantity, fo that B-d may differ from B by lefs than any given quantity; therefore two numbers $p$ and $q$ may always be aligned, fuch, that the ratio of $p$ to $g$ thall be the fame as the ratio of A to a quantity that difiers lefs from B than by any given quantity, however fmall that quantity may be.

Hence we may conclude, that whatever has been delivered in this fegion relating to commenturable quantities, may be conidered as applying eeprally to fuch as are incormenfurable.

## SECT. IV. THE PROPORTIONS OF FIGURES.

## Definitions.

1. Equivalcnt Fivures are fuch as have equal fursaces.

Two figures way be equivalent, although very dif fimilar; thus a circle may be equivalent to a fquare, a triangle to a rectangle, and fo of other figures.

We fhatl git "'u denomindion of equal figures to $\therefore 2$
thote

## 644

G E O M
Proportiors thofe which, being appitid the one upon the other, co-
 U: eren'al' and two trinngles hamin three rides of the one eyan to three fides of the other, each to each, are ato ectual.

1i. Two igures are amiar, when the angles of the one are eran to the anges of the other, each to each; and the rumispous fide proportionals. The homologous fies are thele which have the fame pofition in the two frgures : or which are adjacent to the equal angles. The angies themfelves are called homologous ang/es.

1wo equal figures are always imilar, but imilar figures may be very uncqual.
III. In two different circles, fimilar fectors, fimilar archer, fimilar fesments, are fuch as correipond to equal angles at the centre. Thus the angle $A$ being equal to the angle O , the arch BC is fimilar to the arch DE, and the fector ABC to the fector ODE, \&e.
IV. The Altitude of a parallelogram is the perpen-
dicular which meafures the diftance between the oppo-
Pint:
custif.
1ig. 64 .
V. The Allitude of a triangle is the perpendicular $A D$ drawn from the vertical angle $A$ upon the bafe Bt.
VI. The Alitude of a trapersid is the perpendicular EF drawn between its two parallel bales AB, CD.
VII. The Atra and the furface of a figure are terms of nearly the fame fignification. The term ara, howeever, is more particularly ufed to denote the fuperficial quantity of the figure in refpect of its being meafured, or compared with other furfaces.

## Theorem I.

Fig. 60. Parallelograms which have equal baies and equal altitudes are equivalent.

Let AB be the common bate of the parallelograms $\mathrm{ABCD}, \mathrm{EBAF}$, which being fuppofed to have the fame altitude, the fides DC, FE oppofite to the bafes sill lie in DE a line parallel to AB. Now, from the mature of a parallelogram, $\mathrm{AD}=\mathrm{BC}$, and $\mathrm{AF}=\mathrm{BE}$; for the fame realon $\mathrm{DC}=\mathrm{AB}$, and $\mathrm{FE}=\mathrm{AB}$; therefore, $\mathrm{DC}=\mathrm{FE}$, and taking away DC and FE from the tame line DE, the remainders CE and DF are equal ; hence the triangles DAF, CBE have three fides of the one equal to three fides of the other, each to each; and corfequently are equal (10. i.). Now if from the quadulateral $A B E D$, the triangle $A D F$ be taken away, there will remain the parallelogram ABEF; and if from the fame quadrilateral ABED, the triangle CBE, equal to the former, be taken away, there will remain the parallelogram ABCD ; therefore the two parallelograms $A B C D, A B E F$, which have the lame bafe, and the fame altitude, are equivalent.

Cor. Every parallelogram is equivalent to a rect. angle of the fame bafe and altitude.

## Theorem II.

Ra. $\sigma_{7}$.
Ewery triangle $A B C$ is the half of a parallelogram $A B C D$, having the fame bafe and altitude.

For the triangle $\mathrm{ABC}, \mathrm{ACD}$ are equal (28.1.).
Cik. 1. Therefore - titingle $A B C$ is the half of a zect.ro be BCEF of the fane bafe and altude.

## $\mathrm{E} \mathrm{T} \quad \mathrm{R}$.

Cor. 2. All triangles having equai bales, and equal Froportions altitudes, are equiraleat.
of Figures.

## Theorem MI.

Two rectangles of the fame altitude are to each Fig. 68. other as their bafes.

Let ABCD, AEFD be two rectangles, which have a common altitude AD ; the rectangle ABCD thail have to the rectangle $A E F D$ the fame ratio that the bafe $A B$ has to the bafe $A E$.

Let the bafe $A B$ have to the bafe $A E$ the ratio of the number $p$ (which we thall fuppole 7 ) to the number $q$ (which may be 4) that is, let AB contain $p$ (7.) fuch equal parts as AE contains $q$ (4.), then, if perpendiculars be drawn to AB and AE at the points of divifion, the rectangles ABCD and AEFD will be divided, the former into $p$, and the latter into $q$ rectangles, which will be all equal (r.) for they have equal bates, and the fame altitude; thus the rectangle ABCD will alfo contain $p$ fuch equal parts as the rectangle AEFD contains $q$; therefore, the rectangle ABCD is to AEFD as the number $p$ to the number $q$ (Ax. 4.3.) that is, as the bafe AB to AE .

## Theorem IV".

Any two rectangles are to each other as the pro- Fig. 7 r . ducts of any numbers proportional to their fides.

Let the numbers $m, n, p, q$, have among themfelve, the fame ratios that the fides of the rectangles $A B C D$, AEFG have to each other; that is, let AB contain $m$ fuch equal parts, whereof AD contains $n$; and AF . contains $p$, and AF contains $q$; then fhall ABCD : AEFG::mn:pq.

Let the rectangles be fo placed that the fides $A B$, $A E$ may be in a fraight line, then $A D$ and $A G$ will alio lie in a ftraight liac (3.t.). Now (3.)
$A B C D: A E H D:: A B: A E:: m: p$,
but $m: p: n m: n p$, (t.3.)
therefore $A B C D: A E H D:: n m: n p$.
Again, ALHD : AEFG:: AD:AG:: $n: q$,
but $n: q:: p n: p q ;$
therefore, $\mathrm{AEHD}: \mathrm{AEFG}:: p n: p q$;
and it was ihewn that
$\mathrm{ABCD}: \mathrm{AEHD}:: n m: n p$ or $p n$,
therefore, (6.3.) ABCD:AEFG::m $n: p q$.

## Scholicis.

Hence it appears, that the product of the bafe by the altitude of a rectangle may be taken for its meature, ublerving that by luch product is meant that of the number of linear unite in the bale by the number of linear unis in the altitude. 'I his meature is however not abiolute, but relative, for it mull be fuppoled, that in comparing one rectangle with another, the fides of buth are neatuied by the fame linear unit. For example, if the bale of a rectangle, $A$, be three units, and its altizude 10 , the rectangle is reprefented by $3 \times 17$ or 30 ; this number confidered by ittelf has no meaning,

## Sect. IT

G E O M
Proportiers meaning, but if we have a fecond rectangle B , the bafe of Figures of which is twelve unit, and altitude feren, this fecond rectargle chall be reprefental by the number $12 \times 7$ or E1, and hence it may be concluded that the two rectsng'es are to each other as 30 to 84 ; theretore, if in entimating any fuperficies the rectangle i be taken for the meafuring unit, the rectangle B ihall have for its aofolute meature $-{ }^{+}$, that is, it thall be $: \pm$fuperficial units.

It is more common, as well as more fimple, to take for a fuperficial unit a lquare, the fide of which is an unit in length; and then the meafure which we have regarded only as relative becomes ablolute; for example the number 32 , which is the meafure of the rectangle $A$, reprefents 30 fuperficial units or 30 fquares, each having it, ide equal to an unit. To ilIuflrate this fee fig. 72 .

## Throrey V.

Fig. 67. The area of any parallelogram is equal to the product of its bate by its altitude.

For the parallclogram ABCD is equivalent to the rectangle FBCE, which has the fame bafe BC, and the fame altitude AO (Cor. 1.) but the meafure of the rectangle is $\mathrm{BC} \times 10,(t)$ therefore the area of the parallelogram is $\mathrm{BC} \times \mathrm{A}$ ().

Cor. Parallelograms having the fame bafe, or equal baies, are to each other as their altitudes; and parallelograms having the fame altitude are to each other as their bafes; for in the former cafe put B for the common bafe and $A$ and $A^{\prime}$ for the altitudes, then the areas of the figures are $\mathrm{B} \times \mathrm{A}$ and $\mathrm{B} \times \mathrm{I}^{\prime}$; and it is manifelt that $\mathrm{B} \times \mathrm{A}: \mathrm{B} \times \mathrm{A}^{\prime}:: \mathrm{A}: \mathrm{A}^{\prime}$; and in the latter cale, futting A for the common altitude, and F . and E ' for the bales, it is evident that $\mathrm{B} \times \mathrm{A}: \mathrm{B} \times \mathrm{A}$ $:: \mathrm{B}: \mathrm{B}^{\prime}$.

## Theore: Vit.

Fig. 67. The area of a triangle is equal to the product of its bafe by the half of its altitude.

For the thingle $A B C$ is half of the parallelogram A BCD, which bas the fame bafe EC , and the dame altitule $10(2$.$) , but the area of the prablelogram is$ $\mathrm{BC} \times 10(5$.$) , thencture that of the triangle is \frac{ \pm}{2} \mathrm{BC}$ $\times 40$, or BC $x^{\top} \mathrm{AO}$.

Cor. ' C o triangles of the dume altitude are to each other as their bafen; and tho tringles having the farme bafe are to each other as their altitudes.

## Theprem VII.

Fig. 73. The area of a trapezoid $A B C D$ is cyun' to the product of its altitud EF by haf the fiam of its parulel fides $A B, C D$.

Thancon the point 1, the mi! re of PC, datw KL par. ' it to the opponite fide AD, ar ! irenduce DC to nece KL . In the triangle 1 BI , $\mathrm{I}^{\prime} \mathrm{K}$. If iverterl to IC y conitruction, and the ange Cli=Bli, mat the 2at $1(\mathrm{~K}=I B L(21.1$.) therefore thele thente are equal; and hence the tramezoil A!(i) :- curabient to the razallelogram ALKD, and fods in ite moative

E T R Y.
11. $\times$ Er. Put $11,=\mathrm{DK}$, and becaufe the triangle Proportiot. IBL in equal to the triangle KCl , the fide $\mathrm{Bl}=\mathrm{CK}$, of Figure; ther fore $A K+C D=A L+D K=2 A L$; hence $A L$ i, half the fum of the parallel fides $\mathrm{AB}, \mathrm{CD}$; and as the area of the trapezoid is equal to $F E \times A L$, it is allo equal to $\mathrm{FE} \times\left(\frac{-\mathrm{B}+\mathrm{CI})}{2}\right)$.

## Theorfar Vili.

If four ftraight lines $\mathrm{AB}, \mathrm{AC}, \mathrm{AD}, \mathrm{AE}$, be pro. Fo. portionals; the rectangle $A B F E$, contained by the two extremes, is equivalent to the rectangle ACGD contained by the means. And converiely, if the rectangle contained by $A B, A E$, the extremes, be equivalent to the rectangle contained by $\mathrm{AC}, \mathrm{AD}$ the means, the four lines are proportionals.

Let the rectangles be fo placed as to have the common angle $A$, and let BF, DG interfect each other in
H. Becaufe the rectangles $\mathrm{ABHD}, \mathrm{ACGD}$ have tli: fame altitude AD,

## ABHD : $A C G D:: A B: \perp C ;(3)$,

and becaufe the rectangles $A B H D$, ABFE have the fame altitude AB , for the fame reaton

## ABHD: ABFE : : AD : AE,

but by hypothefis $A B: A C:: A D: A E$, therefore (.1v. 2. 3.) $\triangle \mathrm{BHD}: \triangle \mathrm{CGD}:: \triangle \mathrm{BHD}: \triangle \mathrm{BFE}$, therefore (Ax. 2. 3.) the rectangle $\mathrm{ACGD}=\mathrm{ABFE}$.

Nest fuppole that the rectangle $A C G D=A B F E$; then ABHD : ACGD : : ABHD : ABFE. (Ax. i. 子.) but $A B H D: A C G D:: A B: A C,(2)$ and $A B H D$ : ABFE: $A D: A E$, thercfore $A B: A C:: A D: A E$

Cor. If three itraight lines be proportionals, the rectangle contained by the extremes is equal to the fquare of the mean; and if the rectangle contained by the cxtremes be equal to the fiquare of the mean, the three fraight lincs are proportionals.

## Thforem IX.

If four ftraight lines be proportionals, and alforig. it other four, the rectangles contained by the correfponding terms thall be proportionals; that i , if $\mathrm{AB}: \mathrm{BC}:: \mathrm{CD}: \mathrm{DE}$, and $\mathrm{BF}: \mathrm{BC}:: \mathrm{DH}$ : DI, then thall rafongli $\mathrm{AF}:$ rat. BM: : rat. CH: raz.1) ().

Fon in BG and DI, produced if necellary, the $\mathrm{BF}=\mathrm{BF}$, and $\mathrm{DH}=\mathrm{DH}$, and let MP be patallel to BC , and HN : DE ; ticn (3.)

$$
\begin{aligned}
& \text { rez. AF:raf. BP: AB BC, }
\end{aligned}
$$

but $\mathrm{AB}: \mathrm{BC}: \mathrm{CD}: \mathrm{DE},(:$ hypotheris) therefore

$$
\text { ra7. AF rait } \mathrm{El} \text { : : rect. CIt ras. DN; }
$$

now (3 rat. BP . ra. B. BMI . . BF BG; and rat 1)N rct. DO : DII: DI ; but BF: I:G: : DII D). (by lypotils) thete one

Proportions but it has been thewn that
$\underbrace{\text { of Fizures. }}$
re7. AF : ret. BP : : rat. CH : rect. DN,
therefure (6. 3.)

$$
\text { raf. } \mathrm{AF}: \text { req. BMI : } \mathrm{rec} . \mathrm{CH}: r a \neq \mathrm{DQ} .
$$

Cor. Hence the fquates of four proportional firaight lines are themfelves proportionals.

## Theorem $X$.

Fig. 74. If a ftraight line $A C$ be divided into any two parts at $B$, the fquare made upon the whole line $A C$ fhall be equal to the fquares made upon the two parts $A B, B C$, together with twice the rectangle contained by thefe two parts: which may be expreffed thus, $\mathrm{AC}^{2}=\mathrm{AB}^{2}+\mathrm{BC}^{2}+2 \mathrm{AB} \times \mathrm{BC}$.

Suppose the fquare ACDE to be conftructed; take $A F=A B$, draw $F G$ parallel to $A C$, and $B H$ parallel to CD.

The fquare $A C D E$ is made up of four parts; the firit $\triangle B I F$ is the fquare upon $A B$, becaufe $A F=A B$; the fecond IGDH is the fquare upen $B C$, for $A C=A E$, and $A B=A F$, therefore $A C-A B=A E-A F$, that is $\mathrm{BC}=\mathrm{EF}$; but $\mathrm{BC}=\mathrm{IG}$, and $\mathrm{EF}=\mathrm{DG}$, (26.1.) therefore 1 GDH is the fquare upon BC , and the remaining two parts are the two rectangles $B C G I$, FEHI, which have each for their meafure $\mathrm{AB} \times \mathrm{BC}$, therefore the quare upon $A C$ is equal to the fquares yon AB and BC , and twice the rectangle $\mathrm{AB} \times \mathrm{BC}$.

## Thforem XI.

Fig. 75. If a ftraight line $A C$ be the difference of two Etraight lines $A B, B C$; the fquare made upon $A C$ fhall be equal to the excefs of the two fquares upon $A B$ and $B C$ above twice the rectangie contained by AB and BC ; that is,

$$
A C^{2}=A B^{2}+B C^{2}-2 A B \times B C
$$

Cosstrect the fquare ABIF , take $\mathrm{AE}=\mathrm{AC}$, and draw CG paral!el to BI, and HK parallel to AB; and complete the fquare EFLK. The two rectangles CBlG, GLKD have each $A B \times B C$ for their meafure; and if thefe be taken from the whole figure ABILKEA, that is from $A B^{2}+t C^{2}$, there will remain the fquare ACDE , that is, the fquare upon AC .

## Thforen XII.

Yis. \%6. The rectangle contained by the fum and the difference of two ftraight lines is equal to the difference of the fquares upon thofe lines; that is,

$$
(A B+B C) \times(A B-B C)=A B^{2}-B C^{2}
$$

$C$ wainuct upon $A B$ and $A C$ the fquares $A B I F$, ACDE; produre $A B$, fo that $B K=B C$, and complete the reclangle AKL .E. The bafe A K ot the rectangie i. the fum of the two lines $\mathrm{AB}, \mathrm{BC}$; and it altude $A F$ is the difference of the fame lines; the efure, the re: fame t, : 1 z'e is compofed of two parts $\triangle$ BHE-i-BHLK, of $\because \because \%$, BILLK is equal to the recta:ryle EDCI
for $\mathrm{PH}=\mathrm{DF}$, and $\mathrm{BK}=\mathrm{FE}$; thererore, $\mathrm{AKLE}=$ Proportions $\Lambda \mathrm{EHE}+\mathrm{EDGF}$; bat thefe two parts conntitute the of Figures. exceis of the fquare ABIF above the fquare DHIG, the former of which is the fquare upon AB , and the lattor the fuare upon BC , therefore $(\mathrm{AB}+\mathrm{BC}) \times$ $(A Z-B C)=A B^{2}-B C^{2}$.

## Theorem XIII.

The fquare upon the hypothenufe of a right-angled triangle is equal to the fum of the fquares upon the two other fides.

Let ABC be a right-angled triangle; having formed the fquares upon its three lides, draw a perpendicular AD from thie right angle upon the hypothenufe, and produce it to E , and draw the diagonals $\mathrm{AF}, \mathrm{CH}$. The angle $A B F$ is evidently the fum of $A B C$ and a right angle, and the angle HBC is alfo the fum of ABC and a right angle; therefore the angle $\mathrm{ABF}=$ HBC ; now $A B=A H$, for they are fides of the fame fquare, and $B C=B F$ for the fame reafon, therefore the triangles $A B F, H B C$ have two fides, and the included angle of the one equal to two fides and the included angle of the other, each to each, therefore the triangles are equal, (5. 1.) but the triangle $A B F$ is the half of the rectangle BDEF (which for brevity's fake we fhall call BE) becaufe it has the fame bafe BF, and the fame altitude $B D$, (2.) and the triangle HBC is in like manner half of the fquare AH , for the angles BAC , BAL being both right angles, $C A$ and $A L$ conltitute a Atraight line parallel to BH, i. 1.) and thus the triangle HBC , and the fquare $A H$ have the fame bafe HB , and the fame altitude $A B$; from which it follows that the triangle is half of the fquare (2.). It has now been proved that the triangle $A B F$ is equal to the triangle HBC ; and that the rectangle BE is double of the former, and the fquare AH double of the latter; therefore the rectangle BE is equal to the fquare AH . It may be demonitrated in like manner that the rectangle CDEG, or CE, is equal to the fquare AI; but the rectangles $B E, C E$ make up the iquare BCGF, therefore, the fquare BCGF upon the hypothenufe is equal to the fquares $A L H B, A K I C u_{2}^{\prime}$ on the other two fides.

## Theorem XIV.

In a triangle $A B C$, if the angle $C$ is acute, the Fig. $7^{5}$ fquare of the oppofite fide $A B$ is lefs then the fquares of the fides which contain the angle $C$; and if $A D$ a perpendicular be drawn to $B C$ from the oppofite angle, the difference fhall be equal to twice the rectangle $\mathrm{BC} \times \mathrm{CD}$; that is

$$
A E^{2}=A C^{2}+C B^{2}-2 B C \times C D
$$

First. Suppofe AD to fall within the triangle, then $\mathrm{BD}=\mathrm{BC}-\mathrm{C}$ ), and confequentiy (11.) $\mathrm{BD}^{2}=\mathrm{BC}^{3}+$ $C D)^{2}-2 B C \times C D$; to each of thele equals add $\mathrm{AD}^{2}$; then, oblerving that $\mathrm{KD}^{2}+\mathrm{DA}^{2}=\mathrm{BA}^{2}$, and $\mathrm{CD}^{2}+$ D $A^{2}=C A^{2}$,

$$
\mathrm{AB}^{2}=\mathrm{BC}^{2}+\mathrm{CA}^{2}-2 \mathrm{BC} \times \mathrm{CD}
$$

Neit, fuppofe AD to fall without the triangle, fo that $\mathrm{PD}=\mathrm{CD}-\mathrm{PC}$, and therefore BD$)^{2}=\mathrm{CD}^{2}+$ $\mathrm{BC}^{3}-2 \mathrm{BC} \times \mathrm{CD}$, (11.) to cach of thefe add $\mathrm{AD}^{2}$ as

Propation before, and we get
of Figure.

$$
\mathrm{AB}^{2}=\mathrm{BC}^{2}+\mathrm{CA}^{2}-2 \mathrm{BC} \times \mathrm{CD}
$$

## Thforem XV.

Fig. 79. In a triangle ABC , if the angle C is obtufe, the fquare of the oppofite fide $A B$ is greater than the fum of the fquares of the fides which contain the angle C ; and if AD a perpendicular be drawn to BC from the oppofite angle, the difference fhall be equal to twice the rectangle $\mathrm{BC} \times \mathrm{CD}$, that is

$$
A B^{2}=A C^{2}+B C^{2}+2 B C \times C D
$$

FOR $\mathrm{BD}=\mathrm{BC}+\mathrm{CD}$, and therefore (10.) $\mathrm{BD}^{2}=$ $\mathrm{BC}^{2}+\mathrm{CD}^{2}+2 \mathrm{BC} \times \mathrm{CD}$; to each of thefe equals add $\mathrm{AD}^{2}$, then, obferving that $\mathrm{AD}^{2}+\mathrm{DB}^{2}=A \mathrm{~B}^{2}$, and $\mathrm{AD}^{2}+\mathrm{DC}^{3}=\mathrm{AC}^{2}$,

$$
\mathrm{AB}^{2}=\mathrm{BC}^{2}+\mathrm{CA}^{3}+2 \mathrm{BC} \times \mathrm{CD}
$$

## Scholify.

It is only when a triangle has one of its angles a right angle, that the fum of the fquares of two of its fides can be equal to the fquare of the third fide; for if the angle contained by thofe lides be arute, the fium of their fquares is greater than the fquare of the oppofite fide, and if the angle be obtule, that fum is lefs than the fquare of the oppofite fide.

## Thlorem XVI.

Eg. 3s. If a fraight line AE be drawn from the vertex of any triangle ABC to the middle of its bafe BC ; the fum of the fquares of the fides is equal to twice the iquare of half the bafe, and twice the fquare of the line drawn from the vertex to the middle of the bafe; that is, $A B^{2}+\mathrm{AC}^{3}=$ $2 \mathrm{BE}^{2}+2 \mathrm{AE}^{2}$;
Dr.aw AD perpendicular to $B C$, then

$$
\begin{gathered}
\mathrm{AE}^{2}=\mathrm{BE}^{2}+E A^{2}-2 \mathrm{BE} \times \mathrm{ED},(1+.) \\
\text { and } \mathrm{AC}^{2}=\mathrm{CE}^{2}+E \mathrm{~A}^{2}+2 \mathrm{CE} \times \mathrm{ED},(15 .)
\end{gathered}
$$

therefore, by adding equals to equal, and olferving that $\mathrm{BE}=\mathrm{CE}$, and therefore $\mathrm{BE}^{2}=\mathrm{CE}^{2}$, and $2 \mathrm{BE} \times$ $E D=2 C E \times E D$,

$$
\mathrm{AB}^{2}+\mathrm{AC}^{3}=2 . \mathrm{BE}^{2}+2 \mathrm{AD} .
$$

## Theorfm XVII.

Fig.et. A ftraight line DE drawn parallel to one of the Gides of a triangle ABC divides the other two fides $\mathrm{AB}, \mathrm{AC}$ proportionaily, to that $\mathrm{AD}: \mathrm{DB}$ : : AE: EC.

Jors BE and CD. The triangles BbE, CDE, having the fame bafe DE, and the face alitide, are equivalent, (2.) ard the triangles ALE, BDE, having the fame altitude, are to one motiser a . Ahe is buc, (6) that is, $\mathrm{ADE}: \mathrm{BDE}: \mathrm{AD}: \mathrm{DB}$; the tiat.gite i , E , CDE, having alfo the fame alitude, are ti) on nother as their bafes; that i $A D E: C D E:: \quad .1 \% \mathrm{LC}$, Ea: the trianole BDE ha beet proved nulal so CDE;
thecefore, becaufe of the common ratio in the two pro- Proportions gurtions, we have (A․ 3.3.)

$$
\mathrm{AD}: \mathrm{DB}:: \mathrm{AE}: \mathrm{EC} .
$$

Cor. Hence by compofition $\Lambda \mathrm{B}: \mathrm{AD}:: \mathrm{AC}: A \mathrm{E}$; and $A B: B D:: A C: C E$.

## Theorem XVIII.

Converfely, if two of the fides $\mathrm{AB}, \mathrm{AC}$ of a tri- $\mathrm{Fig}_{\mathrm{g}} \delta_{1}$. angle are divided proportionally by the ftraight line DE , fo that $\mathrm{AD}: \mathrm{DB}:: \mathrm{AE}: \mathrm{EC}$, then thall the line DE be parallel to the remaining fide BC.

For if DE is not parallel to BC , fuppofe fome other line DO to be parallel to BC ; then, $\mathrm{AB}: \mathrm{BD}:$ : $\mathrm{AC}: \mathrm{CO}(17$.$) and fince by hypothefis \mathrm{AD}: \mathrm{DB}$ : : AE: EC, and confequently, by compofition, AB: $\mathrm{BD}:$ : $\mathrm{AC}: \mathrm{CE}$, therefore, $\mathrm{AC}: \mathrm{CO}:: \mathrm{AC}: \mathrm{CE}$, therefore, $\mathrm{CO}=\mathrm{CE}(2 \mathrm{Ax}, 3$.) which is impolfible; therefore DO is not parallel to BC.

Cor. If it be fuppofed that BA : AD : CA. AE, fill DE will be parallel to EC ; for by divilion BD : AD : : CE : AE, this proportion being the fame as in the Theorem, the conclution mult be the fame.

## Theorem XIX.

A fraight line AD , which bifects the angle BAC Fig. 8. of a triangle, divides the bafe BC into two fegments propertional to the adjacent fides BA, AC ; that is, $\mathrm{BD}: \mathrm{DC}:: \mathrm{BA}: \mathrm{AC}$.

Throligh the point C draw CE parallel to AD , fo as to meet BA produced. In the triangle BCE, the line AI) is parallel to one of it fides CE , therefore $\mathrm{BD}: \mathrm{DC}: \mathrm{BA}: \mathrm{AE}$; now the triangle CAE is iliofeles, for, becaufe of the parallels AD, CE, the angle $\mathrm{ACE}=\mathrm{D} A \mathrm{C}$, and the angle $\mathrm{AEC}=\mathrm{BAD}$, (21. 1.) but by hypothefis $\mathrm{DAC}=\mathrm{BAD}$; thetefore $\mathrm{ACE}=\mathrm{AEC}$; and conlequently $\mathrm{AE}=\mathrm{AC}$, (12. 1.) therefore, fubstituting AC inflead of AE in the above proportion, it becomes $\mathrm{ED}: \mathrm{DC}:: \mathrm{BA}: \mathrm{AC}$.

## Theorlu XX.

If two triangles be equiangular, their homologous Fig. $\mathrm{s}_{\ell}$ fides are proportional, and the triangles are immilar.

Ifr ABC, CDE be two equi:ngular triangles, which have the angle $B A C=C D E, A B C=D C E$, and $\mathrm{ACB}=\mathrm{DEC}$; the homologous fides, or the liates adjacent to the equal anyles, wall be proportional ; that is, $B C: C E:=1 \cdot C D: A C: D E$

Place the honsologous fi.tes BC, CE in the fame direction, and produce the fides B , LD, till they mect in F. Eccaufe BCF is a flacak hace, and the angle BC 1 is equal to (ED), the line C A, EF are parallel, (22.1.) and in like matner, becutue the angic ABC=O) E, the lines BF, (D) ate pallel; thereine the figure ${ }^{\circ} \mathrm{CDF}$ in a parahletoram, and hence $A F=(1)$, and $C=F(26.1$.$) In the triangle$
以
rupnitions $\mathrm{BC}: \mathrm{CE}: \quad \mathrm{B} .1$. AF ; or fince $\mathrm{AF}=\mathrm{CO}, \mathrm{BC} \cdot \mathrm{CE}:$ : eiftrures. B.I:CD. Again, in the fame taiangle becaufe CD is parallel to the fide $\mathrm{BF}, \mathrm{BC}:$ CE: ID: DE, or, hace $1 \mathrm{D}=\mathrm{AC}, \mathrm{BC}: \mathrm{CE} \cdot \mathrm{CC}: \mathrm{DE}$; having now the :11 that $\mathrm{BC}: C E: B .1:(D)$ and that $13 C$ : CR: : AC: DF, it follows th: B. : CD : : AC: DE ; therefore the equiancuhar triangles $\mathrm{BAC}, \mathrm{CDE}$ have their homologous files preputional, and hence (山fi 2.) the triangles are fimilar.

## Suholitar.

It is manifen, that the homologous fides are opponte to the equal angles.

## Tusorem XXI.

If two triangles have their homologous fides proportional, they are equiangular and fimilar.

Surrose that BC:EF : : AB:DE: : AC : DF; then thall $\mathrm{A}=\mathrm{D}, \mathrm{P}=\mathrm{E}, \mathrm{C}=\mathrm{F}$. At the point E make the angle $F E G=B$, and at the point F make $E F G=C$; then the third angle $G$ hall be equal to the third angle $A$, and the two triangles $\mathrm{ABC}, \mathrm{GEF}$ fhall be equiangular; therefore, by the latt theorem BC : EF : : AB:GE; but by hypothefis BC: EF : : IB:DE, therefore $\mathrm{GE}=\mathrm{DE}(\mathrm{Ax} .2$ 2. 3.). In like manner, becaufe by the fame theorem BC:EF: : CA: FG; and by hypotheis EC : EF : : C A : FD; therefore $\mathrm{FG}=\mathrm{FD}$; but it was the: m that $\mathrm{EG}=\mathrm{ED}$, therefore, the triangles GEF, DFF, having the fides of the one equal to thofe of the other, each to each, wre equal, but, by conitrtiction, the tiangle GEF is c priangular to $\mathrm{A} \dot{\mathrm{BC}}$, therefore allo the triangles DEF, IDC are equangular and fnilar.
Theorlim XXII.

Two triangles which have an ancle of the one equal to an angle of the other, and the fides about the fe angles proportional, are fimilar.
LUT the angle $A^{*}=\mathrm{D}$, and let $A B: D E: A C$ : DF, the triangle ABC is fimilar to DEF. Take $A G=1 D E$, and draw $G H$ parallel to $B C$, then the angle $\mathrm{AGH}=\mathrm{ABC},(21.1$.$) the:efore the triangle$ $\therefore \mathrm{AH}$ i equiangular to i BC , and confequently (20.) $A B: A G:: A C: A H$; but by hypothens $A B:$ DE : : $A C: D F$, and by contruction $A G=D E$, herefore $\mathrm{AH}=\mathrm{DF}$; the tho triangle; $A \mathrm{GH}$, DEF -re thercfore equal, ( $\therefore 1$.) but the triangle $A G H$ is imilar to $A B C$, thercfore DEF is fimilar to $A B C$.

## Theorev XXIII.

In a right-angled triangle, if a perpendicular $A D$ be drawn from the right ankle upon the hypothenute, then,
3. The triangles $\mathrm{ABD}, \mathrm{CAD}$ on each fide of the perpendicular are fimilar the whole triangle B.AC, and to one another.
2. Wach fide $A B$ or $A C$ is a mean propertional between the hypothenufe BC, and the .djacent fegment B1) or DC.
3. The perpendicular AD is a mean proportional between the two fegments $\mathrm{BD}, \mathrm{DC}$.

1. The triangles $\mathrm{BAD}, \mathrm{BAC}$ have the common ante B; W. fide, the right angle $B A C$ is equal to the rinlt angle $\$ 3 \mathrm{D}!$, therefore the thind atgle BAD of the one, is equal to the third angle BCA of the other; therefore, thefe thangles are equiangular and fimiar; atd in the fame mamer it may be hiewn, that the thiande DAC is equiangular and imilar to $\mathrm{B} A \mathrm{C}$; therefore the three triangles are equiangular and fimilar to each other.
2. Becaufe the triangle BAD is fimilar to the triangle BAC , their homologous fidis are proportional. Now the dide ED of the leller triansle is homologous to the fice $\mathrm{B} \pm$ ot the greater, becaule they are oppofite to the equal angles $B \perp D, B C A$; in like manner B. 1 , conndered as a lide of the leffer triangle, is homologous to the tide BC of the greater, each being oppofite to a right an:le; therefore, $\mathrm{BD}: \mathrm{BA}:: \mathrm{BA}: \mathrm{BC}$. In the fame manner it may be flewn that $\mathrm{CD}: \mathrm{CA}$ : C.1:CB, therefore each fide is a mean proportional between the hypothenufe and the fegment adjacent to that fide.
3. By comparing the homologous fides of the two fimilar triangles $A \mathrm{BD}, \mathrm{ACD}$, it appears that BD : DA : : DA: DC; thevefore the perpendicular is a mean proportional between the fegments of the bypothenule.

## Thforiv XXIV.

Two triangles, which have an angle of the one Fig. s\%. equal to an angle of the other, are to each other as the rectangles of the fides wlich contain the equal angles; that is, the triangle ABC is to the triangle $A D E$, as the rectangle $A B \times A C$ to the rectangle $\mathrm{AD} \times \Lambda \mathrm{E}$.

Jorn BE ; hecaufe the tiangles $\mathrm{ABE}, \mathrm{ADE}$ have a common vertex $\mathbf{E}$, they have the fame altitude, therefore $\mathrm{ABE}: \triangle \mathrm{DE}:: \mathrm{AB}: \mathrm{AD}$, (Cor. to 6.7 but $A B: A D:: A B \times A E: A D \times A E$, (3.) therefore,
$A B E: A D E:: A B \times A E: A D \times A E$.
In the fame manner it may be demonitrated that
$A B C: A B E:: A B \times A C: A B \times A E ;$
Therefore 6.3.$) A B C: A D E:: A B \times A C: A D \times A E$.
Cor. Thercfore the two triangles are equivalent, is the rectangle $A \mathrm{P} \times A \mathrm{C}=\mathrm{AD} \times A E$, or (8.) if $A B$ : AD: AE:AC, in which cafe, the lides about the equal angles ate faid to be reciprscaily proportionat.

## Scholiuvi.

Then hic been proved of triangies is alfo true of parallenogram, they being the doubles of fuch triangle:

## Throrey XXV.

Two fimilar triangles are to each cther as the Fig $c_{3}$ fequates of their henologous fides.

## ThiforlM XXX．

If from a point $O$ without a circle a ftraight line $F$ is ${ }^{\prime}$ OA be drawn touching the circle，and alio a Atraght line（ 1 Cuttmer it，the tangent thall he a mean proportional between the whole line 4 N
whic！
which cuts the circk, atad the part of it without the circle, that is, $\mathrm{OC}: \mathrm{OA}:: \mathrm{OA}: \mathrm{OD}$.

For if $\mathrm{AC}, \mathrm{AD}$ be jomed, the triangles O .1 n , OCA, hase the angle at $O$ common to both, allo the onge ACD or ACO is equal to D.O (18.2.), therefere the triangles are imilar (20.) and confequently CO: OA : OA. OD.

Cor. Theseiore (cor. 20 8.) $\mathrm{CO} \times \mathrm{OD}=\mathrm{OA}^{2}$, that js, tiec iquare of the tangent is equal to the rectangle consained by the whole line wheh cuts the circle, and the puit of it without the circle.

## Theorla XXXI.

Fis. 92. In the ame circle, or in equal circles, any angles $A C B$, DEF are to ench other as the arches iAb, DF of the circles intercopted between the hincs which contain the angles.

E T R Y.
Surf: sl: the arch $A \mathrm{D}$ to have to the arch DF the Pobitems, ratio of the rumber $p$ to the number $q$; then the arch Abl being fuppofed diviled into equal parts $\mathrm{A} \varepsilon, \mathrm{sh}$, hit, the number of which 1s $力$, the arch DF thall cont...is $/$ upual paris Dk, $\mathrm{h}!\mathrm{lm}, \mathrm{m} n, \mathrm{nF}$, each of which i. cgat to any one of the erual parts iuto which $A B$ is divided. Draw fraight line, from the centres of the circles to the points of divition, thefe lines will divide ACB into $力$ angles and DEF into $q$ angle, which are all equal (13.2.) therefore, the angle ACB has to the angle DEF the ratio of the number $p$ to the number $q$, which ratio is the fame as that of the arch AB to the arch DF.

Cor. Hence it appears that angles may lee meafured and compared with each other by means of arches of circles decribed on the vertices of the angles as centres. whersing, however, that the mali of the circles mat be equal.

## SECT. V. PROBLEMS.

## Phomed. 1.

Phate To bifect a given fraight line AD ; that is, to dicoxbilit Fig. 93. vide it into two equal parts.

Frovt the points $A$ and B as centres, with any radius greater than the half of: A B , deferibe arches, cutting each uthe: in $D$ and $D$ on each lide of the line $A B$. Draw a ftraight line throush the points $\mathrm{D}, \mathrm{D}$, cuting $A \mathrm{BinC}$; the line $A \mathrm{~B}$ in bifected in C .

For the points D, D, bing equally diftant from the est: mities of the live $A B$, are cach in a itraight line perpendicular to the middle of $\mathrm{AB},(16.1$.), therefore the ine DCD is that perpendicular, and confequently Cis the middle of $A B$.

## Promlen II.

Fig. 94. To draw a perpendicular to a given Atraight line
BC, from a given guint A in that line.
T.wn the puint. B ad C at equal dilances from A ; and on B and C as watre, with any radins greater than BA, deleribe athes, cutting each other in D; draw a the: hit line fom A through D, which will be thee perpendicular required. For the point D, being at equal dittases foom the atremitios of the line BC, muall be in a perpendialar to the middle of BC (16.1.), therefiere AD is the perpendicular requined.
Promtris ill.

Fig. 95. To draw a perpendicular to a given line, BD, from a given point A without that line.

Oy A as a centre, with a radies fulliciently great, deferitur an arch, cutting the civen line in two points B, D ; whin 1 and D as centres, with a raclins greater shan the half of BD , defcribe two atches, cutting each
other in E ; draw a ftrai, ht line through the points A and E, meeting BD in C ; the line AC is the perpendicular required.

For the two poins $I$ and $E$ are each at equal difences from B and D ; thereore, a line pather thrugh $A$ and $E$ is perpendicular to the midde of BD, (16.1.).

## Problemily.

At a given point $A$, in a given line $A B$, to make rig. 96 . an angle equal to a given angle K .

Oš K as a centre, with any radus, defcribe an arch to meet the lines containing the angle K , in L and I ; and on $A$ as a centre, with the lime radius, defcribe an indefnite arch BO ; on B as a centre, with a radius equal to the chord LI, deicribe an arch, cutting the arch BO in D ; draw AD , and the angle DAB hall be equal to $K$.

For the aches BD, LI having equal radii and equal chords, the asches themtclute are equal ( + - 2.), therefore the angles $A$ and $K$ are alto erual (13.2.).

## Padifim V .

To bifect a given arch $A D$, or a given angle $C$. Fig.07.
First. To bifect the meh $A B$, on $A$ and $B$ as centres, with one and the fame radius, defcribe arches to interfect in D : iofi CD, cutting the arch in $E$, and the arch AE that le equal to EB,

For, fince the points ( and I are at equal dinances from $A$, and al!o from B, the line which joins them is perpendicalir to the middle of the chord AB (16.1.), thertiure, the arch AB is bifected at E , (5.2.).

Sroondly. To lifect the angle C; on C asa cente, with any diuance, delcribe an arch, meeting the lines containing the angle in $A$ and $P$; then find the point

## Schoniem.

By the famc conftruction we may bifect cach of the arches AE, EB; and again we may bifect each of the halves of thefe arches, and to on; thus by fucceltive fibdivitions, an arch may be divided into four, eight, finteen parts, ぶc.

## Problea VI.

Fis s3. Through a given point A , to draw a ftraight line parailel to a given ftraight line BC .
$\mathrm{O} \times \mathrm{A}$ as a centre, with a radius fuficiently large, delcribe the indefinite arch EO ; on E for a centre, with the fame radius, defcribe the arch AF ; in EO take ED equal to $A F$, dra:s a line from $A$ through D , and ID will be parallel to BC .

For if AE be j ined, the angle EAD is equal to AE.B (13.2.), and they are alternate angles, therefure, $A D$ is parallel to $\dot{B C},(22.1$.$) .$

## Problem VII.

Fig. 99. To conftruct a triangle, the fides of which may be equal to three given lines $\mathrm{A}, \mathrm{B}, \mathrm{C}$.

TAKE a fraight line, DE, equal to one of the given lines A ; on D as a centre, with a radius equal to another of the lines $B$, defcribe an arch; on $E$ as a centre, with a radius equal to the remaining lise $C$, deforibe another arch, cutting the former in F ; join DF and EF, and DEF will be the triangle required, as is fuiticiently evident.

## Scholver

It is neceflary that the fum of any two of the lines be greater than the third line (7.1.).

## Problem Vill.

Fig. 1:0. To conftuct a parallelogram, the adjacent fides of which may be equal to two given lines $A, B$, and the angle they contain equal to a given angle C.

Draw the firaight line DE $=A$; make the angle GDE $=\mathrm{C}$, and tatie $\mathrm{DG}=\mathrm{B}$; detcribe two arch..., one on $G$ as a centre, with a radiu. $G F=1) E$, and the Gther on E, with a radius ET=DG; then DEFG Atall be the parallelogram required.

For by conitruction the oppofite fides are equal, therefore, the figure in a parallelogram, (27.1.) and it is fo conflucted, that the adjacent fides and the angle they contain have the magnitudes given in the prublem.

Cor. If the given anele be a right angle, the forure will be a rectangle; and if the idjacent fil: be alls e:ual, the fyrure will be a fquare.

To find the centre of a given circte, $0:$ of 2 cir-Fig. $12 x$ cle of which an arch is given.

Takt: any threce points $\mathrm{A}, \mathrm{B}, \mathrm{D}$, in the ciocumference of the circle, or in the given arh, and !raises drawn the braight lines $A \mathrm{~B}, \mathrm{BD}$ ), bitie it the m the the perpendiculars E.G, FH; the puint C whare the perpendiculars intefect each cther is the entese of the cir cle, as is evident from Theasm Vi. feel. 2.

## Schonima.

Py the very fame contruction a circle may be found that ihall pafi through three given points $\mathrm{A}, \mathrm{B}, \mathrm{C}: \sim$ that thall be deferibed about a given uiangle ABC.

## Problevi X .

To draw a tangent to a given circle through afis t : given point A .
If the given point, $\boldsymbol{\lambda}$, be in the eircumference (fig. 102.), draw the radius $A C$; and through $A$, draw AD perpendicular to AC , and AD will be : tangent to the circle. (9.2.). But it the given print A be without the circle, (fig. Io3.) dra: AC to the centre, and bifect AC in $O$, and on $O$ as a centre, with OA or OC as a radius, defcribe a circle which will cut the given circle in two points D and $\mathrm{D}^{\prime}$; juin $A D$ and $\mathrm{AD}^{\prime}$, and each of the lines $\triangle \mathrm{D}, \Delta \mathrm{D}^{\prime}$, will be a tangent to the circle.

For, draw the radii $C D, \mathrm{CD}^{\prime}$, then each of the angles $A D C, A D^{\prime} C$ is a right angle. (17.2.) ; therefore $1 D$ and $A D^{\prime}$ are both tangents to the circle, (9.2.).

Cor. The two tangents $A D, A D^{\prime}$ are equal to onic another. (17.1.).

## Promitio Xl.

To inferibe a circle in a given tringle $A B C$.
Busca $A$ and $B$ any two angles of the trimgle ly the beraishe lines $A(O, j)$, which meat ath other in O; tum () irm UI), ()E, OF, , Mremticulars to its fido; the fe lines ilne! - fyul to one another.

For in the trathon ODB, OLti, the aryl- ODP $=\mathrm{OE}$ i, and the ante $(0.1)=0$ fil: therente, the rematin! ansles 1 OD, IOE, wre equal; and as the fide OB is con't in to buh trianote, they are capal to one amplice, (6.1.), thatetore the fibe ()I) $=($ OF: ; in the fame ne inu it mey te: denombened, tina: (OD
 one mother, and combeque its ... itrh deteribed on () as a cootre, with (O) is a mition, will 1 ...f tarough E and 1; add on the fide of the thimale ore taments to the circle, (9.2.) it will iecinftibed in the thangle.

## PKon $1 . \mathrm{K}_{\mathrm{K}} \mathrm{Xl}$.

ITpon a given fraight line $A \mathrm{~B}$, to deforibe a feg- fiz 10 ${ }_{4} \mathrm{~N}_{2}$
n!e:it
ment of a circle that may contain an angle equal to a given angle $\mathbf{C}$.

Pkoduce 15 towards D , and at the point B make the angle DBE equal to the given angle C ; draw BO permenticular to BE, and GO perpendicular to the midule of $A B$, meeting $B O$ in $O$; on $O$ as a centre, with OB as a radias, deleribe a civele, which will pals through $A$, and $A M B$ hall be the fegment required.

For innce FE is perpendiculder to BO , FE is a tangent to the circle, theretire the angle EBD (which is equalt to $C$ by corfonation) is equal to any ingle AMB in the altermate fogment (13.2.).
Probimu Zill.
fig. icG. 5ig. 1c7.

To divide a Rraight line, $A B$, into any propofed number of equal parts; or into parts having to each other the fame ratios that given lines have.

Frost, Lent it he propofed to divide the line Als, ion. 1-6.) into five equal part: Through the caticnuty I daw :m intetinite line IG , take AC of any mazatude, and the CD, DE, EF, and FG, eaci, equal to $A C$, that is, take AG equal to five times AC ; join GB , and daw C 1 parallel to GB , the line Al thall be one fifth part of $A B$, and Al heing taken five times in $A B$, the line $A B$ hall be divided into fise equal parts.

For fince CI is parallel to GB, the fides 1 G and AB are cut proportionally in C and 1 ; but AC is the tifth part of $I G$; therefore $A I$ is the fifth part of $A B$.

Next, let it be propoled to divite 1B (fig. 107.) into parte, having to each other the ratios that the lines $P, Q, R$, have. Through $A$ draw $A G$, and in $A G$ take $\mathrm{AC}=\mathrm{P}, \mathrm{CD}=\mathrm{Q} \quad \mathrm{DE}=\mathrm{R}$; join EB , and draw CI and DK parallel to EB; the line AB ihall be divided as required.

For, Uecaut of the parallels $\mathrm{Cl}, \mathrm{DK}, \mathrm{EB}$, the parts $\mathrm{Al}, \mathrm{IK}, \mathrm{KB}$, have to each other the frme ratios that the part, $\mathrm{AC}, \mathrm{CD}, \mathrm{DE}$, have, ( 17.4 .) which parts ate by conilruction equal to the given lines $\mathrm{P}, \Omega, \mathrm{R}$.

## Problem XIV

Fig. res. To find a fourth proportional to three given lines, $\mathrm{A}, \mathrm{B}, \mathrm{C}$.

D: wo two fraight lines DE, DF, contahing any ange; on DE take $\mathrm{D} .1=\mathrm{A}$, and $\mathrm{D} 4=\mathrm{B}$, and on DF tale $\mathrm{DC}=\mathrm{C}$; join AC , and draw BX parallel to iC ; then, BX thall be the fourth proportional requirel.

Cor, becaufe 1 XX is parallel to $\mathrm{AC}, \mathrm{DA}: \mathrm{DB}:$ : $\mathrm{DC}: \mathrm{DX}(17.4$.) that is, $\mathrm{A}: \mathrm{B}:: \mathrm{C}: \mathrm{DX}$, therefure I) X is a fourth proportional to $\mathrm{A}, \mathrm{B}$, and C ,

Cur. The fame conifruction ferves to find a third propertional to two lines A and B ; for it is the fane As is Surth propertional to the lines $\mathrm{A}, \mathrm{B}$, and B .

## Prorlig YV.

Fif. icg. To find a mean preportional between two ftraight lines, $A, B$.

Uros any itraigh: line DF take $\mathrm{DE}=1$, and EF

E T R Y.
Sect. V.
$=\mathrm{B}$; and on DF as a diameter deicrihe a femicircle Problems. DGF; draw EG perpendicular to DF, meeting the circle in $G$; the line EG thall be the mean proportional required.

For, if DG, FG, be joined, the angle DGF is a right angle, (17.2.) thercfore, in the right-angled triangle DGF, GE is a mean proportional between DE and EF, (23.4.).

## Problew XTI.

To divide a given ftraight line AB into two parts, F.g. ro. fo that the greater may be a mean proportional between the whole line and the other part.
AT B, one of the extremities of the line, draw BC perpendicular to AB , and equal to the half of AB ; on C as a contre, with CB as a radius, deicribe a circle: join AC , mecting the circle in D ; make $A \mathrm{~F}=$ A1), and $A B$ flall be divided at $F$ in the manner required.

For fince $A B$ is perpendicular to the radius, it is a tangent to the circic (9.2.), and if AC be prodaced to meet the circle in $\mathrm{E}, \mathrm{AB}: \mathrm{AF}:: \mathrm{AE}: A B,(30,4$.$) and$ by divifion, $\mathrm{AB}-\mathrm{AF}: \mathrm{AF}:: \mathrm{AE}-\mathrm{AB}: \mathrm{AB}$; but $A \mathrm{~B}-\mathrm{AF}=\mathrm{BF}$, and fince $\mathrm{DE}=2 \mathrm{BC}=\mathrm{AB}$, therefore $\mathrm{AE}-\triangle \mathrm{D}:=\mathrm{AD}=\mathrm{AF}$, therefore $\mathrm{BF}: \mathrm{AF}:: \mathrm{AF}$ : AB.

## Schomeri.

When a line jo divided in this manner it is faid to be divided in extreme am/ mean rail.

## Problem A\Il.

To make a fq:are equivalent to a given parallelo- Fis. ir 2 . gram or to a given triangle.

Fig. $123^{\text {. }}$
First, let $A B C D$ he a siven parallelogram, (ig. 112.) the late of which is $\dot{A B}$, and ahtitule DE; find XY a mean proportional between $A B$ and DE, (hy problem 55.) and XY thall be the fide of the fquare required.

For fince by confluction $\mathrm{AB}: \mathrm{XY}:: \mathrm{XY}: \mathrm{DE}$, therefore, $\mathrm{XY}^{-\frac{1}{2}}=\mathrm{AB} \times \mathrm{DE}$ (8.4.) $=$ parallelogran ABCD (5.4.).

Next, fet ABC be a given triangle (fig. 113.) BC its bafe, and AD its altitude; find XY a mean proportional between half the baife and the altitut, and $X Y$ thall be the fide of the fquare required.

For fince $\frac{1}{7} \mathrm{~B}: \mathrm{XY}:: \mathrm{XY}: \mathrm{AD}$; thacfore (8. 4.) $\mathrm{XY}^{\mathrm{r}^{2}}=\mathrm{LC} \times \mathrm{AD}=$ triangle $\mathrm{ABC}(6.4).$.

## Promatiolilit.

Upon a given line EF, to conftruct a rectangle Fiz. $\mathrm{m}_{\mathrm{q}}$. EFGX equivalent to a given reCangle ABCD ).
Find a fourth proportional to the three lines Ef, AE and AD; (by problem 14.) diaw EX perpendicular to EF, and equal to that fourth proportional, and complete the rectangle EFGX, which whill have the magnitude required.

For ince EF: $\mathrm{AB}:: \mathrm{AD}: \mathrm{FX}$, therefore (8. 4.) $\mathrm{EF} \times \mathrm{FX}=\Lambda \mathrm{P} \times \Delta 1$, that is, the rectangle EFGX is equal to the rectangle $\triangle B C D$.

## Sthontur.

As the form of reafoning by which it has been then ! that an equiltseral hexagon inforibed in a circle is aifo equingula, wil apply alke to any equilateral pois gon; it n:qy he inferred, that every equilatemal puly gon imfribed in a circle is allo c, piangular.

## Problem XXIII.

To infuribe a regular pentagon in a given circle. Forn.
Dr iw any radius $A O$, and divide it into two parts $A F, I^{\prime \prime}$, fuch, that $10: \mathrm{OF}:: \mathrm{OF}: A \mathrm{~F}$; (16.) from i phace A $G$ in the circumference equal to (I); join OG, and dras the chond IHE perpendicular to OG, the chord $A B$ wail be a fide of the jentigun re. quired.

Iom $\operatorname{Bi} F$, and becaufe $10: O F:: O F: A F$, and that $A G=(1 F$, thereforc, $A O$ : $A G: A G: A F$; now the ang'e $A$ is common to the tno triangles $\cup A G$, G. 1 F , and it has been thewn that the fiden about that angle in the two thangle are proportionals ; theretore (22.4.) the trimgles are fimilar, and the trianele 10G being ifofcele, the triangle AGF in ato in fceles; fothat $A G=G I$; but $A G=F O$, by comtiour. tion) therefore, $\mathrm{GF}=\mathrm{FO}$, and the anme $\mathrm{FOG}=\mathrm{F}^{\prime} \mathrm{G}()$,
 $F(i), 23.1$. and $A 1 G=F A G$, thereture, $R \therefore G=$ 2 FOG; hence in the infteles triangle - 10 G, whot the atugles at the betfe is double the vertical AUG, theretore the fum of atl the angles is apua: is five times the wertisal angle $A() C$; but the fum ... ..: the angles is equat to tho right angle, (23. 1.) the: Fore the angle $\Delta O G$ is me-fitth of the tifh ... ${ }^{1}$
 right angles equil ons-inteh of har rigit ang: : fore the arch $A B$ in onesefith of $i^{t}$ ande cifoes

## Problen XXIV．

Having given ADCD，\＆c．a regular polygon in－ feribed in a circle，to defcribe a regular polygon of the iame number of fides about the circle．

Draw GHa angent to the circle at T the middle of the arch $A B$ ；do the lame at the middle of each of the other arches $\mathrm{BC}, \mathrm{CD}$ ，\＆c．thefe tangen than form a regular polygon GHIK，\＆c．defcribed about the circle．

Join OG，OH，\＆ic．alfo OT and ON．In the tri－ angles $\mathrm{OTH}, \mathrm{ONH}$ ，the fide $\mathrm{OT}=\mathrm{ON}$ ，and OH is common to both，and OTH，ONH，are r itht angles， therefore the thiangles are equal（17．1．）and the

E T in Y．
an： $\mathrm{TOH}=\mathrm{NOH}$ ；now B is the middle of the of the an IN，there fore OH pafies through B ；and in the Dindrature Fane instumer it appears that I is in the line OC produ－of the cut，sc．Now becaue OT bifects the arch AB it is Circle． permicular to the chord AB （6．2．），therefore GH is，wallicl to 1 B （ 9. ．．and IS．1．），and HI to EC， ther iore the ang＇e $\mathrm{GHO}=\mathrm{ABO}$ ，and $\mathrm{IHO}=\mathrm{CBO}$ ， and hence $\mathrm{GHI}=\mathrm{ABC}$ ；and in like manner it ap－ pears，that $\mathrm{HIK}=\mathrm{BCD}$ ，\＆c．thee efore the angles of the circumfcribed folygon are equal to thofe of the inferibed polygon．And becaute of the prallels，GH ： $\mathrm{AB}:: \mathrm{OH}: \mathrm{OB}$ ，and $\mathrm{HI}: \mathrm{BC}:: \mathrm{OH}: \mathrm{OB}$ ，there－ fore， $\mathrm{GH}: \mathrm{AB}:: \mathrm{HI}: \mathrm{BC}$ ；but $\mathrm{AB}=\mathrm{PC}$ ；there－ fore $\mathrm{G}: f=\mathrm{HI}$ ．For the fame raten $\mathrm{HI}=1 \mathrm{~K}, \& \mathrm{c}$ ． thercfore，the polygon is regular，and imilar to the in－ fcribed polygon．

## SECT．VI．OF THE QUADRATURE OF THE CIRCLL．

Iif．120．IF ABC be an arch of a circle，and $\mathrm{AD}, \mathrm{CD}$ be tho tangents at its extremities，interfeating each other in D ；the fum of the tangents $\mathrm{AD}, \mathrm{IC}$ is greater

Fis． 12 s ． than the arch ABC．
Cor．Hence the perimeter of any polygon defcribed about a circle，is greater than the circumference of the circle．

## Profosition I．Theorem．

Fig．nig．Equilateral polygons，ABCDEF，GHIKLM，of the fame number of fides inferibed in circics are fimilar，and are to one another as the fquares of the radii of the circles．
As each of the polygons is by hypothefis equilateral， it will alfo be equiangular（Schol．22．5．）．Let us fuppofe，for example，that the polygons are hexazon．； then，as the fum of the angles is the fame in beth，viz． eight right angles（ $2: 1$. ．），the angle $A$ will be one－ fixth part of eight right angles，and the angle $G$ will be the fame ；therefore $A=G$ ；in like manner $B=H$ ， $\mathrm{C}=\mathrm{K}, \& \mathrm{C}$ ．and as the figures are equilatera！， AB ： $\mathrm{GH}:: \mathrm{BC}: \mathrm{HI}:: \mathrm{CD}: 1 \mathrm{~K}$, \＆ c ．therefore（2．def．4．） the figures are fimilar．Diaw AO，BO，GP，HP to the cen：tres of the circ＇es；then，becaule the angle AOB is the lame part of four right angles that the arch $A B$ is of the whole circumference；and the angle GPH the fame part of four right angles that GH is of the whole circumference（13．2．）the angles $A O B$ ， GPII are each the fance part of four right ancles； therefore they are equal；the ilofeles triangles $A O B$ ， GPH are thirefore fimilar，（22．4．）and confequently $\mathrm{AB}: \mathrm{GH}:: \mathrm{AO}: \mathrm{GP}$ ，thercfore（9．and 27．4．）po－ ly ${ }^{\text {on }}$ ABCDEF ：polygon GHIKLM ：： $\mathrm{AO}^{2}$ ：GP²．

## Prop．Il．Theoren．

fig．1：1．A circle being given，two fimilar polygons may be foom，the one infribed in the circle，and the other defcribed ：bout it，which fhall differ from each wher by a pace lefs than any given face．
Lu：IG be the fide of a aquare equal to the given frace；and let ABG be f．ch an arch of the given cir－
cle，that $\Lambda G$ is its chord．Bifect the fourth part of the circumference，（5．5．）then bifect one of its halves， and proceed in this manner，till，by repeated bifec－ tions，there will at length be found an arch $A B$ lefs than AG．As the arch thus found will be contained in the circumerence a certain number of times exacily， its chord AB is the fide of a regular figure infcribed in the circle；apply lines in the circle，each equal to $A B$ ， thas forming the regular figure ABC, \＆c．and defribe a regular figure DEF，\＆ic．of the fame number of fides about the circle．Then，the excefs of the circumicri－ bed figure above the infcribed figure fhall be lefs than the fquare upon $A G$ ．Fur draw lines from $D$ and $E$ to $O$ the centre；thefe lines will pafs through $\Lambda$ and $\mathrm{B}(24.5$.$) ；alfo，a line drawn from \mathrm{O}$ ，to H the point of contact of the line DE，will bifect $\triangle \mathrm{E}$ ，and be perycndicular to it；and $A B$ will be arallel to DE．D：aw the diameter AL，and join BL，which will be parallel to HO （18．4．）．Put P for the cir－ cumicribed polygon，and $p$ for the infcribed polygon ； then，becaule the triangles ODH，OAK are evidently like parts of P and $\mathrm{t}, \mathrm{P}: 力: \mathrm{ODH}: \mathrm{OAK}$（ I .3. ）； but the triangle，OnH，OAK being fimilai， ODH ： $\mathrm{OAK}:: \mathrm{OH}^{2}: \mathrm{OK}^{2}(25.4$ ），and on account of the fimilar trianhe OAK ，LAB，OA ${ }^{2}$ or $\mathrm{OH}^{2}$ ： $\mathrm{OK}^{2}:: \mathrm{LA}^{2} \mathrm{LB}^{2}$（2 2 and 9．4．）；therefore， $\mathrm{P}: p:$ ： $L \lambda^{2}: L B^{2}$ ，and by divition and invertion， $\mathrm{P}: \mathrm{P}-\mathrm{p}:$ ： $\mathrm{LA} \mathrm{I}^{2}: \mathrm{LA}^{2}-\mathrm{LB}^{2}$ ，or $\mathrm{AB}^{3}$ ；but $\mathrm{LA}^{2}$ ，that is，the fquare deferibed about the circle，is greater than the equilateral polygon of cisht tides defcribed about the circle，becauf it contains that polygon，and for the fame reafor the polygon of eight fides is greater than the pulygon of fisteen fides，and fo on；therefore LA ${ }^{2}$ $>\mathrm{P}$ ，and as it has been prosed that $\mathrm{P}: \mathrm{P}-\mathrm{p}::$ L． $\mathrm{A}^{2}$ ： $A B^{2}$ ，of which propotion，the firt term $P$ is lefs than the third L．A ${ }^{3}$ ；therefure（2．3．）the fecond $P \rightarrow p$ is lefs than the fourth $\mathrm{AB}^{3}$ ，but $\mathrm{Ab}^{2} \angle \mathrm{AG}^{3}$ ，therefore $\mathrm{P}-\mathrm{p}<A \mathrm{G}^{2}$ ．

Cor．1．Becaufe the po＇ygons P and $p$ difier frum one another more than either of them diffes from the cifc：－，the dificrence betwen each of them，and the circle，in lefs than the given fipace，viz．the fipuare of AG．And therefore，howcte：tmall any firace may

 any polygon that can ut decioned about it, is ugh. at to the circle itfel.

## Prop. III. Thoria.

Fig. ar. The area of any circle is equal to a rectangle contrained by the radius, and a fright line equal to hall the circumference.
 ed in the circle, and DLF, ser. a Charon lescribed about i: ; can: lots from the caremitien of $A B$ and DE ante or rh puls an : $O$ the cert er ; and le: OKH be pratedion'r to the e fides. Pat P for the perimeter bi the polygon DEF, \&c. and $p$ for the perimeter of the po'yena AbC , sic. and $n$ for the number of the tide of each. Then, became $n \times \mathrm{DE}$ $=\frac{1}{2} \mathrm{P}, n \times 1 \mathrm{DL} \times \mathrm{OH}=\frac{1}{\mathrm{I}} \mathrm{P} \times \mathrm{OH}$, but: $n \times \frac{1}{2} \mathrm{DE} \times$ $011=n \times$ trims. DOE $=$ poly $\operatorname{DEE}$, \&r. there-
 manner it appears, $t^{\prime \prime} \pm \mathrm{P} \times \mathrm{OK}=$ poly mon ABC , Sic. Now let $O$ dense the ciocumetence of the
 fore $\frac{1}{2} \times \mathrm{OH}>2 \mathrm{OK}$, that is $2 \times \mathrm{OH}$ is rester than the informed polyum. Again, becaule : O
 i, $\frac{1}{2} 0 \times O H I$, left than the circumaribed poly: Tans it appear that $\frac{1}{2} \mathrm{O} \times \mathrm{OH}$ is greater than any ! ofy on infcribed in the circle, bet left than any polys.ng described about it ; therefore, $: 0 \times \mathrm{OH}$ is equal io the circle (2.)

## Prom. IV. Theurent.

Having given the area of a regular polygon imerib- F o. , ed in a circle, and wino the area of a fimilar polyon deformed about it ; to find the areas of regular inferibed and circumferibed polygons, cochin of double the number of fides.
LiI AB lie the fade of the given inferibed poly ger, and $E F$ pale to $A B$ the of the fimilar circurferibed pollen, and C the centre of the circle; if the chord All, and the tangents AP, BQ be dawn, the chord ANt shall be the eide of the inferibed polygon of double the umber of ide; and Po or 2 PAI that of the frilat circumierited pols con. Put A for the ares of the polygon, of which $A B$ is a fides, and $B$ for the area of the circumferibed polygon : aldo a for the area of the poling of which Ais is a tide, and $l$ for the area of the fimilar circumscribed pulywon ; then A and B are by hypothesis known, and it is required to fond $a$ and $b$.
I. The triangles AC D, ACMI, which have a common vertex $A$, are to one another as their bales CD. C.1, Lefice the fe triarchy are to one another a the polygron, of wia'ithey fum like parts, therefore $A: a$ : CD :CN. The triangles CA<compat>ᄀ, C.IE, which have a common vertex 2.1 , are to each other as their bales $C A$, CE; they are alto to one arother as the polygons $a$ and B , of well they are like parts; therefore, $a: \mathrm{B}:: \mathrm{CA}$ CL ; hut because of the parallels DA, ML, CD : CM

C $1: \mathrm{CE}$; therefore, $\mathrm{A}: a:: a: \mathrm{B}$; therefore, the poly ron $n$, which is one of the two required, is a mean. proportional between the two known polygons $A$ and B, fo that $a=\sqrt{\mathrm{A} \times \overline{\mathrm{B}}}$.
II. The triangles CFMI, CPE, having the fame antitube CMI, ate to one souter ::s PM to PL. But: :s CP :ifects the ante MCE, PM : PE: C NI: CE

 $A+a: 21$; but CN1: an = CPA 1, or CN1P 1 , are
 :re ohepro : ib:
 lat af as in the progun $b$ is detomind ; that is $l=\frac{2 A \times B}{A+a}$.

## Prot. MI. P'mbifu.

To find nearly the ratio of the circumference of a circle to ito dime sta.
Life the rails of the circle $=\mathbf{1}$, then, the fake
 and ed triangle of wish the radii ate the fake
. As, sic aca of the infribed fyuare will be $2 ;$ $(13.4$.$) and the ciscunferibed fruare, teing the tquat$ aft.e diameier, will be + . ミon, retiring t' eno: : on uflot probien, if we mate $A=2$ anc $=$, the tomatio $a=\overline{{ }^{\prime} A \times B}, l=\frac{2 A \times B}{A+d}$ give un $a=2.8: 8+27$, , $\delta c$.
 Esc. the area of the circumparied oramun. Iy unht
 $B$, we that obtan the in as the inkrited and chrcumforibins polyons of 16 . des; and th nce we $m$ y find thofe if 3 -rides, and fu war in the funuwing table:

| No eficicts. | Ins. Pulygrons. | Circ. Pulusons |
| :---: | :---: | :---: |
| 4 | 2.0000000 | 4.0000000 |
| 8 | 2.8.84271 | 3 3137=85 |
| 16 | $3.661467+$ | 3.18259 .9 |
| 32 | $3.1214+1$ | 3.1517249 |
| $6_{4}$ | 3.1365485 | $3.144^{119} 4$ |
| 128 | 3.14:3.3:1 | $3.1+322: 6$ |
| 2,6 | 3.1412772 | 2.14-504 |
| 512 | $3.1+15138$ | 3.1.16:21 |
| 1024 | 3.1415729 | $3 \cdot 1+16=25$ |
| 4295 | 3.1 1 + | $3.1 \quad 15933$ |
| 8192 | 3.141593 | 314159:8 |
| 16384 | $3 \cdot 1+15925$ | $3 \cdot 1+159=7$ |
| 32-68 | 3.145926 | $3^{1}+159=6$ |

Hence it apyears that areas of a recular polygen of 32768 fides inicribed in the cincle, and of a lini-
1.r polygon defcribed about it, difier fo ticte from wher other that the numbers whin expret them a : Whe fame as far as the eightl decimal pace. A.d an the cincle is sreater than the one polygon, and 1ल than the reler, its azea will te rear? $3.1+15926$. Bat the area is the product of the radius and the half of the cirnmer-loce; therefore, the radius leing unity or halt the circumference is $3 \cdot 1+1.926$ nearly ; and the radius is to half the circun-ference, or the ciancter is to the circumference, nearly as 1 to $3.1+15926$.

## Scholicm.

In this way the ratio of the dimeter to the circumference may be found to any degree of accuracy ; but nei ee by this, not ny other method yet bnows, can the ratio be evactly determined.

Aremivides ty means of inferibed and circumferibed polygors of 95 fides, found that the diameter is to the circunference as 7 to 22 , nearly, which ratio is nearer to the truth than can be capretted by any fmaller numbers; and Merin's found it to be more rearly as 113 to 355 . Both of thefe exprefions are convenient on account of the fmallnefs of the numbers, but later mathematicians have carried the approximation to a much greater degree of accuracy. Thus, it has been found that the diameter being $i$, the circumference is greater than $3.1+15926535895032$, kut lefs than the fame number having its lat figure increafed by unity; and tome have even had the patience to carry the approximation as far as the 150 th place of decimals.

## SECT. VII.

## DFFINITION.

1. Aftraight line is perpendicuior, or at right angles, to a plane, when it is perpendicular to every itraight line mecting it in that plane. The flane is ato perpendicular to the line.
II. A line is farallit to a plane, when they cannot meet each cther, althow h buh be produced. The plane is alfo parallel to the line.
III. Parallel planes are fuch as cannot meet each other, though produced.
IV. It will be demonsrated (Theor. 3.) that the common fection of two plancs is a itraight line; this being premifed, the inclination of two planes is the angle contained by two deraight lines drawn perpendicular to the lime, which is their common fection, from any point in it, the one ferpendicular being draisn in the one flane, and the other in the other plane.

This angle may be cither acute or obtule.
V . If it be a right angle the two planes are perpendicular to each other.
VI. A folid argle is that which is made by the meeting of more than two plane anglen, which are not in the fame $j$ lane, in une point. Thus the folid angle $S$ is formed by the plate angles ASB, BSC, CSD, DSA.

## Theorim 1.

One part of a ftraight line cannot be in a plane and another part above it.

For from the definition of a plane (7. def. r.) it is manifett that if a traight line coincide with a plave in two points it mult be wholly in the plane.

## Theonem II.

Two ftraight lines which cut each other in a plane determine its pofition ; that i., the plane can coincide with theie lines only in one pofition.

Plate CXLIV. Fig. 123 ,

LET the ftraight lines $A B, A C$ cut each other in A ; conceive a 1 lane to pafs throunh $A K$, and to te turned about that live, till it paf, through the point $C$; and this it can maniferly do only in one pofition; then, as the points $A$ and $E$ are in the plone, the whole line $\Lambda \mathrm{C}$ mall be in the plane; thenefore there is only one puftion in which the phane can concide with the fame two lines $A P, A C$.

Cor. Therefore, a triangle ARC, or three points A, $B, C$ not in a ftrai he line, detcranine the polition of a plane.

## Theorem III.

If two planes $\mathrm{AB}, \mathrm{CI}$ ) interfect each other, their fig. $\mathrm{I}_{2}$. interfection is a ftraight line.

Lry E and F be tho points in the line of common fection, and let a tiraight line E.F be drawn between them; then the line EF muft be in the plane $A B$,
(7. def. 1.) and foe tome line mut alio be in the fame plane CD, theretuse it matt be the common fection of them both.
Theorev: IV

Fig 125. If a Atraight line $A P$ is perpendicular to two ftraight lines $P B, P C$ at 1 ' the point of their interfection; it will alfo be perpendicular to the plane MN, in which thefe lines are.
Draw any other line $P Q$ in the plane $M N$, and from $Q$ any $\Gamma^{\text {cint }}$ in that line draw $Q D$ parallel to PB; make $D C=D P$; join $C Q$, meeting PI in $B$; and join $A B, A Q, \Delta C$. Becaute $D Q$ is parallel to $P \mathrm{P}$, and $\mathrm{PD}=\mathrm{DC}$; therefore $\mathrm{BC}=\mathrm{C}$, and BC is bifecied in $9:$ Hence in the tiangle $\widehat{\mathrm{BAC}}$,

$$
A B^{2}+A C^{2}=2 A Q^{2}+2 B Q^{2},(16 .+)
$$

and in the like mamer, in the triangle PBC ,

$$
P E^{3}+P C^{2}=2 P Q^{2}+2 C Q^{2}
$$

thorefre taking equal quantities from equal quantities, that is, fiberacting the two lat quantities, which are put eq 22l to each. other, from the two firlt, and oblerving, that as $A P B, A P C$ are by hypothefis right-angled triangles, $A \Sigma^{2}-\mathrm{BP}^{2}=A \mathrm{P}^{2}$, and $A C^{2}-C F^{2}=A P^{2}$, we have

$$
A P^{2}+A P^{3}=2 A Q^{2}-2 F Q^{2}
$$

and therefore $A P^{2}=A Q^{2}-P Q^{2}$, or $A P^{2}+P Q^{2}=A Q^{2}$; therefore the triangle $A P Q$ is right-angled at $P$, (fhol. 15.4.) and confequentiy AP is perpendicular to the plane MN (Det. 1.).

Cor. 1. Tlie perpendicular AP is thorter than any oblique line $A Q$, therefore it meafures the diftance of the point A from the plane.

Cor. 2. From the fame point P in a plane no more than one perpendicular can be drawn. For if it be poifible that there can be two perpendiculars, conceive a plane to pafs through them, and to interfect the plane IIN in the Atraight line PQ; then thefe perpendiculars will be in the fame plane, an 1 both perpendicular to the fame line PQ , at the fame point P in that line, which is impoffible.

It is alfo impoffible that from a point without a plane :wo perpendiculars can be drawn to the plane; for if the ftraight lines AP, AQ could be two fuch perpendiculars, then the trianole APQ would have two right angies, which is impoffible.

## Theorem V.

E: 125 . If a ftraight line AP be perpendicular to a plane MN, every itraight line DE parallel to AP is perpendicular to the fame plame.
Let a plane pafs through the parallel lines AP, DE, and interfect the plane MN in the line PD ; through D) draw BC at right angles to PD ; take $\mathrm{JC}=\mathrm{DB}$, and join $P B, P C, A B, A C, A 1$. Becauf $D B=D C$, therefore $\mathrm{PB}=\mathrm{PC}$; (cor. . 1.) and becaufe AP is perrendicular to the plane MN , fo that $\triangle \mathrm{PB}, \triangle \mathrm{AC}$ are right angles, $A B=1 C$ (cor. 5.1.) thercfore $A B C$ is an ilofceles triangle; and ance its bate BC is bifected at $\mathrm{D}, \mathrm{BC}$ is perpendicular to AD ; (fchol. 11.1.) but by contruction BC is perpendicular to PD : therefore (4.) Yoi. IX. Part II.

E ' F Y.
LC or BD is perpendicular to the plane pafing theroer the lines AD and PD , or $A \mathrm{P}$ and DI:; hence 11 ) is perpendicular to DE , but PD ) is allo perpendwula to $\mathrm{DE},(19.1$.) therefore DE is perpundicular to ze two lines DP, DB ; and therefore it is perpendiculat to the plane MN pafligg through them.

Cor. 1. Convertely, if the fleaight limen $.11, \mathrm{DE}$ are perpendicular to the tame plane $M N$, thes are ps rallel ; for if not, throush D draw a parallel to AP; this parallel will he perpendicular to the plane AN (by the theorm) therefore, from the fa:me point 1) two perpendiculars mas be cramn to a plane, which is impoiftible (4.).

Cor. 2. '1 wo ftraight lines A and B which are paral. lel to a third line $C$, though not in the fame plane, are parallel to each other. For fuppofe a plane to be perpendicular to the line $C$, the lines $A$ and $B$ parallel to this perpendicular are perpendicular to the fame plane; therefore, by the preceding corollary they are parallel between thermielves.

## Theorem VI.

Two planes MN, PQ , perpendicular to the fume Fig. r:ftraight line $A B$, are parallel to each other.
For, if they can meet each other, let O be a point common to both, and join OA, OB; then the line AB , which is perpendicular to the plane MN, muft be perpendicular to $A O$, a line drawn in the plane AN from the point in which AB meets that plave. For the fame reafon AB is perpendicular to BO ; therefore, $\mathrm{OA}, \mathrm{OB}$ are two perpendiculars drawn from the fame point O , to the fame itraight lize AB , which in impotible.

## Theorem Vil.

The interfections EF, GH of two para'lel planes Fig. rix, MN, PQ with a third plane FG, are parallel:

FOR if the lines EF, GH, fituated in the fame plane, are not parallel, they mult meet if produced ; therefore, the planes MN, PQ, in which they are, mult alfo meet, which is contrary to the hypothefis of theibeing parallel.

## Theorev Vill.

Any firaight line $A B$, perpendicular to MN one of $\mathrm{F}_{2} \mathrm{I} .12 \%$ two parallel planes $M \mathrm{~N}, \mathrm{PQ}$, is alfo perpendicular to $P Q$ the other plane.
From $B$ draw any flraight line BC in the plane $P($, and let a plane pafs through the lines $A B, B C$, and meet the plate ANN in the line AD, then AD will be parallel to $\mathrm{BC},(7$.$) and tince \mathrm{AB}$ is perpendicular to the plane MN, it mult be perpendicular to the line AD, therefore, it is alfo perpendicular to BC ; (19.1.) hence (Def. 1.) the line AB is perpendicular to the plane PO.

## Thiorem IX.

Parallel ftraight lines EG, FH, comprehended be- Fig. in . tween two parallel planes MN, $\mathbf{P}^{\prime} \mathbf{Q}$, are equal.
Laf.1 a plane pafs through the lines EG, FH, and 10 m".. taee: tie farcici thes in EF and GH; then EF and GH are partlel (\%) as well as EG and FH; therefore, EGHE is a frrallelogrom, and $E F G=H$.

Cor. Hence two parailel planes are everywhere at the fame ciatuace from each other. For, if EF and (BH are perpendicul. r to the two plancs, they are parallel, (1, cor. 5.) therefore they are equal.

## Titorim X .

If two ftraight lime C. . EA, meeting one another, be parallel to two other lines DB, FB, that meet ene another, though no in the fime plane with the firft two; the firlt twe and the other two thell contain equal angles, and the phane pafing through the frit two thall be parallel to the plane paifing through the other two.
TAEE $A C=B D, A E=B F$, and join $C E, D T, ~ A B$, CD, EF. Decaute $A C$ is equal and parallel to BD , the figure $\triangle \mathrm{BDC}$ is a parallelogram; theretore, CD i. cfra, and parallel to 1 B . For a dimilar reaton EF is equal and paralle! to $A B$; therefore alfo $C E$ is equal and parallel to DF ( 2 cor. 5 . and 28. 1.) ; therefore the triangles CAE, DBF are equal, $(1 \rho, 1$.$) hence tice$ angle CAF. $=\mathrm{DEF}$.
in the fecond place, the plane ACE is parallel to the plane BDE: For fuppofe that the plane parallel to BDF, fafling throu the point $A$, meets the lines CD, EF in any other points than C and E (for example in $G$ and $H$, ) then (c.) the three lines $A B, G D, F H$ are equal; but the three lines $A B, C D, E F$ have been Hewn to be equal : theretore, $\mathrm{Ci}=\mathrm{GD}$, and $\mathrm{FH}=\mathrm{EF}$, which is abfurd, therefore the plane ACE is parallel to B1) F.

## Timeorem XI.

If a Itraight line $A P$ be perpendicular to a phane $M N$, any plane $A P B$, paling through $A P$, fhall be perpendicular to the plane MN.
Let PC be the intu:ction of the planes 1B, MN; If in the plane $N / N$ the line DE be drawn perpendicular to BP, the line AP, being ferpendicular to the plane MN, thall be perpucticular to each of the ftraight lines $\mathrm{EC}, \mathrm{DE}$; therefore the angle $\triangle \mathrm{PD}$ is a right angle; now PA and PD are dawn in the planes AB, MN jerpendicular to their common fection, therefore (5. Dei.) the plase $A B$, MN are perpendicular to each cher.

## Senotius.

When three itraight lines, fuch as AP, BP, DP, are perpendicular to each other, each is perpendicular to the plane of thetwo other lines.

> Thmonem X1I.

Fer 1.0. If the plame AB is perpendicular to the plane MN ; and in the plane $A B$ a ftraight line $P A$ be dsawn perpendicular to BP, the common interfection of the planes, then thall I'A be perpendicular to the plame MN.
For, if in the plane MN, a line PI) he drawn perpendicular to PB , the angle $\triangle \mathrm{PD}$ thall be a right angle, becaufe the planes are perpendicular to each other, thereture, the line AP is perpendicular to the th,
$\mathrm{E} \quad \mathrm{T} \quad \mathrm{r}$.
sea. VII.
lines $P B, P D$, theretot it is perpendicuiar to their plane MiN.

Cus: If the plank $A B$ be perpendicular to the flane IIN, and from any point $P$, in their common interteetion, a perpendicular be dawn to the plane MNS; this ${ }^{\prime}$ crpendicular thall be in the phane AB; for if it is not, a perpendicular AP may be dramn in the plane A3 to the common interfection 1.P, which will be at the fame time perpendicular to the plane MN; therefore, at the tame point $P$, there may be two perpendiculats to a plane NM, which is impuinble (4.).

## Theorem XII.

If two planes $A B, A D$ are perpendicular to a third, $F g \cdot I=$ their common interfection $A P$ is perpendicular to the thind planc.
For, if through the pont P , a perpendicular 1 . eramn to the plane $M N$, this perpeodicular thatil be in the plane All, and alio in the plane AD, (ct. 12.) therfore i is at their common interlection al ${ }^{2}$.

## Thiorem XIV.

If two ftraight lines be cut by parallel planes, they rig. isr. thall be cut in the fame ratio.

Let the line AB meet the plancs MN, PQ, RS in $A, E, B$; and $k: C D$ meet them in $C, l, D$, then thall AE:EB :: CF : FD. For draw AD mecting the plane $P Q$ in $G$, and join $A C, E G, G F, B D$; the lines $\mathrm{EG}, \mathrm{Bi}$, being the common fections of the plane of the triangle $A B 1$ and the parallel planes $\mathrm{PQ}, \mathrm{KS}$, are parallel (7.) and in like manner it appeare, that AC, GFare parallel; therefure $\therefore \mathrm{E}: \mathrm{EB}(:: \Delta \mathrm{G}: \mathrm{GD})$ : CF:FD.

## Theorma XV.

If a folid angle be contained by three plane an- Fig. $13 z$ eles, the fum of any two of thefe is greater the thind.
$I_{r}$ is evidently only necefory to demontrate the theorem, whea the plain angle which is compared with the lum of the other two is greater than either of them; for, if it were equal to or lef than one of them, the thitorcm would be matifeft : thereiore let $S$ be a folid angle formed hy three plane angles ASB, ASC , BSC, of which ASB is the greatert. In the phame ASB make the angle $\mathrm{BSD}=\mathrm{BSC}$; draw :any thaight liac ADB , and having taken $\mathrm{SC}=\mathrm{SD}$, jun IC , BC ; the triangles BSC, BSD having two dides, :nd the :ncluded angle of the one equal to two fidee, and the included angle of the other, each to each, are equal (5.1.), therefore $\mathrm{BD}=\mathrm{BC}$; now $A B \angle \mathrm{AC}+\mathrm{BC}$, therefore, taking BD from the firit of thele unequal quantie, and BC from the fecond, we get $A \mathrm{D} \angle \mathrm{AC}$; and as the tiangles $\therefore S D$, $A S C$ have $S I=C$, and $S I$ common to hoth, and $A D .-A C$, therefore (9.1.) the angle $A S 1)<A S($; and, adding DSB to the one, and CSB to the other, $A S B<A S C+B S C$.

## Thiorem XVI.

If each of two folid angles be contained by three Fig. fi,3. plane

Oi So:ids bou ded by Plane:.
plane angles equal to one another, each to each, the planes in which the equal angles are, have the fame inclination to one another.

LET the angle $\mathrm{ASB}=\mathrm{DTE}$, the angle ASC $=\mathrm{DTF}$, and the angle $\mathrm{BSC}=\mathrm{DTF}$; the tho plane $15 B, A 5 C$, thatl have to each other the fame inclina. time as the two planes DTE, DTF.

The A aty point in S.A, and in the two planes $A S B, A S C$, daw $A B$ and $A C$ perpendiculars to $A 5$, then (iff. 4.) the angle EAC is the inclination of thefe planes; again, take TD $=$ S. 1 , and in the planes TDE, TDF draw DE and DF perpen diculars to TD, and the angle EDF thall be the inclination of thele Uther planes; join BC, EF. The triangles ISB, DTE have the ide $A S=D T$, the angic $S A B=1 D E$ and $A S B=D T E$, therefore the triangles are equal, and thes $\mathrm{AB}=\mathrm{DE}$, and $\mathrm{SB}=\mathrm{TE}$ : In like manner it atperars that the triangles $45 C, D T F$ are equal, and therefore, that $\mathrm{AC}=\mathrm{DF}$, and $\mathrm{SC}=\mathrm{TF}$. Now the riangles BSC, ETF, having $B S=T E, S C=T F$, and

## F T I Y.

$B C=E E$; but it has been thern that $A B=D F$, and buan at:
that $1 C=\mathrm{DF}$; therefore the trimele. B. IC, LDF Phen. are enual, and corferpently the ange D.AC=LDO ; that i, the inclination of the plance $A$ SB Nol 1 CC : Hal to the incination of the phanes DPE and DIF. It the fime manner it may be proved that tice otho fhas have the tome machation to one anather.

S* Colicm.
If the three phane andes which cortain the fuin! angles, are equal enh to exch, and ir betide the ar cles are alio difle tod in the finme ordir in the tho twlid angles, thea thefe andos when applied to one anothes will coincinde, and be equal. But if the plane ande be difperid in a contrary order, the folid angle will 1:ot coincide, whough the theorem is equatly true is
 sjminetrical anghes.

## SECT. VIII. OF SOLIDS BOUNDED BY PLANES.

## Definitions.

1. A Sozid is that which has length, breadth, and thicknes.s.
II. A Prifon is a folid contained by plane figures, of which two that are cypofite are ectual, fimilar, and parallet ; and the others are parallelo rams.
Fig. 134.
To comltruct this folid, let ASCDE be any polygon; if in a plane paraliel to ABC there be dra:n ftraight lines FG, GH, HI, \&:c. equal and parallel :o the iales $\mathrm{AB}, \mathrm{BC}, \mathrm{CD}$, sic. fo as to form a polygorn FGHIK equal to ABCDE, and fraight lines AF, BG, CH, \&c. be drawn, joining the vertices of the homologous angles in the two planes; the planes or face ABGF, BCHG, \&c. thus formed will be paallelograme; and the folid ABCDEFGHIK contained by thefe pefallclograms ard the two polygons, is the priin i: felt.
2. The equal and parallel polygons ABCDE, FGHIK are called the Bafes of the prim, and the distance Letween the bafes is its Aititude.
IV. "hen the bafe of a piim is a parallelogram, and comequently the figure has a: 1 it, fuces parallelugrans, it is called a parallelopped. A parahlelopiped is reabysular when all its faces are rectanglo.
V. A Cute is a rectangular parallchopiped contained by ins equal fipares.
VI. A Pyramid is a folld contained by feveral planes, which meet in the fame point -1 , and terminate i: a polygonal plane BCD.
VII. The polygon ALCDE is callal the Bafe of of the pyramid; the point $S$ is it $l^{\prime}$ 'reer, and a perperdicular let fall from the vertex upon the bafe iv callid ins Altivude.

WII. Two folide are fimilier, "hen ally are con: wined by the fame number of fimilar plane, fimilaty froted, and having li.e inclination to whe ancther.

Theoreal.
Two prims are equal when the threc phates which y contain a folid angle of the one are equal to the three planes which consain a fold angh of the other, each to cach, and are fimilarly thtuated.

LeT the bafe ABCDE be equal t., the bafo a' che the paralielogram ABGI equal to the parailelozam abgf, and the parallelogram BM HG curl to tho pa:allelogram $b c h_{g}$; the prim ABCI that be tani to the prilim abci.

For let the bafe ABCDE be aptlied to its equal the bafe abcd, io that they may cuincide with each other ; then, as the thrce plane angles which: form the folidatale B are equal to the three plane anghe which form the angle $b$, each to cach, viz, $\operatorname{ABC}=a b$ c $A B G=a \%$, and $G B C=b c$, and as thete argles are fimilarly fitaated, the folid angles $B$ and $b$ are uqual ( 15.7 . ' therefore the fide BG hall fall unery the fide

 namaner is may be hawno that (iH folly upun 5/, therefore the uppler bate FGHIA coincidon entirn with it equall $f$ hite, and the two fulid coincide with. ewh otlier, or wer givy the fame fpace, therefore the pritims are equal.

## Se 1407:1:" 1.

A : ifm is entirely deverniond, when it, bite APCDE is hown, and its odge lig is given in meos. nitule an! protions ; for if throu h the point (B, GJf daan enoal and parallel to $A B$, and GH chan ..... baiallel to BC, and the malyon FGHAK be dacio. ed equal to AP(1)! '2..5.), it is eviden: :ha! + () 2
of Solids points FKI wili have determinate pofitions; therefore numbled any two prifms conlracted with the fame data cannot Pazts $\underbrace{\text { An }}$ be unequal.

## Theorem II.

Nig. 135. In any parallelopiped the oppofite plares are equal and parallel.

Frove the nature of the folid (4. cef.) the bates $A B C D, E F G H$ are equal parallelograms, and their rides are parallel, there ore the planes $A C$, EG are parallel ; and becaufe AD is equal and parallel to BC , and AE is equal and paraliel to BF , the angle DAE $=C B F$, and the plane DAE is parallel to the plane $\mathrm{CBF},(10.7$.) therefore alio the parallelogram D $\triangle \mathrm{EH}$ is equal to the parall-logram CBFG. It may in like maver be demonifrated, that the oppotite parallelograms ABFE, DCGH are equal and parallel.

Cor. IIence, in a paralitlopiped, any one of the fix planes which eontain it may be taken for its bale.

## Thforen 111.

Tif. 136. The plane BDHF, which paffes through two parallel oppofite edges $\mathrm{BF}, \mathrm{DH}$, of a parallelopiped AG, divides it into two triangular prifms ABDHEF, GHFBCD, equal to one another.

For the triangles ABD , EFH, having their fides equal and parallel, are equal, and the lateral faces ABFE, ADHE, BDHF are parallelograns; therefore the folid ABDHEF is a prifm; for like reafons the folid GHFBCD is a puifm. Again, becaufe the plane angles which contain the folid angle at $G$ are equal to thofe which contain the folid angle at A , viz. the angle $\mathrm{FGH}=\mathrm{D} \backslash \mathrm{B}, \mathrm{FGC}=\mathrm{DAE}$, and HGC $=B A E$, the planes in which thefe angles are have the fame inclination to one another, (16.7.) as, however, :hele angles are not difpofed in the fame order, but in a coatrary order, the folid angles eannot be made to coincide with one another, and confequently the prifins cannut he proved equal by fuperpofition, as in Theorem I. Their equality may however be ettablihed by reafoning thus:

The inclination of each of any two adjacent faces of a prifm to the bafe, and the length of an edge being siven, the prifm is evidently reltricted to one determinate magnitude; and it will evidently have the fame magnitude whichfoever of the two fides of the bafe it may fland upon; that is, whether it be conitruated above or below the bafe. Now if the upper bafe FGH ,f the one prifm be applied to the lower bafe DAB of the other, fo that the fides FG, GH, FH may be upon the ficie, $D A, A B, D B$ equal to them, then the prifm GHFBCD will have the poition ABDHEF'; and the two faces $A^{\prime} \mathrm{PF}^{\prime} \mathrm{E}^{\prime}, \mathrm{ADH}^{\prime} \mathrm{E}^{\prime}$ of the prifm below the bafe will have each the fame inelination to it, as the equivalent faces ABFE , ADHE of the prifm above the bafe; and the edge $A E$ is equal to the edge $A E$; therefore the conditions which determine the magnitude of both prifms are identical, and confequently the prifins are equal.

If two parallelopipeds $A G, A L$ have a common ${ }_{F}$ bare $A B C D$, and have their upper bafes in the ${ }_{\text {Fig. }}{ }^{\mathrm{F}} . \mathrm{rl}_{3} 8$. fame plane, and between the fame parallel ftraight lines EK, HL, the two parallelopipeds are equivalent to each other.
Becuvse AE is parallel to BF, and HE to GF, the angle AEI=BFK, HEI=GFK, and HEA $=\mathrm{GFX}$; of thefe; ifix angles the three firit form the folid angle E, and the three others form the folid angle F ; therefore, fince the plane angles are equal each to each, and fimilarly fituated, the folid angles E and F are equal. Now if the prifm AEIDHM be applied to the prifm B/KCGL, fo that their bafes AEI, BYK, which are equal, may coineide with each otier, then, beraufe the folid angle E is equal to the folid angle I, the dide Elf thail fall upon FG, and this is all that is neceflary to prove that the two prim, coincide entiiely, for the bafe AEI and the edge L.Hi determine the prifm AEA1, and the bafe BFK and the edge FG deternine the prifin BFL; therefore the prifm: are equal. But if from the folid AEL, the prim AEM be taken away, here will remain the parallelopiped AlL; and if from the fame folid AEL, the prim BFL be taken away, there will remain the parallelopiped AEG; there fore the parallelopipeds AIL, AEG are equivalent to each other.

## Theoren V.

Parallelopipeds upon the fame bafe, and having the Fis. 139 fame altitude, are equivalent to one another.

LET ABCD be the common bafe of the two parallelopipeds AG, AL, which, becaufe they lave the fame altitude, will have their upper bafes in the fame plane; then, becaule EF and $A B$ are equal and parallel, as alfo IK and AB; EF is parallel to IK, (eor. 2. 5.7.) for a fimilar reafon GF is parallel to LK. Let the fides EF, HG, as alfo the fides LK, IM, be produced, fo as to form by their interfections the parallelogram NOPQ; it is manifett that this parallelogram is equal to each of the bafes EFGH, 1KLM. Now, if we fuppofe a third parallelopiped, which, with the fame lower bafe ABCD, has for its upper bafe NOPQ, this third parallelopiped will be equivalent to the parallelopiped AG, (4.) for the fame reafon the third parallelopiped will be equivalent to the paralhelopped AL, therefore the two paraliclopipeds AG, AL, which have the fame bafe and the fame altitude, are equivalent to one another.

## Theorma Vi.

Any parallelopiped AG is equivalent to a rect- F : $\mathbf{R}_{139}$. angular parallelopiped, having the fame altitude, $\mathrm{I}^{\circ}$. and an equivalent bafe.
At the points $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}$, let $\mathrm{AI}, \mathrm{BK}, \mathrm{CL}, \mathrm{DM}$, be drawn perpendieular to the plane $A B C D$, and termanating in the plane of the upper bafe; then, IK,
of Solids KL, LM, MI, teinc joined, a parallelopiped AI, will bousded by thus be formed, whith will manifelly have its laeral $\underbrace{\text { Planes. faces }}$ 1K, PI., CMI, DI retancles; and if the in ie $\Lambda C$ is allo a rectangle, the folid $A L$ will be a rect. angutar parallelonip: quavaent to the parallopoped AG. But if AECD is not a rectangle, fig. 1 \& .) draw $A O$ and $B$ pernendicular to $C D$, and $O$ O and NP perperdicalar so DC , mecting ML in () and $P$; the fohd $\triangle$ RNOIKP; will matitellity be a rectongular parallehoriped, which will be equal to the parallelopiped AL. for they have the fame bafe ABKI, and the fame altitule, riz. AO; therefore the rectangular parallelopiped $A P$ is equivalent to the parallelopiped AG, (fig. 139.) and they have the fame altitude, and the bafe $\triangle B N O$ of the former is cquivalent to the bafe ABCD of the latter.

## Theorem VII.

Fig. 134. Any fection NOPQR of a prifm, made by a plane parallel to its bafe $A B C D E$, is equal to the bafe.

For the farallels AN, BO, CP contained between the parallel planes $\mathrm{ABC}, \mathrm{NOP}$ are equal (9.7.) ; and thus all the figures $\mathrm{ABON}, \mathrm{ECP} \mathrm{C}$, , \&c. are parallelograms; hence the fide $\mathrm{ON}=\mathrm{AB}, \mathrm{OP}=\mathrm{BC}, \mathrm{PQ}=\mathrm{CD}$, \&c. alfo, the equal fides are parallel, therefore, the angle $\mathrm{ABC}=\mathrm{NOP}$, the angle $\mathrm{BCD}=\mathrm{OPQ}, \& \mathrm{c}$. therefore the two polygons ABCDE, NOPQR, have their fides and anyles equal, each to each; therefore, they are equal.

Two rectangular parallelopipeds $A G, A L$, which have the fame bafe ABCD , are to each other as their altitudes $\mathrm{AE}, \mathrm{AI}$.

Suprose that the altitudes $\mathrm{AE}, \mathrm{AI}$ are to each other as the numbers $p$ and $q$, fo that AE will contain $p$ fuch equal parts as $1 I$ contains $q$. Let AE and AI be divided into $p$ and $q$ equal parts relpectively, and let planes pafs throush the points of divifion parallel to the bale $A$ BCD; thas the parallelopiped AG will be div: ted into $p$ folics, which will alto be parallelopipeds having equal bafes (7.) and equal altitudes, therefore, they will be equal among themfelves; and in like manner the pardlelopiped AL will be divided into $q$ tqual folids; and as each of the folids in AG is equal to each of the folids in AL, the parallelopiped AG will contain $p$ fuch equal parts as the parallelopiped $A L$ contains $q$; therefore the parallelopiped $A G$ will be t. The faral.elopiped $A \mathrm{~L}$, as the number $p$ to the number $q$, that is, as AE the altitude of the former to AI the all:tade of the latter.

## Theorfsi IX.

Fg. 1.;2, 'Two rectangular parallelopipeds AC, $A K$, which have the fame altitude $A \mathrm{E}$, are to each other as their bafes $\triangle B C D, A N N O$.

LIf the two folid, !e placed, the one by the fide of the ofl, r, as reprefented in the figure, and let the plane ONKL b- rooduced, foas to meet the plane DCGH

E T R $\quad$ Y.
in $P Q$, thus forming a third parallelopiped $A O$, which may be compared with each of the parallelopipeds $A G$, AK . The two folids $\mathrm{AC}, \mathrm{A} Q$, having the fame batic $A D H E$, are to each other as their altitudes $A B, A O$, (x.) and, in like manner, the two folids $A \Omega, A K h$, having the fame batc AULE, are to each oher as their ..ititudes AI), AM; that is,

$$
\begin{aligned}
& \text { folit } \mathrm{AG}: \text { fol. } \mathrm{AO}:: \mathrm{AB}: \mathrm{AO} \\
& \text { fol. } \mathrm{AQ}: \text { fol. } \mathrm{AK}:: \mathrm{AD}: \mathrm{AM}
\end{aligned}
$$

$$
\begin{aligned}
& \text { but } 1 \mathrm{~B}: \mathrm{AO}:: \text { tafe } \mathrm{AC}: b a f e \mathrm{AP}(3 \cdot 4 \\
& \text { and } \mathrm{AD}: \mathrm{AM}:: \text { bafe } \mathrm{AP}: b a f e ~ A N \text {, }
\end{aligned}
$$

therefore,

$$
\begin{aligned}
& \text { fol. } \mathrm{AG}: \text { fol. } \mathrm{AQ}: \text { bafe } \mathrm{AC}: \text { bafe } A \mathrm{P} \text {, } \\
& \text { jol. } \mathrm{AQ}: \text { fol. } \mathrm{A}: \text { bafe } \mathrm{AP}: \text { bafe } \mathrm{N} \text {, }
\end{aligned}
$$

therefore ( 7.3 .)

$$
\text { fol. } \mathrm{AG}: \text { fol. } \mathrm{AK}:: l_{a j}: \mathrm{C}: \text { bafo } \mathrm{AN} \text {. }
$$

## Theorem X.

Rectangular parallelopipeds are to each other as Fig . t 2 z , the products of the numbers proportional to their bafes and altitudes, or as the products of the numbers proportional to their three dimenfions.

Let AG be a parallelopiped, the three dimenfions of which are expreffed by the lines $A B, A D, A E$, and $A Z$ another parallelopiped the dimenfions of which are expreffed by the lines $\mathrm{AO}, \mathrm{AM}, \mathrm{AX}$. Let the two folids $A G, A Z$ be fo placed, that their furfaces may have a common angle BAE; produce fuch of the planes as are necellary fo as to form a thitd parallelopiped AK, having the fame altitude as the parallelopiped AG. By the lait propofition

$$
\text { fol. } \mathrm{AG}: \text { fol. } \mathrm{AK}:: \text { bafe } \mathrm{AC}: \text { bale } \mathrm{AN} \text {, }
$$

and by the laft theorem but one,

$$
\text { fol. } \mathrm{AK}: \text { fol. } \mathrm{A} Z:: \mathrm{AE}: \mathrm{AX},
$$

but, confidering the bafes $A C, A N$ as meafured by numbers, as alfo the altitudes $A E, A X$,
bafe AC: bafe AN:: AE $\times b a f o \mathrm{AC}: \mathrm{AE} \times b a f_{e} A \mathrm{~N}$ and $\mathrm{AE}: \mathrm{AX}:: \mathrm{AE} \times b a / \mathrm{A} A: \mathrm{AX} \times b a j e \mathrm{AN}$ therefore,
fol. $\mathrm{AG}:$ fol. $\mathrm{AK}:: \mathrm{AE} \times b a f c \mathrm{AC}: \mathrm{AE} \times$ ba/c: AN , fol. $\mathrm{AK}:$ ful. $\mathrm{AZ}:: \mathrm{AE} \times b a f e^{2} \mathrm{AN}: \mathrm{AX} \times b \mathrm{~A}_{\mathrm{c}} \mathrm{A} \mathrm{N}$, therefore, (7.3.)
fol. $\mathrm{AG}:$ fol. $\mathrm{A} Z:: \mathrm{A} \times b a f e \mathrm{AC}: \mathrm{AX} \times b a f e \mathrm{AN}$; which proportion, by fubitituting for the bales AC , $A N$ their numerical values $A B \times A D$ and $A O \times A M$ becomes
fol. $A G: f o l . A Z .: A B \times A D \times-A E: \Lambda O \times A M \times 1 N$.

## S.hol.iUn.

Hence it anpears that the product of the bafe of ? reetangular parallelopiped by its altitale or the produch of its three dimentons, may be taken for its numeric.as
of Suld meatue : and it $i$ upon in. rinciple that all other fohourded lide are eflmatud. When two maralleopipeds are com- thais bafes mut be contidered is mealured by the fame fape-ficial unit, and their alliwhes by the fane lineat wit; thus if fuces $P$ and ? denote two prallelopireds, and the bate of P condin three fish equal foces $\therefore$ a that of $a$ contains four ; and the altitude of $P$ contains two fuch equal lincs, as that of $Q$ contains five, then, $P: Q:: 3 \times 2:+\times 5:: 6: 20$.

If all the dmentions of each foli! are ufed in comparing then together, then the fame linear unit mult be employed in ellanating all the dimenfon, of both folids; thus, if the length, breadth, and height of the folid P be four, threc, and fix linear unit, refpective1. ; and thofe of 9 , feven, two, and five, of the fame wait ; then $P: Q: ~ \& \times 3 \times 6: 7 \times 2 \times 5:: 72: 70$.

As lines are compared together by confidering how often each contains fone other line taken as a meafiring unit, and lurfaces by confldering how often each contains a fquare whofe fide is that unit ; fo folids may be compared, by confidering how often each contains a cube, the fide or edge of which is the fime linear unit. According, the dimenfins of the parallelonipeds $P$ and $Q$ being as we have ju't now fuppofed, the proportion $\mathrm{P}: \Omega: \mathbf{~} 72: 70$ may be confidered as indicating that $P$ contains $7_{2}$ fuch equal cubes as $\Omega$ contains $7=$

The magnitude of a folld, its bulk, or its extenfion onfitutes its folidity, or its coniont; thus we fav, that the Colidity or the content of a rectandular parallelopifed is equai to the product of its bafe by its altitude; or to the product of its three dimentions.

## Thecrem Xi.

The folidity of any parallelopiped, or in general of any prim, is equal to the product of its bafe by its altitude.

1. Asy parallelopiped is equivalent to a rectangular farmelopiped of the fame altisude, and on equivalent tale (6.) ; and it has been thewn, that the folidity of Such a parallecopiped is equal to the produt of its bate .nd altitade.
2. Every triangular prifm is the half of a paralleloiiped of the fame altitude, but having its bafe double that of the prifm (3.); therefore, the folidity of the riim is half that of the parallelopiped, or it is half the product of the bafe of the parallelopiped by its altitude, that is, it is equal to the product of the baic of the pitim by its altitudc.
3. Any other prifm may be divided into as many triangular prifms as the polygon which form it, bale can be divided into triangle, but the folidity of cuch of thefe is equal to the product of its bafe by theit common altitude; therefore, the folidity of the whole prim is equal to the product of the fum ot all their befe by the common altitude, or it is equal to the nroduct of the buife of the prim, which is the fum of them all, Ly its altitude.

Con. Two prifm having the lame altitude are to each other an their bati-; .rod tiw prifins having the fame bafe :re to each other is their altitudes.
Tuscoun Xil.

Ot S.iica
bounded Ly Planes.
Similur prinins are to one another as the cubes of Fig. $\underbrace{}_{\text {433 }}$. their homologoes fides.
Jat AG, IP be two fimitar prifire, of witich $A P$, 1 K are two homologrous fides, the primi AG is to the prital 1 P as the cube of AB to the sube ot 1 K . Let E and iN be two homologous angles ut the prilms, and ES, NV perpendiculan to the planes of their bafes; jum IV ; take IR=AE, and in the plane INV dran RT perpendicular to 1 V ; then RT thall be perpendicular to the plane 1L (II, a:d 12 . of 7 .), alio RT Thall be equal to ES ; for if the folid .angles 1 and I were applied the one to the other, the planes which contain them woud coincide (fchul. 16. 7.), and the point L would fall upon the point $R$, and therviore the perpendicular ES would concide with the perpendicular RT (2. cor. 4.7.) Now the content of a prifm being the produt or its bafe by its altitude (1t.), it follows that $\operatorname{prim}_{m} \mathrm{AG}: \operatorname{prifm} 1 \mathrm{P}:: \mathrm{ES} \times \operatorname{ta} / \mathrm{A} \mathrm{AC}:: \mathrm{NV} \mathrm{N}$ ba/e IL ; but bafe AC : bafe $1 \mathrm{~L}::-1 \mathrm{~B}^{3}: 1 \mathrm{~K}^{2}(27.4$ ) and thetefore, confidcring the lines caprefird by numbere, $\mathrm{LS} \times$ bale AC or RT $\times$ lafe $\mathrm{AC}: \mathrm{NV} \times$ bafo IL : $\mathrm{RT} \times A \mathrm{~B}^{*}: \mathrm{NV} \times 1 \mathrm{~h}^{2}(5 \cdot 3)$, theretore, prim
 $\mathrm{NV}:: \mathrm{R} 1$ or $\mathrm{AE}: \mathrm{N} 1(20.4$ ) :: AB: IK (def. of fim. figs.), and confequently $\mathrm{RT} \times \mathrm{AE}^{2}: \mathrm{NV} \times 1 \mathrm{~K}^{2}::$ $A \mathrm{E}^{3}: 1 \mathrm{~K}^{3}(5 \cdot 3$.$) ; therefore, prim \mathrm{AG}$ : prifin IP :: $A D^{3}: 1 K^{3}$.

Cor. Simplar prifms are to one another in the triplicate ratio of the homologous fides. For let $\bar{Y}$ and Z be two fuck lines that $A B: 1 \mathrm{~K}:: 1 \mathrm{~K}: \mathrm{Y}:: \mathrm{Y}: \mathbf{Z}$, then the ratio of $A B$ to $Z$ is triplicate the ratio of $A B$ to $1 \mathrm{~K}(12 . \mathrm{def}$. 3.). Norr, fince $1 \mathrm{~B}: \mathrm{IK}:: \mathrm{IK}: \mathrm{Y}$, therefore $A B^{2}: 1 \mathrm{~K}^{2}:: 1 \mathrm{~K}^{2}: \mathrm{I}^{-1},(9+$.) and, multiplying the antecedents by $A \mathrm{~B}$, and conlequents by $1 K, A B^{3}: 1 \mathrm{~K}^{3}:: A B \times 1 \mathrm{~K}^{2}: 1 K \times \mathrm{Y}^{2}:: \mathrm{AB} \times 1 \mathrm{~K}^{2}:$ $\mathrm{Y}^{2}$, but $\mathrm{Y}^{2}=1 \mathrm{~F}^{2} \times \mathrm{Z}(\mathrm{Y} .4$.$) ; therefore A \mathrm{~B}^{3}:: 1 \mathrm{~K}^{3}::$ $\mathrm{AB} \times 1 \mathrm{~K}: 1 \mathrm{~K} \times Z:: A B: Z$, but prijn $\mathrm{AG}:$ prim $1 \mathrm{P}: . A B^{5}: 1 \mathrm{~K}^{*}$ taerefore prifm $\mathrm{AG}: \operatorname{pri}_{\mathrm{i}} / \mathrm{m} 1 \mathrm{P}:: \mathrm{AB}$ : $Z$, which lat attio is triplicate the ratio of $A B$ to IK.

## Thlorem XIII.

If a triangular pyramid ABCD be cut by a plane $\mathrm{F}_{\mathrm{ig} .14}$. $b c d$ parallel to its bafe, the fection $b i d$ is fimilar to the bafe BCD.

FOR becaufe the planes $b c d, \mathrm{BCD}$ are paralle!, their interlections $b$, , BC with a third plane BAC are paralle ( 7.7. ) ; and, for a like reafon, $c d$ is parallel to CD , and $d b$ to DB ; therefore the anyle $b c d=\mathrm{ECD}$, $c d==\mathrm{CDB}, \mathrm{nd} d b_{c=\mathrm{D} D \mathrm{C}(10.7 .) \text {; hence the tri- }}$ angio ic ai, $B C D$ are equangular, and confequently fimilar.
Cor. 1. If two triar gular pyramids ABCD, EFGH, whis have equal baties, and equal altitules, be cut by planer bed, $f_{S} h$ that are pard!cl to the bafes, and at i;:21 diftances trom them, the fetions are equal. For (encerve the bafes of the fyranids to be in the fame thane, then their verices win $b=i$ is a plane parallel to thein hafes, and the fections $i$ c $d, f_{5} h$ will atio te in a phace parallel to thar bates, therefere, AB:Ab:

 wion. RCD : rian. tod's mima. WGIl: trion. f.', fu: rian. BCD ) =tan. FGII (bylon.) therture tritn. $b c d=$ tricn,$f_{S} h$.

## S.horn"

It is ealy to fee that what is hese demonitated of triangular pyramids, is equally tree of polys.and prat mids having equal bafes and altituds.

## Theonea Niv.

## SECT. IX. OF CYLINDERS, CONES, AND THE SPHERE.

## Definitions.

1. A Cylinder is a folid figure deferibed by the revolution of a right-angled parallelogram about one of its fides, which remains fixed.

The Axis of the cylinder is the fixed ftraight line about which the parallelogram revolves.

The Ba/es of the cylinder are the circles defcribed by the two revolving oppofite fides of the parallelogram.
II. A Cone is a folid figure defcribed by the revolution of a right-angled triangle atout one of the fides containing the right angle, which fide remains fixed.

The $A x^{2}$ 's of the cone is the fixed line about which the triangle revolves.

The $B a / e$ of the cone is the circle defcribed by that fide containing the right angle which revolves.
III. A Sphere is a folid figure defcribed by the revolution of a femicircle about a diameter.

The Axis of a fphere is the fixed line about which the femicircle revolves.

The Centre of a fphere is the fame with that of the femicircle.

The Diameter of a fphere is any itraight line which pafles through the centre, and is terminated both ways by the fuperficies of the iphere.
IV. Similar cones and cylinders are thofe which have their axes and diameters of their bafes proportional.

## Theorem I.

Fig. 148. If from any point $E$ in the circumference of the bafe of a cylinder ABCD , a perpendicular EF be drawn to the plane of the bafe AEB, the ftraight line EF is wholly in the cylindric fuperficies.

Lrer HG be the axis, and AGHD the rectangle, which by its revolution defcribes the cylinder. Becaufe HG is perpendicular to AG in every polition of the revolving rectangle, it is perpendicular to the plane of the circle defcribed by AG; and becaufe AD, the line which deferibes the cylindric fuperficies, is parallel to GH , it is alfo perpendicular to the plane of that circle. (5.7.) Now when by the revolution of the rectangle $A G H D$ the point $A$ coincides with the point $E$, the line EF will coincide with $A D$, and thus will be wholly in the cylindric fuperficies; for otherwife two perpendiculars might be drawn to the fame plane, from the fame point, which is impoffible ( 2 cor. 4. 7.).

## Theorfar II.

5ig. 149. A cylinder and a parallelopiped having equivalent bafes and the fame altitude are equal to one another.

Let ABCD be a cylinder, and EF a parallelopiped having equivalent bafés, viz the circle AGB and the parallelogram EH , and having alfo equal altitudes; the cylinder ABCD is equal to the parallelopiped EF . It not, let them be unequal ; and firft let the cylinder be lefs than the parallclopiped EF; and from the parallelopiped EF let there be cut off a part EQ by a plane PQ parallel to NF, equal to the cylinder ABCD . In the circle AGB infcribe the polygon AGKbI.M that hall differ from the circle by a fpace lels than the parallelogram PH, ( 1 cor. 2. 6.) and cut off from the parallelogram EH a part OR equal to the polygon AGKBLM, then it is manifeft that the parallelogram OK is greater than the parallelogram OP, therefore the point K will fall between P and N . On the polygon AGKBLM let an upright prifm be conttituted of the fare altitude with the cylnder, which will there fore be lefs than the cylinder, becaule it is within it; ( s .) and if through the point R a plane RS parallel to NF be made to pafs, it will cut off the parallelopiped ES equal to the prifm AGBC, becaute its bafe is equal to that of the prifin, and its altitude is the fame. But the prifm AGBC is lels than the cylinder ABCD, and the cylinder $A B C D$ is equal to the parallelopiped EQ, by hypothefis; therefore, ES is lefs than EQ, and it is aloo greater, which is impoffible. The cylinder ABCD therefore is not lefs than the parallelopiped EF; and in the fame manner it may be fhewn not to be greater than EF, therefore they are equal.

## Theorey III.

If a cone and cylinder have the fame bafe and the Fig. 150 fame altitude, the cone is the third part of the cylinder.
L.ET the cone ABCD, and the cylinder BFKG have the fame bafe, viz. the circle BCD , and the fame altitude, viz. the perpendicular from the point $A$ upon the plane BCD ; the cone ABCD is the third part of the cylinder BFKG. If not, let the cone $A B C D$ be the third part of another cylinder LMNO having the lame altitude with the cylinder BFKG; but let the bafes BCD, LMA te unequal, and firit let BCD be greater than LIM. Then, becaufe the circle BCD is greater than the circle LIM, a polygon may be inferibed in BC1) that thall differ from it lets than LIM does, (1. cor. 2. 6.) and which therefore will be greater than LIM. Let this te the polygon BECFD, and upon BLCFD let there be conitituted the pramid ABECFD, and the prifm BCFKHG. Becaule the polygon BECFD is greater than the circle LIM, the prim ECFKHG is greater than the cylinder LMNO, for they have the fame altitude, but the prifm las the greater bafe. But the pyranid ABECFD is the third past of the prifn BCFHG (16.8.); therefore it is

## scat. 1N.

G E O M
Of Cylin. greater than the third part of the cylinder LiNNO. ders, cunes, Now the cone ABECFD is by hathefis the third ald the $\underbrace{\text { Sphere. }}$ part of the cylinder LMINO, therefore, the jrymid $A B E C[1)$ is gre tur than the cone $\triangle B C D$, and it is allo lefs, becaute it is infrited in the cone, which is impolible. Therefore the cune ABCD is rot lefis than the thind part of the cylinder BFKG. And in the fame manner, by circumtcibing a polygon about the circle BCD, it may be thewn, thet the cone ABCD is not creater than the third part of the cyinder BFKG; therefore, it is equal to the third part of the cylinder.

## Theorev IV.

Fig. $\mathbf{1 5 r}^{1}$. If a hemiphere and cone have equal bafes and altitudes, a feries of cylinders may be inferibed in the hemifphere, and another feries may be circumfcribed about the cone, having all the fame altitudes with one another, and fuch that their fum fhall differ from the fum of the hemifphere and the cone by a folid, lefs than any given folid.
Let ADB be a femicircle, of which the centre is C, and let CD be at right angles to AB . let DB and DA be fquares defcribed on DC, draw CE, and let the 6 gure thus confructed revolve about DC : then the quadrant BCD will defcrihe a hemifphere having C for its centre, and the triangle CDE will defcrice a cosse laving its vertex at $C$, and having for it bafe the circle delcribed by DE, equal to that defcrived by BC, which is the bafe of the hemiphere. Let W be a given folid, a feries of cylinders may be defcribed in the hemif, ADB , and another defcrited about the cone ECI, fo that their fum thall differ from the fum of the hemifphere and cone, by a folid lets than the folid W.

Upon the bafe of the hemifhere let a cylinder be conftituted equal to W , and let its altitude be CX. Divide CD into fuch a nunner of equal parts, that each of them thall be lefs than CX ; let thefe be CH, HG, GF and FD. Draw FN, GO, HP parallel to CB , meeting the circle in K, L, and M, and the ftraight line CE in $\rho, \mathrm{R}$, and S. Draw $\mathrm{K} f, \mathrm{~L} s, \mathrm{M} /$, perpenücular to $\mathrm{GO}, \mathrm{HP}$, and CB ; and draw $Q q$, $\mathrm{R} r, \mathrm{~S}$ s perpendicular to the fame lines. It is cvident that the figure being thus confitutet, if the whole rerolve about CD , the restangles $[f, \mathrm{G} z, \mathrm{H} h$ will defrrite eylinders that will be circunfleribed by the hemifultere BDA; and that the rectangle $15 ., \mathrm{F} q, \mathrm{G} r$, $\mathrm{H} s$ will alio defcrite cylinders that will circuntcribe the sone ICE. Now it may be demonlrated, as was done of the prifms infcribed in a pyramid (14.8.), that the liemiphere exceeds the fum of all the cylinders deficribed within it, by a folid lefs than the cylinder generated by the rectangle HB , that is, by a folid lefs than Wh In the fame manner it masy be demonltrated, that the furn of the cylinders circumferibing the cone ICE is greater than the cone by a folid lefs than the rylinder generated by the rectangle DN, that is, by a folid lefs than W: Therefore, fince the fum of the cylinders infriled in the hemifplere tugether with a flid leto than W, is equal :o the bemifphere; and

[^28]fince the fum of the cylimers deveribed about the cone is efhel to the cone together with a folitl les than IW; addis f epuals to equals, the fum of all the cyliders torether with a folded hes than $\mathcal{W}$ is equal to the Lemifphere and cone to, ether mith a folid lehthan W; therefore, the diflerance between the whote of tae cylinder, ind the fum of the hemifleere and the cone, is equal to the difierence of two fulid, each of whi-h is lef than W : hert this differenere mult a', be lef than W ; therefore the difierence between the two feries of cylinders, and the fum of the hemilibeic and cone is lefs than the given lolid W.

## Theorem $\mathrm{V}^{\circ}$.

The fame things being fuppofed as in laft theorem, the fum of all the cytinders inforibed in twe hemiiphere, and deferibed about the cone, is equal to a cylinder having the fame bate and alttude with the hemifphere.

Fon, the fame confruction being fuppoled as in lan theorem, let L be the point in which GO meets the circle ADF, then becaufe CGI is a right angle, i: CL be joined, the circles detcribed with the radii CG and GL are equal to the circle deicribed with the radius CL or GO (2. cor. 4. 6.). Now ( $\mathrm{G}=\mathrm{GR}$, becaule $\mathrm{CD}=\mathrm{DE}$, therefore, the circles defcribed by the revolution of the radii GR and GL about the point G are together cquall to the circle detcribed by the revolutron of the radius CO about the rame p ㅇint G ; therefore allo the cylinders that itand upon the two fiff of thefe circies having the common altitude GHi are equal to the cylinder which fands upon the remaining circle, and which has the fame altitude GH. The cylinders deferibed by the revalution of the rectangles $\mathrm{G}_{\mathcal{S}}$ and $\mathrm{G} r$ are therefore equal to the cylinder defcribed by the retaragle GP. And as the fame may be thewn of all the reft, the cylinders de'cribed by the rectangles $\mathrm{H} / 2, \mathrm{G}_{5}, \mathrm{~F} f$, and by the retlangles H s, $\mathrm{G} r, \mathrm{~F} q, \mathrm{DN}$, are together equal to tle cylinder defcribed by DB, that is, to the cylinder having the fame bafe and altitude with the hemifphere.

## Theors.: VI.

 cylinder.

LET the figure he contructed as in the two latt theorems, and if the hemin here defcribed by the guadrant BDC be not equal to two thinds of the crlinder deferibed by the rectangle BD , let it be greater by the folid W. Then as the cone decribed by CDE is onc third of the cylinder defrribe 1 by BD , the cone and the hemifpere toget her will aceed the cylinder by W. But that cy linder is equal to the fum of all the cylinders deferibed by the rettangle II $/ 2, \mathrm{G}_{s}, \mathrm{~F} f, \mathrm{H} \cdot \mathrm{G} r, \mathrm{~F}_{q}, \mathrm{DN}$; therefore, the hemiphere and the cone added together exceed the fum of all thefe cylinders by the bolid 11 , whi h is alfurd; for it has been thewn (4.) that the liemifphere and the cone together differ from the fum o: thefe ey linder by a tolid lefs than W. The hemidite i berctore equal to two thirds of the celinder de : P

We here conclude the Elements of Geometry. Their Oi cylinapplication, conftituting what is fometimes called Prac-ders, Gones, tical Geometry, will be given under the article Men- $\begin{aligned} & \text { and the } \\ & \text { Sphere. }\end{aligned}$ SUR.ITION.

A Table fhewing the Theorem of the foregoing Treatife, that correfponds to each of the moft material Propofitions in the firft fix, and in the eleventh and twelfth, books of Euclid's Elements.

## G E O

Gestre. GEORGE I. II. and III. kings of Great Britain. -George I. the fon of Erneft Auguftus, duke of

Brunfwick Lunenburgh, and elector of Hanover; fuccceded to the throne of Great Britain in 1714 , in virtue of an act of parliament, paffed in the latter part of the reign of King William III, limiting the fucceffion of the crown, after the demife of that monarch, 2nd Queen Anne (without iffue), to the princefs Sophia of Hanover, and the heirs of her body, being Prote-thants.-George II, the only fon of the former, fucce ded him in 1727 , and enjoyed a long reign of glory; dying amidl the molt rapid and extenfive conqueils in the 77 h year of his age. He was fucceeded by his grandion Georoc Ill. our prefent fovereign, For particulaf, fee Britain, $\mathrm{N}^{\circ} 377^{-70 s}$.

## G E O

George, or Knighls of St Gaorge, has been the denomination of feveral military orders, whereof that of the garter is one of the molt illuitrious. See Garter, and St Grokgi, below.

King Grokge's I/ands, are two illands in the South fea, lying in W. Long. 14+56. S. Lat. 14. 28. They were firit difcovered by Commodore Byron in 1765 , and have fince been vifited by Captain Cook in 1774 . Commodore Byron's people had an encounter with the inhabitants, which proved fatal to fome of the natives; but Captain Cook was more fortunate. A lieutenant and two boats well-armed were fent on thore by Captain Cook; and landed without oppofition. As foon as the gentlemen landed, the illanders embraced them by touching nofes, a mode of civility ufed in New Zea-
$\underbrace{\text { George. }}$

## G E O

lan!, which is 900 leagues diftant, and the only place belide this where the cutiom has been oblerved to prevail. Notwithatanding this ceremony, however, very little real friendihip feemed to take place on the part of the illanders. They crowded about the boats as the people were llepping into them, and feemed in doubt whether they hould detain them or let them go; at laft, however, not thinking themfetves fufficiently ifrong, they feemed contented with their deporture, and aitited them in puthing off their boats; but fome of the moft turbulent threw alones into the water, which fell very near them, and all feemed to glory that they had as it were driven them of. The Bitihh brought off five dugs of a white colour with fine long hair, with which the illand feemed to be plentifully lupplied. Thefe they purchafed with finall nails, and fome ripe banenas which had been brought from the Marquela: $\mathrm{O}_{\mathrm{n}}$ this illand Mr Foriter found a kind of fcurvygrafs, which the natives informed him they were wont to bruife and mix with ftell fifh; after which, they threw it into the fea whenever they perceived a hool of fih. This preparation intoxicates them for fome time; and thus they are caught on the furface of the water without any other trouble than that of taking them out. The name of this plant among the natives is cnow. The largef illand, which they call Tiooksa, is fomething of an oval thape, and about io leagues in circuit; the other illand, which lies two leagues to the weitward of Tiockea, is four leagues long from northcait to fouth-wert, and from three to five miles broad. The foil of both is extremely feanty; the foundation confits of coral, very bitle elevated above the furface of the water.

George, St, or George of Cappadocia; a name whereby feveral orders, both military and religious, are denominated. It took its rife from a faint or hero famous throughout all the Eaft, called by the Grecks Ms Manoux $^{2} थ \xi$, q. d. great martyr.

On fome medals of the emperors John and Manuel Comneni, we have the figure of St George armed, holding a fword or javelin in one hand, and in the other a buckler, with this inicription; an O , and therein a little P
A, and re-rioc, making O ArIOE reoprios, Oholy ()

George. He is generilly reprefented on horfeback, as being fuppofed to have frequently engaged in combats in that manner. He is highly venerated throughout Armenia, Mufcovy, and all the countries which adhere to thie Greek rite : from the Greek, his worfhip has long ago been received into the Latin church; and England and Portugal have both chofen him for their patron faint.

Great dificulties have been raifed about this faint or hero. Hi, very exiftence has been called in queftion. Dr Heylin, who wrote firft and moll about him, concluded with giving him entirely up, and fup. pofing him only a fymbolical device; and Dr Pettingal has turned him into a m-re Batilidian fymbol of

1) 4.4. victory. Mr Pegg, in a paper in the Archicologia *, has attempted to reflore him. And, tinally, Mr Gibbon + has funk him into an Arian billop in the reigns of Conflantius and Julian.-The bifhop alluded to,

George the Cappaducian, was fo furnamed, according to our author, from his parents or cducation; and was

667 ] G E
born at Epiphana in Cilicia, in a fuller"s thop. "From ce ort . this obfcure and fervile origin he raifed himielf by the talents of a paralite : and the patrons, whom he af. fiduoniy thatered, procured for their worthlels dependent a lucrative commilion, or contract, to fupply the army with bacon. His employment was mean: he rendered it infamous. He accumulated weath by the balett arts of fraud and corruption; but his $m \ldots$ verfations were lo notorions, that George was compelled to eleape from the purfuits of juitice. After this difgrace, in which lie appears to have faved his fortune at the expence of his honour, he embraced, with real or affected zeal, the profelion of Arianitim. From the love, or the oftentation, of learning, he collected a valuable library of hittory, rhetoric, philoluphy, ant theology; and the choice of the prevaiing faction promoted George of Cappadocia to the throne of Athanafius." His conduct in this fation is repretented by our hiftorian as polluted by cruelty and avarice, and his death confidered as a juft punithment for the enormities of his life, among which Mr Gibbon feems ts rank his " cnmity to the gods."

The immediate occafion of his death, however, as narrated by eccleliallical uriters, will not probably appear calculated to add any flain to his memory. " There was in the city of Alexandria a place in which the heathen priefts had been ufed to offer human facrifices. This place, as being of no ufe, Conflantius gave to the church of Alexandria, and Georse the bihop gave orders for it to be cleared, in order to build a Chritian church on the fpot. In doing this they difcovered an immenfe lubterraneous cavern, in which the heathen mylteries had been performed, and in it were many human faulls. Thele, and other things which they found in the place, the Chritians brought out and expofed to public ridicule. The heathens, provoked at this exhiotion, fuddenly took arms and rulhing upon the Chrilians, killed many of them witiz fivords, clubs, and thones: fome alfo they itrangied, and feveral they crucibed. On this the Chrittians proceeded no farther in clearing the temple; but the heathens, purfuing their advatade, feized the bihop a* he was in the church, and put him in prifon. The nest day they defpatched him; and then fatening the body to a camel, he was drazged about the freets all day, and in the evening they bunt him and the camel together. This fate, Sozomen lays, the bihop owed in part to his haughtinefs while he was in favour with Confantiuc, and fome fay the friends of Athanatius were coticerned in this mallacre; but he aferibes it chiefly to the inveteracy of the heathens, whof fuperftitions he had been very active in abolihing.

Thi, George, the Arian bihop of Alexandia. wa, a man of letters, and had a very valuable library, which Julian ordered to be feized for his own ule; and in his orders concerning it, he fays that many of the books were on philofophical and rletorical fuojects, though many of them related to the doctrine of the impious Galileans (as in his finecring contemptuoue way he always affected to call the Chrillians). 'Thefe books (fays he) 1 could wilh to have utterly deftroyed; but leit books of value thouid be dettroyed along with them, let thefe alfo be carcfully fought for.'

But Mr Gibbon gives a different turn to the affai:
$\underbrace{\text { Corge. }}$ of Ceorge's murder, as well as relates it with different ciscumftances. "The Pagans (fays he) excited his docout avarice; and the rich temples of Alexandria were either pillaged or infulted by the haughty prelate, who exclaimed, in a loud and threatening tone, - How long will thefe fepulchres be permitted to fland ?" Under the reign of Conftantius, he was expelled by the furs, or rather by the julice, of the people: and it was not without a violent ftruggle, that the civil and military powers of the ftate could rettore lis authority, and gratify his revenge. The mellenger who proclaimed at Alexandria the acceffion of Julian, announced the downfal of the archbilhop. George, with two of his obieguious minitters, Count Diodorus and Darcontius mafter of the mint, was ignominioufly dragged in chains to the public prifon. At the end of $2+$ days, the prifon was forced open by the rage of a fupertitious multitude, impatient of the tedious forms of judicial proceedings. The enemies of sod: and men expired under their cruel infults; the lifele's bodies of the archbimop and his affociates were carried in triumph through the ftreets on the back of a camel; and the inativity of the Athanafian party was efteemed a hlining example of evangelical patience. The remains of thefe guilty wretches were thrown into the fea; and the popular leaders of the tumult declared their refolution to difappoint the devotion of the Chriftians, and to intercept the future honours of thefe martyrs, who had been punihed, like their predeceftore, by the enemies of their religion. The fears of the Pagans were juft, and their precautions ineffectual. The meritorious death of the archbihop obliterated the memory of his life. The rival of Athanafius was dear and facred to the Erians, and the feeming converfion of thofe fectaries introduced his wor. Mip irto the bofom of the Catholic church. The odious ftranger, difguiing every circumftance of time and place, allumed the mak of a martyr, a faint, and a Chriftian hero; and the infamous George of Cappadocir has been transformed into the renowned St George of England, the patron of arms, of chivalry, and of the garter."

Knizlits of St Georgz: Sce Girter There have been various other orders under this denomination, moft of which are now extinct ; particularly one founded by the emperor Frederic III. in the year 1470 , to guard the frontiers of Bohemia and H -angary againft the 'Turks; another, called St Gieorge of Alfama, founded by the kings of Arragon; another in Auftria and Carintlia; and another in the republic of Genoa, ftill fubfiting, \&ic.

Religzour of St Giokge. Of thefe there are divers orders and congregations ; particularly canons regular of St Cecrge in Alga, at Venice, eftablinhed by ituthority of Pope Boniface 1X. in the year rioq. The foundation of this order was laid by Bartholomew Colonna, who preached, in 1396 , at Padua, and fome other villages in the ftate of Venice. Pope Pius V. in 1:7\%, gave thefe canons precedence of all other religious, Another congregation of the fame intitute in Sicily, \& c.

St Geqrge del Ilina, the capital of the Dutch fretlements on the Gold coaft of Guiriea, ituated feysn or eight miles weft of Cape-conft callle the capi-
tal of the Britin fetlements there. N. Lat. $5{ }^{\circ}{ }^{\circ}$

St George, a fort and town of $\Lambda$ fa, in the peninfula on this fide the Ganges, and on the coaft of Coromandel, belonging to the Britift; it is othernife called Madras, and by the natives Chilipatam. It fronts the fea, and has a falt water river on its back fide, which hinders the frefh water fpring; from coming near the town, fo that they have no good water within a mile of them. In the rainy feafons it is incommoded by inundations; and from April to September, it is fo fcorcl1ing hot, that if the fea breezes did not cool the air, there would he no living there. There are two tuwns, one of which is called the White Town, which is walled round, and hos feveral bulwarks and baftions to defend it : it is 400 paces long and 150 broad, and is divided iato regular ftreets. Here are two churches, one for the Proteltants, and the other for the Papifls; as alfo a good hofpital, a town hall, and a prifon for debtors. They are a corporation, and have a mayor and aldermen, with other proper officers. The Black Town iv inhabited by Gentoos, Mahometans, and Portuguefe and Armenian Chriftians, and each religion has its temples and churches. This, as well as the White Town, is ruled by the Englih governor and his council. The diamond mines are but a week's journey from this place, which renders them pretty plentiful, but there are no large ones fince that great diamond was procured by Governor Pitt. This colony produces very little of its own growth or manufacture for foreign markets, and the trade is in the hands of the Ar menians and Gentoos. The chief things the Britifh deal in, befides diamonds, are calicoes, chintz, muflins, and the like. This colony may confint of 80,000 inhabitants in the towns and villiges, and there are generally 400 or 500 Europeans. Their rice is brought by fea from Gangam and Orixa, their wheat from Surat and Eengal, and their fire wood from the illands of Diu; fo that an enemy, with a fuperior force at fea, may eafily diftrefs them. The houfcs of the White 'Town are built with brick, and have lofty rooms and tlat roofs? but the Black Town confifs chiefly of thatched cottages. The military power is lodged in the governor and council, who are alfo the laft refort in civil caufes. The Company have two chaplains, who officiate by turns, and have each icol. ayear, befides the advantages of trade. They never attempt to make profelytes, but leave that to the Popin miffonaries. The falaries of the Company's writers are very fmall: but, if they have any fortune of their own, thicy may make it up by trade; which muft generally be the cafe, for they commonly grow rich. It was taken by the French in 1746 , who reftored it at the peace of Aix-la-Chapelle.

St George's, the largelt of the Bermuda or Summer iflands. W. Long. $65 \cdot 10$. N. Lat. 32. 32.

Crofs of St GFORGE, a red one in a ficld argent, which makes part of the Britifh flandard.

Gkorge, a lake in Ealt Florida, alfo denominated Great lake, about 15 miles broad, and 20 feet deep. There are fome beautiful iflands in it, the largeft of which is about two miles broad, commanding a delightful and very extenfive profpect. There are manifeft traces of a large town of the A borigines, and

George town,
the ifland iterte appars to have been the f.a onsie refidenee of an Indim prince. It lies to the futh of Lake Champlain, and its waters lic sbout 100 feet higher. It abounds with fithes of a fuperior quality, fuch as the Ofwego bals, and fpeckled trouts of confiderable magnitude. The French at one period called it Lake Sacrament, as they were at the trouble to bring from it their water for lacramental purpofes, to the churches they had planted in Canada.
$\dot{G} E O R G E T O W N$, the name of feveral towns in America, fuch, for imtance, as Georgetown in MaryIand, about $6_{5}$ miles S. W. of Philadelphia; Georgetown in the county of Lincoln, and diftrict of Maine, Iying on both fides of Kennebeck river, \& $^{8} 8$ mile, S. W. of Philadelphia, where the Roman Catholics have a very Hourilling college: it is the name of a village in Favette county, Pennfylvania, where a number of boats are annually built; and of a polt town in the diftrict of the fame name, where the Epifcopalians, Baptifts, and Methodits, have each a place of worhip, although the number of houfes in it does not much exceed 300 , which are conifructed chielly of wood. It lies 127 miles S. W. of Wilmington, and 681 from Philadelohia.

GEORGIA, a conntry of Afia, bounded on the north by Circaflia, on the ealt by Dagheitan and Shirvan, on the fouth by Armenia, and on the weft by the Euvine or Black fea; comprehending the greatelt part of the ancient Colchis, Ibcria, and Albania. About the etymon of the name of this country, authors are not agreed. The moft probable opinion is, that it is a corruption by foftening of Kurgia, from the river Kur ; whence alfo it is fuppofed that the inhabitants are called by the Perfians indifierently Gurgi and Kurgi; and the country Kurgiftan and Gurgi/fan. It is divided by a ridge of mountains into eattern and weftern; the former of which is again fubdivided into the kingdoms of Caket, Carduel or Carthuel, and Goguetia; and the latter into the provinces of Abcitilia, Nireta or Ineretia, and Guricl. Another divinion is into Georgia Proper, Abcallia, and Mingrelia. A third diviion will be afterwards mentioned.
"Georgia (fays Sir George Chardin) is as fertile a comtry as can be feen; the bread is as good here as in any part of the world; the fruit of an exquifie tlavour, and of different forts : no place in Eurrpe yields better pears and apples, and no place in Alia better pomegranates. The country abounds with cattle, venifon, and wild fowl, of all forts; the river Kur is well focked with fifh; and the wine is fo rich, that the king of Perfia has always forme of it for his own talle. The inhabitants are robutt, valiant and of a iovial temper ; great lovers of wine. and cifcemed wry trutty and fathful; endowed with good natural part, but, for want of education, very vicions. The women are generaliy fo fair and comely, that the wives a:d concs:bines of the king of P'erria and his court are for the moit pat Gearginn women. Nature has adorned them with graces nowhere clle to be met with : it is impoffible to fee them without loving them; they ate of a good fize, clean limbed, and well thased. Awher eraveller, however, of no mean character, thus axpelles himefelf with refpect to the women: " A; to the Gcorgion wonen, they did not at all furp:ie us; for we
expected to find them perfect beauties. 'They are, in- Croorg.. deed no way difagreeable ; and may be counted beatrties, $i$ compared with the Curdes. They have an air of health that is pleafing enough ; but, after all, they are neither to handtome nor to well haped as i reported. Thote who live in the touns have nothing extraordinary more than the others; fo that I may, $\vec{I}$ think, venture to contradict the accouns that have been given of them by moit travellers."

This country formerly abounded with great cities, is appears not only from its hiltory, but from the rul ci many of them till vinble, which fhow that they mut have been very large, opulent, and magnificently built. Thefe were all deflroved by the inundations of northern barbarians from Mount Caucafus, as the Alans, Huns, Suevi, and fome others, fo much noted in hiftory for their itrength, courage, and conquefls.

The latell diviion of this country is into nine provinces; five of which are fubject to the famous prince Heraclius, forming what is commonly called the kingdom of Georgia ; and four are under the duminion of Davit, compofing the hingdom or principality of Imeretia. See IVERETiA.

This whole country is fo extremely beautiful, that fome fanciful travellers have imagined they had here found the fituation of the original garden of Eden. The hills are covered with forefts of oak, aft, beech, chefnuts, walnuts, and elms, encirc!ed with vines, growing perfectly wild, but prodacing vait quantities of grapes. From thele is annually makie as much wine as is necefliry for the ycarly confumption ; the remainder is left to rot on the vincs. Cotton grows fpontaneonfly, as well as the finelt European fruit trees. Rice, wheat, millet, hemp, and tlax, are raifed on the plains, almoft without culture. The valleys affond the finett pafturage in the world ; the rivers are full of fih; the mountains abound in minerals, and the climate is delicious; fo that nature appears to have lawihed on this favourite country erery production that can contribute to the happinefio of its inhabitants.

On the other hand, the rivers of Geargia, being ted by monutain torrents, are at all fafons cither too rapid or too thallow for the purpofes of navigation: the Black fea, by which commerce and civilization mioht ee introduced from Europe, has been till very lately in the exclufive poffetion of the Turks: the trade of Geo:gia by land is greatly obtructed by the high mortains of Caucafus; and this ondacle is nill incrated by the fwarms of predatory nations, by which thote mountains are inhabited.

It is faid, that in the $15 t^{\text {th }}$ century, a king of Gcorgia divided among his five fons the provinces of Carducl and Caket, Imerctia, Mingrelia, Guriel, ant? Abcaflia. Thefe petty princes were too jealou, to unite for their common defence, and too weak fingly to refilt a foreign enemy, or even to check the enlcroachments of their great vallals, who foon beceme independent. By formin a party amony thele nobles, the Tur's gradually gained pofellion of all the we!tern provinces, while the Pervians occupied the es vernments of Carduel and Caket. Since that pee : the muy unficcelfful attempts o: the Georsia.s. fover their libroty have repeated!y produced the swattation of their country. $1^{1,}$ is the Great in aid to lawe carsied off in onc expedition from the province

## G E O

## Ceorgia.

of Carduel and Caket no lefs than 80,000 families; a number which, probably, exceeds the whole actual population of thofe provinces. The molt horrible cruelties were again exercifed on the unhappy people, at the beginning of the prefent century, by the mercilefs Nadir; but thefe were trifling evils, compared with thofe arifing from the internal diffentions of the great barous. This numerous body of men, idle, arrogant, and ferocious, pofiefled of an unlimited power over the lives and propertics of their vaffils, having no employment but that of arms, and no hopes of aggrandizing themfelves but by the plunder of their rivals, were contantly in a llate of warfare; and as their fuccels was various, and the peafants of the vanquilhed were conftantly carried off and fold to the Turks or Perfians, every expedition increafed the depopulation of the country. At length they invited the neighbouring mountaineers, by the hopes of plunder, to take part in their quarrels; and thefe dangerous allies, becoming acquainted with the country, and being fpectators of the weaknefs of its inhabitants, foon completed its defolation. A few fqualid wretches, half naked, half harved, and driven to defpair by the mercilefs exactions of their landlords, are thinly difperfed over the moft beautiful provinces of Georgis. The revolutions of Perlia, and the weaknefs of the Turks, have indeed enabled the princes of the country to recover their independence; but the fmallnefs of their revenue has listherto difabled them from repreffing effealually the tyranny of the nobles, and relieving the burdens of the peafants.

The capital of Georgia is Teflis, where Prince Heraclius refides (See Teflis.) Of this prince, fo celebrated for his exploits and fuccefs in thaking off the Ottoman yoke, we have the following account by the late Profeflor Guldenftaedt when he travelled into thefe parts in 1770 . "Heraclius, or, as he is called, the Tzar Iracli, is above to years old, of a middle fize, with a long countenance, a dark complexion, large eyes, and a fmall beard. He pafled his youth at the court and in the army of the celebrated Nadir Shal, where he contracted a fondnefs for Perfian cuitoms and manners, which he has introduced into his kingdom. He has feven fons and fix daughters. He is much revered and dreaded by the Perfian khans his neighbours; and is ufually chofen to mediate between them in their difputes with each other. When they are at war, he fupports one of the parties with a few troops, who diffufe a fpirit and courage among the reft, becaufe the Georgian foldiers are efteened the bravelt of thofe parts; and Prince Heraclius himfelf is renowned for his courage and military fkill. When on horfeback he has alway- a pair of loaded pittols at his girdle, and, if the enemy is near, a mulket llung over his fhoulder. In all engagements he is the foremoft to give examples of perfonal bravery; and frequently charges the enemy at the head of his troops with the fabre in his hand. He loves pomp and expence; he has adopted the drefs of Perfia; and regulates his court after the manner of that country. From the evample of the Rulian troops, who were quartered in Georgia during the lat Turkith war, he has learnt the ufc of plates, huives, and forks, dilhes and houfebold furniture, \&c."

The fabjects of Herclius are eftimated at about

60,000 families; but this, notwithtanding the prefent Georgiz. defolated thate of the country, is probably an under valuation. The peaiants belonging to the queen, and thofe of the patriarch, pay no tax to the prince, and therefore do not appear on the books of the revenue officers. Many limilar exemptions have likewife bee:a granted by the prince to his fons in-law, and his $\mathrm{f}_{\mathrm{a}}$ vourites. Befides, as the impolt on the peafants is not a poll-tax, but a tax on hearths, the inhabitants of a village, on the approach of the collectors, frequently carry the furniture of ieveral huts into one, and deltroy the remainder, which are afterwards very eafily replaced. It is probable, therefore, that the population of Georgia does not fall thort of 350,000 fouls. The revenues may be eftimated at about 150,000 rubles, or 26,2501 . They confit of, i. The cuitoms, farmed at $17501 .-2$. Rent paid by the farmers of the mint, at Teflis, 17501.-3. The tribute paid by the khans of Erivan and Ganilha, 70001.-and, 4. The hearth money levied on the peafants, amounting to 15,7501 . The common coins here are the abaffes, of about 15 d . value, and a fmall copper coin, Itamped at the mint at Teffis. Belides the fe, a large quantity of gold and filver money is brought into the country from Perfia and Turkey, in exchange for honey, butter, cattle, and blue linens.

The goverument of Georgia is defpotic ; but, were it not for the aflilance of the Ruffian troops, the prince would be frequently unable to carry his decrees into execution. The punifuments in criminal cafes are fhockingly cruel; fortunately they are not frequent, becaufe it is feldom difficult to efcape into fome of the neighbouring countries, and becaufe the prince is more enriched by conficating the property of the criminal, than by putting him to torture. Judicial combats are confidered as the privilege of nobility, and take place when the caufe is extremely intricate, or when the power and interef of two claimants are fo equal, that neither can force a decifion of the court in his favour. This mode of trial is called an appeal to the judgment of God.

The drefs of the Georgians nearly refembles that of the Coffacks; but men of rank frequently wear the habit of Perfia. They ufually dye their hair, beard, and nails with red. The Georgian women employ the fame colour to fain the palins of their hands. On their heads they wear a cap or fillet, under which their black hair falls on their forehead : behind, it is braided into feveral treffes. Their eyebrows are painted with black, in fuch a manner as to form one entire line, and their faces are perfeclly coated with white and red. Their robe is open to the girdle, fo that they are reduced to conceal their breaits with their hands. Their air and manner are extremely voluptuous. Being generally educated in convents, they can all read and write; a qualification which is very unufual among the men, even of the higheft rank. Girls are betrothed as foon as poffible, often at three or four years of age. In the ftreets the women of rank are always veiled, and then it is indecent in any man to accort them. It is likewife uncivil in converfation to inquire after the wives of any of the company. Thefe, however, are not ducicnt cuitoms, but are a confequence of the violences comuitted by the Perlians, under Slaks Nadir.

Travellers

Georgia. Thavellers accufe the Georgians of drurkennels, fupertition, cruelty, hluth, avarice, and cowardice ; vices which are everywhere common to flaves and tyrants, and are by no means peculiar to the natires of this country. The deicendants of the colcnifts, carried off by Shah Abbas, and fettled at Peria, near Ifpahan, and in Mafanderan, have changed their character with their government; and the Georgian troops, employed in Perfia againft the Affighans, were advantageonly diftinguithed by their docility, their dilcipline, and their courage.

The other inhabitants of Georgia are Tartars, OIT, and Armenians, called in the Georgian language Somakhi. Thefe laft are found all over Georgia, fometimes mixed with the natives, and fometimes in villages of their own. They ipeak among themfelves their own language, but aill underitand and can talk the Georgian. Their religion is partly the Armenian, and partly the Roman Catholic. They are the mott opprefied of the inbabitants, but are thill dittinguihed by that inflinctive indullry which everywhere characterizes the nation.

Bendes thefe, there are in Georgia confiderable numbers of Jews, called, in the langunge of the country, Uria. Some have villages of their own ; and others are mixed with the Georgian, Armenian, and Tartar inbabitants, but never with the Oifi. They pay a fmall tribute above that of the natives.

Glorgia, one of the United States of America, Iying between South Carolina and Florida. It extends 120 miles upon the fea-coait, and 300 miles from thence to the Apalachian mountains, and its boundaries to the north and fouth are the rivers Sa vannah and Alatamaha. The whole coalt is bordered with iflands; the principal of which are Skidaway, W'ffaw, Offabaw, St Catherine's, Sapelo, Frederica, Jekyl, Cumberland, and Amelia.

The fettlement of a colony between the rivers Savarnah and Alatamaha was meditated in England in 1732, for the accormodation of poor people in Great Britain and Ireland, and for the further fecurity of Carolina. Private compaffion and public fpirit confpired to promote the benevolent defign. Humane and opulent men fuggefted a plan of tranfporting a number of indigent families to this part of America free of expence. For this purpole they applied to the hing, George II. and obtained from him letters patent, bearing date June $9 .{ }^{1} 732$, for legally carrying into execution what they had generoully projected. They called the new province Georgia, in honour of the king, who encouraged the plan. A corporation, confifling of 21 perfons, was conftituted by the name of, The Truftees for fettling and eitablithing the colony of Georgia.

In November 1732, 116 fettlers embarhed for Ceorgia to be conveyed thither free of expence, furnihed with every thing requifite for building and for cultivating the foil. Mr James Oglethorpe, one of the tuftes, and an active promoter of the fettlement, embarked as the head and director of thefe fettlers. They arrived at Char'eftoun early in the next year. Mr Oglethorpe, accompanied by William Bull, fhortly ifter his arrival, vifited Georgia; and after furveving the country, marked the fot on which Savanali now suind, as the fitteft :o Legin tucin fe:leme.... He:e
they accordingly began and built a fmall fort, and a Georgia. number of fraill luts for their defence and accommodation. Such of the lettlers as were able to bear arms were embodied, and well appointed with ollicers, arms, and ammunition. A treaty of friendiup was concluded betwen the fettlers and their neighbours the Creek Indians, and every thing wore the alpect of peace and future profperity But the fundamental regulations eftablihed by the truilees of Georgia were ill adapted to the circumblances and fituation of the poor fettlers, and of pernicious confequences to the proferity of the province. Yet although the truftees were greatly miltaken with refpect to their plan of fettlement, it muft be acknowledged their views were generous. Like other diftant legillators, who framed their regulations upon principles of fpeculation, they were liable to many errors and miftakes; and however good their defign, their rules were found improper and impracticable. Thefe injudicious regulations and reflrictions, the wars in which they were involved with the Spaniards and I'vians, and the frequent infurrections among themfelves, threw the colony into a ftate of confulion and wretchednefs too great for human nature long to endure. Their oppreffed fituation was reprefented to the truftees by repeated complaints; till at length finding that the province languifhed under their care, and weary with the complaints of the people, they in the year 1752 furrendered their charter to the king, and it was made a royal government. -In the year 1740 , the Rev. Geurge Whitefield founded an orphan houfe academy in Georgia about 12 miles from Savannah. Mr Whitefield died at Newbury port, in New England, in October 1770, in the 56 th year of his age, and was buried under the Prefbyterian church in that place. From the time Georgia became a royal government in 1752 till the peace of Paris in 1763 , fhe itruggled under many difficulties, arifing from the want of credit and friends, and the frequent moleftations of enemics. The good effects of the peace were fenfibly felt in the province of Georgia. From this time it began to flourifh under the fatherly care of Governor Wright. To form a judgnent of the rapid growth of the colony, we need only attend to its exports. In the year 176:, they conflited of 7500 barrels of rice, 9633 pounds of indigo, 1250 buthels of Indian corn, which, together with ceer and beaves ikins, naval itores, prostions, timber, \&c. amounted to no more than $2,-221$. Aerling. Ten years atterwards, in 1773 , they amumnted to 121,6771 . Herling. The chief articles of export from this tlate are, rice, tobacco, indigo, fago, lumber of various kinds, naval ftores, leather, deer $\mathbb{k}$ ins, fake-root, myrtle, bees wax, corn, live Ilock, \&:c.

During the Anserican war, Georgia was ovcrrun by the Britin troops, and the inhabitants were obliged to flee to the neighbouring itates for fafety. Since the peace the progrefs of the population of this ftate is laid to have been atlonithingly rapid; though it has been a good deal checked within thefe few year by the hotile irruptions of the Creek Indians, who continually harals the frontiers of the ftate. Treaties have been held, and a celfation of hulilities ageed to, between the parties, but all have hitherto proved ineffectual to the accom plihmetit of a peare.

Thefe Indians inlabit the middle parts of the fate

## G E O

In the grand convention at Philadelphia in 1787 , Georgis. the inhabitants of this fate were reckoned at 90,000 , including three-fifths of 20,000 negroes. Eut from the number of the militia, which has been afcertained with a confiderable degree of accuiacy, there cannot be at molt mure than half that number. No general character will apply to the inhabitants at large. Collected from different part, of the worid, as intereft, neceiiity, or inclination led them, their character and manners muft of courte partake of all the varieties which difinguifh the teveral ltates and kingdoms from whence they came. There is fo little unitormity, that it is difficult to trace any grverning principles among them. An averian to labour is too predominant, owing in part to the relaxing heat of the climate, and partly to the want of neceffity to excite incultry. An open and friendly hofpitality, particularly to limagers, is an ornemental characterittic of a great part of this people.

In regard to religion, politics, and literature, this ftate is yet in its infancy. In Savarnah is an Epi:copal church, a Preibyterian church, a iynagogue, and a German Lutheran church, fupplied occafionally ly a German minifter from Ebenezer, where there is a large convenient fone church, and a fettlement of fober induftrious Germans of the Lutheran religion In Auguit: they have an Epifcopal chuch. In Miduay is a lociety of Cbritians eftablithed on the congregational plan. Their anceftors emigrated in a colony from Dorcheiter, near Bollon, about the year 1700 , and fettled at a place named Worchefter, about $2 c$ miles fouth-weft of Charleftown, South Carolina. In 1752, for the fake of a better climate and more land, almoft the whole fociety removed and lettled at Midway.They, as a people, retain in a great meafure that fimplicity of manner, that unaliected ficty and brotherly love, which characterized their anecfors, the nirt fettlers of New England. The upper counties are fupplied pretty generally by boptif and Itctheditt munfters; but the greater part of the rate is without minifters of any denomination.

The numerous defecs in the late confitution of this ftate, induced the citizens pretty univerfally petition for a revifion of it. It was accordingly revifed, or rather a new one was formed, in the courfe of the year 1780 , nearly upon the plan of the conititution of the United States, which has lately been adopted by the itate.

The charter containing the prefent fyitem of education in this ftate was paffed in the year 1785 . A college, with ample and liberal endowments, is inftituted in Louifville, a high and healthy part of the ccuntry. near the centre of the ftate. There is alfo provifion made for the inftitution of an academy in each county in the flate, to be fupported from the fame funds, and confidered as paris and members of the fame inditution, under the general fuperintendance and direction of a prefident and boand of truffes, appointed for their literary accomplifhments from the different parts of the flate, and insefted with the cuflomary powers of corporations. The inftitution thus compofed is denominated the unizerlity of Georgia.The fund for the fupport of this inftitution are principally in lands, amounting in the whole to about :0,000 acres, a great part of which is of the beft qua-

$$

Georgis lity, and at prefent very waluabic. lhere are allo
neary 6000 . itering in bowds, houks, and tom lots in the cuwn of Auguita. Onser public property to
the amount of $1006 \%$. in e:ch county has been fet apart for the purpoles of building, and furnilhing their refpestive academiec. The funds origitatly deligned for the fuppert of the orfhan heufe are chiety in rice platations and negroes.

Gcorgha, a townhip in the county of Eranhin, conthining about 420 inliditants. It is tituated an L. ke Champlain, oppoite to the north end of Suuth Hero illand.

Georgia, a elufter of barren illands in the Souts Sea. to the eattward of the coatt of Terra del Fuego, in lat. $54^{\circ} 35^{\prime} \mathrm{S}$, and lung. $36^{\circ} 33^{\prime} \mathrm{II}$. One of thele illands is from $1 ; 0$ to 180 miles in length.

GEORGIC, a poetical compofition upon the ivbjeat of hubandry, cont.ining rules therein, put into a pleang dres, and let off with all the beauties and embellihments of poetry. The word is borrowed from the Latin georgicus, and that of the Greck rengrixes, of $\gamma$, terra, " earth," and $\varepsilon_{5} \times x_{3} \rho_{0} u x+$, opero, "I wurk, or labour," of igyor, opur, " work." Heimd and Virgil are the two greateft mafters in this kind of poetry. The moderns have produced nothing in this kind, except Rapin's book of Gardening ; and the celebrated joem entitled Cyder, by Mr Philips, who, if he had enfoyed the advantage of Virgil's language, would have heen fecond to Virgil in a much nearer degree.

Georgium Sidus. See Astronomy Inder.
GEPIDI, Gepides, or Gifidt, in Ancient GeoF'as' 4 , according to Procopius, were a Gothic people, or a canton or branch of them; lome of whom, in the migration of the Goths, iettled i:s an illand at the mouth of the Viitula, which they called Gepidus after their own name, which denotes lazy or fothful; others in Dacia, calling their fettlement there Gepidia.

GERANIU'I, crave's bill, in Botany, a gemus of plants belonging to the monadelphia clais; and in the natural method ranking under the 1 qth order, Gruinaler. See Botany Index.

GERAR, or Gerara, in Ancien! Geography, the fouth boundary of Cunan near Berfeba; fituated beween Cades and Sur ; two deferts well known, the sormer facing Egypt, the latter Atabia Petraa.

GERARDE, Joнv, a furgeon in London, and the greatell botanift of h: time, was many years chitf gardener to Lord Burleigh; who was himblf a great lover of plants, and had the beft collection of any nobleman in the kingdom, among which were a great number of exotic, introduced by Gerarie. In 1597 ise publifhed his Herlal, which was printed at the ex. nence wi J. Norton, who procured from Fanctort the 1 tme blocks in wood as were ufed in the hertal of Pa bernzenontanu:. In $1666_{3}$. Thomas lohnfon, an apo$\therefore$ tecary, publihed an improved edition of Gerarders book ; which met with fuch approbation by the univertity of Oxford, that they conterred on him the degree of doctor of phyfic. The deferiptions in the herbal are plain aud familiar ; and both theie authors have laboured more to make their readers underftand the characters of the plants, than to inform them that they : nemfelves undertood Greek and Latin. The herbal of Gerarde is nov to be condidered only as a literary ruriofity. The figures in general exprefs very ac. Vol. IX. Part II.
cuateiy the characters of the plants they are intended C.ras. to repreient.

GEREALCONV. See EALco, Oixifhomagy ln. der.

GERGESA, in Ancient Geograply, a Transjord in town, no otheruife known than by the Cerzefoni of St Matthew, and Gergelat of Mofes; fuppoded to have flood in the neighbourhood of Gadara and near the fea of Tiberias. The Gergefai, one of the feven ancient people of Canaan, lefs frequently mentioned than the rell, appear to have been lefs confiderable and more obicure : their name is from Girgafi, one of Canam"s fons. See Girgashites.

GERIZIMi. See Garizin.
GERMI, in vegetation. See Germen.
GERMAN, in matters of genealogy, fignifies whole, entire, or own. Germani, qua i cadem firpe geniti: (Felt.) Hence,

Brother Gramsn, denotes a brother both by the father's and mother's fide, in contraditination to nterine brothers, \&c. wha are only is by the mother's nide.

Cou/ins German, are thofe in the fir't or neareft degree, being the children of b:others or fillers.

Among the Romans we have no inftance of mar. riage between coufins german before the time of the emperor Claudius, when they were very frequent.

Theodofius prohibited them under very levere fetalties, even fine and profeription. See Covsingurnily

Germas, or Germanic, alfo denotes any thing velonging to Germany ; as the German empire, German Hate, \& C.

GERMANDER. See Teucrium, Botany Inder.
GERMANICUS C.Estr, the fon of Drufus, and paternal nephew to the emperor Tiberius, who adopted him; a renowned general, but till more illuitrious for his virtues. He took the title of Germanicus from his conquefts in that country ; and though he had the moderation to refufe the empire offered to him by his army, Tiberius, jealous of his fuccefs, and of the univerfal efteem he acquired, caufed him to be poifoned, A. D. 29, aged 34. He was a protetor of learning; and compofed fome Greek comedies and Latin poems, fome of which are ditl extant.

GERMANFOWN, in the county of Philedelpiata, Pennfylvania, in North America, about feven miles from the eity of Philadelphia. It was once e teemed the fecond town in the country, till many inland towns in a thort time rofe fuperior to it , both for the extent of their etiablithments and number of inhaibitants. The knitting of cotton, thread, and worled thockings, is carried on in it to a confiderable extent. The principal congregation of the people called Mennonils is in Germantown, who derive their name from one Menno Simon, a learned man of Witmars in Gernany. Aithough inimical to the doctrine of general talvation, they will not fwear, fight, bear any civil office, go to luw, or take intereft for money. Germantown is alio memorable for a bloody battle which was fought in it un the $4^{\text {th }}$ of Otober, 1777.

GEK.IINY, a very extenfive empire of Europe, but which, in different ages of the world, has had $+Q$ very

 prob ble conjectere, is derived from the Celtic wo:d tihur man, ligniting a varhke man, to which tidis other name, difrocn, or Alcman, likewife alludes.

The ancient hisory of the fermans is altogetler wrapped up in obicuity; ner do we, for many ages, hnow any thing more of them than what may be leamed from the hitions of their wars with the Romans. The firt time we find them nemtioned by the Romar historians, is alout the sore $211 \mathrm{~B} . \mathrm{C}$. nt which time Marcellus fuldued Imubria and Ligurin, and defeated the Cafatit, a Gemman ration fituased on the bank of the Rlaine. From this time hifory is filent with regad to any of thete northern nations, till the irrupton of the Cimbri and Teutones, who inbabited the mont northerly part of Germany. The erent of their Anterpalie is related under the articies Avbrosas, CIVBer, and Izutosis. We muft not, howesor, imarine, becauie thele people happened to invide Iraly at the fane time, that therefore their countries were contiguous to mee another. The Cimbri and Teutcnes only dwelt beyond the Rhine; while the Ambones inhabited the country between S:sizerland and Proverce. It is irdeed sury diricult to fix the li-

Lomit= of stcic:t Gicimany The fouthern Germans were intermixed with the Gauls, and the nortlenn ones with the Scythians; and thus the ancient hiftory of the Germans includes that of the Dacians, Huns, Guths, \&c, till the defruction of the weitern Roman empire by them. Ancient Germany, therefore, we may reckon to have included the morthern part of Fance, the Netherlands, Holland, Gervary fo called at prefent, Denmark, Prutia, Poland, Hungary, part of luhey in Europe, ard Mufc Juy.

The Romans divided Germany into two regions; Delgic or Lower Cermany, which lay to the fuuthward of the Rlime: and Gemany Proper, or High Satiots in- Gernany. Ite fin it liy between the risers Seine and inntre a, Rhise: and in this we find a number of diflerent Low elicr-mations, the molt remarhabic of which were the folLくい!n!

1. The Luii, whofe terntory lay between the Rhine Tu'tice Mula or Nuef, and whote capital was the city of Celugne. 2. Nest to them were the Tungri, Appolid to be the fime whom Citircalls Eturomsand Countat ; and vheie metropolis, then called shuatica, stas fince leen namud Tongres. 3. Higher up from i.c... and on the other fide of the Morlle, were the Iievini, whole canital was Augula Trevirornm, now Iram 4. Nest to them were the Tribocci, Nemetec, ad Simyimes. '1he former dwelt in Alface, and lad Argetiostum, now Straflur's, for their catital ; the whers inlabited the citics of Worms, Spire, and Menir. S. The Mediomatrici were fituated along the Mofthe about the city of Metz in Lorraia: and above them vere fitwated another Gemmen nation, naned Kaurici, Ruaraci, or Rauriaci, and who inbabited that lart of Hedetia, or Switzerland, about Bufl. To the wefter rd and fouthwart of the ie vere the Nemvii, Suif fium-e, silsanctce, Icwi, Khemi, Lingoses, \&c. who Ahta iv 1 Belgic Cital.

Letweon the hads of the Rline and Donube vat feated the ancient kinveem of Vindelicia, whole canjte! vis: called Aurugla Vindelicorv", now Alug lurg. I E-

Low it on the bank of the Danube were the Kingdoma Germany. of Nutam and Panonis. The firt of thele was divid.d in:o Noricum ? ${ }^{2}, n, z$ and Mediterrantam. It () At aned a giest part of the provinees of Auitris, S:ya, Carinthia, Tyrol, Bavaria, and fome others of leis note. The hatter cossained the kinglom of Hunga!v, diviled into Upher and Lower; and extending from Illyricum to the Darube, and the mounthins Cxtii in the neighbuuhood of lindebuna, now li, $: a$.

U: jer or High Germany lay beyond the Rhine and Nation i: 1 the Duube. Between the Khine and the Elbe were High Ger the following nations. 1. The Chauci, Upper and many Loner ; who were civided from each other by the river Vifurge, now the It $/$ /er. itheir country contained What is surw cailed Bromen, Lane, barr, Frizzland, and Gromingten. The Upper Chauci bad the Cherufci, and the loner the Chamani on the fouth eait, and the Gcrman ozean on the north-weft. 2. The Friti, Upper and Loser, were divided from the Lower Chauci by the fiser Arifia, now the Ems; and from one anotier oy an arm of ti.e Rhine. Their cuantry thll retaiss the name of Frieland, and is divided into eat and wett; but the latter is now difmembered from Germany, and become one of the Seven United Provinces, 3. Berund the lielu, now the IG, which bounded the country of the Frifi, were fitu:ted the Bructeri, who inhabited that trace now called Brocmorland; and the Mirin, about the river Luppe. Os the other fide of that river were the CYipii or Cipries; but thefe were famed for often changing their territories, and therefore found in cther places. 4. Next to theie were the Juones, or inhabitants of Juliers, between the Maele and the Rhinc. .: The Catti, another ancient and warlike mation, inhabited Henle and Thuringia, from the Hastzian nountains to the Rhine and Wefer : among uhom were comprehended the Mattiaci, whofe capital is by jume tha ught to be Marpurs, by others Badon. 6. Noxt $t$, the were the Scculii bondering uton Suabia; the Nurici, or ti.e ancient inhabitants of Northgow, whole capital was Nurcmberg; and the Narcomanni, whole country ancient!y reached from the Rhine to the kead of the Danare, and to the Neckar. The Marcomanni afterwards went and fettled in Bohemia and Muravia, undur the ir general or kisg Marobodnus: and fome of them in Gath, whence the: drove the Boii, who lad tented themtiven there. - . On the oiher fide of the Datute, and tetreen the Rhire and it, were the Hermunduri, who politied the courtry now cathed Wha ia Upper Sawny; though fone make theis territuries to bave eatended much farther, and to have ra ached quite to, or even berche, the h.ugdom of Bo bemia, once the feat of the Poni, wheme its name. b lieyond thm, on the north of the Databe, was motlier feat of the Narconami along the river Albis, or Ellue. g. Nest to Behemia vere tithated the (Guadi, whof territories extended from the Dumbe to Moravi, , and the northern part of Aultria. Thele are compreboncic! under the ancient nanse of Suezt; part of whom at length forced their way into Spain, and fittod a hingdem there. 10. Eatward of the guadi were lianted the Butlarnse, and parted from them by the Cranna, now (iran; a river that falls into the Danube, and by the Cargathian mountains, from them cancd Itpes Boffarnica. The country of the Batlarna:

Germany. own fide. Thofe who efcaped the general flaugbter, being joined by the Vindelici, took their route towards Gaul, with a defign to invade that province. But Auguftus, upon the firf notice of their march, defpatched againft them Tiberius with feveral chofen legions. He was no lefs fucceffful than Drufus had been; for having tranfported his troops over the lake Brigantium, no:v Conftance, he fell unexpectedly on the enemy, gave them a total overthrow, took moft of their ftrong holds, and obliged the whole nation to

## 7

 They are rubdued, Iogether with the Vandelici a: ${ }^{2}$ Nerici fubmit to fuch terms as he chole to impofe upon them. Thus were the Vindelici, the Rhætii, and Norici, three of the moft barbarous nations in Germany fubdued. Tiberius, to keep the conquered countries in awe, planted two colonies in Vindelicin, and opened from thence a road into Rhatia and Noricum. One of the cities which he built for the defence of his colonies, he called, from his father Drufus, Drufomagus; the other by the name of Suguftus, Ausufa Vindehcorum; which cities are now known by the names of Mimminglith and Augsburg. He next encountered the Pannonians, who had been fuidued by Agrippa, but revolted on hearing the news of that great commander's death, which happened if years B. C. Tiberius, bowever, with8 and the P'annon:ans. the affiftance of their neighbours the Scordifci, foon forced them to fubmit. They delivered up their arms, gave hoftages, and put the Romans in poffefion of all their towns and ftrong liolds. Tiberius fpared their lives; but laid wafte their fields, plundered their cities, and fent the belt part of their youth into other countries.

In the mean time, Drufus having prevented the Gauls from revolting, which they were ready to do, prepared to oppofe the Germans who dwelt beyond the Rhine. They had collected the mott numerous and formidable army that had ever been feen in thofe parts; with which they were advancing towards the Rhine, in order to invade Gaul. Drufus defeated them as they attempted to crofs that river; and, purfuing the advantage he had gained, entered the ccuntry of the Ulipetes, now Relinchufen, and from thence advanced Lyppe and Yfiel. Them he overthrew in a great battle, laid watte their country, burnt molt of their cities, and following the courfe of the Rhine, ap- proached the German ocean, reducing the Frifii and the Chauci between the Ems and the Elbe. In thefe marches the troops finfered extremely for want of prosifions; and Drufus himfelf was often in great danger of being drowned, as the Romans who attended him were at that time quite unacquainted with the flux and reflux of the ocean.

The Roman forces went into Enft Frielland for their winter quarters; and next year ( 10 B. C.) Drufus rarched againft the Tenchtheri, whom he eafily fubdued. Afterwards, pafing the Lupias, now the Lypje, he reduced the Catti and Cherulci, extending his conquefts to the banks of the Vifurgis or Wefer; which he would have pafied, had he not been in want of provifions, the enemy having laid wafte the country to a condiderable diftance. As he was retiring, the Germans unexpectedly fell upon him in a narrow paffage; and having furrounded the Roman army, cut a great many of them in pieces. But Drufus having animated bis men by his example, after a bloody contict, which
lafted the whole day, the Germans were defeated with Germany. fuch flaughter, that the ground was firewed for feveral miles with dead bodies. Drufus found in their camp a great quantity of iron chains which they had brought for the Romans; and fo great was their confidence, that they had agreed beforehand about the divition of the booty. The Tenchtheri were to have the horfes, the Cherufci and Sicambri the baggage, and the Ufipetes and Catti the captives. After this victory, Drufus built two forts to keep the conquered countries in awe; the one at the confluence of the Lyppe and the Alme, the other in the country of the Catti on the Rhine. On this occation alfo he made a famous canal, long after called in honour of him Fofia Drufiana, to convey the waters of the Rhine into the Sala or Sale. It extended eight miles; and was very convenient for conveying the Roman troops by water to the countries of the Frifi and Chauci, which was the defign of the undertaking.

The following year (9 B. C.) Auguftus, bent on fubduing the whole of Germany, advanced to the banks of the Rhine, attended by his two tons-in-law Tiberius and Drutus. The former he fent againft the Daci, who lived up to the fouth of the Danube; and the latter to complete the conqueit he had fo fuccefsfilly begun in the weilern parts of Germany. The former eafily overcame the Daci, and trantplanted 40,000 of them into Gaul. The latter, having paffed the Rhine, fubducd all the nations from that river to the Elbe; but having attempted in vain to crofs this latk, he let out for Rome : an end, however, was put to his conquetts and his life by a violent fever, with which he was teized on his return.

After the death of Drufes, Tiberius again overran all thofe countries in which Drufus had fpent the preccding fummer; and ftruck fome of the northern natic:as with fuch terror, that they fent deputies to fue for peace. This, however, they could not obtain upon any terms; the emperor declaring that he would not conclude a peace with une, unlels they all detired it. But the Catti, or according to lome the Sicambri, could not by any means be prevailed upon to fubmit; fo that the war was fill carried on, though in a languid manner, for about 18 years. During this period, fome of the German nations had quitted their forelts, and begun to live in a civilized manner under the protection of the Romans; but one Quinctilius Varus being fent to command the Roman forces in that country, fo provoked the inhabitants by his extortions, that not only thofe who nill held out refifed to fubmit, but wen the nations that had fubmitted were feized with an eager defire of throwing off the yoke. Among them was a young nobleman of extraordinary parts and valour, named diminius. He was the fon of Si-Arminius gimer, one of the moft poverful lords among the heads the Catti, had ferved with great reputation in the Ro-Gernro. man armies, and been honoured by Augultus with the Romans. privileges of a Roman citizen and the title of knight. But the love of his country prevailing over his gratitude, he refolved to improve the general difcontent which reigned among his countrymen, to deliver them from the bondage of a foreign dominion. With this view he engaged, underhand, the leading men of all the nations between the Rhine and the Elbc, in a confiracy againit the Romans. In order to put Varus

Germart. of his guard, he at the fame time adwifed him to thow bimit 1 : 0 the i:habitants of the nore ditant provinces, Adminiter for ice among them, and accuthen then, -y Lis examole, to live after the Ruman maner, which the hid woth more eifectually fubdue them than the R man fwod. As Varus was a man of a pe comble ? aper, sad aver'e from military toik, he sudi) (c. iceted to th.. intures propohi, and, leavins the weightourhoad of the Rhime, farded into the country it the Cheruici. If.aing there fent fome time in hearHeg caufe: and te iding civll controverties, Arminiev fertuaded him to weaken lis army, by fending out detachments to clear the cumetry of robbers. When this was done, fome ditant nations of Germary rofe up in arms by Arminius's directions; while thofe through which Varus was to pafs in marching againit them, pretended to be in a ftate of profound tranquillity, and ready to join the Romans againt their enemies.

## 11 Cuts Off

On the firf news of the revolt, Varus marched ahis army. gainft the enemy with three legions and fix cohorts; but being attacked by the Germans as he pafied through a wood, his army was almoit totally cut off, while te himfelf aud moft of his officers fell by their uwn hands. Such a territle overthrow, though it raifed a general coniternation in Rome, did not, however, dithearten Augutus, or caule him to abandon his enterprile. About two years after (A.D. 12.), Tiberius and Germanicus were appointed to command in Germany. The death of Augutiuc, however, which happened foon after, prevented Tiberius from going on his expedition; and Germanicus was for fome time hindered from proceeding in his, by a revolt of the legions, firlt in Pannonia, and then in Germany. About the year 15: Germanicus having brought over the foldiers to their duty, laid a bridge acrofs the Rhine, over which he marched 12,000 legionaries, 26 cohorts of the allies, and eight alre (quadrons of $3=0$ each) of horfe. With thefe he firt traverfed the Coffan foreft (part of the Hercynian, and thought to lie partly in the duchy of Cleves, and partly in Weitphalia!, and fome other woods. On his march he was informed that the Marii 12 were celebrating a fefival with great mirth and jol-

Arminius then, more paraged than ever, for the lofs of lis wife, whom lie tencer'ध ioved, ttirey up all the neighbouting nations againt the Romans. Gormanius, however, without being dimived ty fuch a formidable confederacy, prepared limatelf to oppole the enemy with vigour: but, that he might not be obliged to engage fuch numerous forces at once, detached his heutenant Cexina, at the head of $49 \mathrm{co}-$ horts, into the erritories of the Bructeri; while his cavalry, under the command of Pedo, entered the country of the Frifii. Ao for Germanicus himfelf, he emborked the remainder of his army, confiting $c \hat{f}$ four legion, on a neighbouring lake; and tranfported them by rivers and canals to the place appointed on the river Ems, where the three bodies met. In their march they found the fad remains of the legions conducted by Varus, which they buried with all the ceremony their circumflances could admit. Atter this they advanced againit Arminius, who retired ard polted himfelf advantageoully clofe to a wood. The Roman general followed him ; and coming up with him, ordered his cavalry to advance and attack the enemy. Arminius, at their firit approach, pretended to fly; but fuddenly wheeled about, and giving the fignal to a body of troops, whom he had concealed in the wood, to rulh out, obliged the cavalry to give ground. The cohorts then advanced to their relief; but chey too were put into diforder, and would have been pulhed into a morafs, had not Germanicus himfelf advanced with the reft of the cavalry to their relief. Arminius did not think it prudent to engage thefe frefh troops, but retired in good order; upon which Germanicus alfo retired towards the Ems. Here be embarked with four legions, ordered Cacina to reconduct the other four by land, and fent the cavalry to the fea fide, with orders to march along the fhore to the Rhine. Though Cæcina was to return by roads well known, yet Germanicus advifed him to pafs, with all poffible ipreed, a caufcuay, called the long briages, which led acrofs valt marflies, furrounded on all lides with woods and hills that gently rofe from the plain.

Amminius, however, having ght notice of Caciniss march, arrived at the long bridges before Ciecina, and filled the woods with his men, who, on the approarla of the Romans, rulhed out, and attacked them with great fury. The legions, rut wble to manage their arms in the deep waters and flippery gotounl. Were oblised to yield; and would in all probsbility have been wirely defeated, had not night put an end to it combat.  before dat, the canp ulish the Romans had begun va hatd wher water, and :har work nere ovetumed. C.ecina ud for fome time at a lafs what to do; but at latt refulved to attuck the enemy by dayreck, and, bating driven them to ther woud, to kee, them there in a mamer befugu, till the baygage and wounded r.en hould pats the caumon, and get ont of the enemy's reach. But when his army we dawn ure the Texions potied on the wines, feized with a fuden ya1.ic, defented their llations, and occupied a field beyond the mathes. Cacina thought it advifable to follow them; but the baggage nuck in the mire, as he attem ted to crofs the marthes, which greatly embarratfe! the foluiers. Arminin perceining this, laid hold of the opportunity to begin the attack; and crying cut, "This is a fecond Varus, the fame fate attends lime and his legions," fell on the Romans with ines. prefiible fury. As he had ordured his meen to aim chiz? at the horfes, grent numbers of them were kilhed; and the ground becoming dippery with their thood and the flime of the marm, the ret either feit or threw their riders, and, galloping through the rank, put them in diforder. Cecina dithnguifed himelt in a very eminert maner, but his horfe being killed. he would have been taken pribner, had not the frit legion refcued bim. The grectinefs of the enemy, lowever, faved the Romans from utter delraction; for juit as the legions were puite frent, and on the point of yielding, the barbatian on a fudden abandonud them in order to feize their bageage. During this refpite, the Romans flruggicd out of the marfh, and having gnined the dry fields, formed a camp with all ponible freed, and fortified it in the beft manner they could.

The Germans having lot the opportunity of defroving the Rumans, contrary to the advice of Arninius, attacked their camp next mornind, but were repulfed with great flaughter; after which they gave Citcina no more molellation till he reached the banks of the Rhine. Germanicus, in the mean time, haring conveyed the legions he had with him down the river Ems into the ocean, in order to return by fea to the ziver Rhine, and finding that his velels were overloaded, dehivered the fecond and $14^{\text {th }}$ legions to Publius Titellius, defring him to conduct them by land. But this march proved fatal to great numbers of them; who Were either buried in the quickfands, or fwallowed up by the overflowing of the tide, to which they were as yet utter flrangers. Thofe who efcaped, toft their atme, utenfils, and provifions; and pafled a melancholy wight upon an eminence, which they had gained by wading up to the chin. The next morning the land returned with the tide of ebb; when Vitellias, by a haily march, reached the river Uningis, by fome thueght to be the Hoereniter, on which the city of Gronirgen Itand.. There Germenicus, who had reached that river with his tleet, tool. the logiots agsin on lard, and convered them to the mowh of the Rhine, whence they all fetumed to Cologne, at a time when it was reported di.ey were totally bint

whost arn-, utcinis, holfes, \&ec. half naked, lame., ci-1 fanf. and uit for icuicc. The next year, however, Germenicus, hent on the entire reduction of Germany, H. ande wat preparations tor arother expedition. Haw- expectica ing condered the v.rivus accidents that had befallen Thine curing the was, te found that ti.e German were c) Sify indetited ior their fafety to their woods and mars deeir thort funmers and long winters ; and thet hin trom fuffered mare fron their long and todibes mathe $t$ an from the enem. For this reano he refived to enter the country by fea, honing by that means to begin the campaign earier, and furprite the encme. Having therefore built with great de$f_{\text {fatch }}$, curing the winter, 1200 veffels of different fort", he ordered them carly in the frinige (A. D. 16.) to $\mathrm{f}: 11 \mathrm{~d}$ :wn the Rhine, and apnointed the illand of the Batavians for the gentral rendezvors of his forco: When the fieet was failing, he detached Sillus one of his hutemants, with orders to make a dudden irrup. tion into the country of the Catti; and, in the mean time, he himielf, upon receiving inelligence that a Roman fort on the Luppias was befieged, hattened with dix legion to its relief. Silius was prevented, by fudden rains, from doing more than tiking fome imall bouty, with the wife and daughter of Arpen king of the Catti; neither did thofe who benieged th.e fort wait the arrival of Germanicus. In the mean time, the fleet artiving at the ifland of the Batavians, the provitions and warike engines were put on board and fent forward; Lhips were affegned to the legions and allies; and the whole army being embarked, the fleet entered the cala! formerly cut by D:ufus, and from his mane callet For Dryana. Hence he failed profperoufly to the maxth of the Ems; where, having landed his troons, he marched directly to the Wefer, where he found Arminius encamped on the oppolite bank, and determined to difpute his paffage. The next day Arminius drew out his troops in order of battle; but Gennanicus, not thinking it adviable to attack them, orderd the horfe to ford over mader the command of his lieutenants Stertinius and Emilius; who, to divide the enemy's forces, crofted the river in two different places. At the lame time Cariovalda, the leader of the Batarinn auxiliarice, croffed the river where it is molt rapid: but being drawn into an ambulcade, he was killed, together with moft of the Batavian notility; and the relt would have been tutally cut off, had not Stertinius and Emilius hattened to their alliftance. Germanicus in the mean time paffed the river without moleflation. A batte foon after enfud; in which thee Germans were defeated with fo great a flaughter that the ground was covered with arms and dead bodies for more than 10 miles round: and among the facilstaken on this occafion, were fund, as formety, the chans with which the Germans had horef to lind that cattives.

In memory of thi fignal viedory Germanicus raifed a moant, uin whic! he placed as tornies the arms of the enemy, and inferibed underneath the names of the conquered nations. This fo prow whed the Germans, then alredy valronnimed and derermined to obandun thent conter, that they attacked the Roman army un roced!y on its merch, and ut them into forne diforder. Being repuld, they encamped between : rive: and a large foitet forrolided by a marth except

Germany. he orderd two caftles to be built; one on this fide the Danube, and the other on the opnofite fide; and all this was accomplifged in the face of one fummer. Trajan, honever, as the feafon was now far advanced, did not think it advifable to enter Dacia this $y$ ara, but contented himfelf with making the neceflary pre17 patations.
They are In the year 106, early in the fpring, Trajan fet out fubdued by for Dacia; and having paffed the Danube on the bridge Trajan. he had built, reduced the whole country, and would have taken Decebalus himfelf, had he not put an end to his own life, in order to avoid falling into the hands of his enemies. After his death the kingdom of Dacia was reduced to a Roman province; and feveral caftes were built in it, and garrifons placed in them, to keep the country in awe.

After the death of Trajan, the Roman empire began to decline, and the northern nations to be daily more and more formidable. The province of Dacia indeed was held by the Romans till the reign of Gallienus; but Adrian, who fucceeded Trajan, caufed the arches of the bridge over the Danube to be broken

Is Marcomanni and Quadi formidable to the empite. down, left the barbarians fhould make themfelves mafiers of it, and invade the Roman territories. In the time of Narcus Aurelius the Marcomanni and Quadi invaded the empire, and gave the empetor a terrible overthrow. He continued the war, however, with better fuccefs afterwards, and invaded their country in his turn. It was during the courfe of this war that the Roman army is faid to have been faved from deftruction by that mirsculous event related under the article Christians, p. 70. col. 2.

In the end, the Marcomanni and Quadi were, by repeated defeats, brought to the verge of deftruction; infomuch that their country would probably have been reduced to a Roman province, had not Marcus Aurelius been diverted from purfuing his conquefts by the revolt of one of his generals. After the death of Marcus Aurelius, the Germanic nations became every day more and more formidalle to the Romans. Far from being able to invade and attempt the conqueft of thefe northern countrics, the Romans had the greateft difficulty to reprefs the incurfions of their inhabitants. But for a particular account of their various invafions of the Roman empire, and its total deftruction by them at latt, fee the article Rome.
Remanem- The immediate deftroyers of the Roman empire pire deftroyed by the Herui. were the Heruli; who, under their leader Odoacer, dethroned Auguftulus the laft Roman emperor, and proclaimed Odoarer king of Italy. The Heruli were foon expelled by the Ofrogoths; and thefe in their turn were fubducd by Juftinian, who reannexed Italy to the ealtern empire. But the popes found means to obtain the temporal as well as firitual jurifdiction over a corifderable part of the country, while the Lombards fabducd the relt. Thefe latt proved very troublefome to the popes, and at length befieged Adrian I. in his capital. In this diftrefs he applied to Charles the Great, king of France; who conquered both Italy and Germany, and was crowned emperor of the weft in 800.

The pofierity of Charlemagne inherited the empire of Germany utitil the year 880 ; at which time the different princes aflumed their original independence, rejected the Carlovingian line, and placed Arnulph king
of Bobemia on the throne. Since this time Cermany Germany. his ever been conitered as an elective monarchy. Princes of dificent families, according to the prevalence of their intereft and arms, have mounted the throne. Of the'e the moft conliderable, uttil the AuItrint line acquired the imperial power, were the houfes of Sixony, Franconia, and Suabia. The reigns of thele emperors contain nothing more rematkable than the contelts between them and the popes; for an account of which fee the article Italy. From hence, in the teginning of the $13^{\text {th }}$ century, arofe the factions of the Guelphs and Gibellines, of which the former wos attarhed to the popes, and the latter to the empercr; and both, by their virulence and inveteracy, tended to difquiet the empire for feveral ages. The emperors too were often at war with the inidels; and fometimes, as happens in all elective kingdoms, with one another, about the fucceffion.

But what more deferves our attention is the progrefs of government in Germany, which was in fome meafure oppofite to that of the other kingdoms of Europe. When the empire raifed by Charlemagne fell alunder, all the different independent princes affumed the right of elcetion; and thofe now diftinguified by the name of electors had no peculiar or legal influence in appointing a fuccefior to the imperial throne; they were only the officers of the king's houfehold, his fecretary, his fleward, chaplain, marfal, or mafter of his horfe, \&c. By degrees, however, as they lived near the king's perfon, and had, like all other princes, indcpendent territories belonging to them, they increaled their intuence and authority; and in the reign of Otho III. 984 , acquired the fole right of electing the emperor. Thus, while in the other kingdoms of Europe, the dignity of the great lords, who were all originally allodial or independent barons, was diminifhed by the power of the king, as in France, and by the influence of the people, as in Great Britain; in Germany, on the other hand, the power of the electors was raifed upon the ruins of the emperor's fupremacy, and of the people's jurifdiction. In 1440, Frederic III. duke of Aultria was elected emperor, and the imperial dignity continued in the male line of that family for 300 years. His fucceffor Maximilian married the heirefs of Charks duke of Burgundy; where. by Burgundy and the 17 provinces of the Netherlands were annexed to the houfe of Auftria. Charles V. grandfon of Maximilian, and heir to the kingdom of Spain, was elected emperor in the year 1519 . Under him Mexico and Peru were conquered by the Spaniards; and in his reign happened the Reformation in feveral parts of Germany; which, however, was not confirmed by public authonty till the year 1648 , by the treaty of Weftphalia, and in the reign of Ferdinand III. The reign of Charles V. was continually difturbed by his wars with the German princes and the French king Francis I. Though fuccefs? $u$ l in the beginning of his reign, his good fortune towards the conclufion of it began to forfake him; which, with other reafons, occafioned his abdication of the crown. See Charifes V.

His brother Fcrdinand 1. who in 1558 fucceeded to the throne, proved a moderate pince with regard to religion. He had the addrefs to get his ion Maximilian deciared king of the Romans in his own life-

 Mrathr, and ata hing wher interch beeral of $t$. in Sumatert prices of Garmany. The tan pillisy which now took piace, howeve, was not exiohthat unoar ay femanent bali. Wae with opain was rat fumed in the year 1663; and the gent iuscali's of Tuncme in the Notherlands mimulated the ambition of the prince of Conde to attempt the conquat of Francire Compte, at the time under tise protection of tive hou'e of A.fria. This was accomplihed in thece weeks: Lut the rapid fuccels of Lunis had wwhened the jeaturly of his neighbours to theh a degre, thet is letgue wa formed asaint him by England, Holend, ond Sweden; and the Frenh monarch, dreading to t:ace the lills with fuch formidable enemies, comemed to the treaty of Aix-la-Chapelle, by which, annong chicr articles, Fraache Compte was relloced. The flames of war, however, were renewed by the infatizble ambition of the French monarch; who, having entcred into on alliance with Charles II. of Eogland, aincd at nothing lefs than the total overthrow of the 1)uth republic. The ceents of that war are related under the aricle Uximed Provinces; here it is fullicient to oberve, that the miffotunes of the Dutch excited the compalion of the emperor and court of Spain, who now openly declared thenelves tha ir alliec. Turenine wa oppofed by the prince of Oange in conjunction with the celebrated Imperial general Montecuculi, whofe artiul conduct eloded wen the penctration of Turcnae, and he fat down faidenly before the city of Bunne. Here he was foined by the prince of Orauge, who had likewife found means to clude the visilance of the Trench generals. Bome firrendered in a hort time, and feveral cther places in Cologne fell into the hunh of the alies, who likesife cut off the commmi ntion betwist lrance and the United Posinece; is tha: Louts was fron obliged to recal his amies, and abomdon all his conquells with greater rapidity than they had been mate. In 16ift he was aimandoned by his ally Charles 11. of England, and the bilhop of Monter and eleano of Cilogne were compelled to renomece their allemiance to him; bot nutwithlanding thefe misfortune, he continued everywhere to mathe head ayank his enemic, and even me ditated hew conqueth, With a poverful army he again invaded Vranche Compte in perfon, and in fix weck, redused the whale province to hi obedience. In Alface, Tacence defeated the Imperial general at sintahein, and ravaged the palatinate: Seventy thoufand Gernans were furpriied; a confiderabie cetachment was cut in pieces at Mulhaufen; the elector of Erandenburg, who had been istrufted with the chief command, was routed by Turenne near Colmar; a third body met with a fimilar fate at Turkheim; and the whole German fusce were obliged at lall to evacuate the province and replais the Rhine.

## G E R [ 682$]$ G E R

inproany Errinan: In whimpace of thefe dif.fers the Imperial general Monteruculi was recalled to azt againh Tureane. The military fkill of the two commanders feemed to be neariy equal ; but befure the fuperiority could be adjucjzed to either, Turenne was killed by a camon ball as he uds recomoitring a fituation for erecting a bettery. By his death the Imperi.ulith, obtained a decided tuperiority. Montecuculi pencirated iato A!lace; and the French, vade: De Lorges nephew to the deceafed general, were happy in being able to eicape a defeat.

Pat of the German army no:v fat down befure Treves, where they were oppofed by Marefchal Crequi; but the negligence of that general expofed him to fuch a drealful defeat, that he was obliged to fly into the city wihh only four attendants. Here he endeavoured in vain to animate the people to a vigorous defence. The garrilon mutinied againft his authority; and, When he refufed to fign the capitulation they made, delivered him up prifoner to the enemy. Louis in the mean time had taken the field in perion againft the prince of Orange ; but the difatrous ftate of affairs in Germany induced hin to recal the prince of Condè to make head agaimf Montecuculi. In this campaign the prince feemed to have the advantage. He compelled the Germans to raife the fieges of Hagenau and Saverne; and at lait to repafs the Rline without haling beea able to force him to a battle.

This was the laft campaign made by thefe celebrated commanders; both of them now, contented with the lame they lind acquired, retiring from the field to fipend the remainder of thir days in peace. The exvellent difcipline, however, which the two great French generals had introduced into their armies, fill contisiued to make them very formidable, though it did Eot always enfure them of victory. In Germany, the duke of Lorrain, who had recovcred PhilipBurgh, was repeatedly defeated by Marefhal Crequi, who had been ranlomed from his captivity, and become more prodert by his defeat. In Flanders, the prince of Orange was overmatched by the duke of Orleans aud Marilal Luxemburg. A peace was at length concluded at Nimeguen in 1679, by which the king of France lecured limelf Franche Compté with a great many cities in the Netherlands; wh:le the king of Sweden was reinflated in thofe places of which he had been flipped by the Danes and Germans. This tranguillity, however, was of no long duration. Louis employed every moment in preparations for new conquelis; poficfed himielf of the imperinal city of Stratburg by treachery; and difpoffeffed the elector Palatine and the elector of Treves of the lordhips of FalRenaburg, Germanflicim, and Valdentz. On the moll frivolous pretences he had demanded Alont from the Spaniards; and on their refufal, feized upon Luxemhurg. His conduct, in thort, was fo intolerable, that the prince of Orange, his invetcrate enemy, found means to unite the whole empire in a league againft him. Spain and H olland became parties in the fame caufe; and Sweden and Denmark feemed alfo inclined to arcede to the general confederacy. Notwithilanding this formidable combination, however, Louis feemcd fill to have the advantage. He made himfelf mafter of the cities of Philiphbargh, Manhcim, Frankendal, syircs, Worms, and Oppenheim: the fruitful
conntry of the palatinate was ravaged in a dreadful man. Germany. ner; the towns were reduced to alhes; and the people, drisen from their habitations, were everywhere left to p.rih through the inclemency of the weather and wan of provitons. By this ciuelty his enemies were ratioer easfperated than vanquined: the Imperiaiitts, under the conduct of the duke of Lorrain, relumed their courage, and put a ftop to the French conquells. At length all partics, weary of a deftructive war, confented to the treaty of Ryluick in 1697 . By this treaty Louis gave up to the empire, Fribourg, Brifitc, Kheil, and Philipiburg; he confented alfo to deitroy the fortifications of Stralburg. Fort Lonis and Traerbach, the works of which had exhaulled the kill of the sreat Vauban, with Lorrain, Treves, and the Pabatinate, were refigned to their refpective princes; infornuch that the terms to which the Fronch monarch now confented, after fo many victurics, were fuch as could fearce have been expected under the preflure of the greateit misfortunes. The views of Lowis, however, in confenting to this apparently humiliating treaty, were bevond the views of oodinary politicians. The health of the king of Spain was in fuch a declining way, that his death appeared to be at hand; and Louis now refolved to renew his pretenfions to that kingdom, which he had formerly by ireaty folemnly renounced. His defigns in this refpect could not be concealed from the vigilance of William III. of Britain; of which Louis being fenfible, and knowing that the emperor had claims of the fame nature on Spain, he thought proper to enter into a very extraordinary treaty with William. This was no lefs than the parition of the whole Sparith dominions, which were now to be ditributed in the following mamer. 'To the young prince of Bavaria were to be afigned $\mathrm{S}_{\mathrm{p}}$, in and the Eaft Indies; the dauphin, fon to Louis, was to have Naples, Sicily, and the province of Guipufcoa; while the archduke Charles, fon to the emperor Leopold, was to have only the duchy of Milan. By this fandalous treaty the indignation of Chatles was roufed, fo that he bequeathed the whole of his dominions to the prince of Bavaria. This fcheme, however, was difconcerted by the fudden death of the pinace; upon which a new treaty of partition was concluded between Louis and Wiliam. By mis the kingdom of Spais, together with the Ealt India territuriec, were to be beltowed on the archduke Charles, and the duchy of Milan upon the duhe of Lorrain. The laf moments of the Spanif monarch were diflurbed by the intrigues of the rival houfes of Auftia and Boturbon; but the haughtin fs of the Aufria minitters to difgufted thofe of Spain, that they prevailed upon their dying monarch to nake a now will. $\mathrm{B}_{\mathrm{y}}$ this the whole of his dommions were bequeathed to Philip thae of Anjou, graudfun to the king of France; and Louic, prompted by his natural ambition, accepted the kingdom bequeathed to his grandfon, cxoufing himfelf to his allies in the bett manner he could for departing from his engagements with them. For this, however, he was made to pay dear. His infatiable ambition and his former fuccelies had alarmed all Europe. The emperor, the Dutch, and the king of England, cntered into a new confederacy againt him; and a bloody war enfucd, which threatened

## G E R

Germany. to overthrow the French monarchy eatisely. Whi'c this war (of which an account is given under the article britans) was carried on with fuch fuccels, the emperur Leopold died in the year 1705 .
He was fucceeded by his fon Jofeph, who put the electurs of Cologne and Bavaria to the ban of the cmpire; but being ill ferved by Prince Louis of Baden genere! of the empire, the Freach partly recovered their aftuirs, notwithitanding their repeated defeats. The dule of Marlborough had not all the fuccefs he expected or deferved. Joteph himielf was fufpected of a deïgn to fubvert the Germanic liberties; and it was plain by his conduct, that he expected England thould take the labnuring oar in the war, which was to be entirely carried cal for his benefit. The Englith were difgulted at his flownefs and Clfimnefs: but he died in 1711, before he had reduced the Hungarians; and leaving no male iffue, he was fuccee:led in the empire by his brother Charles VI. whom the allies were endeavouring to piace on the throne of Spain, in oppoftion to Pailip duke of Anjou, grandfon to Louis XIV.

When the peace of Utrecht took place in 1713 , Charles at firft made a thow as if he would continue the war; but found himfelf unable, now that he was forf.ken by the Englilh. He therefore was obliged to conclude a peace with France at Baden in 1714 , that he might attend the progrefs of the Turks in Hungary; where they received a total defeat from Prince Eugene at the battle of Peterwaradin. They receivcid athether of equal importance from the fame general in 1717, before Belgrade, which fell into the hands of the Imperialifts; and next year the peace of Palfarowitz, between them and the Turks was concluded. Charles employed every minute of his leifure in making arrangements for increafing and preferving his hereditary dominions in Italy and the Mediterranean. Happily for him, the crown of Britain devolved to the houle of Honover; an event which gave him a very decifive weight in Europe, by the connexions between George I. and II. and the empire. Charles was fenfible of this; and carried matters with fo high a hand, that, about the years 1724 and 1725 , a breach enfued between him and George I. and fo unfteady was the fyttem of affairs all over Europe at that time, that the capital powers often changed their old alliances, and concluded new ones contradictory to their intereth. Without entering into particularc, it is fuinicient to obferve, that the fafety of Hanover, and its aygrandizement, was the main object of the Britifh court ; as that of the emperor was the eltablifhment of the pragmatic fanction in favour of his daughter the (late emprefs queen), he having no male illue. Nutual concellions upon thofe great points reftored a guot underilanding between George II. and the emperor Charles: and the Hetur of Saxony, Hattered with the view of gaiming the throne of Poland, relinquified the great claims he had upon the Auftrian fuccetion.

The emperor, after this, had very bad ficcess in a war he entered into with the Turks, which bo had undertaken chielly to indemnify himfelf for the great facrifices he had made in It aly to the princes of the hor ic of Pourbon. Prince Fugene was then dead, and lic had no general to fuptly his place. The fyftem of France, however, under Cardinal Fleury, happened :t that time to be pacific: :and the orminat for him, from
the Turl:, a botter pace than lie had reafon to . . . n i pect. Chanles, to heep the German and nether pmos, -... eafy, had, before his death, given his chtert whathe. the late emprefs qqueen, in marrizge to the dive © Larrain, a prince who could britg as accellion a power to the A'dtrian family.

Charles died in $10 .+5$; and was ro forme: in $t$. grave, than all he had to long laboured tor tnu! has. been overthrom, had it not been for the firmme's 1 George 11. The young king of Pampeatered end compuced Silefia, which he iaid had heen wrong gutul., difme wered fiom his family. The King of Suins at the electoz of Bazaria fet up claims direetly incomptible with the pragmatic fanction, and in ti:s they wer joined by France; though all thofe power, had folem:ly guarantes it. The imperial throne. alfer a canderable vacancy, was filled up by the clector of Bava. ris, who took the title of Charles I'II. in lamary 1742. The French poured their armies into B ismil, where they took Prague; and the queen of Hungary, to take off the weight of Pruffia, was forced to cede is that prince the moit valuable part of the ductry of Silcia by a furmal treaty.

Her youth, her beauty, and fuferings, and tl noble fortitude with which fhe bore them, totched the hearts of the Hungarians, into whole arms he threw herfelf and her little fon; and though they hat been always remarkable for their diaffection to the houfe of Aultia, they declared unanimsuly it her favour. Her ge rals drove the French out of Bohemia; and George II. at the head of an Englihn and Hatoverian army, gained the battle of Dettingen, i: 1743. Charles Vil. was at this time miferable on the imperial throne, and would have given the queen of Hungary almont her own terms; but the haughtily and impolitically rejetted all accommodation, though advifed to it by his Britannic majelty, her beit and indeed only friend. This obftinacy gave a colour for the king of Prulfia to invade B hemia, under pretence of fupportiry the imperial dignity; but thourh he took Prague, and fubdued the greatela part of the hingdom, he was not fupported by the French; upo:1 which he abaudoned all his conpuefl, and retired into Sitelia. This event confirmed the obftimacy of the queen of Hungary: who came to an accommodation with the eaperor, that the might recaver Silctia. $S$ oon after, his Inperial majelly, in the beginning of the year ${ }^{17} 45$, died, and the duke of Lomain, then grand duke of Tufeny, contont :n the queen of 11 m gary, after furmounting fome ciliticulties, was chofea emperor.

The bad furrefs of the allies aranint the Trenth and Buarians in the low Countrice, and the lof of the battic of Fmenoy, retarded the operation of the emprefo quern againil his Pruman th.jody. Tha lat ter beat the emperot's hrother, Prince Chater of Lor raim, who had befrice driven the Prulfims out of Bus hemi. ; and the eonduct of the empref ques: ads fuch, that his B-itonic majoth theereht proyer to

This prince ihowed an active and reftefs difpo. Germany. fition, much inclined to extend his territorics by conqueft, and to make reformations in the internal policy of his dominions, yet without taking any proper methods for accomplihing his purpofes. Hence he was almolt always difappointed ; informuch that he wrote for himielf the following epitaph:" Here lies Joieph, unforturate in all his undertakinge." In the year 1788, a war commenced betwist him and the King of Prulia; in which, notwithitanding the impetuous valour of that nonareh, iwaph adted with fuch caution that his adverley could gain no advantage over him; and an acconmodatim took place without any remarkable expluit on either fide. In 178 I he took the opportunity of the quarrel betwi:t Britain and the Lnited Provinces, to deprive the later of the barior towns which had beca fecured to them by the treaty of Utrecht. The ie indeed had fruguently been of great wie to the hout of Aultic: in is thate of wealinets; but Joieph, comiciou o hiv own thergth, hoked upon it as derothatary to lis hovoer to aliow io many of his cities to semain in the hands of foreignore, and to be garrifoned at his. expeace. Is at that time the Dutch $n \rightarrow$ re unable to retia, the i melinh ortens for twicuting the barries towns were intimity complied wita, nor did the court of France, though thea in frimhinip with Holland. make any ofter to interpole. Encuuraged by this tuccoll, theph nest demanded the free navigation of the Schelde; but as this would evidenly huse been very detrimental to the commercial intereits of Holland, is that refulal wa- given to his requitions. In this the empeerer was mach dilappointed; having thatterel himfeli that the Hollmender, intmidated by bis powe would yich the natigation of the river as edfiiy as the had done the barricr. Great preparations were raus by the emperor, which the Dutch, oa their part, Eemcd determined to rehit. But while the emperor apperr. ed fo much let upon this accuiintion, he fuddenly abandoned the project entirely, and emered into a new Theme of exchursing the Netherlands for the duche of Bavaria. This was oppoficd by the king of Prutian; aid ly the :merfermic of the csint of France, the emperor found himetef at lat obliged aifo to abandom his other fcheme of obtaining thic navigation of the Scheldet. A treaty of peace was concluded, under the gunamtee of his mot Cluitian majelty. The principal articles were, that the Hates acknowiedged the emperor's forsrcignty over the Scheldt from Antwep to the limits en Seftingen ; they Rgreed to dem lifh re:ain fort, and to pay a comber inle fum of money ia liun of tome chain- which the enveror had on Minelricht, and by way of ind manication for hying part of his territorics wader water.

The treaty with the Dutch was no fooner conchubed than a quared with the Turk, touk place, which terminated in an ojen war. It does mot appear that the empeore had it it is time any send provocation, but feems to have athed m. rely in conticquence of his ensagement, with Kumin in : Peluce the dominions of the Guand signior. All thefeforeign engagement, however, did not in the leat retard the progrefs of of formation which the emperer cerried on throuthout his domi.: wh wit's a rapility [encely to be muched, and whata at lat productil the acwolt of the Amatan N:

Gormano reiga was deprelled, and a new form in the government railed $u_{2}$. The dukes exalted themfelves above the poser of the emperor, and fecured for their fons a fuccation to theis greatnefs; while the interell of the forereign, in order to trengthen the bond of farinal attachment, ratified to others and their defcendants that lway which had been formerly delegated and dependant on his will. Hence arofe the modern contitution of ditinct principalities, acknowledging one head in the perfon of an emperor. But thortly a iter the election of Conrade duke of Franconia to the throne, this new-gained authority of the princes becune doubtiul. However, after mof violent diflurbarees and confufions, the regulations yiclded to by Albert II. and his fuccefors, a+iculerly by Frederick III. laid the foundation of the Ge:man conflitution; but the poser and form of whoh were afterwards improved by Maximilian. Beisre Charles V. momnted the throne, on the death of Maximilian, the eiectors formed a bulwark againit the Imperial power, Ey an inftument called the capitulation; to which articles of government he and all emperors elected fince have fwom, previous to their invelliture with the Impe-
burg as grand chomberlain, The number originally Cirmany. was Seven, but the emperor Leopold created the duke of Lunenburg, anceltor to our prefent Britihl fovereign, an elector; to whom the poit of arch-treafurer whis afterwards given; and thus Hanover forms the eichth electorate. But this number cannot be increaCid by the emperor without a previous election by the e: ctors themfelves; who, thus capable of electing and of heing elected, may ifyle them!elves Coinperantes; and they evercile part of the imperiat authonity, if a vacancy of the throne happen. But when or before this Election or occurs, the election of the emperor is proceeded to af- the emp:ter the following manner: The elector of Mentz, be- ${ }^{\text {ror }}$ fore the lapfe of a month after the death of the emperor, fummons, as great chancellor of the empire, the relt of the electors to attend on fome fixed day within the fpace of three months from the date of the fummons. The clectors generally fend their amballadors to the place of election, which is held at Frankfort on the Mayne ; but faving the right of the city of Frankfort, it my be held elfewhere.

When the diet of electors is affembled, they proceed to compofe the capitulation, to which the emperor when elected is to lwear. The capitulation being adjutted, the elector of Mentz appoints a day for the election. When this day arrives, the gates of the city are thut, and the keys delivered to the elector of Mentz. The electors or their ambaffadors, Proteftants excepted, repair in great pomp to mals; and after its celebratio: they take a folemn oath to choofe, unbia?ed and uninfluenced, the perfon that appears moft proper for the imperial dignity. After this they repair to the facrifty, where the elector of Mentz firit afks, if there be any impediment known againt their proceeding at prefent to an clection; and next he obtains a promife, that the perfon elected by the majority thall be received as emperor. The declarations of the electoral ambaffadors, in refpect to thofe two points, are recorded by two notaries of the empire. Then all witnefles withdraw ; and the elector of Mentz collecting the fuffrages, which are viva voce, and giving his own laft, the witnefies are recalled, and he declares the perfon whom the electors have chofen. But the election is not complete, nor is the new emperor proclaimed, until the capitulation be fworn to either by himfelf or by his ambaffadors if he be abfent. From this time he is tlyled king of the Romans until the coronation takes place; which ceremony confers the title of emperor. According to the golden bull, it fhould be celebrated at Aix-la Chapelle, out of refpect to Charlemanne, who refided there; but faving the right to Aix-la Chaplle, it may take place ellewhere. The coronation i: ferformed by the archbihop of Mentz or elector of Culogne. And, when he is feated on his throne, the duke of Saxony delivers into his hand the fword of Charles the Great, with which he makes fome knights of the holy Roman empise, and is alio obliged to conter that honour upon fuch others as are nominated by the relpective electors. When he proceeds to dimner in the great hall, he is feated at a table clevate? two fteps higher than that of the clectore, and in ferved l.y counts of the emfire. 'The elector, each of whom has alfo his table, are attended by the gentlemen of their refpectise courts. Thele electors, who iflift perfonally at the ce-
 are repromed ly amberadors have only tixir tables coveral out of furm with plate, at which the amomiduen do nut lif.

For the bur.ef: of the empise daring the reign of an emperor, his piefumptise fuccethor may be ciceted King of tie R anan. But this elcetion cuaters at frit a mere title; for hy an exprets artis le in his capitulation, the king of the Komans fivears not to intertiere wifh the goverment curing the life of the emperor: but on his deckate, the coronation cuntams him emperur without a lecond eleation.

Whould there not be a king of the Roman, and the thone become vacant, the governmat is numinitered 1y vicars of the empine, who are the eletors Palatine and of Soxoin, as csent pahane and anch-marthal of the empire. Eat: has his di.kist and tribum of the vicariate; and by the golden bull it is eltabliked, that all ats of the vicars tre suld; bet they are all fully confrmed by the enperat; which confrmation, by an article of lac capitulation, he is bound to give.

There are alio vicars of the emperor. Thefe officers are confiouted by a delegation of the impenial poser from the emperor to any prence of the empire, when he so unable to execue his authority hinifeif. But thefe whass fand arcunt ble to the emperor; their acte moy be amulad and their orfices revohed, all dependent on the sill of the cmperor, and determinable at his p'eature.

When the race of Charlumagne ceaied to govern in Germany, the princes and late, arociated to contintie the empire; and that its majetty mi he be vifible, and its laws enforced, they ayred to choofe an emperir. From this emperor all electors and priaces except thofe before 1552 receive invelliture of their dominions; counts and free cities from the Aulic council. But this inveltiture is no more than a dign of fubmition to the majelty of the empire, which is depofited in the empe:or. For as the contituted members of the empire are dependent on that collective union from which they derive protection, they therefore flow this dependence on the emperor, becaule he reprefents the majelly of that union of of that empire; but in all other refiects they are independeat and free.

Thefe princes or fovereigns masy even wage war with the prince veating the imperial crown, as poffefied of other titles and duminions, unconnected with his imperial fortion. Nor can the fovereignty of any memter be affected fo 1 the as he remins loyal to the empie: which loyaly conthitutes his duty, and fecures him it procetion Bet trould he be guily of any sication argant the empror, as bead of the empice, furb a ciline would conmit hin to the punilment of iv has, and he wuald te put under the ban. For :hic crime wount be a ainul that colle ctive berdy of foveceiens wh ofe urin contintes the empire ; and therefire ny vi,hetono of that union is jumly punilled with deptivation of thefe teriturice, whirlh reader fuch fovecti ne members of the empire. Nor can this punic....ent of te ban denote from the dignity of thofe pritices. 0 ha derise the it lovercignty from this contlisutions. and whof fultaction is an a t of their own conion. If, ever, member of the empice can at ; reicht ie pu: under the ban without being fint heaid,
and without t.e corcurreme of the clectors, princes, (wan and itate, being presi aty whaned.
the empent is endowed with many privilege, and pare ${ }^{25}$ : his puace partly andears in the exertice of his refer:ed the cmeo. ri his, cr the pecuiar prerocatives anne:- to the im-ru. perial dignity. He crants th rin'o the invertituse of their dominime : but to this he is towed an the laws direct. Ho confers tithe, hat pronaice that they thall be betfosed only on fuch pertons an will maintain their dignity, and can fupport their rank. Defide, he c:a give merely the title; for the power or privilege. of prince or count can be obtained only from their zefective bulies. Bat in fome imlanco, cven title ase of high importance. For the defcend.ints of a prince are incapable of luccelion, if their mother be of inferior rank to their father; but the conferring of a titlec emobles her and removes the bar, if the collateral lia* confent:
The emperor can alfo make cities, found univerfities, grant the privilege of fairs, \&c. He can alfo difpente with the tedious terms of minority, and cmpower princes to aflume at an earlier age the governnent of their own cominions. He decides all rank and precedency, and has a power of pramas preces, that is, of granting for once in every chapter of the empire a vacant feat. But he is not above the law ; for electurs have nut only chofen but depofed emperor However, the induence of the capitulation is to prevent fuch digorous proceedings : but thould the capituladion be violated, the college of electors might proceed to remomitrance; and if thefe remonitrances thould be withurt effect, in conjunction with the diet, they might re'net to more forcible remedies.

The diet is that affembly of the flates in which the Di ${ }^{2} \mathrm{of}$ the legilative power of the empire refins; and is compor- emp. $e d$ of the electors, princes, prelates, courts, and free cities of the empire. It has fit fince 1663 , and $i$, held ufunlly at Ratifbon. The emperor, when prefent, prefiuts in perfon; when abfent, by his commitfary, whofe communication of propofals from the emperor to the affembly is called the commilistial dicree. Tine elcitor of Mentz, as chancellor of the empirc, is director of the diet; and to his chancery are all thinge addreffed that are to be fubmitted to the empise ; the reading of which by his lecretary to the lecretaries of the other minifies at the diet is denominated per aifataram, and confitutes the furm of tranfmitting papers or memasials to the dictatare of the cmpie.- The dic: is compofed of three diilinct collitges, each of which has its particular dirctor.  in the dinficts of the provinces by cow con anpeals 1.\% fiom their courts to that of the empror Etiore tiec
 of the emnoror, they interrarted alio the conte ofultice, ziot inatic. The conlument inconveninones coubd feveral indectatiens to be preterred from the thates to dif rent emperors for the ettabil bantent of a court of furtice, which flould take cognizance of great an well as !:mail caufes. And at length fuch a comat was cefected by Maximilim I. under the titie of the Inomer/camber a: Horme, in the year 1495 ; but was remured to Spires in 1533 , and to Wetziar in 1590 , whete is is now held. The members of this comet are a juege ot the chamber and 25 afien re, pattly Protenthets partly Papits. The prefident is arpointed sy the ewsencr, the affefor, by the dates. The comet recelies ozocals from inferior iurifdifions, and derines dubion= tithes; and all caufes betore it between frince and prince, or prince, and private ferfon, are aduded accoraing to the laws of the reneztive parties, or according to the Imperia! law. the tribunal is under the intpection ot sintors appointed by the fitates; and, duritg their viliation, the fentences of the court are fubject to revition. Apreals lie afterwards alfo from the judgment of the viliturs to that of the diet.

The emperors finding themilyes deprived of mony of their powers, wibled to raife their prergatives at by forning a tribunal, of which they thouid name the judge, and before whom catifes in the latt refort thould come. But Maximulian forefaw, in refpect to the new tribunal, that though a confcioulnets of its importance made the itates flruggle for it erection, the expences oit its eitablihment would make them neglect its lupport; and the event bore wi:nefs to his fagacity. But when, through the omiftions and negligence of the itate, there harpened to be a ceflation in the diIfribution of juffice by the Imperial chamer, he revived his cuurt of the count Palatine, or Aulic council. And in order to gain the guict acquefcence of the flates, under the maik of a particion of power, and of generous moderation, he delired them to add eight to the number of aflefiors, and the falaries of all hould re dicharged by him. The flates fwallowed the bait, but foon perceived that they had loft part of their liberty.

The emperor, by keeping the tribunal always open, by fling its keats with men of firft-rate talents, and by baving its fentences duly and freedrly executed, drew all candes before it. The rtates remontiated, declaring, that the Imperial chamber uught to be not only the fupreme, but fole tribupal of that kind. The emperor snfiwered, that he had erecked the lmperist chamber in confequence of their folicitations; but as they had rot fupplied the tribunal with judges, he provided for that deficiency by a conftant adminilimation of jutice in the ettablithment of another.

The Aulic council now fubfints with equal authority, each receiving appeals from inferior jurifdictions; but neither apjealing to the other, as the dernier refort from hoth mufl be had to the diet. However, to the Aulic council belong the refirved rights of the emperor; and to the Inperial chamber alfo are atnetied peculiar powers. The Imperial chamber fublits during a va-

Germany. The wore number of forces in the forive of the feve-lam- ral Getman princes has been tiated at half a million; other, calculate, that the ecclefaftical princes can furnith $74,500 \mathrm{men}$, the temporal princes 379,000 , and the emperor 92,000 , as head of the loule of Auitria. Total $543,5=0$.

The revenue accruing to the emperor as fuch in time of peace, is very tritling, only about 20,000 crowns, being the contributions of a few imperial town, but in cale of war, extraordinary aide, called Romon Mnth, luid on by the diet, are contributed by the different circles at the following rate for raing $I^{\frac{1}{2}}$ millions of forins, viz.

'The aftual revenue of all Germany has been calculated at nearly $18.000,0001$. Aterling, or 100 millions of dol-

Fsom the great extent of the empire, every varicty of foil is to be met with; but it is upon the whole more fertile than otherwife. The middle parts are moft productive in corn and cattle; the fouthern abound with excellent wines and fruits. The northern parts, from thit coldnefs, are rather unfavourable to vegetation; however, agriculture throughout improves exceedingly. Their mines, though early explored, filil continue great furces of wealth. Thev produce, excepting tin; almoit evcry mineral. Of quickilver, one mine alone is computed to yield 50,000 pounds weight a-yedr. They furnifh the finell fort of clay for porcelain, and have excellent and extenfive falt works.

From the central fituation of Germany, its comsuerce with the re!t of Europe is very extenfive. Its mincrals are decidedly the firil native articles for trade; afier uhich its madicinal water", fait, hemp, flax, linen, Sik, vines, frwit, corn, cattle, ftuffs, cloths, timber, porcclain, wrought iron and flcel, drugs, oil, and colours, are the principal. The artizans furnihed by the revocation of the edict of Nantz, enable Germany ho lunger to fand in need of the wrought filks of other countrics. Great commercial fairs ftill exilt in Germany, and it is confidered upon the whole that the balance of trade is in its favour.

With regard to the charatter of the ancient Germans, they are defcribed to us by the Greek and Roman writers as refembling the Gauls; and differing from other nations by the largenefs of their ftature, ruddy complexion, bluc eyes, and yellow bufly hair, hanglity and threataing looks, ftrong conflitutions, ard being proof againft hunger, cold, and all kinds of hardhip.

Their mative diffofition difplayed itfelf chietly in thei: martial genius, and in tbeir fugulas fidelity.

The former of thefe they did indeed carry to fuch an Germang. execfs as came little thort of downright ferocity ; but, as to the latter, they not only valued themfles; highly upon it, but were greatly elkeemed by other nations for it ; infomuch that Auguftus, and feveral of his fucceflors, committed the guard of their perfons to then, and almoll all other nations either courted their friendhip and aliance, or hired them as auxiliaries; though it mult be owned, at the fame time, that their extreme love of liberty, and their hatred of tyrany and oppreffion, have often huaried them to treachery and murder, elpecialy when they hare thought thembleses ill ufed by thofe who hired them; for in all fuch cafes they were eatily firred up, and extremely vindictive. In oiber cafes, Tacitus tells us, they were noble, magnanimous, and beneficent, without ambition to aggrandize their dominions, or invading thofe from whom they received no injury; rather choofing to employ their ftrength and valour defentively than offenfively; to preferve their own, than to ravage their neighbours.

Their friendhip and intercourfe was rather a compound of honcit bluntnefs and hofpitality, than of wit, humour, or gallantry. All ftrangers were fure to meet with a kind reception from them to the utmoft of their ability : even thofe who were not in a capacity to entertain them, made it a piece of duty to introduce them to thofe who could; and nothing was looked upon as more fcandalous and cetcitable, than to refufe them either the one or the other. They do not feem, indeed, to have had a tatte for grand and elegant entertainments; they affected in every thing, in their houfes, furniture, diet, \&ic. rather plainnefs and fimplicity, than fumptuoufneis and luxury. If they learned of the Romans and Gauls the ufe of money, it was rather becaule they found it more convemient than their ancient way of bartering one commodity for another; and then they preferred thefe ancient coins which had been famped during the times of the Roman liberty, efpecially fuch as were either milled or cut in the rims, becaufe they could not be fo eafily cheated in them as in fome others, which were frequently nothing but copper or iron plated over with filver. This laft netal they likewife preferred before gold, not becaufe it made a greater thow, but becaufe it was more convenient for buying and felling: And as they became in time more feared by, or more ufeful to, the Romans; fo they learned how to draw enough of it from them to fupply their whole country, befides what flowed to them from other nations.

As they defpifed fuperfluities in other cafes, fo they did allo in the connubial way : every man was contented with one wife, except fome few of their nobles, who allowed themfelves a plurality, more for thow than pleafure; and both were fo faithful to each other, and chatie, true, and difinterefted, in their conjugal affection, that Tacitus prefers their manners in this refpect to thote of the Romans. The men fought not douries from their wives, but bettoned them upon them. Their youth, in thofe cold climes, did not begin fo foon to feel the warmth of love as they do in hotter ones: it was a common rule with then not to inarry young; and thole were moll eflecmed who continued longelt in celibacy, becaufe they looked upon it as an effectual means to make

## C E R

 old, was ecound hanctil vantomsel. The wora a thared wis thei hathands not on'y the care of the fariily, ar 1 the educution of their children, Keteven the hard!ing of war. They atiended them in the field, cooked the vistuniv for them, dreiled their weunds, thirred i'sem up to fight mavfully againt their enemies, and fometimes have, hy their courace and bravery, recovere 1 a bianry when it was upon the poirt of being fratched from them. In a word, they looled ufon fuch contant attendance on them, nut as a Pervitude, line the Roman dames, but as a duty and an lonour. But what annens: to have been ftill a harder fate upon the ancient German dames was, that their great Odin excluded all t!ofe from his wallalla or paradife, who did not, by tome violent death, fullow their deceafed hufban's thither. I'ct notwithftanding their having been anciently in fuch high repute for their widdom and fuppofed fpirit of prophecy, and their continuing fuch faithful and tender helrmates to their hufbands, they fink in time fo low in their efteen, that, according to the old Saxon law, he that hurt or killed a noman was to pay but half the fine that he mould have done, if he had hut or killed a mar.

## 33 <br> Their func.

There is fearcely any one thing in which the Germans, thourh fo nearly allied in moft of their other cultoms to the Gable, were yet more ontente to them than in their funerals. Thofe of the latter were performed with great pomp and profulion; thofe of the former "ere dune with the fame plannef, and fimplicity which they obferved in all other thines; the onls granderr they affected in them was, to burn the bodies of their great men with fome peculiar kinds of wood; but then the funeral pile was neither adorned with the clothes and other fine furniture of the deceafed, nor perfurned vith fragrant herbs and gums: each man's armour, :that is, his froord, theld, and facar, were flung into it, and fometimes his riding horfe. The Dane, indeed, flung into the funeral pile of a prince, gold, bilver, and wher precious things, which the chief moumers, who walked in a gloumy guife round the fire, eyhurted the byftanders to fing liberally into it in homour of the decealed. Thev aft rwards denofited their aftes in urrs, like the Gauls. Romans, and other nations; as it plainly appears, from the rat numbers which have been duy up all over the comatry, a well as from the fundry dilitretions which have been writLen upon them by feveral learned modern. of that nation. One thing we $\mathrm{m} \cdot \mathrm{y}$ obieve, in general, that whatever facrifises they, fiered for their deal, whatever prefents they made to them at their fimer ls, and Whatever other fuperfitious rites they micht perform at them, all was done in confequence of thofe evcellent notions fhich t! eir ancient rclizion had tanght thern, the immortality of the foul, and the blif or mi34 Fery of a furure life.
Thesilelif It is impolible, indeed, as they did not commit any of a forat thing to writing till very lately, and as nose of the ancient writers have given u anv arrount of it, to sue's Braw foon the belief of their great () !im, and hiv mar wife, was received among them. It may, for moht we hnow, have been oldor that: the time of Tacine,

 tho! ver: promis which we"e Atill prefurved monat then; we mey ridhtly enomel fapole, that whe eve -
 ed by the yenerdity of the motion, finecin! y tince we find their atcient pratice of evactly conformbe to it Thas, fince the faiett ruaid to this paradise was, to eveel in martis' deed, am? to die intrepialy io the lield of battle; and fince wone were excluded from it but bate comards, and betravers of their conatry ; it is moturn to think, that the lignal and escelfive bravery of the Germans flowed f:om thi , ncient belief of theirs: and, if their femmies nere for brave and fathtul a not only to thare with their hufband all the cancers and tatigues of war, but at lensth to follow then by a voluntary death, into the other world ; it can harily be attribuied to any thing elfe but a ftrong perfuaion of their heing admitted to live $w$ ith them in that place of blifs. This belief, therefore, whether raceived or:Ninally from the old Celtes, or atemwards tanght the:a by the fince deified Odin, foems, from their general Fiatice, to have been univerfally received by all the Getmane, thoush they might diffor oue from another in ticir notions of that future life.

The notion of a future happinefs obtained by martial exploits, efpcially in dying fivord in hand, mode them bewail the fate of the who lived to an old a a, as dihonourable here, and hopelels hereafter: un which account, they had a barbarous way of fending them into the other world, willing or rot willing Ald this cuftom latted feveral ages after their receiving Chrilianiv, efpecially among the Prulians and Venidi; the former of whom, it feems, defpatched by a quick death, net only tleir children, the fich, fervants, \&c. but even their parcht, and fometimes themelves: and amones the latter ve hase inilances of this horriz parricide being practifed even in the beginning of the $14^{\text {th }}$ century. All that neet he added is, that, if thofe perfone, thus fuppofed to have lived long enough, either cefired to be put to deah, or at len? leamed cheerfully to fubmit to what they linew the could not avoid, their exit was commor.lv precoded ith a faft, and their funeral with a feaft; but if they endeavoured to hun it as it fonctimes happerted, hot'l cermonies were performed with the deepetl mourning. In the former, they refoised at thio delivernace, and being admitted pro bilf. in tie latter, they bewalled their cowardly evc'ading themfelves from it. Much the fame thing was done towards thufe wives who betrayed a backirardne ce follow their de thellumes.

Cutanary, the utwoft in them, not only in their fans, and efpecinliy iefure an engagement, but cven in their common ne is.

The modern Germans in their perions are tall and A.rong built. The la lies lave generally ne complexions; and tome of them, elpecially in Saxony, have all the delicucy of features and thape that are fo bewitching in a certain island of Euroic.

Thth men and women aflect rich drelies, which in fution ate the time as in France and England; but Fhic better fort of men are excetfively fond of gold and filver lace, effecially if they are in the army. The ladies at the principal courts differ not much in their drefs from the French and linglith, only they are not Co excetricly fund of paint as the former. At fome courts they appear in rich furs; and all of them are loaded with jewel, il they can obtain them. 'The female part of the Lurghers faniliec, in many German towns, drets in a very different manner, and fome of them inconceivaliy fantaftic, as may be feen in many prints publibed in books of travels; but in this repect they are gradually reforming, and many of them make quite a different appearance in their drefs from what they did 30 or 40 years ago. As to the peafantry and labourers, they drefs as in other parts of Europe, according to their employments, conveniency, and opulence. In Weitphalia, and moit other parts of Germany, they heep between two feather beds, or rather the upper one of down, with theets Atretched to them, which by ufe becomes a very comfortable practice. The moft unhappy part of the Germans are the tenants of little needy princes, who fqueeze them to keep up their own grandeur ; but, in general, the circumblances of the common people are far preferable to thofe of the French.

The Germans are naturally a frank, honef, hofpitable people, frec from artifice and dilguife. The higher orders are ridiculoully proud of titles, anceftry, and fhow. The Germans, in general, are thought to want animation, as their perfons promife more vigour and activity than they commonly exert even in the feld of battle. But when commanded by able generals, efpecially the Italians, fuch as Montecuculi and Prince Eugene, they have done great things, both againt the Turks and the French. The Imperial arms have feldom made any remarkable figure againft either of thofe two nations, or again't the Sivedes or S; aniards, when commanded by German generals. This polfibly might be owing to the arbitrary oblinacy of the court of Vienna; for in many wars the Auftrians have exbibited prodigies of military valour and genius.

Induftry, anplication, and perfeverance, are the great characteritics of the German nation, efpecially the mechanical part of it. 'Their works of art would be incredible were they not vifble, efpecially in watcls and clockmaking, jewellery, turnery, fcalpture, drawing. paining, and certain hinds of architecture. The Germans have been charecal with intemperance in eating and drinking; an. 1 perhaps not unjuitly, owing to the vall plenty of their country in sine and prowifons of every kind. But thofe prafices feem now io be wearing out. At the greatell tables, though the guelts drink pretty freely during dinner, yet the revalt is commonly finithed by coffee after thiree or Sur public :oats have becn drank. But no people
have more feating at marriages, funcrais, and birti. Germare, dirs.

The C man nobility are generaily men of fo much honour, that a tharper in other countues, efeecially in Enjland, moets with more credut if he pretend, to be a German, than of any other mation.

The morchants and tradefmen are very civil and obliging. All the fons of no lemen inherit their fatiser's titles, which greaily perplexes the heralds and gencalogifts of that country. This porbaps is one of the reafons why the German burbands are nct quite fo complailant as they ought otherwife to be to their ladies, who are not entitled to any pre-eminence at the table; nor indeed do they feem to affect it. being far from cither ambition or loquacity, though they are faid to be fomewhat too fond of gaming. From what has been premifed, it may eaflly be conceived, that many of the German nobility, having no other hereditary eflate than a high founding title, cafily enter into their armies, and thofe of other fovereigns. Their fondnefs for title is attended with many other inconveniences. Their princes think that the cultivation of their lands, though it may treble their revenue, is bclow their attention; and that, as they are a fipecies of beings fuperior to labourers of every kind, they would demean themlelves in being concerned in the improvement of their grounds.

The domeftic diverfions of the Germans are the fame Amuleas in England; billiards, cards, dice, fencing, dan-ments, cing, and the line. In fummer, people of fallion repair to places of public retort, and drink the waters. As to their feld diverfions, betides their favourite one of bunting, they have bull and bear baiting, and the like. The inhabitants of Vienna live luxurioufly, a great part of their time being fpent in featting and caroufing; and in winter, when the feveral branches of the Danube are frozen over, and the ground covered with fnow, the ladies take their recreation in fledges of difierent thapes, fuch as grifins, tygers, fwans, fcollop-hells, \&ic Here the lady fits, drefled in velvet, lined with rich turs, and adorned with laces and jewels, having on her head a velvet cap; and the fledge is drawn by one horie, ftag, or other creature, fet off with plumes of feathers, ribands, and bells. As this divertion is taken chielly in the nighttime, fervants ride before the fledge with torches, and a gentleman fitting on the fledge belind guides the horle.

The Reformation firft fpread in Germany to moft Religion $3^{38}$ advantage; and fince the religious peace of 1555 , and learnthere lave been eitablifhed the Roman Catholic, pre-ing. vailing moftly in the fouth; the Lutheran in the north; and the Calvinit, called alfo the Reformed, near the Rhine. Civil wars confiderably deranged this fettlement : it was, however, eftablithed by the celeorated peace of Wettphalia, that the religion of the Seven States thould remain as in 1624 . The Rominh fuperior clergy confilt of 8 archtihops, 40 bihhops, and nany abbots. The Proteftant ciergy are governed by comilionies under the fovereign of each state, The Corpus Catholicormo is under the direction of the archbiniop, clector of Mentz; and the Curpus Evangclico$r: m$, or Proteltantc, under the electorot Saxony; who have the care of the public concerns of their refpective bodies,

Literature is in a very alvaned fate throu rout almot all Ganmy, but particularly in the Protedant Atates. It is dut about hali a cencay fince the German lanfuage has 'reen purifiet and cutwatel; ince which variow works of tafe and elegame", as well an fuperior productions in the diff. nt walk of ferme, have appeared in it. There are $3 \$$ univerlicio in Cermmy; 19 Frotellor, i7 Citholec, and two which partahe of both; behles a numbe: of literary tocieties an I academic imatutions: and elucation in general is particularly attended to even in the very lowent ranks.

We have faid nothing of the part which the flates of Germany, either individually or as a body, naturally took in the late revolution in France. It would indeed be only an unneceffary repetition of the hitory of tranfactions already detailed under France and Britain. Of the changes in the govermment of paricular llates, or rather in the names of the rulers, we thall lay nothing. Thefe changes, made at the iniligation of France, will probaty not fatisfy the inordinate ambition and growing power of her prelent ruler, and therefore will not be permanent.

GERMEN, the feed bud; defined ly Linnous to Le the bafe of the piftillun, which contains the rudiments of the feed; and, in progref of vegetation, fwell: and becomes the feed veffel.

In allmilating the regetable and animal kingdoms, Linnzus denominates the feed bull the oxarium or uterus of plants; and affirms its exittence to be chiefIy at the time of the difperion of the male dult by the anthera; as, after its impregnation, it becomes a fecd veffel. Sce Botany.

Gerven, by Pliny and the ancient botanifts, is ufed to fignify a bud containing the rudiments of the leaves. See GEviMA.

GERMINATION, among botanifls, comprehends the precile time which the leeds take to rife after they have been committed to the foil.-The different fpecies of feeds are longer or itionter in rifing according to the degree of heat ihich is proper to each. Millet, wheat, and feveral of the grailes, rife in one day; blite, fpinach, beans, multard, kidney beans, tumips, and rocket, in three days; lettuce and dill, in four; cucumber, gourd, melon, and crefs, in five; radihh and beet, in fix; barley, in feven; orach, in eight; purlain, in rine ; cabbage, in ten ; hyffop, in thirty ; pariley, in forty or fifty day © ; peach, almond, walnut, chefnut, peony, horned poppy, hypecoum, and ranunculus falcatu, is one year; role buth, cornel tree, lawthom, medlar, and hazel nut, in two. The fords of fome frecies of orchis, and of fome liliaceous plants, never rife at all. On leed, fome require to be fowed almoit as foon as they are ripe, othervile they will not fprout or germinate. Of thi hind are the teerls of cofiee and frasinella. Othere, particularly thofe of the pea-bloom flowen, prelirve their gerninating faculty for a leries of year: Mr A danfon affert., that the tenfitive plant ret in it at virtue for 30 or + ycars.

An and ". Mr are the agents of germination. The humfinty of the air alune makes feveral leeds to rile tf:t are ex ofid to it. Seeds too are ubferved to rile in $v$ ater, without the intervention of carth; but watet : ithrut : ir is infuffeient. Mr Fiombers's experineents on this laeod are decitive He put feveral teeds
unler the esinaned receiver of an air pump, with a con: $=$ vicw to elablith fomething certain on the caules of germination. Some of them did not rife at all: and the greatent pant of thole which did, made very weak and feeble productions. Thus it is for want of air that leeds which are buried at a very great depth in the earth, cither thrive but indiferently, or do not rife at all. They frequently peferve, however, their germinating virtue for many years within the bowels of the earth; and it is not undual, upon a piece oi ground being newly dug to a contiderable depth, to : blerve it foon after covered with ieveral plant, which had not been feen there in the memory of man. Were this precaution frequently repeated, it would doubtlef's be the means of recovering certain feecies of plants which are regarded as loft; or which perhap, never coming to the knowledge of botanith, might lience appear the refult of a new creation. Some feeds require a greater quantity of air than others. Thus purflain which does not rife till afier lettuce in the free air, rifes before it in racuo; and both profer but little, or perith altogether, while creffes vegetate as freely as in the open air.

GERONTES, in antiquity, a kind of judges, or magiltrates, in ancient Sparta, anlwering to what the Areopagites were at Athens. See AkbopisGl's.

The word is formed of the Greek $\boldsymbol{r}^{\prime}$ ger, which fignifies " old man." Whence alfo the words gerontic. fomething beionging to an old man; and Geronicon, a famous book among the modern Grceks, containing the lives of the ancient monks. The fenate of geronte was called gorufa, that is, aifembly or council of old men.

The gerontes were originally intlituted by Lycurgus: their number, according to fome, was 23 ; and, according to others, 32. They governed in comiunction with the king, whofe authority they were intent? ed to balance, and to watch over the interells of the people. Polybius defines their ounce in few words when he fays, per ipfor, ot cum ing is, omnia almimplrarNone were to be admitted into this oftice unter 60 years of age, and they held it for life. They were fucceeded by the ephori.

GEROPOGON, a genus of plants belonering to the fyngencha clat, and in tise namal methot ranking under the $7^{\text {th }}$ order, Comphe.... See Boinsy Inder.

GERRE1Z. Sce Reverisdi.
GIRVAlsE, or Grovist, of Tilbury, a famoue Englith writer of the 13 th century: thus named from bis being born at lillay on the Ihmer. He was tephew to Henty II. king of England; and was in great credit with Oho 15 . emperor of Germany, to whom he dedicated a Defeription of the Wind, wad a Cwonicle. He atfo conpoled a Jitary of Lingland, u.ut of the H ty Land, and other womb

GTSNER, COMRID, a celehrated phyfician and naturalik, was born at Zurich in 1516 . Hoving finibhed his ftudies in France, he travelled into It.ly, and taught medicine and philolophy in his own commtry with extraordinary reputation. He was açuaintwed with the languages; and excelled fo much in naturall ittory, that he was furnamed the Pliny of Germany' He died in 1564 , leaving many works behind him; the princival of which are, $\boldsymbol{r}$. A hillory of animals, plant, and fofils; 2. Bibliotheca Thiverfalis. A Greek and Latin lexicon. This author is by Boerhaave em phatically faved Monfrum Erudilionis, " a jrodigy of learning." Thefe indced (as Mr Coxe obferves in his Letters on Switzerland) " who are converfant with the rrorks of this great fcholar and naturaliff, cannot reprefs their wonder and admiration at the amplitude of his knowledse in every fecies of erudition, and the varie$\because$ of his difcoveries in natural hiftory, which was his peculiar delight. Their wonder and admiration is flill further nugment.d, when they confider the grofs ignorance of the age which lie helped to enlighten, and the foanty fuccours he poffeffed to aid him in thus extending the bounds of knov ledge; that he compofed his works, and made thofe ifcoveries which would have done honour to the mon enlightened reriod, under the complicated cuils of poverty, ficknefs, and domettic uneafinefs."

Gesnir, Solomon, the celebrated author of the Death of Abel and many other admired works in the Geman language, was born at Zurich in the year 1\%: fuperior abilities; and his progrefs in the rudiments of education was to flow, that his matter gave him up as incapable of any greater attainments than writing and the four firt rules of arithmetic. Upon this he was placed under a clergyman in the neighbourhood, a relation of bis father's, and who thowed himfelf better acquainted with the art of difcove:ing the natural inclinations of his pupils. '1 his gentleman often carsied young Gefier with him into the ficld, where he made him obferve the beauties o" nature ; and findin. that he took greater pleafure in fuch leffons, and feemed to litten to them with peculiar attention, he occafionally repeated fome of the moll liriking pal. faces of the ancient authors, who have written on thefe fubjects, in the molt agreeable and pieafing mannet. By this ingenious artifice, the mind of young Gefner hegan to opere, and its powers to expand; and it is, perhaps, owins to this circumfance, that he became fo fond of the language of Virgil and Theocritus. When he arrive $i$ it a proper aze to think of purfarog fime line of butinet:, Nir Gefuer made choice of that of a bookfeller, which was the profcition of his father, and in fome meafure of his family. Of five foules at Zurich in the printing and bookfoling tuliLefs, tho were occuried by Gefin M: one belonged ? . . lanthers of that mane; and the other, that in
whith out roct be? thae, was knowa by the firm Gemer.
 the event $c$ ? its ware pordence, and by the choice and clecanece of the works whel it gave to the public.

Thu If Tre Gefner was a bookleller, he did not, hovever, dump his genios, by fubmoteng to the drudper of bumefs. He indulged himfrlf freciy in purluit his favourite onect, and his patners never envicol him that time which he devoted to meditation and to itady. In 1552 , le made a tour through Germany, not fo mach for the purpole ef extending his commerce, as to lee and be accuainted with thofe authots who liase done honour to their comerv. The folloning circumftance, which occurred during this tour, deferses to be mentioned, as it is frikingly charackerific of that timidity which often accompanies true genias. Whea MIr Gemer was at Berlin, he was admitied into a literary fociety, of which Gleim and Lefing were membes. Eacin of the authors who compofed it ufed to read in turn fome pieces of their own compofition, and Mr Gefier was very defirous of fubmitting to thele able critics a fmall work, which was his fint attempt; but was far from refembling thofe poets, whom Horace and other fatirifs have ridiculed, and who thun every one they meet by reciting their verfes before them. As each of the members had done reading, Gefner was obferved to move his hand with a kind of tremor towards his pocket, and to draw it back again without the manufcript which he ought to have produced. Having not as yet publifhed any thing, none of the company could guefs the caufe of a motion which his modefty prevented him from explaining. The work which he had not the courage to thow, was his fmall poem, entitled Nioht, which be publighed on his return to Zurich in $17: 3$. It was contidered as an original, of which no model is to be found anong the moderns; but in the opivion of the author, it was only a piece of ima inary painting, or, to ufe an expreflion of his own, in one of his letters to Mi Huber who has tranflated his works, "A caricature compofed in the monents of folly or intoxication." In this little poem he has introduced a fhort epifode on the orisin of the glow-worm, containing a poetical explanation of this natural phofphorus, which has all the beauty of Ovid's Metamorphofes without their prolisity. The fuccefs of this eflay emboldened the too timid mufe of our young bookfeller, and he publihed a palloral romance, called Daphinis, in three cantoss The applaufe that was defervedly beftowed unon this performance induced the author to publith, fome time after, his Idylls and fome other rural pooms in imitation of thofe of Theocsitus. Paforal poetry, which at this time was little known in Ge many + ut by tranflations from foreign poets, began to find many partizans, and to be preferred to every other kind. Detirous, therefore, of tracing out a new path for himfelf, our woet thought that he could $n$ nt do a more acceptable fervice to his countrymen, than to paint the felicity of innocence and rural life, and the tendes emotions of love and gratitude. The only author worthy of notice who ha:d preceded Mr Gefuer in this career, was Mr R oft of Leiplick, whofe paftoral poems appeared for the firf time in 1744. This writer poliffed the languase of the Cerman thepherds; he had addels enough to unite fpirit and fmplicity in a kind

## GES [605] G E s

 and which becomes and and difuting if it too abundan. He fomathen theows a delic.te veil over thofe images wisich :it derefert in dicency, but it is to be regreted that it is biten too lifht. Sich was the a:tarinititagaint whom Gefuer had to contend. Oar pote, however, parfued a dithent courte. Inftead of placine, like Roik, his fente; in modern times, he gocs back with Theocritus to the goilea age, that happy age which we are fond of revic:ing when our paffions are calm, and when freed from thote ansious cares whirh hury us beond ouritlin, we contenplate amidn tranquility the beauties and fertility of the countiy. The charaters of Gefser's Itylle, therefore, are iaken from thole fucicties thich exith no Ionger that in the remembrance, or rather the imagination. His flaw herds are fathers, cliildren, and huibands, who bluh not at thele tities to dear to nature, and to whom genctotiy, beneficence, and reifect for the Di'y are lentiments no kels familiar than love. Thele ldyls were the principh and favourite object of his purluit, and that part of his wook which acquired him the greatet reputation, efpecially among his counarymen. His death of Abel, which is well known, was publificd for the firt time in 175 s . It is written, Iike the reit of his pieces, in poetical profe; and was fo much fought after, that it went through no lefs than three editions in the fpace of a year, without fpeahing of the fpurious ones which appeared in Holland, at Berlin, and in France. The French edition was followed by feveral others. One came out in ItaIian: another in the Dutch language; a fourth in the Danim: and linily, two in Englih, one of them in profe and the other in verle. Among the picces which M: Geiner rublihed after the Death of Abel was his Firit Navigator, a poem in thrce cantos, which many people in Germany confider as his matterpiece. Fie made an attempt aho in the paltoral dram?, bat not with the fame fuccelis as in other kinds of rural poetry. He produced likewife, in the fane flyle, Evander and Alcime, in three acts; and Eratuc, a find ll piece of one act, which nas repretented with tome applaufe in Ieveral focieties, both at Leipfick and Vienna.

But though poetry was Gefnes's darling purfuit, and though he eariched the literature of his country with wotks which will render his name inmortal, he did not confine himelf to one manner of imitating nature; he in tura took up the pencil and the pe.., and his acive genius equally directed them both. I: his infancy le lad received a few leffens in drawing, end he had afternards purfued this tudy, but without any interation of becoming an atill. At the ase of thir:y he felt that violent defire, which may be comidered as the voice of geniu*; and this was in fome mewture excited by the fight of a beautiful collection formed by Mr Hrid ghem, whofe daugher he had married. 'To pleale his f.ther-in-taw, he titulied this treafoe, compoled principally of the beit piecen of the Flemith fichont; and in this now tate he hat almosh tacritioed every other. Mar Gefier at frif weniured only to deli: ante fome decoations for the frometpicecs of carimas toosls primed in his ollice; but by lithe and lizte the lad the courge to make other it empts. In a 7 - 5 , is gabithed wandrapes ctched and engraved by him-

Aclf, and Jedicatel them to his friend Mr Wratict. Ni. Gedies owed him this mark of relipect for the care which he tovi to olament with beautiful vignethe Mr Huocr's tramation of his luylls. Twelve othe: pieces appes.red in 1769 ; and after thefe attempt., Mr Gefiner esecuted oridments for many worhs which came from his prefles, among which were bi, own worke, a German trambation of $S$ sift, and feverat others.

Were we to judge from Mr Gefier's enthufiafm for his favourite purfuits, and from the time and uttertion which he beitowed upon them, we hould be apt to conclude, that he found little lcilure for ditchar ring his daty as a citizen. The contrary however, was the cale, for he paited almon the hatif of his life in the firlt employ ments of the itate. In $1-65$ he was calted to the grand council, in 1707 to the lefier. In $1-6$ he was appointed bailifi of Elibach, that of the fou: guards in ${ }^{1776}$, and in 1781 fuperintendant of water. which office in 1787 was continued to him for is years. In all thede thations Mr Gefner difcharged hi: duty with the molt fcrupulous fideli:y; and did of a paralytical diforder, lamented by lis countrymen and by thofe who had the pleafure of his acquintance, of the $2 d$ of March 1788, at the age of 56 .

As a pattoral poet, Gefiner undoubtedly is entited to a very diflinguilled rank: and we may jwthy Cay, that if he has been equalled by any, he has been evculled by none. It is commonly believed, that pałoral poetry is very limited and confined; but thofe who retd the works of Gefner will be convinced, that it is fulceptible of much variety when tieated of by the hand of a mater. His patoral romance of $\mathrm{D}_{\text {. phat }}$ is not iaferior in natural fimplicity to the celeurated wors: of Longus; but it furpaffes it far in variety of images and incident. Eraltus and Lvander are minlrustice and intereating pooms, on account of the contait between the world and nature which reign throu hout them; and his Fint Navig tor unites the milde.t philurs. phay to all the fplendour and imatery of Firy Land. If we analyze his dramatic pocme, we that ind is them interelling fictions, charaters we!l delimated, and fituations 1 eplete with novelty. Hi, langa pe is that of the Graces, and the chatelf car min hemen to the fore which he has created. If he has fumetimes the bumour of Secne and Fonmane, it is without their licention'ne.s. 'I lie feverelt t.ate can timi in hi, writinge, :o lacum to fur, in, no teale derving repre-
 fioms be funthituted in t.se ro m of the ie which he has adopted.-Gefner' charater as a man, aspo irs to be

Cimia sadit uns uniy in the proínce of thuie with whom he 1 Gerhin. vis acruainted, that his real character appeared in its full Iulire.

Mr Gdfer's reputation and virtues were linown even w the romotelt parts of Europe. 'The emorels of Ruwia Coth rine II. prefented him wi:h a gold medal as a mak of hut etteem. Strangets of at nations gave him nolds : Eiterine tettimonies of their admatation ; and traveliers thac be they had can only the hatif of Switzerland, it they had not been in the company of Gefoer, or procured come of his landicapes or dianings. In this latit way he had accuired fo much reputation, that he was ranked amens the beit artits of Germany; and Mr Fueflin, his countryman, uho was himelf a painter, in the prefice ts the third volume of the new edition which he publithed of his - Hittorical effay on the painters, engruver, architects, and fculptors, who have done henour to Swizerkad,' gives a ciltinguihed place to Mr Gefiner, thow ha then living.

GLSNERIA, a genes of plants belonging to the didynamia clafs, and in the natural method ranking under the $f^{\text {th }}$ order, Porfonate. See Botany Index.

GESSOR!ACUV, in Ancient Ge raphy, a port and ftation for Alios of the Morini in Belgica. In Cafar's time, according to Dio, there was no town; but Florns freaks of it as ore : and the Geforimenfes Muri are mentioned by Fumenins in his panegyric. The author of 'Tabula 'Theodofana, commonly called Pcutinort's mat, fars exprefsly, that Gelloriacum was in his time callied Bonchia. Now Boulugne in Picardy. E. Long. 1. 32. N. Lat. $\mathrm{SO}_{4} 42$.

GESTiTION, among phyficians. See Preg*.ncs.

GFSTRIC! A, a province of Sweden, bounded by Helingia on the north, by the Buthnic gulf on the eaff, by Upiand on the fouth, and by Dalecarlia on the weft.

GESTURE, a motien of the body, intenced to ficuify frme idea or paffion of the mind. It conits prineipally in the action of the hands and face; and may be defned, a fuitable conformity of the motions of the countenance, and of feveral parts of the body, in fpeaking, to the fubject matter of the difourfe. See Declavibion and Oratory.

GEDA, Seftrilus, a fon of the emperor Severus, brother to Caracalla. In the eifhth year of his age, he was moved with com ation at the fate of fome of the partizans of Niger and Albinus who were to be executed, and bis father truck with his bumanity retracted the fentence. After Severus's death he reigned at Rome conjointly with his brother; but Caracalla, who envied his virtues and was jealous of his popularity, ordered him to be poifoned ; and when $t$ is could not be effected, he murdered him in the arms of his mother Julia, who in the attempt of defending the fatal blows from his body received a wound in her atin, from the hand of her fon, A. D. 212 . Geta had nint vet reached the 23 d year of his age, and the Romans had reafon to lament the death of fo virtuous a prince, while they groaned under the cruetties and oppretion of Caracalla.

GElHIN, Lady Crace, an Englifh lidy of uncommon parts, was the daushter of Sir George Nurton of Ahbets-I eich in Somerfetlise, and horn in ofe: yar 1675 . She had all the advantages of a libe-
ral education; and lecane the wife of Sir Richard Gethin, of Gethia G., tt in Ifeland. She nas mithefs of great accomptilhments, natural and acquired, but did nit live long enough to thima then to the world; for the died in the 2 at year of her age. She was buried in Wetmintier abbey, where a beactifu! noonameat with an inicristion is ctected over her; and, for perpetuating her memory. provition was made for a fermon to be preacled i: Wenminter abbey yeariy, on Ah Weduelday for ever. S'e wrote, and left behind her, in loole papers, a work which, foon after her daath, was methodized, and publihed under the title of "Reliquix Gathinions; or, Sume remains of the moll ingenious and excellent lady, Grace, lady Gethin, lately deceafed. Being a collection of choice difcourfes, pleafat apophthegms, and witty fentences. Written by her, for the moft past, by way of effay, and at fpare hours." Lond. 1750, +to ; with her picture betore it.

GETHSEMINE, in Ancicnt Geographiz, a village in the mount of Olives, whinher Jeins Chritt fometimes retreated in the nipht time. It was in a garden belonging to this village that be fuffered the agony in whicb be fweated drops of blood; and here he was arrefled by Judas and the reit who were conducted by this traitor. The place is by Maundrel delcribed as an even plot of ground, not above 57 yards fquare, lying between the fout of Mount Olivet and the brook: Cedron.

GETHYLLIS, a genus of plants belonging to the dodecandra clats, and in the natural method ranking under the ninth order Sparhaciz. See Botany Inde.

GEUM, Avers, or Herb Bennet, a genus of plarts belonging to the icoland.ia c'als, and in the naturd method ranking under the $35^{\text {th }}$ order, Senticofe. See Botany Incies.

GHENT, a city of the Auftrian Netherlands, capital of the province of Flanders. It is leated on four navigable rivers, the Scheldt, the Lys, the Lieve, and the Moere, which rus through it, and divise it into canals. Thefe form 26 little illes, over which there are $3=0$ bridges: among which there is one remarkable for a itatue of brafs of a young man who was obliged to cut off his father's head; but as he was going to ftrike, the blade Hew in:o the air, and the hilt remained in his hand, upon which they were both pardoned. There is a pieture of the whole tranfaction ire the townhoufe. Ghent is furrounded with walls and other furtifications, and is tolera'ly ttrong for a place of it circumference. But all the ground within the walls is not built upon. The ftreets are large and well paved, the market places fuacious, and the houfes built with b:ick. But the Friday's market place is the largeft, and is remarkable for the itatue of Charles V. which flands upon a pedelal in the imperisl habit. That of Cortere is rema:kable for a fine walk under fewers tows of trees. In 1737 a fire opera houfe as huilt here, and a suard houfe for the garrifon. Ne is the town is a very high tower, with a handfome eluck, and ciimes. The great bell weighs 11,000 pounds.

This tomn is famous for the 1 acification figned here, in $152^{\text {f }}$, for fettiong the tranquilli:y of the Seventeen Province, which was afetwards confirmed by the hing of Spain. It was tahen by Lewis XIV. in 1678 ,

The moft furiking outlines of the popular fuperiti－ tions refpecting ghoits among us，are thus humoroully collected by Captain Grofe in his Provincial Gloffary： ＂A ghot is tuppofed to be the fpirit of a perfon de－ ceafed，who is eitier commilioned to return for fome fpecial errand，fich a，the difovery of a murder，to procure reftitution of lands or money unjultly withheld from an orphan or widow－or，having committed fome injuftice whilit living，cannot reft till that is redrefled． Sometimes the occaifon of firits revifiting this world， is to inform their heir in what fecret place，or private drawer in an old trunk，they had hidden the tisle deeds of the eitate；or where，in troublefome times，they buried their money or plate．Some ghofls of mur－ dered perfons，whofe bodie have been fecretly buried， cannot be at eafe till their bones have been tisken up， and depofited in coniccrated ground with all the rites of Chitilian burial．
＂Sometimes ghoffs appear in confegtence of an agreement mate，whith living，with fome particular freend，that he who frit died lhould appear to the fur－ vivor．
＂Glanvil telle w it the wholl of a perfon who had lived but a ciforderly kind of lite，for which it was condemned to 1 inder un and down the earth，in the comprany of evilfirit，till the day of iu lement．
＂In moti of the relations of ghe it，thoy are fur）－ pofed to be mete aerist l cinge，whothon fubtance，and that they can paif thromgh walls and other folid bo－ dies at pleafure．A particular inftance of this is given， in relation the 27th，ia Glanvil＇s collection，where one David Hunter，neat－herd to the bifhop of Down and Yol．IX．Patt II．

And clay cold was her lily hand
That held her fa＇to flroud．
This，however，may be comfidered as a poeti at licente． wed，in all lihelihuod，for the fake of the oppotiuon of hi＇y to fathe．
＂It，cluning the time of an apparition，there is a lighed cardle in the rowm，it will burn extremely blue ． thi is fo univerlally acknowledged，that many eminent phil fophers have bufied themfelves in accounting for it，without once doubting the truth of the fact．Dogs， $t 00_{2}$ have the faculty of fecing fpirits，as is inftanced is．

David

Choft.
 they w intly thow han of terror, by whing and cree?. ing to their matter for prutection; and it is guerally Funpoled that they often ice things of the nature when their owner camme; thene being fome perfons, partic larly thofe boan un a Ciantmas eve, who cannot lei $\mathrm{f}_{\mathrm{i}}$ irits.
"The coming of a inist is announced fome time before is apperance, by a varicty of loud and dread. ful noife; fonctimes rattling in the old hall like a coarh and fix, and rambling up and down the ficircale like the tranding of bowls or cannon balls. At length the dour riies open, and the fectre fallss itovily uo to the bed's foot, and opening the curtains, lookis fleflally at the perfon in bed by whom it is feen; a ghout being very rarely vifible to more than one perfor, ahohoug there are leversl in company. It is here recenary to obferve, that it has been univerfally found iy experience, as well as athemed by diverfe apparitions themfelves, that a gholf has not the power to 1peak till it has beea firf fpoken to ; fo that, notwithstanoing the urgency of the bulines on which it may cone, every thing mult and thill till the perfon vifited can find futticient comage to fpeak to it: an event that fometimes does not tulke place for many years. It has not been found that female ghols are more loquatious than thofe of the male fex, both being erjually reftrainrd by this law.
"The mode of a drefling a ghoft is by commanding it, in the name of the Three Perfons of the Trisity, *) te! you who it is, and what is its butimes ; this it way be nocefliry to refeat three times ; after which it siill, in a low and hollow voice, declase its fatisfac. tion at being fpoken to, and detire the party addelfing it not to be afraid, for it will do him no hatm. Ihis being prenifed, it commonly enters into its narrative; which leing completed, and its requen or cummands given, with injuctions that tliey be immediately evecoted, it smifhes anday, frequently in a flath of light : hatich cate, fome ghots lave been fo connderate is to defire the party to whom they appeared to tat their eyes: fimetimes its departure is attended sith deliyitfal mutic. Daring the narration of its bufnefs, a ghoft mult by no means be interrupted by queition of any kind ; fo doing is extremely danerous: if any doubte :aife, they muti be itated atter tl:e fpait lias done its tale. Guchions refpecting its flate, or the llate of any of their former acquaintance, are offinfive, and wot otien anfvered; firits perhays being reltrained from divalsing the fecrets of their priton houfe. Occatonally fpirits will even condefcend to talk on common ocrustences, as is inftanced by Glansil in the apparition of thajor George Sydenbam do Captain Wiliam Dyke, relation soth, wherein the major reproved the eaptain for fitiering a fiword he had Given him to grow rully: faying, Captain, captain, this foord did nut ufe to be kept after this manner when it was mine.' 'Mlis attention to the fate of arms, was a remant of the major's profeffional duty when livit:s.
" it is fomewhat remarhable that ghoils do not go about their butinets like the perfon of this world. I. crife of murder, a gholt, in tead of going to the nest jutice of the peace, and laying itsinfornation, or os the nearett relation of the perfon mudered, appors
to wome por labonicr who linows none of the partice, draw the curtains of fome decrepit murfe or alms voman, or hovers about the place where his body is denonted. The fame circuiturs mode is parfued with rafed to redrefling iniured ophans or widurs; when it tuems as if the thuted and mot certion way would be, to go to the perton guily of the inmitice, and haun him contimully till he le terified into a reffitution. Nor is the pointing out lot writings generallymanaged in a more fumsaty way; the ghoi commoni1\% appding to a third petion ignorant of the who?e afior, and a llrange: to all conesmed. But it is prefumntuous to foratinize too far into thete matters: ghonts have undou tedly forms and culloms pecuilar to inemfics.
" $1 f$, after the firft appearance, the perfons employe. 1 neglect, or are prevented from, perioming the meflage or buninefs committed to their management, the ghot appear, continually to them, at fitt with a difcontented, next an angry, and at leng! wh a fuious, countenance, threatemng to tear $t \mathrm{em}$ in pices if the matter is not forthwith execoted; fometimes terriying them, as in Glamit', relation a6h, by annearing in nathy formidable faxpes, and fometimes even alriking them a violent blos. Of klows given by ghofts there are many intances, and fome wherein they have been followed with an incurable lamenefs.
" It mould have leen oblerive, that ghofts, in delivering their comminions, in order to enture bof, cmmuncate to the peafois employed lome iecret, known only to the patics concoraed and themfelves, the relation of which alomes produces the efrect intended. The bufnelibeine con leted, ghots appear with a cheerful countenanci, fang they hall now be at reit, and will never wore dinturb any one; and, thanking their agents, by wo feward communcate to them iomething reiative to thenfelven, which they will never reval.
" Sunetimes ghofs appear, and diflurb a houre, without deigning to gire any realon for fo doing: with thele, the thosell and ony way is to exorcife, and ceet them; or, as the wular term is, lay them. For this purpofe there maft be tuo or three clergymen, and the cermony malt be periomed in Latin; a language that firikes the moit audacions ghof with terror. A ghouk may be had for ainy term lefs than 100 years, and in any plice or buty, full or empty; as, a iolid oak - the ponmel of a fword-a barrei of heer, if a yeoman or fimpte gentleman-or a lipe of wine, if an efquire or a jutitice. Bue of all places the mot? common, and what is ghook leat like, is the Real fea, it Leing related, in mony intances, that ehotis live mot earnally berowht the exurcifts not to cmfine them in thet yace. It is merthelefs conflered as an indifurabie S.A, that theee are an infuite number lid there, forbers from its being a fafer prifon than any other nowne it land ; thowh neiber hillory nor tradition a ise os ay intance of ghoth efeaping or returning from the kind of tranfortation before their time.
" Aur ther fikecies of human apparition may be here notiend, thous it dows not come ander the etrict defripan of a ghot. Thetizare the exast fgures and refem dan es of perfons then living, often feen not only by t'acir friends at a ditiance, but many times by them-
filves;

Giagh lelve; of which there are feveral infances in Anbery', Mifcelianies: one of sir Richard Napier, a pytician o: London, who being on the read from Bedfordatate
to witt a friend in Berkthere, faw at an im hi, own appartion lying on his bed as a dead corpie ; le nove:tielels wont forward, and died in a hort theme: another of Lady Diana Rich, daughter of the earl of Hollawd, who met her own anpartion walking in a garden at Kendin, ton, and died a month after ot the fmatpox. Thete apparitions are called futches; in Cumberland, fuathr; and in Scotland, weraith: they mot commonly appear to diftant friem's and relatime, at the very imbant preceding the death ot the cerion whole figure they put on. Sometimes, as in the intances abowe mentioned, there is a greater interval betwach the appearance and drath." For a philulophical in. quiry in to the fubject of apparitions in sencral, fee the aticle Spectre.

GliCH. in C monolory, a cycle of 12 years; in ui amons the 'twins and Catherans.

Each year ut the giagh bears a name of lome animal: the firlt that of a moule; the fecond that of a banloch; the third of a lynx or leoratd; the fouth of a hare; the fift of a crocodile; the fixth of a ferrent; the feverth of a horie; the eighth of a fheep; the ninth of a monkey; the tenth of a hen; the elesenth of a dog; and the twelith of a hog.

They alo divide the day into 12 parts, which they cail giush, and ditinguith them by the name of fome :nimals. Each ciagh contains two of our hours, and is divided into eighi kehs, as many as there are quarters in our hours.

GIALLOLINO, in Natural H:fory, a fine yellow pigment, much uled under the name of Niples YelLOW.

GIANT, a perfon of extraordinary buik and fature.

The romances of all ages have furnimed us with fo many extravagant accounts of giants of incredible bulk and itrength, that the exiftence of fuch people in now generally diffelieved. It is commonly thought, that the ftature of men loath been the fame in all ages; and fome have even pretended to demonfrate the impolilit lity of the exiltence of giants mathematically. OF thefe our countryman M'Laurin hath been the moll explicit. " in general (fays he) it will eanly appear, that the efforts tending to deftroy the colnefion of beams arifing from their own gravity only, increafe in the quadruplicate ratio of their lengths: but that the oppofite efforts tending to peferve their crhetion, increaie only in the triplicate pronortion of the fane length. From which it follow, that the oreater 'eams muft be in greater danger of breahing than the lefler dimilar ones; and that thourh a leffer bean may be firm and fecure, yet at greater fimilar one may be made fo lone, that it will wecteraily brak by its own weight. Hence Galico junts conchade, that what appars bery firm, and fuccecds very well in models, may the wery weak and infrm, or even fall to pieces ly its onsin weight, when it comes to be esecuted in large dimenfions according to the model. Irom the fame principle he argue, that thore are nerediafy limit, in the overation of wature and art, which they camot firpati in maernitude. Were riees of a very enormole fize, their branches would fall by their own "ici-ht. Larrege mi-
mals hare not arengt in prorortion to thei: $\therefore \therefore$, and $\underbrace{C \quad \text { ancen }}$ it there were aty lant animali notuch lager then thofe wa know, they coukt hardly muas, and wouth le perpetrally fibjed to the mont das:erous arcidents. A; th the animath of the lea, inded, the cate in difierent ; for the gravity of the water in a geat meaf:ac Entams thofe animals; atd in fact thele ano kown lumatimes tw be watly large than the greatett !and ammoh. Nut doe it avail abyint this doetrine to tell w, thet bonen have $f$ metime been frund which were fing \& I whate
 tons mantioned by Strabo and Phisy, the fummer owh:ch wa, co cutits high, and the litter $\rightarrow$ : for 11:turalits have comcladed on juit grande, that sia home cafes thefe bones had belonered to elephent- ; a:al that the larger ones were bones of whales, which lal. bee 1 Frought to the places where they were fond by the: revolutions of nature that have happened in pati times. Thoush it mant be owned, that there appeas no radfon why there may not have been men who have c:ceeded by fome feet in height the talleit we lay: ken."

It wit cafly be feen, that argurents of this hind can never be concluive; becaue, alung with an increafe of ftature in any animal, we mult ahways fuppoit a proportional increafe in the cohelion of the parts of its body. Large works fomctimes fail when contucted on the plas of models, becaufe the cohetion of the materials whereof the model is made, and of the large wolk, are the fame; but a difference in this refpect will produce a very remarkable diference i: the uttimate refult. Thus, fuppote a model is made of iirwood, the modd may be ftrong and hirm enoush; but a large work made aifo of dir, when executed according to the plan of the model, may be fo weak that it wiil fall to pieces by its own weight. If, however, we make ufe of ion for the large work intlead of hir, the whole will be futticiently itrong, even though made ex. actly according to the plan of the model. The like may be faid with regard to large and fmall animal. If we could find an animal whole boncs excecded in hardnefs and ftrength the bones of other animats as much as irm eveed, fro, fuch an aninal might be of a monitron lize, and yet be excee dinsly ftrong. In like manner, if we luppofe the then atd boris of a giant to be greatly fuperior in hardnef and frength to the bones of other men, the great fize of his body will be no wotection at all to his trength. The whole of the matter thercfore comeming the exiduce of giants must rell on the credibility of the accomats we have from thofe ulo preterd to base feen them, and net on any arcuments dranen a priort.

In the Scripture we ate told of giame who were poodured foom the marriages of the /ons of (ind with

## G I A

rant. to Herculcs their fint hero; and in our days we have fen men eight feet high. The giant who was hown in Ronen in ${ }^{1735}$, meafured eight fect fome inches. The emperer Mavimian was of that fize; Shenkius and Plateras, phyficians of the lats century, faw feveral of Shat itanare; and Goropius faw a girl who was ten fett high.-The body of Orefec, according to the terecks, was eleven feet and a half; the giant Galba: 2 , lrought from Arabia to Rome under Claudius Celar, was near ten feet : and the bones of Secondilin and Pulio, keefers of the gardens of Sathut, were Sut in inches thorter. Funnam, a Scotiman, who iviw in the time of Eugtve JI. king of Scotland, meanued eleven feet and a lalf; and Jacob le Maire, in tis wyage to the Etrait of Magellan, reports, that on the 17 th or December 1615 , they found at Port Deire feveral graves covered with itcnes; and having the uriofity th 1 cm ve the itones, they dicovered human theletons of ten and eleren feet long. The chevalier Suzury, in his voyage to the peak of Tenerifie, fays, that they found in one of the fepulchral caverns of that furmatin tie head of a Guanche which had So teeth, and that the buly was not left than 15 feet long. The fi.nt Ferragu. Main by Otando neplew of Chatlemagne, was 13 leet high. Kioland, a celebrated anatomilt, who wrote in 1614 , fuy, tlat fome years before there was to be feen in the fuburbs of St German the tomb of the ciant liforet, who was 20 feet high. In Routs, in 1509 , in digging in the ditches near the Duminicans, they found a fone tumb containing a Skeleton whofe thull held a buthel of corn, and whofe frin bone reached up to the girdle of the talleit man there, being about four feet long, and confequently the tody mut have been 1 ; or is feet high. Upon the tomb was a plate of copper, whereon was encraved, " In this tomb lies the noble and puifant lord, the chevalier Ricon de Vailemont, and his bones." Platerus, a fimous phyfician, declares, that he faw at Lucerne the true human bones of a fubject which muit have been at leaft 19 feet high. Valence in Dauphine kontts of potlelling the bones of the giant Bucart, tyrant of the Vivarais, who was dlain with an arrow by the count de Cabillon his valfal. The Dominicans had a part of the thin bone, with the articulation of the knee, and his figure painted in frefo, with an infription, howing that this giant was 22 feet and a Falt high, and that lis bones were found in 1705 , near the banks of the Morderi, a little river at the foot of t':e mount in of Cruiful, upon which (tradition fays) the giant dwelt.
"January ti. tor 3 , fome mafons digging near the zuins of a caftle in Dauphine, in a dield which (by tradition) had long been called the giant's field, at the derth of 18 feet difcovered a brick tomb 30 feet long, 12 feet wide, and 8 feet high; on which was a gray stone, with the words Theusabchus Rex cut thereon. When the tomb was opened, they found a human ikeSton entise, 25 feet and a hali long, 12 feet wide aros the choulders, and nive feet deep from the breaft tone to the back. His tecth were :bout the fize each of an on's foot, and his hain bone meafured four feet. - Near Muzarino, in Sicily, in 1516, was found a giant 3o fee: high; his head was the fize of an hurdiear, and earh of his tetth weiglied five ounces. Near Pa-

a giant 30 feet long was found, in the year 1548 ; Giart. and another of 33 teet high, in 1550 ; and many cu $\underbrace{\text { dancel }}$ rious perfons have preferved feveral of thefe gigantic bunes.
"The Athenians found near their city two famous fleletons, one of 34 and the other of $3^{6}$ feet high.
"At Totu, in Buhemia, in 758 , was found a fheleton, the head of which could fcarce be encompafied by the arms of two men together, and whofe legs, which they diill keep in the callle of that city, were 26 feet long. The fiull of the giant found in Macedonia, September $169^{1}$, held 210 pounds of corn.
"The celebrated Sir Hans Sloane, who treated this matter vory learnedly, does not doubt thefe facts; but thinks the bones were thofe of elephants, whales, or other enormous animals.
" Elephants bones may be thorm for thofe of giants; but they can never impole on connoifeurs. Whales, which, by their immente bulk, are more proper to be fulutitutad for the largell giants, have neither arms nor legs ; and the head of that animal hath not the leaft relemilance to that of a man. If it be true, therefore, that a gieat number of the gigantic bones which we have mentioned have been feen by anatomits, and by them have been reputed real human bones, the exittence of giants is proved."

Witl reard to the credibility of all or any of thefe accounts, it is dificult to determine any thing. If, in any catille of Bohenia, the bones of a man's leg 26 feet in length are prelerved, we have indeed a decifive proof of the exitfence of a giant, in comparion of whom moft others would be but pigmies. Nor indeed could theie bones be fuppofed to belong to an elephant: for an elephant itfelf would be but a dwarf in comparifon of fuch an enormous monter. But it thefe bones were really kept ia any part of Bohemia, it feems ifrange that they have not been frequently vifited, and particular defcriptions of them given by the learned who have travelled into that country. It is certain, however, that there have been nations of meat confiderably exceeding the common itature. Thus, ait the Roman hitcrians inform us, that the Gau's and Germans exceeded the Italians in lize ; and it appears that the latians in thofe days were of much the fime ftature with the people of the prefent age. Among thele northern mations, it is alfo probable, that there would be \&s great differences in thature as there are among the prefent race of men. If that can be allowed, we may eafily believe that fonse of the ban barians might be called giants, without any great inpropriety. Of this fuperiority of hize, indeed, the hitorian Florus gives a notable intiance in Teutotochus, above mentioned, king of the Teutunes: who being defeated and taken prifoner by Marius, was carried in triumph before him at Rome, when his head reached above the trophies that were carried in the fame procefion.

But whether thefe accounts are crelited or not, we are very certain, that the llature of the human body is by no means abfolutely fixed. We ourfelves are a hiad of giants in comparifon of the Laplanders; nor are thefe the molt diminutive people to be found upon the earth. The Abbe la Chappe, in his journey into Siberia in order to oberve the latit tranfit of Venus, pated through a village inhabited by penple called
llotiacks.

## $G 1 A \quad[\rightarrow i] \quad G \quad I A$

Giants Wratioks, nether meo nor women of whom we re above Cantew-y
rance of culumns, in, a. general, from io is is fect; at une $\because$.luce or two it miy be nearly po tor a tery yards. In this account are eswluded the broken an! tcatered pieces of the fime hind of contran on, that ate detwehe 1 from the fides of the gras! caut wis, 23
 priacipal arrangement, thw hey have sergaty been taken into the width: which has beet t.ectu of fuch wild and dilimilar rebeefentations of t t.is cas way, which diferent accoun's have exhoite1. '1 limheit part of this canferay is the narroweit, $\because$ th very foos of the impending chiff from whence the whole projects, where, for four or f.ve yard, it in m; abuve ten or fitteen feet wide. '1'ice columms of thas narmes pat incline from a perpandicular a linde い thweitwin\}, and form a hope on their tops, by the very unequat height of the columns on the two dile:, by which an aicent is made at the foot of the clifif, tronthe head of one column to the wext above, gralation, to the top of the great caufersay, which, at the diifance of half a dozen yards from the cliff, obtains . perpendicular polition, and lowering in its generas height, widens to about 23 or between 25 and 30 fee: and for to yard nearly is ahwys a dove water. The tops of the columns for this length being nearly of an eyual height, they form a grand and fingular parade, that may be eafly walked on, rather inclining to the water's edge. But from high water mark, as it is perpetaully walbed by the beating furges on every return of the tide, the platiom lowers coniderably, and becomes more and more umeven, to as not to be walked on but with the greateit care. At the diftance of 150 yards from the cliff, it turns a little to the eat for 25 or 35 yards, and then finks into the fea. The figure of thete column is almot unexceptionably perntagonal, o: compofed of five fides; there are but very few of any other figure introduced: fome few there are of three, four, and fix fidec, but the generality of them are fire-fided, and the fpectator mutt look very nicely to find any of a different conltruction: yet what is very extraordinary, and particularly curiou, there are not two culumns in ten thouland to be townd, that either have their fides equal among themelves, or whofe figutes are alike. Nor is the compofition oi thefe colu:mns or pillars lefs deferving the attention 0 . the curious fpectator. They are not of one folid ttone in an upright potition ; but compoled of feveral thur: lengthe, curioully joined, not with that furfaces, but articulated into each other like liall and foches, o: like the joints in the vertehre of fome of the lavee: kind of fill, the one end at the foint having a casi:s, into which the convex end of the oppolite is exastiy fited. This is not vible, but by divioning the tiso frones. The death of the concavity or consexity is reacrally about three or four inchec. An? what is pill farther remakable of the joint, the convexity, an : ti.e correlpondent concavity, is not conformed to th. external angular figure of the column, but exar-1!? round, and as large as the fize or diancter of the column will admit ; and conrequently as the angles of $\hat{i}$ thefe columns ate in ceneral cattemeiy unequal, th circular cares of the joint are Chlum coincident wis mere than two or threcs fides if the pentagor, an' from the edge of the circular part of the jeint $t$, the "enevin idde an! angic ohe: ar" nuit plain. It is

Gent. Wi kother rexy remarkalte, likerife, that the aniCation 1 dions of thote joints are freprenty inverted; in 4ax.… ' nie the concury is upsads, in others the rever's. libit uccafions that varity and mixture of concavites and convexities on the top of the columen, which is obervable throughout the platiorm of this cauleway, St without any dicoverabie delign or regularity with refeel to the number of either. The length allo of thele particular ftone, from joint to joint, is various: in geveral, they are from i 8 to 24 inches lond; and, for the mon pait, longer toward the heotom of the columns than nearer the top, and the articulation of the joints fumething deeper. The fize or dianeter lanewife of the columns is as difierent as thesin leagth and tgure; in general, they are from 15 to 20 inches in diameter. There are really no traces of unformity or defign dicovered throughout the whole combinstion, excent in the form of the joint, which is invalably by an aticulation of the conver into the concave of the piece next above or beiow it; nor are there any traces of a finithing in any part, either in height, lerth, or breadth, of this curions cauleway. If there i here and there a fmooth top to any of the columns ahove water, there are others jull by, of equal height, that are more or lefs convex or concave, which fhow them to have been joined to pieces that have been wehhed, or by other means takea off. And undoubtedly thofe part; that are always above water have, fion time to time, been made as even as might be; and the remaining furfaces of the joints muit naturally have been worn fmoother by the contant friction of weather and walking, than where the fea, at every tide, is beating upon it and continually removing fine of the upper ftones and expofing frefl joints. And farther, as thefe columns preterve their diameters from top to bottom, in all the exterior ones, which have two or thrce fides expoled to view, the fame may with reaton be inferred of the interior columns whofe tops only are vifible. Yet what is very extraordinary, and equally curious, in this phenomenon, is, that notwithlanding the univerfal diflmilitude of the columns, both as to their figure and diameter, and though perfectly difinct from top to bottom, yet is the whole arrangement fo clofely combined at all points, that hardly a knife can be introduced between them either on the fides or angles.

The cliffs at a great difance from the caufeway, efpecially in the bay to the eaftward, exhibit at many Places the fame kind of columns, figured and jointed in all refpects like thofe of the grand caufeway: fome of them are feen near to the top of the cliff, which in general, in thefe bays to the eall and welt of the caufeway, is near 300 feet in heieht; others again are feen about midway, and at different clevations from the itrand. A very confiderable expoliure of them is feen in the very bottom of the bay to the callwarl, near a bunded rood, from the cauleway, where the earth has evilently falten away from them uon the frand, and evil its a moll curious arrangenent of many of thefe pentagonal columns, in a perpendicular potition, fupportine in appearance, a cliff of different flata of carth, Clay, rork, \&xc. to the hight of 1,50 teet or mare, abose. Some of thefe columus are between io and $f=$ feet ligh, from the top of the leoping bank below tt $n$; and, being longeft in the middle of the arrangement, thort-
ening on either hand in vies, they have outaned the appeliation of oranc, from a rude liketeds in this particular to the extcrior or fiontal tubes of that intterment; and as there a:o fery broken pieces on the fland mear it, it is probable that the cutdie range of columas that now appears is really the original enterior hise, to the leaward, of this collecitun. But how fir they evtend intamally into the bowels of the incumbent clit, is utimonn. The very fubitatace, indeed, of that pat of the chitr which pa jects to a point, between the iroo bays on the ex? and weft of the cauieway, feern, compoled of this kind of materials; for bohice the many pieces that are leen on the files of the cinll that circulate to the bottom of the bays, particularly the allern fide, these is, at the very puint of the clift, ath jul above the narro:, and highell part of the canfewty, a long collection of them feen, whele heads or tops jut appearing without the floping bank, planly fhow them to be in an oblique polition, and ab. ut half way between the perpendicular and horizontal. The heads of thefe, likenile, are of mixed furiaces, conves and concave, and the columns evidently appear to have been removed from their oriemal upright, to their prefent inclining or oblique polition, by the finking or falling of the clif.

GIBBET, or Giblt, a machine in manner of a gallows, whereon notorious criminals, after execution, are lung in irons or chains, as fpectacles in terrorem. See G.nliows.-The word in Fiench, givet, properly denotes what we call gallows: it is fuppofed to come originally from the Arabic gibd, "mount or elevation of ground;", by reafon gibe's are ufually plazed on hills or eminences.

GIBBON, EDward, a hiftorian of diffinguifhed eminence, was born at Putney in the yoar 1737. He was the fon of a gentleman of fortune and family diftinction, who fat as a member in two feparate parliaments. Etwand when a boy, was of fuch an extremely delicate contrituion, that his life was frequently defpaired of. When at the fchool of Weftminfter, his proyrefs was often retarded by repeated fhocks of bad health. After being for a long time under the management of the beft medical pracitioners, his conflitution was radically changed for the better, which induced his father to place him in Magdaten college as a gentleman commoner, that he might be puihed into manly acquifions. This was prior to the completing of his fifteenth year. Before this time his reading had been of fuch a nature as to ftore $l$ is mind with much valuable hiftoriral hnowledge, althoush bis grammatical and philofophical knowledge at this time was not fo extenfive as that of fome others at the tame period of life. He fay of bimelf; I arrive 1 at Oxford with a floch of erudition that might have puzzled a doctor, and a degree of ignorance of which a fchool-boy would have been ahamed, Under fuch circumblances he was but ill prepared to receive the benefis of an univervity education, and this was no doubt the reaton why he exclained fobitterly againit the public and private inflruations at O stord.

H . was fond of polemical divinity from his infancy, and duning his lifure mennents he turned his attention, when farties advanced, to the cetebrated controveriy between Pipihs and Proteltants; and as he had not then weyuised talents fuiticient to emable hin to combat

## $\mathrm{G} I \mathrm{~B} \quad\left[\begin{array}{lllll}70.4\end{array}\right] \quad \mathrm{G} \quad \mathrm{I} \quad \mathrm{B}$

Eal. an moternst caufe, it is generaly from a relax $-1-$ of its vertebra; ; though the fpine may be inflected forward, and the vertebrix thrown out $b_{j}$ a too firong and repeated astion of the aldominal mufcles. This, if not timely redrefied, grows up and fixes as the bones harden, till in adults it is totaly irretrievable: but when the diforder is recent, and the perfon young, there are hopes of a cure. The common method is ty a tmacline of patteboard, wood, or fteel, which is made to prefs principally on the gibbous part; and this by long wearing may let all right. The furgeons, ho:sever, tave a different inftrument, which they call a $\mathrm{cr} / \mathrm{f}$, much more efficacious, though not quite fo convenient in the wearing. By the ufe of this, the par:s are always prevented from growing any worfe, and are often cured During the application of thefe affintances, the parts mould be at times rubbed with Hungary water, fpirit of lavender, or the like, and defended with a ftrengthening plafter.

Gibbous, in Alfronomy, a term ufed in reference to the enlightened parts of the moon, whilit the is moving from the firlt quarter to the full, and from the full to the lait quarter: for all that time the dark part apfears horned or falcated; and the light one bunches 1 out, cnavex, or gibbous.

GIBEAH, a city in the tribe of Penjamin, lying north of Jerufalem about 20 or 30 furlongs, and built upon a hill, as its name imports.-This city gave birth to Saul, the firlt king of Irael, for which reafon it is frequently called Gibeah of Saul, or Gibeah the native country of Sanl.

GIBELINS, or Grbellins, a famous faction in Italv, oppofite to another called the Gireifhs.

Thofe two factions ravaged and laid wafte Italy for a long feries of years; fo that the hiftory of that countuy, for the fpace of two centuries, is no more than a detail of their mutual violences and daughters. The Gitelins flood for the emperor againtt the pope: but concerning their origin and the reafon of their names we have but a very obfcure accommt. According to the generality of authors, they rofe about the year 124 , upon the emperor Fre.'erick II.'s being excommunicated by Pope Gregory IX. Other writers maintain, that the two factions arofe ten years before, though ftill under the fame pope and emperor. But the molt probable opinion is that of Maimbourg, who laye, that the two factions of Guelphs and Gibelins arcie from a quarrel between two ancient and illuftrious houfes on the confines of Germany, that of the Henries of Gibeling, and that of the Guelphs of Adorf.

GIBEON, a city feated on an eminence about 40 furlongs from Jecufalern northward, and not far from the city of Gibeah. See Gera.

This was the capital city of the Gibeonites, who took the advantage of Johnua's oath, and of that which the elders of Ifrael likewife fwore to them, upon an artificial reprefentation which they made of their belonging to a very remote country, and their defire of making an alliance with the Hebrews. Joftua (ix. 3. 4, (: fiq.) and the elders inconfiderately entered into a league with thefe people; but foon difeovered their miftake. Upon this, fending for the Gibeonites, they -proached them with their fraud; and without revok-
ing the pronife which they had made to them, of giving them their lives, they condemaed them to carry wood and water to the tabcrnacle of the Lord, as flaves and captives taken in war; in which flate of fervitude they remained till the ruin and entire difperion of the Jewih nation.

The Gibeonites were defcended from the Hivites, the old inhabisants of that country; and poffeffed four cities, whereof Gibeon was the capital. The cities were Chephirath, Beeroth, Kirjathjearim, and Gibeon, Jolh. ix. 17. Thefe citics were afterwards given to the tribe of Benjamin, except Kirjathjearim, which fell to the tribe of Judah. The Gibeonites cortinued ever after fubject to thofe burdens which Jothua had impofed on them, and were very faithful to the Iiraelites.

GIBLETS, the offals or entrails of a goofe; including the heart and liver, with the feet, gizzard, \&c. The word is fuppofed to be formed of gollits; from the French goicau, " mouthful."-Giblets make a conifderable ar. ticle in conhery: they boil giblets, hew githets, make ragouts of giblets, giblet pies, \&c.

GIBRALTAR, a famous promontory, or rather peninfula, of Spain, lying in N. Lat. $3^{66.6 . W}$. Long. 5. 17. To the ancients it was known by the name of Calpe, and was allo called one of the Pillars of Hercules; by the Arabians it is called Gel el Tark, that is, "the mouth of Tarek," from Tarck the nanie of the Saracen general who conquered Spain in the beginning of the eighth century. The whole is an immenie rock, riing perpendicularly about 440 yards, meafuring from north to fouth about two Englih miles, but not above one in breadth from eaft to welt.- The town lies along the bay on the weft fide of the mountain on a declivity; by which, generally fpeaking, the rains pafs through it, and keep it clean. The old toun was confiderably larger than the new, which at prefent confifts of between 400 and 500 houfes. Many of the flreets are narrow and irregular: the buildings are of different materials; fome of natural ftone out of the quarries, fome of a factitious or artificial ftone, and a few of brick. The people are fupplied with frefh provifions chiefly from the coaft of Barbary, with fruit, roots, and vegetables of all forts from thence, or from their own gardens. Befides what is properly called the town, there are feveral fpacious and commodious public edifices erected ; fuch as barracks for the foldiers, with apartments for their officers, magazines of different kinds, Itorehoufes for provilions, \&c. The inhabitants, exclufive of the Britilh fubjects dependent on the garrifon, or who refide there from other motives, conift of fome Spaniards, a few Portuguefe, a confiderable number of Genoefe, and about as many Jews; making in the whole, according to Dr Campbell, between two and three thoufand, without reckoning the garrifon; though fome make them much fcwer. This town may be faid to have two ports; the firit lying to the north, and is proper only for fmall veffels; the other is very commodious for large velfels, and has a fine ftone quay. The bay is very beautiful and capacious, being in breadth about five miles, and in length eight or rine, with feveral fmall rivers running into it. It is very advantageous to the place. There is no ground to be found in the middle of it at 500 fathoms depth, fo that a fquadron may lie there in great fafety; the breezes from it are very refrefting; and it contributes
likewife

 ing them watis pelity of thth.

If admiral perceiving, that, by gaining this pur: of the fortification, the reduction of the rat would be icilitated, ordered out lome armed boats t.) take punite lion of it. On their approd in the Sipaniads firung a nane, which demolihed Iart of the worhs, hilled two lieutenants and to private foldiers, wounding about 60 more. Nutwithatanding this dilaser, the antatants keft porichton of the work, and took a in: ll bation, now the eight-gun battery, hail way between the mose and the town. On this the goventor thuaght proper to capitulate, and the prince of Heic: twok poletho: of the gates on the $24^{t h}$. The garriton, coniting at noolt of 150 men, marched out with the honours of war; and the Spanards who choie to reman were alloned the fame privileges they had eniuyed under the reign of Charles II. The works were found vey itrong. and the place well provided with ammunition and military thores.

This conquet was atchieved with the lofs of about 60 killed and 216 wounded on the part of the Englith. The prince of Heffe remained goveraur; and 19 men of war were lett at Litbon under the command of Sir John Leake, to fuccour the garrifon if there fhould be occafion. The lofs of fuh an important fortrets, however, having alarmed both the courts of Madrid and Paric, orders were fent to the Marquis de Befieqes Villadariac, a Spanih grandee, to lay fiege to it, in the cun" which he was to be aliuted by a naval force from Tou year liy the lon. The prince immentately apried to Sir Jom Varquin de Leake for afintance; but before the latter had lime to comply with his requell, a Ftench Hect arrived, and debarked fix battalions to the athiance of the Spaniards; after which they proceeded to the wentward, leaving only fix filigates in the buy. The trenches were opened on the thth of Octover, sumut which time Sir lum arrived with 20 fill of Euglif and Dutch haip, ; but heariny that the French were about to attack bim with a Cuperior forec, he judged it proper to return and refit. Having very pidentiy left o:ders at Litbon to make preparations for this turpole in his abience, he was enabled to accomplith the work with fuch eapedition, that on the $2 y^{2}$ ti of the fame month, he returned, and furprifed in the byy tirce figsutes, a fire thip, two Englith prizes, a tar6 tan, and a thore hip, After this exploit he landed rhe garrifine reinfurcements, lupplied the garrifon with tix ian iup nounths proviiion and ammunition; at the fime time plied with detaching on thore a body of 500 failors to alfit in re-ment and pairing the breaches which had been made by the ene-prowifins tily's ne.

Thus the Spaniards were difappointed in their hopes of fuccefs from an attack which had been projected that very night, and for which purpofe 200 boats had been collected. Still, however, they did not defrair; 4 U and

## $\mathrm{G} 1 \mathrm{~B} \quad\left[\begin{array}{r}7\end{array}\right] \quad \mathrm{C}$ I B

COMr.iter $\xrightarrow{-}$ and fupping that the garrifon would be off theis guasd and lecure on account (. . the vicinity of their ticet, they formed the rain defign of attenipting to furprite tue place, though the Britith admiral was fill before it. In this mad attempt $s c 0$ volunteers affo. ciated, taking the facrament never to return unlefs they aicosplithed their putpofe. They were conducted by a goat-heri to the fruth file of the rock near the cave puard, at that time called the pafs of locuf? trees. This they mounted, and lodyed themelves the firft wight in the cove of St Michacl: the next they faled Charles V's Wall ; furprifed and maffacred the guard at Middle hill ; where aftewarde, by ropes and ladders, feveral hundreds of the party defigned to fupfort them nere bawled up: but being difcovered, they were attacked by a ftrong party of grenadiers, and all of them at latt either hilled or taken. Thele brave ad. venturers were to have been fupported by a body of Fiench troops, and fome feints were propofed to draw off the attention of the garrition; but, through the difagrement of the conmanding officers, thefe pronofals were not put in execution, and thus the volunteers were left to their fate.

Notwithftanding thefe misfortunes, the Spaniards fill continued the fiege, and fited ont a itrong fquadron from Cadiz, with a defign to intercept the convoys of provifions which might be fent to the garrion ; fiattering themfelves at the fame time, that, on the arrival of their fleet, Sir John would be obliged to retire, and the garrion of confentuence to furrender to their united attacks. They continued their fire thereiose with additional fury, difmonted many of the canuon, and did ellential injury to the works in feveral difierent places. The prince of Heffe, however, was by no means deficient in his endeavours to difappoint thei espectations. As it was probable that an attompt might be made to florm the curtain, a curctte was dug in the ditch, which was flled by the tide, and ? duthle rem of palifades placed parallel to the woms. Hhe chambers of the nine under the glacis were loaded, and all means taken to defeat fuch an attompt; but on a fudden the Spaniards feemed to have altered thair defign, and threatened an attack on the lines which the garrion had on the declivity of the hill works. While affiis remained in this fituation, part of the fuccours they had long expected arrived in the bay, Decmber . $7 \cdot 17=4$, and in two days after, the remainder came in with near 2000 men, along with a proportiomable quantity of ammunition and provifions. Thete lad fatled from Cape Spartel under convoy of four frigates; tut vese in imminent danger of falling into the hatads of the encmy, whofe fleet they miftow for their own; however they efcaped by the fortunate circumtance of being becalmed, to that they could not get up to them.

Sir Juhn Leake having thus powerfolly reinforced the graritun, thought his prefence in the bay no longer necellary, and thercfore fet fail for Lifbon, where he arrived about the end of the year. In the beginning of

17
Vig'fi us
attack ty the spamiards. January i 70 ; the Spaniards were reinforced by a confiderable body of infantry, and on the wh of the month made an attack on the extiemity of the King's Lines, but were repulfed. The attack was renewed next day with 600 grenadiers, French and Walloons,
fupported by 1000 Spaniards, under Lieutenant General Tuy. They difoutcd thenielves in fuch a manner as hlowed an intention to flom a breach which had been made in the Rond Tuwer at the extremity of the King's Lines, and another in the intrenchment on the hill. The retrenchment which covered the latter breach, with past of the intrenchment joining the precipice of the rock, was defended at night by a captain, three fubalterns, and 90 men; but it was cuilomary for the captain to withdraw, with two fubalterns and 62 men, at daybreak. The Round Tower was defended by 180 men, commanded by a lieutenant-colonel. The marquis, by defetters from the garvifon, had oftained inteliigence of the ftrength of thele potts, and planned his attack accordingly. The detachment for the upper breach mounted the rock at midnight, and concealed themelves in the clitis until the captain had withdrawn; after which, advancing to the point of the intrenchment, they tintew grenades on the fubaliern and his party, fo that they were obliged to leave the place. At the fame time $3 \supset \supset$ men itormed the R and Tower, where Lientenant Colonel Bar made a vigorous defence, though the enemy, having palled the breach above, annoyed them on the tlanks with great flones and grenade. Obtersing, however, the Snaniards marching down to cut of his retreat fom the town, he retired; and, by getting over the parapet of the King's Lines, defcended into the covered way, where the Engliih guards were poited. Thus the garrifon were alarmed; all the regiments were allembled at their proper polls: and Captain Fiher endeavoured to ftop the progrefs of the enemy with 17 men, but they were repulfed, and himfelf taken prifoncr. At 1 li however, the Tower was retaken Lieutenare Coond Noncal at the head of 400 or 500 men, after it lad been in the polieflion of the enemy upwards of an hour.

The garrifon was now farther reinforced by fix companies of Dutch troops and 2202 Englilh foldicrs, together with fome provifons and flores. The affailants, The fiege honever, were till determined to go on. The mar-carried on quis de Villacar:as was fuperfeded by Marifchal Teffe, with freth a Fiencliman, with whom Admiral Pointis was defired ${ }^{\text {ardour. }}$ to co-operate in blocking up the place. The maricional therefure joined the army nith four fref battalions, befides eight companies which had been lent before; the ordnance, which had been greatiy injured by conithat ufe, was exchanged for others, and the works, as they thein food, put into the beit repair. On the part of the Englibh, a reinforcenent was ordered under the cunmand of Sir Thomas Dilkes and Sir luhn Ifardy, to $j$ in Admiral Leake at Linhon: which junction being efiected, the whole tleet, convifing of $2 \$$ Englinh, 4 Dutch, and 8 Poriuguefe men of war, having on board two battalions of land forces, fet fail from Lifbon. Happily for the befieged, however, the inceffant rains and forms about this time had retarded the onerations of the land forces, and greatly diffreffed the tlect of the enemy. Eight hips of the latter were forced from their anchors by the flrong wefterly wind, and obliged to drive aloft. At this critical period Sir John Leake, with the allicd tieet, cntered the flatats. On his approach the few remaining French thips put out to fea; and the Brition admiral difcovering five fail making out of the bay, and a gun fired at them from the

14 the riench al by a turn.

## G I B $\quad\left[\begin{array}{lll}7<7 & \text { B }\end{array}\right] \quad$ I B

Gibraitar. garrion, immediately gave chafe. Three French meas of war were taken, and the admiral's hip and another deiven on thore, where they were burnt. The reit, on hearing the renort of the guns, had made the betl of
15 their way to Toulon.

The fieze turned tato a blockade, and at lut satied.

The garifon was now fo well fupplied, that Marifchal Teffe withdrew his troops from the trenches, and formed a blockade, drawing on intrenchment acrof, the ithmus to prevent the garriton from ravaging the country. The prince of Heffie remained for fome time in the place, where he repaired the batterics, and made fume additions to the fortifications; atter which he ;oined the archduke Charles at Libon. As the latter, however, was relolved to try his fortune with the earl of Peterborough in Valencia and Catalonia, the prince was fent back to Gibraitar to prepare part of the garrifon fur embarkation, and foon atter was followed by the whole fitet. Major General Ramos was now appointed governor of Gibraltar, in which only two new battalions were left, as nothing was to be feared from the enemy. The new governor, however, brought with him 405 men for the greater fecurity of the place; but foon refigned his government to Colonel Roger Elliot, during whofe time Gibraltar was made a free port by a fpecial order from the queen.

Colonel Elliot was fucceeded by Colonel Cong:eve before the year 1714, and he by Colonel Cotton a

16
flort time after. In 1720 the Spaniards feem to have threatened another attack. Ceuta, a Spanifh fortrefs in Barbary, had been for many years befieged by the Moors; and a powerful armament, commanded by the marquis de Lada, was now affembled in Gibraltar bay, under pretence of relieving the African fortrefs, hut with a fecret defign of firt furpriing Gibraltar; fur which purpofe they had provided faling ladderc, \&ic. The armament, however, had not been fitted out with fuch fecrecy, but that the Britifh miniftry had intelligence of it. Oa this they fent orders to Colonel Kane, governor of Minorca, to embark with part of his gorrifon for Gibraltar under convoy of the ticet in the Mediterranean. On his arrival he found the place in a critical fituation. The garrifon confitied only of three weak battalions under Major Hetherington, belides whom there was only one other field oficer, Major Battcroux, in the place, and no more than $1+$ days provifions remaining. The pofture of aftairs, however, was aitered by the arrival of Colonel Kane with 500 men, with provifions and ammunition; which reinforcement, together with the fpirited behaviour of the Britih commodore, induced the Spanith commander to abandon his defign, though he remainell of opinion that the fortrefs might then have been carried by a general affault.
Notwithflanding this difappointment, the Spaniard, continued to keep a watchful eye over Gibraltar ; and, in the latter end of the year 1726, affembled an army in the nei hbourhood of Algefiras, encamping, on the zoth of January following, on the plain below St

Roch, and creating a battery on the beach to protect or atar. thecir camp. Though Admiral Hopfon was then at su- -. chor in the bay of Gibratar, yet, as he hat recinct no iatelligence of the attual cormencement ot ho.ilitics betwea Britain'and Spain, he nais oblizel to atlow the boats of the later to pafs with provinom, anm. and ammanition, between Algeniras and the camp, at the fame time that colonel, afterward B is ablier K we, who had beena iecond time fent from Ninores, lay under imilar embarraftments. The opentions of the Spa niard, however, feemed fo evidently to tend towards an attack, that the governor thowht !roper to or der fuch of that nation as were in the town to leave it, and to forbid their galleys to anchor under bis, guns (1).

The count de las Torres commanded the Spanih forces, amounting to near 20,000 men; and foon after forming his camp, he advanced within reach of th: garrifon. The brigadier then defired him to keep out of his reach, otherwife he thould do his utmont to force him; but to this the Spanith commander replied, that, as the garrion could command no more than they hat power to maintain, he thould obey his Catholic majeity's orders, and encroach as far as poftible. H thilistiec, however, were not commenced until the 1 sth of February 1727, when the Spaniards, having brought materials for batteries to the old windmill on the neutral gromd, it was determined in a council of war. that the Spanith general had commenced holilities by encroaching to far on the liberties of the garrifun. Sill, however, the governor fent to the count to know the reafon of breaking ground before the garrifon; but received for anfwer, that " he was in his matter's territories, and was not anfwerable to any other perfua for his conduct." On this the governor opened the batteries of the Oid Mole and thofe of Wiilis upon the Spauifh workmen : however, they perifited on carrying on their operations, and at night marched a party down to the Devil's Tower, where they imanediately broke ground, and began a communication with their other works. The governor was now infurmed by tome deferters, that the enemy were forming a mine in a cave mader Willi*s Battery, with a defign to blow it up: but the plot being thus happily dicovered, a party was immediately itationed to cut off the communication. O. the $22!$ of February the Spaniards of ened on the garrifon with 17 pieces of cannun befides mortars; and the day following Brigadier Kane left Gibraltar to fend a reinforcem nt from Minorea. On the 3 d of March the enemy onemeni a new battery of 22 guns, on the Ohd Mole, and on the 8 th another of 15 gens, bearing alf, u, on the fame moic, the guns of which had amoyed the "ellern tlank of their approaches.

All this time the garrion had kept up a conlant and well dire ted fire from the batteries which bore upon the work, of the enemy; but the ordnance in general being old, were frequently hurlting; by which they tuffered more thaia from the bire of the lenegers. $+\mathrm{U}=$

1h.
(1) At this tine the fortifications of Gibraltar were confiderably diferent from what they hat been in 1725 . Several works were erefted on the heights atove the line: called 11 illis's Batteriet; the Prince', I es were extended to the extremity of the rock, and an inundation was formed out of the mosis in fromt of the grand battery.

## G I B [ 708 ] $\quad$ G I B

Gibratar. The later were alfo greatly diffeffed by the fleet under Idmiral Lfonfon and Sir Charles Wager, who, fiace the heginning of the fiege, had intercepted their homebound fhips, and at the fame time greatly beneited the darrion by bringing the prizes into the bav. Finding the spaniards, however, obilinately bent on their enterfile, they formed a defign, on the 2 d of April, to bombard Algenirns, from whenre the befiegers were fupplied with various articles of ammunition; but the fiet happening to be becalmed, the defign was afterwards unaccountably aband ned; and on the arrival of a reinforcement from Minorca, they failed to the wettward, leaving the garrifon to defend themfelves the beit way they could.

The enemy continued to augment their batteries, and erezt ners ones, until they amounted at iall to 60 cannon befides mortars; and, on the 3 d of May, the governor received intelligence that a general affalt was intended; to repel which he took every proper precaution. The enemy, however, fill added to their as-

19
Q.effation of hoitilities.

20
Creat lofs of the $S_{i}$ ad mards in their at. temnts.

21 Gibraltar biocked up in 1779 . proaches, and conliderable reinforcements were received by both parties. Hoftilities, however, ceafed on the 12 th, when news arrived that the preliminaries of a general peace were figned; from which time to the year 1779 , no farther attempts were made on Gibra!tar. In the courfe of thele tro fieges the lofs of the Spaniards was very coniderable; that of 170 ; coting them not lefs than $10,000 \mathrm{men}$, including thofe who died of fickne?; and in that of 1727 their lofs was computed at near $\$ 000$, helides cafualties, which could nut be afcettained. That of the garrifon amounted in $170 ;$ to 400 ; and in 1727 to 300 ; a very fmall number, confidering that during the fiege 70 camnon and 30 mortars burit on the batteries.

The hotile manifefto prefented by the Spanith ambaflador to the court of London at the commencement of the late war, was foon followed by an interruption of communication betwixt Spain and the fortrefs of Gibraltar. No direct intention of attacking or ditireffing it, however, was manifeited till the 16 th of July, when the fort was completely blocked up by a fquadron of two 74 gun thips, feveral frigates, gallevs, \&c. Ten days after they began to form a camp on the plain below St Roch, three miles from the fortrefs. The garrifon at this time confifted of 5382 men, including officers, with a company of engineers and artincers: but the greatelt expectations were formed from the abiiities and valour of General Elliot the governor. As foum as the breaking off the communication with Spain indicated approaching hnftilities, the governor took every precaution that could be fuggefled by military widicm; but though informed of the rupture betwixt the two courts having actually taken place, and though were ufed to interrupt them till the 12 th of September, when the batteries of Green's Lodge, Willis, and Queen Charlotte, were opened for a few hours, with a view to diflurb the w rkmen.

From this time to the beginning of the year $1-80$ the enemy continued the blockade both by lea and land, but without doing any damage to the works or
garrifon, and it was not urtil the 12 th of January that a fingle perfon was wunded. This happened to be a woman, who, palling near one of the houfes, was nightly hutt by a thot from :iee cuemy. In the mean
time, however, the ufual fupplies of provifions being cut off, the garrifon began to feel all the horrors of famine. All the neceflaries of life were very fcarce, and to be procured only at exorbitant prices. Veal, Exvelise mutton, and beef, fold trom halt a crown to four thil. dearris of lings per pound; freih pork from two to three ihilings; prsifionso falted beef and pork fifteenpence; fowls eighteen thillings per couple; ducks a guinea; fire wood, five thillings per hundred weight; a pint of milk and water fifternence; a fmall cabbage colt five thillings, and a fmall bunch of outer leaves fivepence; Itihh butter hiif a crown per pound; candles as much; and eggs fixpence each. As the rock, however, is almoll furroundel by the fea, it was natural to fuppofe, that in fuch a fearcity of other provinons great benefit would have been derived from the ocean; but the fihermen, being all foreigners, and under mo regulation, took advantage of the prefent farcity of provitons in the garriton to evact a mon exorbitant price for the fith they fupplied.

Had matters remained long in this ftate, it is plain The ${ }_{2}^{25}$ that the fortref, howeter ttrong, muft have fallen into nifh fleet the hands of the enemy. They were, however, effec- defeated tually relieved in confequence of the victory gained by a tmiral Admiral Rodzey over the Sparith rieet commanded by taken by Don Juan de Langara. The former had been furnilh. Rodncy, ed with a itrong fquadron, in order to relieve this important fortreis; with which having fet fail, he in a few days fell in with a Spanith tleet of 16 tranfports bound from Bilboa to Cadiz, and laden with provilions and naval ftores, convoyed by a man of war of 64 guns, four frigates, and two armed vefiels. Of thefe only a fingle tranfort efcaped, the relt being all captured on the 8 th of January 1780 ; and the lols of them, at the fame time that it promifed to be very ferviceable to the garriton, was equally detrimental to the enemy, who were now in great want both of provifions and materials for their thipying.

This advantage was fon after followed by a much greater. On the 16 th of the fame month a Spanifh fquadron of it fail of the line was difcovered of Cape St Vincent; and the Britilh admiral having tahen the proner methods to come up with the:n as quichly as potible, an engagement took place about four in the afternoon. At this time the headmolt hips of the Britith line clofed in with the nearell of the enemy, and in half an hour one of the Spaniards, mounting $7>$ guns, and having on board 603 nien, blew up, and all on board perilhed. In two hours more another Spanith thip of the line was taken; notwithltanding which the fight continued with great vigour till two in the morning, when the headmolt thip of the enemy fruck to the Sandwich; after which the firing ceafed. The weather throughout the night was fo tempeltuous that it was with the utmott difficulty the Britilh could take poltelion of thofe fhips which furrendered. Thefe were ix in number, but two of them drove athore and were loit, only four being brought fafe into Gibraltar. 'Thefe were the admiral's thip of 80 guns and 700 men, with three ohhers of 70 guas and 600 men . The engegement, however, happened fo near the fhore, and the Britih were fo cager in fecuring the lee gage to prevent the enemy's efcape, that Admiral Rodney's inip, together with fonie of the largeit in the Heet, were in ertent danyer of raming on the hoals of St Lucar;

## G I B $\left[\begin{array}{lll}7<0\end{array}\right] \quad$ G I B

Gibrator ner could they be ent into dee? water are.in without much labour and the exertion oi great maval ikill. is was the opinion of all who were prefent in the ation, that had this engagement happered in the day time. or had the weather been lef, boilcross, not one of the Stanilh thios could have eforped; and erca as it man, thoue which got of were fo effatially dumaged is to 26 be unlit for lervice.
The garsi- The ne's of this important victory arrived at Giob fon ritucuraler on the evening of the day after it was fuaght; and rein- and in two days more the garrifon was com,lete! reforied. lieved by the arrival of the fiect and convoy, at the fime time that they were farther reinfored by a regiment of Highlanders, coniming of 1051 men, oficers incluled. An opportunity was allo tahen of fending asay with the flect all the invalids and womes in the garrifon; with whom they fet fiil on the $1:$ th of Fe bruary, leaving in the bay only the Edgad and Panther flups of the line, with wo frigates.

On the departure of the Britih fleet the blockade was immediately relumed; and notwithlianding the ample fupplies lately received, the garrifon foon began again to experience the inconveniency of wanting freih prowinons. It had hithorto received thefe in abundance from the conit of Barbary; but an uaccountable alteration had now taken place, fo that the friendthip of the emperor of Morocco was transferred from Gieat Britain to Spain in a manner totally unprecedented. His partiality towards the latter was the more furpriing, as Britain had given no provocation, and the enmity between Spain and Moroceo feemed to

27 The garri- caufes as could never ceafe to operate. Thus, how for again reduced to fraits. Thus, how: ever, the garriion became daily more and more diftreffed, from being obliged to make conttant ufe of

28 Unfaceef. fulationvis obutcution was the 6th of June 1730, when io fire-ithps, to burn the favoured by an uncommon darknef, fload over from Britih $\mathrm{h}_{\mathrm{p}}$. ping. project of burning all the Britin thipping in the bay. Tte night appointed for puting this fcheme in exefavoured by an uncommon darknef, tlood over froms
the Spanihat to the Britih fide of the bay. Their defign was to fet fire to the florehoufes nearelt to the their falt proviions, and even this with the fricter? economy. The induftry and refolution of the Britinh feamsn and officers, indeed, fometimes overcame all ouitacles, fo that they found means to procure the neceffary refrehments; though in fo duing they were ceitainly expofed to the utmoit doneer from the enemy. At the fame time the defence of the garrifon was io vigorous, that while it continued to be fupplied even in this feanty manner, the Spaniards began to lofe all hone of reducing it ; for which reaton they formed a water fide, is well as to the thipping there; but hawing been too procipitate in fring their thips, and being receivel allo by a very heavy cannonade, the attempt was tudlrated. Oa this oceafion the filll and intrepiuity of the Britilh feamen were eminently difplayed. Having manned their boats, they grappled the i.re hips already in tlames; and, notwithaanding their dreadful appearance and the danger of their exploling, towed them clear of the veliels under the walle, and extinguihed them.
The failure of this project was a grievous dif.ppointrent to Don Barcelo the Spanih admiral, who lay ready with his fyuadron to intercept the Beitioh iefols lat might antmit to efcape; at the fane time
the $t$ ': batteries on :heir liacs wee in readinef, to of

 batterics, they ucre corminly dadrond by the bedroyed. freged; and their mortincation on theie occerm was the gre:ter, as it was wfanl fors the governer $t$, ail, , then to complete their wolk before ho commened lis dehrative operations. Thu the la, our of amy divemas often lol in a few hours, and hierward, was to be refund with as little profinet of faccefs an before The gartion was now conderdy amoyel be the garrithe Soami:h gen boet, to whith indeed the hivens were equally expoled with then? Cels from 30 to 40 tans burden, cminctel fo that they on buate lay low in the water, which readered them dinalt to be ained at. They hat 15 oars on a fide, carried to or 50 men, with a 26 ounder on the pros; and, from the facility of managisy them, two were decmed, i: calm weather to be a match for a frigate of moderate fize. All their efforts, however, could atill do t.o more than to reduce the garrifon to yreat fitrais for wan: of provilions; and to this deadful inconvenience the Bitih fubmitted with the greatell cheerfincls. From the time of Admiral Rodney's departure in the month of February 178 o to the montls of O:lober, almoit the only provitions in the gerrifon were futh as tended to produce the fcurvy; which accordingly raged in fuch a manner, as to threaten the moll fat.! confequences. An antidote, hosever, was happily procured by the capture of a Danilh dopger from Malaga laden with lemons and oranges, which the governor immediately purchafed for the ufe of the garriton and diltributed among them. "At this time (fays Captain Drinkwater) the feurvy had made drealful ravages in our hofpitals, and more were datily confined: many however, unwilling to yield to its firit attacks, perfevered in their daty to the more atvanced flages. It was therefore not uncommon, at this period, to fee men, who, fome months bef, ire, were hale, and capable of endoring any fatigus, fu?porting themelves to their polfs upon crutches, and even mith that aditance fearcely able to move along. The molt fatal confequences in thort were to be apmrehended to the garrilon from this terrible diforler. when this Dane was happily direated to our relief.," Aecording to Mr Cairncrofs, an eminent furgeon, ines. who was prefent during this fiege, "the le:ryy which" now raged in Gibraltar, difiered in wo retpet from ${ }^{\text {it }}$ that difeafe ufually contracted by failors in limg for voyages; and of which the immediate caufr ferned to be the fublinting for a length of time upon fatted provifions only, without a fullicient quantity of ve cuablo or otheracefent foods. The circumftances related in the voyage of that celbrated circumavigitor I. it Anfon of confolidated fratu:- difunitios, and the callohity of the bone being perfectly difilulval, ncured frequently in our hof itah, and old fores :and :xounds opened anew from the nature of the difonder. Various antifeorbutics were ufed without ficcefs, fuch as acid of vitriol, four crout, extract of nalt, effence of fipruce, Se.; but the on'y fiperifice were freth tem... and uanges given Liberally or, when they wull

Ahatar. ie procered, the preferved juice in fuch quantitics, -, tom one to fuar ounces per day, as the parient conlld best. Whilit the lemons were found, from one to thiree were adminifitered each day as circumflances cireated. The juice given to thoie in the molt maligmant flate was fometimes diluted with fugar, wine, or fririts; but the convalefients took it without dilution. Women and childrea were equally affected ; nor were the oficicers exempted from this dreadiul diforder. It became almolt general at the commencement of the winter feafin, cwing to the cold and moilure, and in

3
Metherl of preferying iemon juice esiming of The juice was preferved by adding to 60 gallms of expected liquor about five or ten gallons of brandy, which kept it in fo, wholefome a diate, that feveral c.afs were opened in good condition at the clofe of the fiege. The old juice, howcyer, was not fo freedily elficacious as the fruit, though by perfevering longer in its ufe it feddom failed.
Till this month the allowance of filt provitons had continued undimininihed; but now it was judged neceffary to reduce the allowance of breal and meat, and to make fome other regulations in order to enforce the flrictet economy with regard to food. Every thing of this kind that could be pracifed, however, feemed infufficient to preferve the garrifon from abfolute want. In the beginning of the year 178 r provitions became exceedingly farce, by reafon of the almoft total expenditure of what was contained in the public flores, and the vigilance of the enemy's cruifers. About the middle of February the town bakers left off work for want of flour; and many of the poorer fort wanted bread. The price of freeh provitions agzin role to a moll enormous height. Small piss folld at two guineas ; turkeys at three ; geefe at 30 hillinfs; forls and ducks at to thillings ; damaged bifcuit a fhilling the pound; peare 18 d ; and all other necefliries in proportion ; at the fame time the fcarcity of fuel was fuch, that it was fometimes farcely procurable in quantity fufficient to drefs the viAuals.

The garrifon had hitherto derived affifance occafionally from the gardens on the neutral ground, though vaft quantities of vegetables had been removed thence by the enemy. Towards the end of the month of Otober 1780, however, the Spaniards determined to expel the Britilh from the gardens entirely : and this they accomplilised in fpite of all that could be done to prevent them. From this time the refources with regard to vegetables depended entirely upon the attention paid to cultivation; which, happily for the garrifon, was attended with fuch fuccefs, efpecially during the winter month, that the produce came at lait to be nearly equal to the demand. It laft, on the 12 th of Aprii 1781 , fupplies were brought by the Britih fleet
ber of tetween 20 and 30 , feveral of them carrying $\underbrace{G}$.alt.r. mortar-pieces; and as they ufed both lails and oars, they eluded all purfuit, by withdrawing on the rile of any breeze. To keep off thefe troublefome gueits, feveral fout frigates were obliged to thation themfelves along the bay for the prozection of the thipping; but even this did not prevent them from continuing their moletiation; and notwithitanding the vigilance and aftivity of the Britifl failurs, it was fidum that they could come near enough to do them any damage. In finite of all their endeavours, however, the garriton was effectually relicved: an exploit which fo exceedingly The opairritated the court of Spain, that they determined to nisrd reexert the utmoll force of the kingdom rather than fail ert them. in the execution of their favourite project. The worksfilves to before the town were therefore carried on with more the utmold. vigour than ever, and the moft tremendous preparations made to caufe the obttinate garrifon fecl the refentment of an exafperated enemy. Their batteries were now mounted with guns of the heavich metal, and with mortar pieces of the largeft fize; the number of the former augmented to near 250 , and of the latter to upwards of 80 . For three weeks this prodigious artillery continued to pour forth an almolt inceflant mower of thot and thells, infomuch that, in the time jutt mentioned, they had confuned $100,0001 \mathrm{~b}$. of gunpowder, and thrown into the town four or five thoufand thot or fhells every 2,4 hours.

By fuch an immenfe bombardment the town was almoft totally laid in ruins. The inhabitants, computed at more than 3000 in number, experienced every difficulty that could arife from the deftruction of their habitations: feveral of them were killed, and all forced to leave the town, and take ohelier under tents with what accommodation could be provided for them in fuch feenes of horror and confufion. Numbers took the opportunity of retiring with the fleet; while many that remained were now reduced from a flate of opulence to the greateft difrefs. The conduct of Governor Elliot was very humane and compaftionate to fuch as were inclined to depart; allowing them a free paffage to England, and fupplying them with provifions for the royage.

During this bombardment, not only the greateft part of the effects belonging to the inhabitants were det?royed, but the fortifications were in many places greatly injured; and the worlt was, that the remainder Diforderls were deftroyed by the foldiers, who had arrived at fuch behaviour a pitch of licentionfnefs, that they neither regarded dicrs. nor would obey their officers. They were incited to this deltructive fcheme by the avarice of fome of the inhabitants who had hoarded up and concealed a quantity of necelhary articles, in order to procure an advanced price. They now, theretore, kept no bounds in diflipation, walle, and extravagance; a remarkable infance of which is given by Captain Drinkwater, in their roathing a pig by a fire made of cimamon. To put a ftop to thefe atiocious proceedings, rigorous meafures were of neceflity adopted; and it was intimated, that any foldicr convicted of being drunk or affeep upon his polt, or found marauding, hould be immediately executed. The lafs of human lives during this dreadful bombardment was lefs than could have heen expected; but many remarkable circumitances are taken under Admirals Darby, Digby, and Rofs, though they could not be got in without great difficulty. The gun boats already mention ed were now much increafed in number and flrength of contruation; infelling the bay in fuch a manner as greatiy to interrupt the debarkation of the Aores. As no veffels of the fame kind had been prepared to oppofe them, they could fcance be prevented from effecting their purpofe of burning the thore "ips. With this view they had approached them every morning in hasy weather to tho num-

Cibrotar rotice of by Captain Drinkwater, fome of which ate relisted is the nre ( $B$.)

By the beshang of June 1781, the enemy had relaxed conflecably in their firing, feldum cxcoding $6: 0$ thot in a das; and coprinued gradually to diminifh this numier fo remasd:hly, that rowards the end of Auget they felcom tied in the disy, and only dif. charged lix or foven, and fometimen not above thres, fhot in the nigint. The batteri"s at land, bosever, were fucceeded k: the gun boat.; which renewed their ataiks evely dey. keeping the garriton in continuad alarm, and never failing to do more or lels execution. To retirain them, theretore, a battery of guts capable of throwing their thot to a great ciliance was erected as near as porfible to the enes $y$; and as it reacl, $d$ their very camp, it was determined to open it tepon them as often as the gun boats made their attacks; which being foon percei:ed, they thought it prodent
of Fratice and Spain ; fothat by the latice port of N ovember: 1781 , they had prou the them to fuch a flate of perfection as filled both hingdems with the molt fanguine expectations of fuccefs. Goremor Elliot, however, far from teing dimiayed at thefe formidable bulwaks, fuffered them to proceed wihuut mulellation to the end of their kheme, that he might is in a moment dedroy the labour of fo m:ny months, and thas render the diompointment the reater. In the night They ar of the 27 :h of Nuvember, a chofen party of 2000 men entirely d:was detached, in order to defloy the enemy's work stroyed. and Laticrien ; and their fuccefs was equal to their mast famene expectations. They marched out in great order and fitence about two o clock in the morning, under the command of Brigndier General Rofs; atter which $i$. y proceeded with the tame circumfection, hat with the utmoit celerity, to the enemy* worh, which they formed and overthrew with athonining rapidity. The Spaniards were inftantly thrown into confuGon, ad thed on every fide; the guns and mortars on the batteries were all fiked up; and
(E) Two boys belonging to the artificer company were endowed with fuch wonderful fitength of vifion, that they could fe the flot of the enemy in the air almot as foon a it came from the mouth of the gun; and were therefure contantly placed upun fume part of the worhs to give notice to the foldiers of the approaching danger. During the time of the hottelf fire, howcrer, the men were fo habituated to the fall of thells and fhot around them, that they contractei an infentibility of danger, and almon required to be cautioned by their othcersto aroid the explotion of a thell when lying with the fulee burning at their feet. In confequence of this inaticntion, thes frequently neglected the adsice of the boys above mentioned, and their neglect could not but be productive of fatal effects. An inllance of this happened on the Princels Amelia's battery, where a fhet thus difregarded came through one of the capped emhrafures, rarried off one of the legs from three foldiers, and vounded a fourth in both. In other caces, in which the perions themfelves lave obferved the thot or liells coming towards them, they have been fafcinated by its appearance, and unable to move from the fpot, as fmall birds are faid to lee by the rattlenake. "This fudden arrelt of the facu'ties (fays our author) was nothing uncommon: feveral inftances occurred to my own offervation, where men, totally free, have bad their fentes fo encaged by a ficll in its defcent, that though tenble of their danger, even fo far as to cry for affitaarce, they have been immoseably fixed to the place. But what is more remarkable, thefe men have fo initantaneouf: recovered themelves on its fall to the ground, as to remove to a place of fafety before the thell burf." In this mamer Lieuteuant Lowe of the 12 th regiment was facinated by a thut which he faw coming, but hal tot power to remove from the place before it fell upon him and tock off his leg.

Where thefe thells burf they produced inftant and certain dofruction, nangling in the moft dreadal manse:. The folloning are fome infances: I matrofs had the minfortune of breaking his thigh by fome accident; and being a man of great fpirit, could larce bar the confinement necellary for its remion. In confequence of this he went abroad too foom, and thus unfortumately bruke the bone a fecond time. Being now confined to bed, a hell happened to fall into the room where he was, and, rebounding, lolged itfelf directly upon him. The convaleicents and fick infantly fummonel all their ftrength, and crawled out of the roon., while the poor matrols lay betow the thell, kept down by its weight, and uiterly unable to dir. la a kets teconds it burtt, and tork iff both his leas, and foorched him ia a dreadful manner. FIe furvived the evplotion, was ferfible to the lat moment, and died regretting that he had not been hilled on the batterics. Sike cafe of a foldier of the 73 regiment hows, that even in the mull langernus calc we thoth never defpair of recovery while life remens. I his unfortunate man had been knocked down by the wind of a Reell, which, intantly butiting, killed his companion, and mangled himbli in a ihocking monner. Hi, tkull was diendfully fractured, his leit arm troken in two glaces, one of his legh hattered, the fin and mulchetorn of from pari of his right hand, the middle finger broken to pieces, and bis whole body moft keverely bruiled and marhed with gunpuader. He prefented io horrid an object to the furgeons, that they had not the leatt hopes of biving lia life, ard were it a loh what part to attend to firl. He was that exening trepanned; a few dayuaftermards his iet was amputated, and other wounds and fraclures were dreficd. Yeing polfefed of a motl eacellent contiention, tature performed :onders in his favour, and in 11 weeks his cure was completely eficed. ") the Isth of Septentor a thell from the lines fell into a houfe where the town major (aptain Bumpe, with Mat
 therculb the lleor into the cellar: there it burfit, and forced the roming with the undithonate tnajor up to the

 themfelves fo vigorouly, that in the face of an hour the magazines vere bluwn up, the forehoufes of aims, an munition, and military impenents of erery kind, and all the works that had leeti conltueed, were iet on fire, and totally confumed ; the whole damage done on this occalion leing eftimated at up ards of wo millions terling.

Ior feversl days after this difater the $\mathrm{S}_{\mathrm{p}}$ panards rontimed inactive, withent exon making an:* attempt to catinguih their batterics, which ftill continued in flames; but in the beginting of December, as if fuddenly aroufed from their reverie, upwards of 1000 nuen were fet to work in order to prepare a great number of falcines, from whence it was concluded that they defigned to repair ilecir works. In this they proceeded with their ulual perleverance and ditigence; Lut as the former methods of attack had conitantly failed, it was evident, that if the place could be reduced at all, it mult be by fome means hitherto unattempted; and for the reduction of this fingle fortrefs, the Spawith monarch, after the conqueft of Minorca, determined to employ the whole itrength of his empire. Among the various projects formed at this time, that of the chevalier D'Arcon, a French engineer of dillinetion, proved the mof acceptable to the court of Spain; and though the expence attending it was immenfe, this feemed in the prefeat circumfiances to be but a matter of fmall confideration. His plan was to confiruct fuch floating batteries as might neither be liable to be funk nor fet on fire. With this view their bottoms were made of the thickeft timber, and their fides of wood and cork long foaked in water, with a layer of wet fand betwixt them. Their thicknefs was fuch, that they were impenetrable to cannon flot; and to prevent the effects of red hot balls, a numher of pipes were contrived to carry water through every part of the vellel, and pumps fufficient to furniih a conftant fupply for the purpofe. The people at the batteries were fheltered from the bombs by a rope netting, made lloping that they might roll off, and fpread with wet thins to prevent fire. Ten of thefe batteries were conftructed out of the hulls of large
reffels, fome of 50 or ( 0 guns, cat down fir that fur-Gi'rita: pole, and carrying from io to 28 gans each, wit! about half as many in reforve in cafe of accilents. Fetel gun was ferved by 36 art:lle:y men; anl thefe Hoasing catteries were to be leconded by 80 inrge bosts carring guns and mortats of heary mevai; "a great number of thips of torce and fifgates, what tume hundreds of frall craft, were to accomany them with troops, for the inftant execution of whit might be jadged neceffary. On this occancia upwards of 1000 pieces of artillery and 8:,0c0 barre's of gumpowd.r were provided. A body of 12,000 of the beit roops of France were now added to the Sanith amy vetore the flace; the body ofengincers was the beft that both kingdems could proluce; and numbers of volunteers, of the beft families in hoth, atterded the fiege. Nuinbers of military gentlemen alfo came from evesy part of Europe to be nimetlies of what paffed at this cele. brated fiege, which was now compared to the moft famous recorded in hiltory. The conducing of it was committed to the duke de Crillon, who had ditinguithed himfelf by the conquelt of Minorca. Two princes of the blood royal of France, the count of Artois brother to the king, and the duke of Bourbon his coufin, came to be witneffes of this extraordinary enterprife. Thefe behaved with the greateft politenefs both to the goveinor and garrifon. The cctunt of Artois tranfmitted a packet of letters for various indiriduals in the garrifon, which had been irtercepted and carried to Madrid, and which he requelted that he might be the means of conveying to thefe for whom they nere defigned. Both he and the duke of Bourbon fignified to General Elliot the high regard they had for his perfon and character; and the dule de Crillon himfelf took this opportunity of expreting the fame fentiments, and to entreat him to accept of fome refrefhments. General Elliot returned a polite anfwer, but accepted of the prefent with reluctance, and requelted him for the futere not to confer any favours of that kind upon him.

Such a prodigious armament rajed the confidence Prodgious of the befiegers fo bigh, that they looked upon the armament conqueft brought be
fore the fore trefs.

Vignoles had time to efcape before the fhell burft; neverthelefs they were flightly wounded by the fplinters, as were a ferjeant and his daughter, who happened to be in the cellar when the thell entered.

The fullowing are related as inftances of very catraordinary efcapes fiom the deftructive power of thefe engines, and which indeed it fcems difficult to account for-A corporal had the muzzle of his firelock clofed, and the barrel twifted like a French horn, by a hlell, withont any injury to his perfon. A hell happencd to fall into a tent where two foldiers were alleep, without awakening them by its fall. A ferjeant in an adjacent tent heard it, and ran near 40 yards to a place of fafety, when he recollected the fituation of his comrades. Thinking the thell had fallen blind, he returned and awakened them; both immediately rofe, but continued by the place, debating on the narrow efcape they had had, when the fhell exploded, and forced them with great violence againft a garden wall, but, " miraculoufly" did no further mifchief thas deftroying every thing in the tent. On the new year's day of 1772 , an oflicer of artillery obferved a flell falling towards the place where he ftood, and got behind a traverfe for proteclion. This be had farcely done, when the thell fell into the traverfe, and inftantly entangled him in the rubbifh: one of the guard, named Martin, obferving his diltref, generounly riked his own life in defence of his officer, and ran to extricate him: but fuding his own efforts ineffectual, called for afliftance; when another of the guard joining him, they relieved the officer from his fituation; and almoft at the fame inflant the fhell burft, and levelled the traverfe with the ground. Martin was aftervards promoted, and rewarded by the governor ; who at the fame time told him, that " he thould equally have noticed him for attending to his comrade." A fhell happening to t.tll into the room whare Enfign Mackenzie of the $73^{\mathrm{d}}$ regiment was fitting, carried away part of his chair, and fell into the room below, where it burf, lifting him and the chair from the floor without further injury.
 began to the imatiem at tiee whe wint ato in
 and the commander in chief wes Wrordit by foes tor, modert, when he fail that the E:-rika mifhe hath cut for a futhight. " It anfared how Cuptais Irinkwater! that the meant, 1 cwous to their fotal efforts, to trike if purible a terroe :la, emh their op ponents, by difplaying an :"mment more :"werful than had probatly ever been brousht betore amy forstrefs. Forty-feven fitil of the linc, inciuding thrice inferior two-deckers; ten hattering hirs, dumed perfect in defion, and eitecond invoncibe, carroing 212 guns; innamerable ficulics, sinqus, lamb' ketcher, cutters, gun ari t mortar heat, and to ther oftit for difembarking men, were afiemivkd in ine kny. On the latd fide were mol? utupendous and dren Soteries and work : muanting $2=0$ fiecos of hew ordamer, and protected by an ammo of thear 4 a.zeo men, cun, manded by a victorious and asfive getrexat, and anima ted ty the immediate preince of two pirices of the blood royal of France, with other dignitiod pertonaze, aul many of their own nobility. In their certainty of fuccefs, however, the enemy feemed catirely to have overlooked the nature of that force which was oppoied to them; for though the garriton farcely conSited of more than 7000 effective men, including the marine brigade, they forgot that they were now veterans in this fervice, had long been habituated to the cfiects of artillery, and were by degrees prepared for the arduous conflict that awaited them. We were at the lame time commanded by othicers of approved courage, prudence, and activity; eminent for all the accomplilaments of their profefion, and in whom we had unbounded confidence. Our fipirits two were not a little elevated by tl.e fuccels attending the firing of red-hot thot ( $C$ ), which in this attack we hoped would enable us to bring our labours to a conclufion, and relieve us from the tedious cruelty of a vexatious bluckade."

As a prelude to the dreadful form which was about to be poured forth on this devoted garrion, the enemy, on the $9^{\text {th }}$ of September 1782 , opened a battery of $6+$ of their largeft cannon, which was flortly accompanied with a terrible fire from other batterics, and a great number of mortars. Ont this and the following day an attack was made upon the batterics erected on Europa Point (fo called from lectur the moft fontherly point of the continent of Europe), which at that time were entircly under the management of Captain Curtis of the Brilliant frigat", who had diftinguited himfelf during the tiege, and now commanded a brigade of feamen by whom the !atherits *ere fersed. Py the fe the fire of the Spmiarts was is warmly returned, that they not only could make no impredo on, but wese firced to retire, after hasiog lecrived fo marh domate, that tho of their primeipal niops aere obsined to withdeaw to the bay of Algefiras oppotite to Gibraltar, in order to refit.  fave them very da،gerous.In ctaity
This terrible catatrophe took place in fight of the of the combinca fliet. combined tleets of France and Spain. It had been propofed that they floould co-operate upon this important occafion, by attacising the garrifon at Europa Point, and fuch places as appeared moit expofed to an attempt bv lea. This, it was afterwards faid, mult have occafioned a material diverion of the garrifon's force, and, by dividing it, have weakened confiderably the vigorous means of defence ufed in thofe parts which were actually attacked. The reafon alligned for this inactivity was the want of wind.
The bine.
Theugh this terrible repulfe effectually convinced kade conti- the Spaniards that Gibraltar could not be taken by nued. force, fome hope till remained, that, without any further exertions on their part, the garrifon would be obliged to furrender from want of ammunition and provifions. With this view they continued to blockade it clofly, and to cut off all communication, flattering themfelves that Brition would not be able to collect a naval force fufficient to drive their fleet from the bay before the fortrefs was reduced to extremity ; and this they imagined mut be the cafe in a few days. Sach diligence, however, had been ufed on the part of the Britih, that a fleet was already aflembled at Portfmouth, conditing of 35 fail of the line, in excellent condition, and filled with the beft officers and failors in Europe. The command was given to Lord Howe, who was accompanied in the expedition by Admirals Barrington, Milbank, Hood, Sir Richard Hughes, and Commodore Hotham, all of them men eminent in their profefion. At the fame time alfo it fortunately happened, that a large liritith fleet of merchantmen had juft arrived in fafety from the Baltic ; and that a Datch iquadron, which had been cruiling on their own coalts, rot being able to pene'rate fouthwards in order to join the French, had retiral into port, and given up the intention of ffecting any jumetion for that feafon.

At this time the Britilh nation was in the utmolt anxiety about the fate of Gibraltar. The progrefs of the fhips was delayed by contrary winds, and it was not until they had gained the fouthern coalt of Portugal that they received iniormation of the defeat of the enemy's attempt on the $13^{\text {th }}$ of September. On the wth of October Lord Howe entered the Straits, and feveral of the ftore flips deftined for Gibraltar came lafe to anchor under the cannon of the fort without any moleltation from the eneny. The combined fleet in the mean time had been much damaged by a florm; two flips of the line were driven alhore near Algefiras; two more were driven out of the bay into the Mediterranean; others loft their mafts, and mott of them fuffered confideribly. One in particular, a hip of 70 guns, was carried by the florm acrofs the bay, and ran aground under the works of Gibraltar, where the was taken by the garrifon, with her whole complement of men, confifting of 700 . Notwithlanding the endeavours of the enemy to deftroy her, the was lafely got off, and properly repaired. The combined tleet, however, put to faa on the 13 th, with a view to prevent the remaining forellips that had overfhot the bay to the eaft from making good their catrance into it ; and
at the face time to rejoin the two difps hast had been Gideatar. lepartted from the main body by the ftorm. Having tive advantage of the wind, they bore down upon the Etitith tlect, which drew up in order of battle to rerive them; but notwihatanding their fuperiority, $t$ ity declined coming to anengagement. O.t the wind becoming more favourable nest diy, Lord Fiswe took the opportuaity to bring in the ftorethips that were in company; and the day following the remainder were conveyed to Gibraltar, the troops for the reinforcement of the garifon were landed, wheh a large fupply of powder, and ample provinion in every other repect. As they returned through the Itraits they were threatened with an engagement by the combined fleets; but though the latter had a fuperiority of 12 thips of the line, they kept a wary dittance. Some firing indeed took place, but it was attended with little effect on either tide.

This latt relief proved entirely decifive; for though The garri the blockade continued till news arrived of the prelimi- ionfinaly naties of peace being figned, in the beginning of Fe - relieved. bruary 1783 , no other attack was made. The news of the pacification were received with the utmolt joy by the Spaniards. Mutual civilities paffed between the commanders in chief, and the Duke de Crillon pait many handiome compliments to the governor and garrifon for their noble defence; declaring that he had exerted himfelf to the utmon of his abilities, and though he had not proved fucceffful, yet he was happy in having his fovereign's approbation of his conluct.

The poffelion of Gibraltar is elteemed of very great Importance confequence to Britain. It not only gives us the com- of Gibralmand of the Straits, and their navigation; but affordstar. refrellement and accommodation to our fleets in time of war, and to our merchantmen at all times; which, to a maritime pown, is of very great advantage. From its fituation, it divides both the kingdoms of France and Spain; that is, it hinders a ready communication by fed between the different parts of thefe kingdoms. This, of courfe, hinders the conjunction of their fleets and fquadrons with each other, or at lealt renders it fo difficult as to be a perpetual check upon thefe ambitious powers. It awes alio the piratical ftates of Barbary, and in like manner the emperor of Morocco; infumuch, that our conmerce is more fafe than that of any other Enopean power, which gives us great advantages in point of freight. It is otherwife highly favourable to our trade in the Mediterranean and Levant. It procures us the refpect of the lian lian and other powers; who, though far ditant from Britain, mult confider this as an inftance of her posser to hust or affilt them. It alfo faves us the expence of fquad rons or convoys, upon any difputes or diifu:bances that may happen among thefe power, and which would otherwife be necellaty for the protection of our navigation.
" The form of this mountain is (feys Major Imric) oblong ; its fummit a fharp craggy ridge; its direction is nearly from north to fouth; and its greatelt length, in that dircetion, falls very little fhort of three miles. Its bieadth varics with the indentations of the fhore, but it nowhere exceeds three quarters of a mile. The line of its ridge is undulated, and the two extremes are fomewhat higher than its centre.
" The fummit of the Sugar Loaf, which is the point Natural

## $\mathrm{G} \mathbf{I} \mathrm{B} \quad\left[\begin{array}{lll}75\end{array} \quad\right.$ G I B

Gibrabar. of its greatelt eleration towards the fouth, is $1+39$ feet ; the Rock Mortar, which is the highelt point to the noath, is 1350 ; and the Signal Houle, which is nearly the central point between thele two, is 1276 fee: abo:e the level of the fea. The weftern fide of the mountain is a leries of rugged flopes, interfperfed with abrupt precipices. Its northern extremity is perfectly perpendicular, except towards the nurth-well, where what are called the Lincs intervene, and a narfow patage of that ground that deads to the i:thmus, and is cntirely covered with fortitication. The eaftern lide of the mountain moftly confifts of a range ot precipices ; but a band: of land, rifing from the Mediterranean in a rapid acelisity, cuvers a third of its perpendicular height. Its funthern extremity falls, in a rapid tlope from the fumnit of the Sugar Loaf, into a rocky flat of confiderable extent, called Windmill Hill.

* The principal mafs of the mountain rock confits of a gray, denfe (what is generally calied primary) matWie ; the different beds of which are to be examined in a face of 1350 feet of perpesdicu'ar height, which it prefents to Spain in a conical form. Thefe beds, or itrata, are of various thicline's, from 20 to upwards of 40 feet, dipping in a direction from ealt to weft, nearly at an angle of 35 degrees. In fome parts of the folid mals of this rock are found teftaceous bodies entirely tranfmuted into the contituent matter of the rock, and their interior hollows filled up with calcareous fpar ; but thefe do not occur often in its compofition, and its beds wre not feparated by any intermediate frata.
" The caves of Gibraltar are many, and fome of them of great extent. That which moft deferves attention and examination is called St Michael's Cave, which is fituated upon the fouthern part of the mountain, almol equally ditant from the Signal Tower and the Sugar Loaf. Its entrance is 1000 fect above the level of the fea: This entrance is formed by a rapid llope of earth, which has fallen into it at various periods, and which leads to a facious hall, incruted with fpar, and apparently fupported in the centre by a large mally italuctitical pillar. To this fucceeds a long fcries of caves of dificu!t accefs. In thefe cavernous receffes, the formation and procefs of ftalactites is to be traced, from the dimfy quilt-like cone, fufpended from the roof, to the robult trunk of a pillar, three feet in diameter, which rifes from the floor, and feems intended by Nature to fupport the roof from which it originated.
"The only inhabitants of thefe caves are bats, fome of which are of a large fize. The foil, in general, upon the mountain of Gibraltar is but thinly fown; and in many parts that thin covering has been wathed off by the heavy autumnal rains, which have left the fuperficies of the rock, for a confiderable extent, bare and open to infpection. In thofe fituations, an o'ferving eye may trace the effects of the ilow, but conftant, decompofition of the rock, caufed by its expofure to the cir, and the corrofion of fea-falts, which, in the heavy gales of eafterly wind:, are deponted with the fpray on every part of the mountain. Thole uncovered pants of the mountain rock alfo expofe to the eye a phenomenon worthy of fome attention, as it tends clearly to demonIrrate, that, however high the furface of this rock maty now be elevated above the level of the fea, it has once been the bed of agitated waters. This phemomenon is is Le obfer"ed in many parts of the rock, and is com-
nantly fo.an.. it the lis do of torrente. It confen of fot- c hinc hoics, of various izes, bollowed oat ot :! folit rock, s.ad formed apparently by the attrition of erravel or peblice, fet in motion by the rapidiey of rivers or currents in the lea.
" Upon the weft fide of the mountain, towards it, bale, fome flrata occur, which are heterogeneal to the mountain rack : the firlt, or higheit, ioums the fis zmeat of a circ!e ; its convex fide is towards the mountain, and it hopes alfo in that direction. This ithatum cu:fills et a nomber of thin buts; the uatward onc, ving. the thinnelt, is in a thate of decompuftion, and is muldering down into a blachith brown of ferruginous coluare carth. The beds, inferior to this, progreflively iacrafe in breadth to 17 inches, where the ilratification reft, upon a rock of an argillaceous nature.
" This lat bed, which is $1 \%$ inc!es thick, conifts of quartz of a blackilh blue colour, in the lepta or cracks of which are found fine quart $\angle$ cryalals, colourlefs, and perfectly tranfparent. Thele cryitals are compoled of 15 planes, difpofed in hexangular columns, terminated at both extremities by hexangular pyramids. The targett of thofe that Majur Imile faw did not exceed one fourth of an inch in length: They, in general, adhere to the rock by the dides of the column, but ate detached without dificulty. Their great degree of tromparency has obtained them the name of Gilratar diamonds."
"In the perpendicular finures of the rock, and in fome Boncstoun? of the caverns of the monatain (all of which afford evi- in fillures $0:$ dent proofs of their former communication with the the rock furface), a calcareous concretion is found, of a reddih bronn ferruginous colour, with an earthy fracture, and confiderable induration, incloing the bones of various arimals, fome of which have the appearance of being haman. Thefe bo:aes are of various fizes, and lic in all directions, intermixed with thells of frails, fragments of the calcareous rock, and particles of fpar ; all of which materials are itill to be feen in their ntural uncombined fiates, partially fcattered over the furface of the mountain. Theie have been fwept, by heavy rains at different periods, from the furtace into the fituations above defcribed, and having remained for a long feries of years in thote places of rett, expoled to the pemmeating action of water, have become enveluped in, and cemented by, the calcareous matter which it depolits.
"The bones, in this compofition, have not the fimallef? appearance of being petrifed; and if they hase undergone any change, it is mure like that of calcimation than that of petrifaction, as the moit folid pats of them $\mathrm{ge}-$ nerally admit of being cut and fraped cown with the fame cafe as chalk.
"Bones combined in fuch concretions are not peculiar to Gibraltar: they are found in fuch large quantities in the country of Dalmatia and upon its coats, in the inlands of Cherio and Ofero, that fome naturalits have been induced to go lo far as to affert, that there ha, been a regular ilratiom of iuch matier in that country, and that its pretent broken and internupted appearance has been cauled by earthruahes, or other convulfons, experienced in that part of the globe. Bat, of late years, a traveller (Able Alucro lortis) has given a minute delcription of the concretion in which the bones are found in that country: And by his account it appeate, that with regard to lituation, compolition, and

## $\mathrm{G} 1 \mathrm{~B} \quad[716] \quad \mathrm{G} \quad \mathrm{I}$ B

G acitar. colotr, it is pefectly fimilar to that found at Gibraltar. By his defcription, it alfo appears that the two momtan iocks of Gibraltar and Dalmatia confift of the fame 1 ecies of calcareous ftone; from which it is to be prefursed, that the concretions in both have been formed in the fame manner and about the fame periods.
"Perbaps if the mifires and caves of the rocks of Dalmatia were fill more minutely examined, their former communications with the furface might yet be traced as in thole deferibed above; and, in that cafe, thene would be at leait a flrong probability, that the materials of the concretions of that country have been brought togetlier by the fame accidental caule which has prohably collecled thofe found in the caverns of Gibraltar. Majer Imric traced, in Gibraltar, this concretion, from the lowell part of a deep perpendicular fiffure, up to the furface of the mountain. As, it approached to the furface, the concretion became lefs firmly combined, and, when it had no covering of the calcareous rock, a imall degree of adhetion only remained, which was evidently produced by the argillaceous eartl, in its compofition, havints been moitened by rain and baked by the tire.
" I he depth at which thefe materials had been penetrated by that proportion of italactitical matter, capable of giving to the concretion its greatel adhelion and for lidity, be found to vary according io its fituation, and to the quantity of matter to be combined. In fillures, narrors and contracied, he found the concretion poitelling a great degree of hardnefs at fix fect from the furface; but in other lituations, more extended, and where a larger quantity of the materials had been accumulated, he found it hed not gained its greatef degree of adhefion at double that depth. In one of the caves, where the mafs of concretion is of confiderable fize, he perceived it to be divided into different beds, each bed being covered with a cruft of the falactitical fpar, from one inch to an inch and a half in thicknefs, which feems to indicate, that the materials have been carried in at various periods, and that thofe periods have been very remote from each other.
" At Rofia bay, upon the weft fide of Gibraltar, this soncretion is found in what has evidently been a cavern, originally formed by huge unfhapely malles of the rock which have tumbled in together. The fiflure, or caUurn, formed by the difruption and fubfidence of thofe maffes, has been entirely filled up with the concretion, and is now expofed to full view by the outward mafs having dropped down in conlequence of the encroachments of the fea. It is to this fipot that ftrangers are generally led to examine the phenomenon; and the compolition, having here attained to its greatelt degree of hardnefs and folidity, the balty obferver, feeing the bones inclofed in what has fo little the appearance of having been a vacuity, examines no further, but immediately adopts the idea of their being incafed in the folid rock. The commmication from this former chafm, to the furface from which it has received the materials of the concretion, is ftill to be traced in the face of the rock, but its opening is at prefent covered by the bafe of the line wall of the garrifon. Here bones are found that are apparently human; and thofe of them that appear to be of the legs, arms, and vertebra of the back, are icattered among others of various kinds and fizes, even down to the frnalleft bones of imall birds. Major

Imrie found here the complete jaw-Lone of a fheep; it Gibraltar. contained its full complement of teeth, the enamel of which was perfect, and its whitenefs and luftre in no degree impaired. In the hollow parts of fome of the large bones was contained a minute cryflallization of pure and colourlefs calcareous ipar ; but, in moft, the interior part confified of a fparry cruil of a redouth colour, farcely in any degree traniparent.
"At the northern extremity of the mountain, the concretion is generally found in perpendicular fiffures. The miners there employed upon the sortifications, in excalating one of thole fillures, found, at a great depth from the furface, two ikulls, which were fuppofed to be human; but, to the Major, one of them, it not both, appeared to be too finall for the human ipecies. The bone of each was perfectly firm and folid; from which it is to be piefumed, that they were in a itate of maturity before they were inclofed in the concretion. Had they appertained to very young children, perhaps the bone would have becn more porous, and of a lets firm texture. 'The probability is, that they belonged to a fpecies of monkey, which thill continues to inhabit, in confiderable numbers, thofe parts of the rock which are to ns inacceffible.
"This concretion varies, in its compofition, according to the fituation in which it is found. At the extremity of Prince's Lines, high in the rock which looks towards Spain, it is found to confift only of a reddifh calcateons earth, and the bones of fmall birds cemented thereby. The rock around this fpot is inhabited by a number of bawks, that, in the breeding feafon, neille here and rear their young: the bones in this concretion are prohably the remains of the food of thote birds. At the bafe of the rock, below King's Lines, the concretion confilts of pebbles of the prevaling calcareous rock. In this concretion, at a very coniderable depth under the furface, was found the under parts of a glafs * Phit. bottle, uncommonly fhaped, and of great thicknefs; Tranf.Edim the colour of the glafs was of a dark green**"
"The fubterraneous galleries are very extenfive, subterrane. pierce the rock in feveral places and in various dirce- Ms gathetionc, and at various degrees of elevation; all of them ${ }^{1 i e s}$. have a communication with each other, either by flights of fteps cut in the rock, or by wooden ftairs where the paflages are required to be very perpendicular.
"The centinels may now be relieved during a fiege from one poit to another in perfect fafety; whereas, previoully to the conflructing of thefe gelleries a valt number of men were killed by the Spaniards while march. ing to their feveral ftations. The width of the le $g: 1-$ leries is about twelve feet, their height about foutten. The rock is broken through in various places, both for the purpofe giving light and for placing the guns to bear on the enemy. In different parts there are fipacious receifes, capable of accommodating a confideralle number of men. To thefe recelles they give names, fuch as St Patrick's Chamber, St George's Hall, \&c. The whole of thefe fingular ilructures have been formed out of the folid rock by blalting with gunpowder. Through the politenefs of an officer on duty, a place called Smart's Refervoir was opened for our infpeclion, which is a great curiofity, and not generally permitted to be flewn. It is a firing at a confiderable depth in the body of the rock, and is above 700 feet above the level of the fea; we defcended into the cavern that con-

## G I B $\quad\left[\begin{array}{lll}717\end{array}\right] \quad \mathrm{G}$ I B

 15 upwarde of ach huted feet i: le:sh, it heighe nearis the fon.e. It is formed in a temicircular part of the ruch: ifacious apertures are broken throush, where cull umb of a very darze calibre command the illhmus, the sanith lines, and a great part of the bay. The top of the rock is pierced through, i, as to introduce futtiont light to enable you to sie:- every part of it. It appers almolt incredivle that fo large an excusation could be formed by gu powder, without blowing up the whole of that patt of the rock, and till more fo, that they thould be able to direct the ope-ations of fuch an inftrument, fo as to render it fur fervient to the purpofe of elegance. We found in the hall a table, placed, I funpufe, for the conveniency of thele : ho are traverfing the rock. The cloth was fpread, the wine went round, and we made the vaulted root refound with

* Montb. the accents of misth and the fong, of conviviality *."

Nug ${ }^{279}$ s. GIBSON, Richakd, an Erglith painter, commonly called the $D$ warf, was originally page to a lady at Mortlake; who, obferving that his genius led him to painting, had the generolity to get him infructed in the rudiments of that art. He devoted himfe.f to Sir Peter Lely's manner, and cozied his pitures to admiration, efuecially his portraits: his paintin; in water colours were alio efteemed. He was in great farour with Charles I. whomade him his pare of the back Itairs; and he had the honour to inftuct in drawing Queen Mary and Qusen Aune when they were princelies. He marsied one Mrs Anne Shemherd, who was alfo a dwarf; on which occanion King Chatles I. konoured their marriare "i:h his prefence, and gave away the Wrise. Mr Waller wrote a puem on thi occanion, entitled "I he Marriage of the Diarto;" in which are the lines:

Defign or change makes chese wive,
But noture did this match cur.trive;
Eve might as well have iJm tied,
As the deny' 1 ber little bed
To him or thom leav'n foem'd to frame
And meature out this only darme."
Mr Ferton, is his notes on this poem, obferves that t.e had leen this couple painted by Sir Petur Lely; and that they were of an ergual itature, earh being tliree fect ten inches high. They had nime children, five of whom arrived at maturity; thefe were well propertioned, and of the ufual itandard of mankind. In: shat nature denied this couple in fiature, the gave then in length of days: for Mr Gibion died in the 7 ith year of his age; and his wife, having furvived him a!mont 20 years, died in 1709 , aged $X_{0}$.

 bithop Temion dying in 171 and Dr Wacke binopos: Linculn bsing made archbilhop of Canterbury, Dr Gibin fucceeded the latter in the lice of Lincom, itad is 1722 was promoted to the buhorick of Lowlon. He now not only governed his divele with the mote ex....t regularity, but ly his gieat care promoted the foirituat affairs of the choch of England colonies in the Wit ludies. He was extremely jealous of the leaft of the privileges belonsing to the charch; and therefore, though he approved of the toleration of the Proteitant Difenter, he continually guarded againft all the attempts made to proure a repral of the corporation and teft actr; in purticular, his oppofition to thofe li centicus aflemblies called mafquerades, gave great umbrage at court, and effectually excluded him from a!l furtber favours. He fpent the latter part of his life in writing and printing pattoral letters, vilitationclarges, occafional fermons, and tracts asainit the prevailing immoralities of the age. His patoral letters are juily eftecmed as the mot matherly productions againi intidelity and enthuliafm. His moft celcorated wo:h, the Coter, has been already mentioned. His other publications are, I. An cation of Drummond', Phemo-Midünia, and James V. of Scotianl's Can. thiena Rulitia, with notes, 2. The Chrmionn Saveitciom, with a Latin tranllution, and notcs, 3. Ke:quace Spelmanmiance, the pothumous worhs of its Henry Spelman, relating to the laws and antiquitic of Encland. 4. An edition of guntilian de Ala Oratoria, with notes. 5. An Englah tranflution of Camden's Bruannia, with additions, two wolunies folio: and, 6. A number of fmall picees, that have been collected together and printed in three volumes folio.His intenfic application to ftudy impaired his health; notwithlanding which, he attaned the age of 79. H1: expired in September $174^{8}$, atter an epifconate of ne:s 33 years. With regard to Bihhop Gibfon's private lite and chartcter, he was in every refpect a perfect conomitt. Ilis abilitics were fo well adapted to dni harge the dutics of his facsed function, that durin!s the it. capacity of Archbithop Wake, the tanfaction of ece clefiatical affairs was committed to the bithop of Londou. He was a truc friend to the ellablimed chatrch and government, and as great an enemy to perfecution. He was uffally confulted by the moft learned and exilted perfonages in church and ftate, ind the greateit deference was paid to his judgrment. H: poffefled the focial virtues in an emiment degree; beseficence was very extenlive; and he bad luch ges

## G I G $\left[\begin{array}{lll}718 & \text { G }\end{array}\right] \quad$ G I L

Gideon ronly, that he f.ecly gave two thonkind five hundred pounds, left him by Dr Crow, who was once his chapLinn, to Crow's own relations, who were very poor.

GIDEON the fon of Joni, of the tribe of Man aifeh. He dwelt ia the city of Ophralı; and had a very extraordinary call to deliver the Irraelites from the opprellion of the Midianites, to which they had become fubje th atier the death of Barak and Deborah. Having effected their deliverance by fupernatural aid, he was chofen judge of Ifrael in the year of the world 2759 , and died in 2763. (See Judges, chap. vi. vii. and viii.)

GIFT, Donum, in Law, is a conveyance which paffeth either lands or goods; and is of a larger extent than a grant, being applied to things noveable and immoveable; yet as to things immoreable, when taken ftrictly, it is applicable only to lands and tenements given in tail ; but gift and gtant are too often confounded.

New Tear's Gifts, prefent' made on new year's dav, as a token of the giver's good will, as well as by way of prefage of a happy year.

This practice is very ancient, the origin of it among the Romans being referred to Tatius king of the Sabines, who reigned at Rome conjointly with Romulus, and who having confidered as a goud omen a prefent of fome fprigs of verrain gathered in a wood confecrated to Strenia the goddefs of Arength, which he received on the firt day of the new year, authorized this cuftom afterwards, and gave to thefe prefents the name of Strenre. However this may be, the Romans on that day celebrated a feltival in honour of Janus, and paid their refpects at the fame time to Juno; but they did not pafs it in idlenefs, left they floould become indolent during the relt of the year. They fent prefents to one another of figs, dates, honey, \&c. to fhow their friends that they wilhed them a happy and agreeable life. Clients, that is to fay, thofe who were under the protection of the great, carried prefents of this kind to their patrons, adding to them a fmall piece of filver. Under Auguftus, the fenate, the l:nights, and the people, prefented fuch gifts to him, and in his abfence depofited them in the Capitol. Of the fucceeding princes fome adopted this curtom, and others abolihed it, but it always continued among the people. The early Clriftians condemned it, becaufe it appeared to be a relick of Paganifm, and a fpecies of fuperftition; but when it began to have no other object than that of being a mark of veneration and efteem, the church ceafed to difapprove of it.
gigG, Giga, or Jig, in Mufic and Dancing, a gay, brik, fprightly compofition, and yet in full meafure, as well as the allemand, which is more ferious. Menage takes the word to arife from the Italian siga, a mulical inftrument mentioned by Dante. Others fuppofe it to be derived from the Teutonic gicg, or ghitishe, " a fiddle." This is a favourite air in moft nations of Europe: its characteriftic is duple time, marked $\frac{6}{5}$, or $\frac{1^{2}}{6}$ : it confifts of two firains, without any determinate number of bars.

GIGGLEWICK, a town in the weft riding of Yorhihire, lalf a mile from Settle, ftands on the river Ribble; where, at the foot of a mountain, is a fpring, the mott noted in England fur ebhing and flowing fometises thice in an hour, and the water fubfides
three quarters of a yard at the reflux, though the foa is 30 miles off. At this town is an erminent free grammar fchool; and in thie neighbourhood are dug up flags, flate, and fture.

G!HON, in Anciant Geggraphy, one of the :ivers of Paradile; according to Wells, the eaftern branch of the Euphrates, into which it divides after its conjunction with the Tigris.

GiLAN, or Ghilan, a confiderable province of Perfis, on the fide of the Calpian lea, to the fouthweit. It is fuppofed to be the Hyrcania of the ancients. It is very agreeably fituated, having the fea on one fide and bigh mountains on the other ; ar.d there is no entering in but through narrow pafles, which may eatily be defended. The fides of the mountains are covered with many forts of fruit trees, and in the bighent parts of them there are deer, bears, wolves, leopards, and tygers; which laft the Perfians have a method of taming, and hunt with them as we do with dogs. Gilan is one of the moft fruitful provinces of Peifia, and produces abundance of filk, oil, wine, rice, and tobacco, befides cxcellent fruis. The inhabitants are brave, and of a better complexion than the other Indians, and the women are accounted extremely handiome. Refht is the capital town.

GILBERT, or Gilrerd, IT:liam, a phyfician, was born at Colchefter in the year. 1540 , the eldeff fon of the recorder of that borough. Having fpent fome time in both univerfities, he went abroad; and at his return fettled in London, where he practifed with confiderable reputation. He became a member of the College of Phylicians, and phyfician in ordinary to Queen Elizabth, who, we are told, gave him a perfien to encourage him in his ftudies. Irom his epitaph it appears that he was alfo phyfician to King James I. He died in the year 1603 , aged 63 ; and was turied in Trinity church in Colchelter, where a handfome monument was erected to his memory. His books, globes, inftruments, and foffils, he bequeathed to the College of Plyficians, and his picture to the fchool gallery at Onford. He wrote, r. De Magnete, magncticifque corporibus, at de magno magnete tellure, physiologia nova; London 1600, folio. 2. De murdo nofiro fublunari philofophia nosa: Amfterdam 1651 , 4to. He was alfo the inventor of two mathematical inftruments for finding the latitude at fea without the help of fun, moon, or fars. A defcription of thefe inftruments was afterwards publifhed by Thomas Blondeville in his Theoriques of the Plancts.

Gilbert, Sir Humplircy, a brave officer and tkilful navigator, was born about the year 1539 , in Devonhlire, of an ancient and honouratle family. Though a fecond fon, he inlerited a cotfiderable fortune from his father. He was educated at Eton, and afterwards at Oxford; where probably be did not continue long. It feem, he was intended to finith his fludies in the Temple; but teing introcuced at court by his aunt Mrs Catharine Athle $\mathbf{y}$, then in the queen's fervice, he "as diverted from the ftudy of law, and commenced foldier. Having diltinguibhed himfelf in feveral military expeditions. particularly that to Newhaven in 1563, he was fent over to Ireland to afint in fupprefling a rebellion; where, for his fignal ferrices, he was made commender in chicf and gover-

 a fiuadro: of nine :lips to reinforce Colum 1 Mrann, who at that time mefitated the recuvery of Fiulhing. I'robably on his rearn to Linglatid he refumed his comogratical fadier, to uhich he was naturally inlined: for, in the your 15 , on the nothowet paniae to the Lat hadio; and is Mutio Frutar ar hizd the Gme err, probabiy it was in conicuance oì this theatile. In 15\%8, he obtaned from the çucen a very amy le pareat, empoweing hia t.) diffover and pofie.e. in North America any lands then unketted. He faiken to Nestomdhand, but foon returned to Lazlind without fuccef; meverthelef, in 1533. he embarked a fecond time with five thips, the largett of which put back on account of a contagious ditember oa board. Ous genera? landed oa Newfoundland on the third of Augull, and on the fifin took polfellion of the harbour of St John's. By virtue of his patent, he granted leafes to feveral people; but thouch none of them remained there at that time, thiey fetied aiterwards in contempence of thefe leales; fo that Sir Humphry deferves to be remembered as the real founder of the valt American empire. On the 2oth of Augut he put to fea again, on board a fmall floop; which on the 20 h foundered in a hard gale of wind. Thus peritad Sir Humphey Gilbert; a man of quick part, a brave iodier, a good mathematician, a Ikiltol navigator, and of a very eaterprifing genius. We learn alio, that he was remarkable for his eloquence, being nuch almired for his patriotic freeches both in the Englihh aid 1ith parliamerts. He wrote" A difcourle to prove a pallage by the northweft t) Cathaia and the Eat Indies, printed Londun 15,6 ." This treatie, which is a matterlv performance, is preterved in Hakluyt's Collection of Vovazes, vol. iii. p. tr. The fitle is fuperior to moft, if not to all, the writers of that age; and hows the author to have teen a mas of coniderable reading. He mentions, :t the clofe of thi work, another treatife on navigation, which he inte:ded to publih : it is probably fort.

GILEERTINES, an order of religions, thus called fre:n St Gilloest if Sempringham, in the county of Lincols, wh., founted the fame about the year $114^{9}$ : the motik: of which obferved the rule of St Auguftine ; and were accountelit canoms: and the nuns that of it Fenedict.

The founder of this order ereited a double monntere, or rather two difice. : once, cuntiguous to each other, the one for taen, the cther for women, but parted by a very high wail.

St Gilbert himelf Eunded 13 monafteries of this ories, viz. four tor men alone, and nine for men and woren together, which hed in them 700 brethren end 1500 fifters. At the diflutution there were about 25 hufes of this order in England and Wales.

GILSOA, in Aincent Gcography, mountains of Samaria, freching cut from welt to eaft, on the confines of the half tribe cf Manalith, and of the tribe of Iflachar. and to the fouth paat of the valley of Jzreel; befimin $r$ weflward at the city of Jezreel, fituated at the funt of thefe mourtaia, teaching illonft quite to the Jor-

Falfe gilding with la. quer or Dutch leaf.
though it never arrived anong them at the perfection to which the moderns have carried it. Hliny altures us, that the firf gilding feen at Rome was after the dettuction of Carthage, under the cenforfhip of Lucius Munmius, when they began to gild the ceilings of their temples and palaces; the Capitol being the fint place on which this enrichment was beftowed. But he adds, that luxury advanced on them fo hattily, that in a littie time you might fee all, even private and poor perfons, gild the very walls, vaults, \&c. of their houfes.

We need not doubt but they had the fame method with us, of beating gold, and reducing it into leaves; though it fhould feem they did not carry it to the fame height, if it be true which Pliny relates, that they only made 750 leaves of four fingers fquare out of a whole ounce. Indeed he adds, that they could make more; that the thickeft were called bracte:e Praneflina, by reafon of a ftatue of the goddefs Fortune at Prænefte gilt with fuch leaves; and that the thinner fort was called bractece quefloria.

The modern gilders do alfo make ufe of gold leaves of divers thicknefles; but there are fome fo fine, that a thouland do not weigh above four or five drachms. The thickeft are ufed for gilding on iron and other metals; and the thinneit on wood. But we have another advantage over the ancients in the manner of ufing or applying the gold : the fecret of painting in cil, difcovered of late ages, furnifhes us with means of gilding works that fhall endure all the injuries of time and weather, which to the ancients was imrraaticable. They had no way to ley the gold on bodies that vould not endure the fire but with whites of eggs or fize, neither of which will endure the water; fo that they could only gild fuch places as were fheltered from the mointure of the weather.

The Greeks called the compofition on which they applied their gilding on wood leucophacum or leucophorum; which is defcribed as a fort of glutinous compuund earth, ferving in all probability to make the gold tick and bear polithing. But the particulars of this earth, its colour, ingredients, \&ic. the antiquaries and naturalifts are not agreed upon.

The luitre and beauty of gold have occafioned feveral inquiries and difcoveries concerning the different mothods of applying it to difierent fubitances. Hence the art of gilding is very extenfive, and contains many particular operations and various management.

A colour of gold is given by painting and by varnifhes, without employing gold ; but this is a falle kind of gilding. Thus a very fine golden colour is given gold-coloured varnith, which, being tranfyarent, thows all the brilliancy of the metals beneath. Many ormaments of brafs were varnilhed in this manner, which is called gold laquering, to diltinguith them from thofe which are really gilt. Silver leaves thus varnilhed are
put upon leather, which is then called gilt lather. See Gilding. Laguer.

Amongt the falfe gilding may alfo be reckoned thofe which are made with thin leaves of cupper ur brafs, called Dutch liaf. In this manner are made all the kinds of what is called gilt paper.

In the true gilding, gold is applied to the furface of bodics. The gold intended for this purpole ought in general to be beat into thin leaves, or uthcrwife divided into very fine parts.

As metals cannot adhere well merely by contact to Gilding any but to other metallic fubfances, when gold is to with fize, be applied to the furface of lome unmetallic body, that furface mult be previoully covered with fome gluey and tenacious fubllance by which the gold ttall be made to athere. Thefe fubltances are in general called fises Some of thefe are made of vegetable and animal glues, and others of oily, gluey, and drying matters. Upon them the leaves of gold are applied, and preffed down with a little cotton or a hare's foot; and when the uhole is dry, the work is to be finihed and polihed with a hard initrument, called a dog's tooth, to give luftre.

When the work is required to be capable of refift. With ${ }^{5}$ oit ing rain or moifture, it ought to be previoully covered with a compofition of drying oil and yellow ochre ground together ; otherwife a water fize may be ufed, which is prepared by boiling cuttings of parchment or white leather in water, and by mixing with this fome chalk or whiting: feveral layers of this ine mult be laid upon the wood, and over thefe a layer of the fame fize mixed with yellow ochre. Lattly, Another mixture, called gold fize, is to be applied above thefe; upon which the gold leaves are to be fixed. This gold fize, the ufe of which is to make the gold leaf capable of being burnihed, is compofed of tobacco-pipe clay, ground with fome ruddle or black lead, and tempered with a little tallow or oil of olives. The edges of glafles may be gilt by applying firt a very thin coat of varnith, upon which the gold leaf is tu be fixed; and when the varnilh is hardened, may be burnifed. I his varnim is prepared by boiling powdered amber with linfeed oil in a brafs veffel to which a valve is fitted, and by diluting the above folution with four or five times its quantity of oil of turpentine; and that it may dry fooner, it n:ay be ground with fome white lead.

The method of applying gold upon metals is entirely different. The furface of the metal to be gilt is firft to be cleaned; and then leaves are to be applied to it, which, by means of rubbing with a polifhed bloodflone, and a certain degree of heat, are made to adhere perfectly well. In this manner filver leaf is fixed and burnithed upon brafs in the making of what is called French plate, and fometimes alfo gold leaf is burnifhed upon copper and upon iron.

Gold is applied to metals in feveral other ways. One of thefe is by previoufly forming the gold into a pafle or amalgam with mercury. In order to obtain a fmall amalgam of gold and mercury, the gold is firft to be reduced into thin plates or grains, which are heated red hut, and thrown into mercury previoufly heated, till it begins to fmoke. Upon ftirring the metcury with an iron rod, the gold totally difappears. The proportion of mercury to gold is generally as fix or eight to one.

## G I L $\left[\begin{array}{lll}721\end{array}\right] \quad$ G I L

C........ Winh this andgan the furface of the metal to be gided is to be covered; then a fullicient heat is to he aprlied to eworate the mercury : and the gold is latily to be bumnied with a blood ilone.

This method of gilling ly atmalyation is chietly ufe 1 for ciluing copper, or alloy of copper, with a fratl portion of zinc, which more rendily receives the amalsam ; and is affo preferable fur its colour, which more refembles that of gold thai the colour of cop. per. When the metal to be gilt is wrought or chaled, it -ught to be previoutly covered with quichinver betore the amolgom is applid, that this may be eafier fpread: but when the Curface of the metal is flain, the amaigam may be applied disectly to it. Ih quich:ilver or amalgam is made to adhere to the metal by means of a little aquafortis, which is ralbed on the motallic lurtace at the fame time, by which this furface is cleanled from any ruft or tarninh which might prevent the union or adhefion of the metals. But the ufe of the nitrous acid in this operation is not, as is generally fuppoied, contined merely to cleanfe the furface of the mutal to be gilt from any rult or tarninh it may have acquired; but it allo greatly facilitates the application of the amakatn to the furface of thit metal, probably in the folwwing manner: I: frrt chitolves patt of the morcury of the copper, this latter metal having a flroncer thuity for nitrous acid than the mercury has, preciptates the mencury upon its furface, in the fame manaer as a polifhed pitce of iron precipitates copper upon its furface from a fulution of blue vituiol. When the metal to be gilt is thus covered over with a this frecipitated coat of mercury, it reathy receives the amalgam. In this folution and precipitation of merLury, the principal ufe of the nitrous acid in the procet's of ilding appears to confit. The amalgam bcing equally frread over the forface of the me:al to be cilt by mean; of a bruth, the mercury is then to be vaperated by a heat juft furticient for that purpofe ; for if it be too great. part of the gold may alfo be exrelled, and nart of it aill run together, and leave fome if the fafface of the metal bare: while the mercury is evomratin, the fiece is to be from time to time wher fom the fre, that it mas be exumined, that the amslam may be pread more equally by means of a bruha, that any decerive patte of it may be again covered, and that the heat may not be too ficidenly anphed to it: $w$ hon the meacury is evaporited, which is hnown by the furfere being entirely become of a dull sellow colcur, the metal nuft thet undergo other opeationc, by which the tine grold colour iv given to it. Firf, The gitded pire e tmetal is rubhed with a foratch bruin (whith is a brath compofed of brafswire) till it furface is nade fme th; then it is covered over with a complition called rilding wes, and is again expofed to the wre till the wax be kurnt off. Ihis rax is compoted of bees wax, fomctines mixed with fome of the following fubitances; red achre, verdisrie, copwer fcalcs, alum, viriol, boras. bat according to Dr Lew: the falme fubfances a'one are fufficient, withut any wax. By this operation the colour of the gilditg is heightened; and this efeet leem to be produced by a periect difination of tome m. rcury remaining ater the former operation. This difl ation is well etscecd by this equable application of leaz the gilt צ'ヶ. IX. 1'art II.

Iron cannot be silt by amal aration, unler, as it is fad, it be previunly coated whin copper by denine in a folution of the vitrial. Iron may aim recene a solden coat from a laturated bolution of no d in aquasregia, mised with if irit of winc, the iron havig a greater afnity with the arit, from which it therefore precipitates the sold. Whether any of the two methods be applicable to wie, is uncertain: but the methou' come monly employd of fixing gold upon iton is that a. bove mentioned, of burniling gold leaf unon this metal when heated fo as to become blue; and the neration will be more ferfect if the furfice has bacti precvoully feratcised or graved.

Another method in mentioned by authors of vilding upon mactale, and alfo upon earthen ware, fom! apon glafe; which i, to fufe gold with regulus ui antimony, to pulverize the mufs vhich is futhriently batthe to admit that operation, to fread this poné= uno:s the piece to be gilt, ind expofe it to fuch a tire that the regulus may be exaporated, while the gold remains fired. The inconveniences of this method, according to Dr Lewic, are, th the powler does not adhere to the piecs, and cannot be cqually :poad; that part of the yrdi in dimpated amon whith the regulus; that glafs is falble with tie lieat neceliary for the canporation of regulas of antimony, and that coprer is liable to be corroded by the regulus, and to have its furface rendered uneren.
On this fabect of ailling by amalgamation Dr Lewis Lupuse has the following renamis. "There ate two princi al wen a
 men are expolid to the funco of the nerc...ry, ..nl gee erally, foner or later, have their health greatly in paired by them. the aler, the lof of the merculy; for though part of it is had to be detanced in caviric made in the chim ey is that purpole, yet the greatent part of is is 16.f. Cion fome triats I have made, it apmeared that buth thefe inconveniences, partic alarly the firlt and molt confiderable one, might in good meafure be awoided, by neans of a furnace of a due contructio:. If H.e con munication of a turnace a..h it chmesy, inItead of being ouer the fire, is made under the grate, the allapit doon, of other apertures bentath the grate, Cufe , at l the reath of the fornare let open; the cuncnt of air, which wile wowlishe enter the$4 Y^{r}$ neatu,

If fuch a furnace is made of frone forgel (nut milled: irun plate, it will be futiciently dutable: the upher end of the chimaey may each above of foot and a balf higher than the level of the fire : uver this is to be placed a lurger tube, leaving an interval of an inch or more all round between it and the chimney, and reaching to the height of 10 or 12 fect, the hifher the better. The external air, affing up between the chimnes and the outer jipe, revents the latter fom leing mab heated, fo that the hercuial fumes will condeace agrinit its fides into running quikWher, with, falling down to the botom, is there catched in a hollo: rm , formed by turning inwards a portion of the lower part, and conveyed, by a a pipe at one fide, into a proper receiver.
"i... Foy's "Mr Hullut commuricates, in the Nemoirs of the Fr the if French Academy for the year 1745 , a method of making raifed figures of goid on wo:ks of gold or filver, found anooig the papers of M. du Fay, and of which
MI. du Fay himfelt had teen feveral tials. Fine gold in powder, fuch as refults from the parting of gold and flver by aquafortis, is direcled to be lad in a heap on a levigating ftune, a cavity made in the middle of the heap, and half its weight of pure mercury put into the cavily; fome of the fetid firit obtained from garlic rout by difillation in a retort, is then to be added, and the whole immediately mingled and eround with a muller till the mixture is reduad into an uniform sray powies. The powder is to be ground with lemon juice to the confilfonce of paint, and applied on the piece procrionty well cleaned and rubleat over with the fame acid ju.. e: the fours dranm with it may be raifed to any desper lo repenting the application. The piece is cajoed to sentle fise till the mercury is evaperated to as leave the gold yellow, which is then to he prelled down, and rubbud with the finger and a Bittle fand, which nakes it appear feniel and brilliant; after this it mas be cot and embellihed. The author werves, that bing of a dpongy tenture, it is more advilable to cot it with a childel than to raile it with a sraver; that it has an imperfection of being always pale ; and that it would be a detirable thing to find mean of giving it colnur, as by this method ornaments mithe be mode of expuitite beaty and with great facility. A the patencts appears to froceed from a part 1.f the me:cury uctined by the gold, 1 apprehend it might be remudie. Ly the prudent application of a litte warm aquarort, which dillolving the mercury frem the exterior part, would give at leat a fuperficia hi ' colver: if the piece is filser, it mult be defendad irum the aguafortio by covering it with was. Inffrumeme and comament, of gold, itaned by mercury where tha gold is comeeted with fubtances incapable of bearin fiec, m: be rellored to their culour by the s.me was ank

The foreguing procefs is given cali. $\therefore$ y on the $c_{2}$ 'ding ausivutity of the Fiench arater. I nave had no caericonce of it myde wat have feen very elenant figures A t.
 diderent pr eture. Some cinnaoar was ground, bot with the ditilled ginit, but wita the explenied uice of garlic, a thuid remartabiy tenarous. This misti.re vas lirend all over the pulihed thver; and when the firt lityer is dry, a fecond, and atier this a thad, wis applied. Over thefe were fpread as nas y luye: of another mixture, compofed chietly of aphaltum and linfeed cil boiled down to a due conatence. Ithe whole being dried with a gentle heat on a kind of wit grate, the figures were traced and cur down to the it. ver to as to make its furface rough : the inciions werc filled with an amalgan of gold, railed to different height, in different parts according to the nature of the defign; after which a gentle fre, at the fame time that it evaporated the mercury, deitroyed the tenacity of the summy juice, fo that the coating, which ferved to contine the amalgam, and as a guide in the application of it, was now ealily got off. The gold was then prefied down and embellithed as in the fomer method; and had this advantage, that the furface of the filver under it having been made rough, it adhered more firmly, to as not to be in danger of coming off, as M. du Fay fays the gold applied in his way fometimes did. The artifl, however, found the procefs io troublefome, that though he purchafed the receipt for a coniderable fum, he has hid the practice afrie."

Finally, Some metals, particularly filver, may be gilt in the following manner :

Let gold be diffolved in aqua regia. In this folu- Eary me tion pieces of linen are to be dipt, and burnt to black thod of gild. athes. Theic athes being rubbed on the furface of the thg fi.ver. filver by means of a wet linen rag, apply the particles of geld which they contain, and which by this method athere very well. The remaining part of the athes is to be wahed ofl; and the furface of the filver, which in this tlate does not leem to be gilt, is to be burnilhed with a blood-hone, till it acquire a fine colour of gold. This method of gilding is very eafy, and confumes a very fmall quantity of gold. Moit gilt ornaments upon fans, fruff boxes, and other toss of much thow and little value, are nething but filver gi't it this manacr.

Gold may alfo be applied to glafs, porcelain, and 1 is ${ }^{12}$ other vitrited matter. A, the furface of thefe matters of glding is very fmooth, and contequently is capable of a very bla. perfeet contace with guld lenses, thele leaves adhere to them with fome force, although they are not of reet. Wic nature. This gitding is to much more perfect. as the gold is more cactly applied to the furtace of the glafs. The piects are then to be expoled to a certuin degace of heat, and burnihad tighty to give them futre.

A more fubtumial gilling is fixed upon glati, enamel, and purceluin, ty applying to the fubtlances powder of celal mixed with a bohtion of gum arabic, is with Race eflential oil, and a imall quansity of bo. rax ; after which a foaicient heat is to be aryilied to tufton the glas and the weid, which is then to be bursinhci. Wi:h this minture any figures may be draca. The ponders for this purpole may le made, I. By grinding erod leaf with honey, which is etterwards

6.f. bimflf a complet: mater: in gort, there was no branch offrontwae that could either cala e or enrich Biblical learnag, which, however d hoult, was not attempted and ottained: and it may be truy alferted, that in this line he bad but few equals, ind that the armal, of literature do not exhbit a character by whom he wa excelled.

In $17+b$ Mr Gill publithed a commentary on the New Feltmant in three volumes folio. The immenfe reading and leaming difcoverable in this arduous work, attrafed the attention of the Marifchal College and Univerfty of Aberdeen; and procured for him, without either his folicitation or his hnowledre, a diploma, creating him doctor in divinity. This intelligence was conmmicated to the doctor in the molt handfome terms by the profellors Otborn and Pollock; who declared, "that on account of his knowledge of the Scriptures, of the Oriental languages, and of Jewif antiquities, of his learned defence of the Scriptures againft Deilts and Infidels, and the reputation gained by his other work; the univerfity had, without his privity, unanimoully agrced to confer on him the degree of dector in divinity."

Dr Cill's fentiments, as a divine, were throughout Calminitic: "And perhaps no man (fays the Rev. Mr Toplady, a minititer in the church of England) fince the days of Auftin, has written fo largely in defence of the fyltem of grace; and certainly no man has treated that momentous lubject in a!l its branches, more clofelz, judiciouly, and fuccefffully. What was faid of Edward the Black Prince, that he never fought a battle which he did not win; what has been remarked of the great duke of Mariborough, that he never undertook a fiege which he did not carry; may be juilly accommodated to our great philofopher and divine; who, fo far as the dititinguilhing doctrines of the gofpel are concerned, never beficged an error which he did not force from its ftrong holde, nor ever encountered an adverfary whom he dil not baffle and fubdue. His learning and labours, if exceedable, were exceeded only by the insariable fanctity of his life and converfation. From his childhood to his entrance on the miniltry, and from hi entrance on the minitry to the moment of his difflution, not one of his moit inveterate oppofers was ever able to charge him with the leaft fhadow of immorality. Himfelf, no lefs than his writings, demonfiated that the docrine of yrace does not lead to licentioufnefs. Thofe who had the honour and happinefs of being admitted into the namber of his friends, can go tilll farther in their teltimony. They know that his moral demeanor was more than blameles's: it was from firit to latt confitently exemplary. And indeed an undeviating confinlency, both in his iews of evangelical truthe, and in his obedience as a fervant of God, was one of thofe qualities by which lis calt of charater was eminently marked. He was in cvery refpect a burning and a chining light: Burning with love to God, to truth, and to fouls; fhining as an example to believers, in word, in faith, in purity; a pattern of good worke, and a model of all noly converfation and godlinefs; and while true religion and found learning have a fingle friend remaining in the Britih empire, the works and name of Gill will be precious and revered."

He cied at Camberwell, Oetober 14. 1771, ad 73

Gill, a meafure of capacity, containing a quarter of an Engliih pint.

GiLLS or Branchie of fifhes. See Anatomix Index.

GILLINGHAM, a parih in Dorfethire, on the river Stour, near the foreft of its own name; where, anno 1016, King Edmund Ironfide vanquiihed the Danes. It is one of the largelt parihes in the county, being 41 miles in circuit, containing 64,000 acres. It lies on the borders of Wilts and Somerfet, four miles north-weft of Shaftubury. It has a manufacture of 1 inen, but the chief produce is grazing and the dairies. Near it are the traccs of an ancient relidence of Norman or Saxon kings, 320 feet long and $2 \psi_{0}$ broad, furrounded by a rampart of earth. Henry I. refided here, and King John repaired it at the expence of the county. Edward I. fpent his Chriltmas here in 1270 ; but the whole of the materials are removed, and the foundation of the houre only can be traced, which was in the form of the letter L, in length 180 feet by 80 broad, and the foot of the letter 48 by 40 ; the area of the houfe containing 168,000 fquare feet. It itoond half a mile from the church, on the road to Shatton, encompaffed by a moat, now dry, in fome places nine feet deep and 20 broad. The rampart appears to have been 30 feet thick. Here is a free fchool, a large old building, and a workhoufe, as well as two ftone bridges. In 1694 it received damage of near +0001 . by a fire. Near it is Gillingham foreft, four miles long and one mile broad. The church is a large ancient fabric.

Gillinghim, a parill of Kent, three miles below Chatham, and on the lame fide of the Medway. Part of Chatham dock is in this parih; and here is a cafte well furnihed with guns that commands the river, there being no lefs than 170 embrafures for cannon; which would ftop the progrefs of any enemy that fhould happen to make way by Sheernefs fort, before they could reach Chatham. Here are alfo copperas works. At this place 600 Norman gentlemen, who came over in the retinue of the two princes Alfred and Edward, were all barbaroully murdered by Earl Godwin. It was in remote times the property of the archbihop of Canterbury, who had here an elegant palace, the old hall of which is now converted into a barn; it is built principally of lint, but the windows are filled up with brick. Near it are the remains of the chapel, Sic. and a great part of the whole of its original outer walls may be traced.

GILOLO, a large illand of the Pacific ocena, lyins between $1^{\circ}$ S. Lat. and $2^{\circ} \mathrm{N}$. Lat. and betwee $125^{\circ}$ and $125^{\circ}$ E. Long. It belongs to the Duath,

G I I
Gilpin. but does not produce any of the fine ipicea, though it lies in the neigebvurhood of the fpice illand. The natives nee fierce and crucl favages.

GllpIN, Berrard, rector of Houghton, diltin. guined by his extraordinary piety and hofpiality, was defended from an ancient and honourable family in Weitmorland, and born in 1517. A, he was bred in the Catholic religion, fo he for fome time defended it againt the reformers, and at Oxford held a dilputation with Firoper afterward bithop of Worceiter and a martyr for the Protertant iaith; but was flagerered in another difputation with Peter Martyr, and begin ferioully to examine the contericd points by the belt authorities. Thus, being peefented to the vicaraze of Notton in the diocefe of Durham, he foon religned it, and went abroad to confult eminient profefiors on both iides; and after three years abfence returned a little before the death of Queen Mary, fatisfied in the general doctrines of the reformation. He was kindly received by his uncle Dr Tonitall, biuhop of Durham; who foon after gave him the archdeaconry of Durl:am, to which the rectory of Efingtoa was annsved. When repairing to his parih, thoug the perlecution was then at its height, he boldly preached againt the vices, errors, and corruptions of the times, efiecially in the clergy, on which a charge confining of 13 articles was drawn up againt him, and prefented in form to the bihop. But $\mathrm{Di}_{i}$ Tonttall found a method of difmifing the caufe in fuch a manner as to prote ${ }^{2}$ his nephew, without eadangering himfelf, and foon after prefented him to the rich living of Houghton le $\mathrm{S}_{\mathrm{i}}$ rinicg. He was a lecond time accufed to the bithop, and again protected; when his enemies, enraged at this fecond defeat, laid their complaint before Dr Bomer, bilhop of London; who immedrately gave orders to apprehend him. Upon which Mr Gilpin bravely prepared for martyrdom; and ordering his houfe fteward to provide him a long garment that he might make a decent appearance at the itake, fet out for London. Luckily, however, he broke his leg on the journey; which protracted his arrival until the news of the queen', death freed him from all further apprehenfions. Being immediately fet at liberty, he returned to Houghton, where he was reccived by his parimioners with the fincerelt joy.

Upon the deprivation of the Popih bihops, he was offered the fee of Carlile, which he declined; and confining his attention to his rectory, difcharged all the duties of his function in the mont exemplary manner. To the greatell humanity and courtely, he added an unwearied application to the initruation of thote under his care. He was not fittiffied with the advice he gave in publir, but wifd to indruct in private; and brought his parinione:- to come to him with their doubts and cilliculties. He lad a mott engaging manner towards thofe whom he thought well difpuied: nay, his very reproof was fo conduates, that it ieldom gave offence; the becoming gentlenef with which it was urged made it always appear the efect of tricndhain. Thus, wih unceating atiduity, did he cmploy himfelf in admonilhing the ficious, and engrging the well-intentioned; by which means, in a few years, he made a greater change i: his neighbourhood than could well hive heen imagined. A reararkalle initance, .what reformation a fangle man may effect, whe. b: hath it carnelly at hear:'

But his hopes were not fo much in the prefent geraration, as in the fucceching. It was an ealicr talk, he found, to prevent vice, than to corseit it ; to form the young to virtue, than to amond the bad habics of the oid. He employed much of his time, therefore, in endeavouring to improve the minds of the younger part of his parihh; fuffering nonc to grow up in an ignorance of their duty; but prefling it as the witeft part to mix religion with their labour, and amidit the cares of this life to have a contant eye upon the next. He attended to every thing which might be of fervice to his parihioners. He was very afliduous in preventing all law fuits anong them. His hall is faid to have been often thronged with people, who came to him about their differcnces. He was not indeed mach acquainted with lavr ; but he could decide equitably, and that fatisfed: nor could his fovereign's commifion have given him more weight than his own charafter gave him.

His holpitable manner of living was the admiration of the whole country. He feent in his family every fortuight 40 buihels of corn, 20 tulhels of malt, and a whole ox ; befides a proportionable quantity of other kinds of provifion. Strangers and travellers found a cheerful reception. All were welcome that came; and even their beafts had fo much care taken of them, that it was humoroully faid, "If a horle was turned loofe in any part of the country, it would immediately make its way to the rector of Houghton's."

Every Sunday, from Michaelmas till Emer, was :a fort of public day with him. During this feaion he expected to fee all his parihioners and their families. For their reception, he had thrce tables well covered: the firit was for gentlemen, the fecond for hubandmen and farmers, and the third for day labourers. Thi: piece of hofpitality he never omitted, even when lones. or a fcarcity of provifion, made its continumace rather dificult to him. He thought it his duty, and that was a deciding motive. Even when he was able:it from home, no alteration was made in his family expences; the poor were fed as ufuzl, and his neighbours entertained.

But notwithfanding all this painfal indutry, an! the large fope it had in fo extended a parilh, In Gilpin thought the fphere of his benerolence yet too confined. It grieved him extremely to tee everywhere, in the pas rithes around him, fo great a decree of ignormee ancl fupertition, occationed by the thameful neglect of the paftoral care in the clergy of thole parts. Thefe basl confeqquences induced him to fupply, as far as he could, what was santing in others. For this purpofe, every year he ufed regulariy to wint the moni neglected pi rihes in Northumberland, Yorkhire, Chewire, Wett morand, and Cumberland ;and that his own parith in the mean time might not fiffer, he was at the enpence of a conilat affisant. In ech place he thand two or three days; and his method was, to call the peopic about him, and lay before them, in as plain a ay as pollible, the danger of leading wicked or even carclefs lives; explaining to then the nature of true relifion; inftructing them ia the duties they owed tw Gol, their neighbour, and themelves; and howine thera how greatly a moral and relligious conduct would contribite to their prefert as well as future happinef.
A. Ne Gilpia had all the warmoth of ata cethulat

Gerit on the north fide of the equator in the peninfula of A.rice."

With regatd to this country, very little farther is known, than fome of the cultoms of the people ramiently piched up by the Jefuit mifionaries in Abyfinia. Fom thim we learn, that the kingdom is hereditary in one family, though it does not regularly decend to the eldeit fon, the hing being choien by the nobles; in which they rembic their neighbout, the Abyflimans. When the king dies, his body is wraped in a fine cloth, and a cow is killed. The body fo wrapyed up is next cnclofed in the cow's fin; and all the princes of the royal family liy and hide themfelses in the buhhes, while thole who are intrulted with the election enter the thickets, beating about everywhere as if for game. - It lat a bird of prey, called in their language liber, appear, and hovers over the perfon dertined to be king; crying and making a great noife wi hout quitting his flation. By this means the perfon deftined to be elected is found out, furrounded, as is reported, by lions, tigers, panthers, ind other wild beafts; all which are fuppofed to be brought by the power of magic or of the devil.-- fter the hing is found, he tlies upon thofe who came in queft of him with great fury, killing and wounding as many as he can reach, until at latt he is dragged to the throne whether he wiil or not. One particular family have the privilege of conducting him to the throne; and if they fhould not happen to find him at firtt, they liave a right to take him out of the hands of thofe who did fo; and thus another battle enfues before the vacant throne can be filled. Lafly, Before he enters his palace, two men muft be killed; one at the foot of a tree by which the houfe is fupported; and the other at the threfhold of the door, which is belmeared with the blood of the victim. It is the paiticular privilege of one family to afford thefe victims; and fo far are they from teeking to a:oid this fate, that they glory in the occation, and willingly wtfer themfelves to meet it. Thi laft particular, Mr Pruce lays, he had in Abylhnia from people coming from Gingiro.

GINCIV E, the gums. See Guas.
GINGLYMUS, in shatomy, one of the feccics of articulation. It is that jointure of the hones where each bone mutually reccives the other; fo that each bone both receives and is received. Sce Anitomy Inde:

GIOIA, Flavio, of Amalfi, in the kingdom of Naples, the celebrated mathematician; who, from his knowledge of the magnetic powers, invented the mariner's compaf, by which the navigation of the Europeans was extended to the mofl dillant regions of the slobe : before this invention, navigation was confined to coafting. 'The king of Naples being a younger branel of the royal family of France, he marked the yorth Ioint with a heur-de-lis, in compliment to that
country. It is faid the Chinefe knew the compafs Ciordana long before; be tlis as it may, the Europeans art 11 debted to Gioia for this invaluable difcovery. He HouCi raders. rilled A. U. 1300 .

GIORDANA, Leca. See Jordino.
GIORGIONE, to called from his comely afpect, was an illuftiots Venetian patnter, born in $1+78$. He received his firf intructions from Giovanni Eellino; but fludying afterwards the works of Leonardo da Vinci, he loon furpatied them both, being the firlt among the Lombards who found out the admirable effects of ftrong lights and thadows. Titian became his rival in this art ; and was to careful in copying the life, that he excelled Giorgione in difcovering the delicacies of mature, by tempering the boldacls of his colouing. The matt valuate piece of Giorgione in oil is that of Chrift carrying his crois, now in the church of San Rovo in Venice ; where it is held in great veneration. He died of the plague young, is 1511.

GirAFFE. See Cerves, Minmahia Inder. GIRALD, Barry, or Giraldus Cambrenfis. See Barry.

GIRALDI, Lilio Grfgorio, an ingenious critic, and one of the mott learned men that modern Italy has produced, was born at Ferrara in 1479. He was at Rome when it was plundered by the emperor Charies V.; and having thus lolt all he had, and being tormented by the gout, he ftruggled through life with ill fortune and ill health. He wrote, neverthelefs, 17 performances, which were collected and publifhed at Pafl in 2 vols, folio in 1580 , and at Leyden in 1696. Authors of the fiff rank have beftowed the highof culogies on Ciraldus; particulaly Cafaubon and Thumas.

Gikaidi, Juln Bapif? Cintio, an ltalian poet of the fame family with the forcgoing Lilio, was born in $15=4$. He was fecretary to the duke of Ferrara, and a terwards bccame profeffor of rhetoric at Pavia. He dicd in 1573. His works, which contift chietly of tragcdies, vere collected and publihed at Verice by his fon Celto Giraldi, in 1583 ; and fome fcruple not to rank him anoong the beit tragic writers Italy has produced.

GIRARi.ON, Francis, a celcbrated French architect and feulftor, born at Troyes in $162 \%$. Louis XIV. being informed of his great talents, fent him to Kome with a penfion of 1000 crowns. At his return into France, he laboured for the royal palaces and the $g$ rdens of Verfailles and Trianon; where there are many of his works executed in bronze and in marble, from the defigns of Chartes le Brun. The maufoleum of Cardinal de Richelicu, in the Sorbonne, and the equeftrian flatue of Louis XIV. at the Place de Vendome, where the tatue and horfe are caft in one piece, pats for his moft eacellent performances. Girardon $u$ as profeffor, rector, and chancelior, of the Acadeny of Painting and Sculpture; and had the poft of infpector general of all the works done in liculpture. He died in 17150

GIRLERS, in Architciture, the largef pieces of timber in a floor. Their encis are ufually fatiened into the fummers, or hoft trmmers; and the joits are fram of are to to the gidines.

By the itotute toz robuilding London, no girder is

## 

Girdle to be leís than ten inches into the wall, withear ends to be alwavs haid in losm, \& c .

GIRDLE (Cingz/hs or Cma), a belt or band of leather or other matter, tied about the reins, to kee? that part more firm and tishlt.

It w:.s anciently the ctitions for barkrupts and other infolvent debtors th put o!f and furrender their girdle in open court. The reaton of this was, thit our ancentots uled to carry all their necentary utemils, as purle, key", \&ic. tied to the gitdle; whence the girdle became a fymbol of the ftate. Hillory relure that the widow of Philip I. duke of Purgundy, renounced her right of fucceffion by putting ofl het girdle upon the cuke's tomb.

The Romane alway's wore a girdle to tu-k up the thnica when they had occation to do any thine : this cutlom was to general, that fuch as went withont girdles, and let their guwns hang lowle, were reputed ide dimolute perions.

Dazin's or l'rrgin's Girdiz. It was a cufom among the Grecks and Romans for the huband to untie his brid's girlle. Homtr, lib. xi. of his Odyley, calls the girdle refetamr לamy, maid's girlle. Fetus relates, that it was made of theep's wool, and that the hulband untied it in bed; he adds, that it was tied in the Herculanean knot ; and that the huiband unlooled it, as a happy prelage of his having as many children as Hercules, who at his death left §eventy behind him.

The poets attribute to Venus a particular kind of girdle called ceffus, to which they annexed a faculty of infpiring the paffion of luve.

GIRGASHITES, or Gercesenes, an ancient people of the land of Conaan, whole habitation was beyond the fea of Tiberias, where we find fome footfteps of their name in the city of $G+r_{g} \varepsilon / a$, upon the lake of liherias. The Jewifh doctors inform us, that when Jomua firt cance into the land of Cannan, the Girgalhites took a refolution rather to forfake their country than fubmit to the Hebrews, and accordingly retired iuto Africa. Neverthelefs, it is certain that a good number of them liaid behind, fince Johna (axiv. II.) informs us that he fubdued the Girgathites, and they whom he overcame were certainly on this ide Jordan.

GIRGENTI, a town of Sicily, which occupies part of the fite of the ancient sfrufontum. It has only one itreet fit for carriages. It is inhabited by $15,0<c$ perfons; but has no remarkable buildings or works of art that deferve mention: the only antifuities to be feen were a Leatin infeription of the time of the Antonines, as is pretended, relatise to fome afociation between Agrigentum and Lilybstum; and a piece of atcient matonry in the foundations of a churd pretended to be the remains of a temple of Jupiter. At fome difance, on the old ground in the vale, fands the carhedral, a clumily building patched up by barbarous architcets with variou difcordant paite. This chureh is enriched with no works of modern painters or foulptors that claisn any title to praife, but the baptinal tont is made out of an ancient farcophagus faced vith very beautitul bulu rehewor. This See is the richetk in Sicily, but has the characher of beeing lefs enliglitened and polished tham the reat of the illand. Among the curintities belonging to the cathedr. 1 is an Etrufican vale of rare fize and prefervation.

Yol. IX. D'art II.

Thare a.e aifo fome golden pateras of evtrense rani: The monatery of San Nicolo tame's on a lithe usinence in the centre of the old city, adsitaty tarte... The range of hills tonard the hratli.. ent finks gradually, fo as to admit a noble remblo of 1 as and of plain, terminated on each lide l: th \& . .t. : of truit trees. Above appear the romain of ationt grandeur, wonderfully c intated with t'ice hamle ttraw cottages built ai their fect. In the - band e. this cowvent is a Square building wih , ?acer, whis is fuppofed to have been! !art of the priace of Wic Ro. man prator.

Girgenti h:s the convenience of a port; for which, however, it is Jefs inde'ted to its antural lituation than to the recent aflittance of art. The harbous is formed by means of a pier carried out in three hidece of an octacon, with a battery at the head; the li hithoule is to be erected on the cliffs on hore, as there is no pofficility of railing it high enough on the mole nithout danger of fanking. The work is admirable as to ftrength and neatnefs, but the intention of creating a fafe and complete haven has not been fully anincrad; the Sirocco commands it entirely, and drives in great quantities of fand, which it is feared will in time choke up the poit; even now hlips of burden find it dilicior to get in, but the Caricatore is conliderable, and the magazines in the rocks along the shore are very fpacious.

GIRONNE, or Gironsy, in Heruldery, a coat ol arms divided into girons, or triangular ligures, meeting in the centre of the hield, and alternately colour a:ns metal.

GIR T, the fituation of a hip which is moored is ftrait by her cables, extending from the have/e to two diftant anchors, as to be prevented from lwinging or turning about according to any change of the wind of tide, to the current of which her head would otherwile be directed. The cables are extended in this manner, by a Atrong application of mechanical powers withia the flip; fo that when the veers, or embeavours to tiving about, her fide bears upon one of the cablec, whic! catches on her heel, and interrupts her in the at of traverting. In this polition the mult ride vilh her broadfide to the wind or current, till one or both of the cabies are flackened.

GISCO, fon of Himilco the Cathasinian genera?, was banifred from Carthace by the imbluence of his enemies. Being afterwards recalled, he was made geac:al in Sicily againft the Corinthians, about $;=9$ years bofore the Chriltian era, and by his fuccts and intre idity he obliged the enemies of his country to fue for peace. See Carthigh..

GISB: )R OUGH, a town of England, in the weat riding of Yorkthire, on the road from Whit's to Durham, $22+$ mile from London, and fur miles from the mouth of the Fees, where is a bay and harbour for thips. It had formerly an abbey, which was once the common burial place of the nobility of thefe parts, and its church by the ruin feems to have been equal to the bert cathedrals in England. The foil, befides its fertility in pature and a contlant verdure adomed with plenty of field tlowers almoft all the year, has earths of fundry colours, lome iron, and mines of alum, which were firt difcovered in the reign of King James I. and have been fince very much improved. Sir Paul Pin4 L
dar,

Guttich diar, who firft iarmed them, paid rents to the king II William Penniman 60c1. and had moreover Soo men
by fea and land in conftant pay; yet be was a confiderable gainer, becaule there was then farce any other to be had, and the price was 261. a ton; but now there are feveral other alum works in this county, uhich have taken a great part of the trade from hence; fo that the works here have for fome years lain neglected.

GIITITH, a Hebrew word occurring frequently in the Pfalms, and generally tranflated wine preffes. The conjectures of interpreters are various conceming this "ord. Some think it dignifies a fort of mufical inftrument; others, that the pfalms with this title were fung after the vintage; latlly, others, that the hymns of this kind were invented in the city of Gath. Calmet is rather of opinion, that it was given to the clafs of young women or fonglireffes of Gath to be fung by them, Pfal. viii. 1. lxxxi. I, lxxxxiv. 1. Dr Hammond thinks that the pfolms with this title were all fet to the fame tune, and made on Goliath the Gittite.

GIULA, a itrong town of Upper Hungary, on the frontiens of Tranlylvania. It was taken by the Turks in 1566, and retaken by the Imperialiits in 1695. It is leated on the river Keretblan, in E. Long. 2 1. 1. N. Lat. 46. 25 .

GIUSTANDEL, a large and itrong town of Turkey in Europe, and in Macedonia, with a Greek archbilhop's fee. It is feated ncar the lake Ochrida, in E. long. 20. 50. N. Lat. 4 1. 10.

GL ACIERS, a name given to fome very extenfive fields of ice among the Alps. Mr Coxe obferves of thefe mountains in gencral, that they are compofed of many parallel chains, the higheft of which occupy the centre, and the others graduaily diminifh in proportion as we rocedc from thence. Thic central chain appears covered with pointed rocks; all parts of which, that are not ablolutely ferpendicular, lie hid under perpetual foow and ice even in fummer. On each fide of this ridge are fertile and cultivated valleys, interfperfed with numerous villages, and watered by numerous atreams. The elevated peaks of the central chain are covered with fnow: but their declivities, excepting thoie that are extremely fleep, have all a covering of ice as well as fnow; the intermediate parts being filled with vaft fields of ice, terminating in the cultivated vallws above mentioned. The fame phenomena, though on a imaller fcale, occur in thofe chains that are at a diftance from the rrincipal one: In thofe which are moft remote, no ice, and fearcely any fnow, is offerved, unlefs upon fome of the moft elevated fummits; and the mountains diminiming in beight and ruggednefs, appear covered with verdure, until at ladt they terminate in fmall hills and plains.

Thus the glaciers may be divided into two forts; one occupying the deep valleys lituated in the bofom of the Alps, and dittinguithed by the name of Ice valleys; the others are thole whieh clothe the declivities and fides of the mountains. Thefe two kinds of glaciers are diltinguihed by Mr Coxe into the upper and lower glaciers.

The lower glaciers are by far the moit confiderable; fome of them extending feveral leagues in length. They do not communicate with cach other, as has been
generally fuppofed, fow of them being parallel to the Glaciers. central chain; but, ftretching moftly in a tranfverle direction, are bordered at the higher extremity by inaccetrible rocks, and at the lower extending into the cultivated valleys. The thicknefs of the ice varies in different parts. In the glacier des Buis, which extends more than 15 miles in length, and upwards of three in breadth, M. Saullure found it generally from 8o to 100 feet; but he was credibly informed, that in fome places it was not lefs than 600 feet, and even more. Thefe valt mafles of ice ufually rett on an inelined plane; where, being puihed forward by their own weight, and but weakly fupported by the rugged rocks beneath them, they are interfected by large crevices, and have an appearance of walls, pyramids, \&c. according to the pofition of the eye in viewing them. In thofe parts, however, where they lie upon even ground, or fuch as has only a gentle inclination, the furface of the ice is nearly uniform, the crevices being few and narrow, and the glacier being crolied by travellers on foot without any difficulty. The furface of the ice is rough and granulated, fo that people may walk upon it, excepting fuch places as have a tteep defcent. It is opaque, full of imall bubbles about the fise of a pea, very porous, and greatly refembles a mixture of fnow and water congealed. A vail quantity of ftones and earth falls down from the momitains upon the glacicro, and are by them thrown off on each fide according to the defcent of the ise, as will be afterwards explained. The place on which thefe reft is more hard and elevated than the refo of the ice, and is very difficult to walk upon; the earth is likewife laid upon them in fuch regular heaps, that it appears to have been done by art. This collection of earth and llones is termed by the natives the Moraine.

Mr Coxe, who vifited the glacier des Bais, informs us, that the appearance of it at a diftance was fo tremendous, that it čemed impracticable to crofs it. Numerous and broad chafms interfected it in every disection; but entering upon it, the company fond that courage and activity "ere only required to accomplith the tak. They had large nails in their thoes, and fipiked fticks; which on this occafion were found to be particularly ferviceable. Having paffed the moraine, and defcended upon the glacier itfelf, they found the ice foftened by a warm wind which rendered it lefs flippery than uflual. Having walked acrofs it for about a quaster of an hour, they came again to the moraine, along wlich they continued their journey for half an hour, and then entered upon the great body of the glacier. "Here (hays Mr Coxe) it was curious to obferve the numerous littic rills produced by the collection of drops occafioned by the thawing of the ice on the upper part of the glacier : thete little rills hollow out finall chamels, and, torrent-like, precipitate themfelves into the chatms with a vivient noile, increafing the body of waters formed by the melting of the interior furface, and finding an outlet under the immenfe arch of ice in the valley of Chamouni, from which the Arveron ruthes." is our traveller pioceeded on his journey, he was furprifed ty the noife of a large fragment of rock which had detached itfelf from one of the highelt needles, and bounded from one precipice to another with great rapidity; but before it reached the plain, it was almon reluced to duft. "Maving proceeded about an hour

## 

Giaciers, (fays he) we were aftonithed with a vicw nore magnifcent than imagination can conceive: hitherto the glaciers had fcarcely anfwered my expectations, but now they far furpaffed them. Nature had clad herielf in all her terrors. Before us was a valley of ice 25 miles in extent, bounded by a circular glacier of pure unbroken fnow, named Takul, which leads directly to the foot of Mount Blanc, and is furrounded by large conical rocks, terminating in Charp points like the towers on an ancient fortification; to the right roce a range of magnificent peaks, the intervals filled with glaciers; and far above the reft, the magnificent fummit of Mount Blanc, his highelt point obfcured with clouds. He appeared of fuch immenfe magnitude, that, at his prefence, the circumjacent mountains, however gigantic, feemed to thrink before bim, and hide their diminifbed heads. In half an hour we arrived at the moraine, which forms a boundary of the valley, croffed it, and proceeded upon a body of ice about three quarters of a mile broad. Here the ice was more even and free from chafms than in the great valley. We then paffed a fecond moraine, and beyond that another mals of ice to a third moraine: defcending from thence we came upon the laft ridge of ice, broader confiderably than the two former, and full of large chafms: it is leparated from the rock only by a very narrow moraine. Thefe moraines contain great quantities of cryital."

They continued to afcend the valley of ice, the fcene conftantly increafing in magnificence and horror ; and naving walked about five miles on the ice, they arrived at lait at the foot of the eminence named Couvercle, where they were obliged to quit the ice. The doling this was extremely dangerous, and at one place very tremendous. It was a bulging fmooth rock, with a precipice of confiderable depth terminated by a valt crevice in the ice, which feemed to ftop all further progrefs: a fmall hollow in the middle, however, afforded room for one foot; and having fixed this, they fprung over to the other ide, being helped and directed by the guides who went over firit. Having gained the top of the Couvercle, they had a view of three of the glaciers, viz. that of Talefre to the left, l' Echant in front, and Ta$k_{u} /$ on the right ; all uniting in that great one called the Glacier de Bois. The Couvercle itfelf is a moft extraordinary rock, having the appearance of a large irregular building with many fides; the fubitance of which is granite. Having reached the top, they were furprifed with a thunder ftorm, from which they took fhelter under an impending rock. The view was exceedingly magnificent; the glaciers appearing like a rugged expanfe of frozen fea bounded by gigantic rocks, and terminated by Mount Blanc. A lingle rock appeared of a triangular figure covered with Alpine plants; and which by reafon of its contratt with the rugged and fnowy mountains in the neighbourhood, has obtained the name of the Gardin. During this, as well as other excurfions among the $\lambda_{p s}, \mathrm{Mr}$ Cose had occation to obferve that the colour of the Aky was of a much deener blue than in the lower regions.

The upper glaciers may be fubdivided into thofe which cover the fummits, and thofe which extend along the fides of the Alps. Thofe on the very fummit, howcver, though they have the appearance of ice, are not fo in reality, but confint entirely of fnow hardened by the extreme cold. M. Squflure found that which co-
vard the top of Mount Blane to be penetrabie, though fila-ins. with dificulty, by a lick; but below this hand cruft was a foft frow without coherence. The inde are covered with a mixture of ice and thow ; by realon of the fuperior power of the fummer fun to difilve the frow, which afterwards congeals into hard ice.

Several conjectures have been made concerning the formation of thefe extraordinary bodics of ice. Mr: Cose agrees with M. Gruner in opinion, that they are produced by the continual diffolution of the fnow in fummer, and its congelation by the fucceeding froits. Hence, on the fummits of the mountains where the fun has very little power, the glacier is foft, and contain no ice: as we delcend the mountains the confitence becomes firmer, becaufe there is a confiderable mixture of fnow water, the congelation of which augments the hardnefs; and in the valleys, the glacier is hardett ot all, becaufe the portion of water is there much fuperio: to that of the fnow. Hence it feems plain that the glaciers derive their origin from the melting of the fnow on the upper parts of the mountains, and the congel?tion of the water as it advances: and to this caufe M. Sauffure adds the quantity of fnow which often rolls down into the valleys, and congeals along with the water juft inentioned.

Another queltion concerning the glaciers naturally eccurs, namely, Whether they are to be confidered as in a thate of increafe or diminution? Mr Coxe is of opinion, that they occafionally increafe and decreafe; in proof of which he adduces the following obfervation : "The borders of the glacier of Montanvert are moltly fkirted with trees : towards its bafe a valt arch of ice rifes to near 100 feet in height; under which the river Arveron rufhes with confiderable force, and in a large body of water. As we approached the ice, we paffed through a wood of firs: thofe trees which fland at a little diftance from the arch are abous 80 feet high, and are undoubtedly of a very great age. Between thefe and the glacier the trees are of a later growth; as is evident from their texture and inferior inze. Others, fill fmaller, have been overturned and enveloped in the ice: there feems to be a kind of regular gradation in the age of thefe fereral trees, from the largett which are itanding to the imalleft that lic proltrate."-Hence our author concludes, that the glacier once extended as far as the row of fmall firs; but that upon its gradual dillolution, a number of trees thot up on the fpot it had occupied ; fince which time the ice has again advanced, and overturned the latt grown trees before they had attained to any confiderable heisht.-This he thinks alfo confirmed by the following fact.-" Large ftones of granite are ufually found at a limall dillance from the extremities of the glacier. Thefe ftones have certainly fallen from the mountains upon the ice; have been carried on in its progrefs; and have tumbled into the plain unon the diffulution or finking of the ice which fripported them. Thefe itones, which the natives call Mrains, form a kind of horder to vards the foot of the valley of ice, and lave been puibed forward by the glacier in its advances: they extend even to the place occupied by the larger pines."

In oppostion to thofe who maintain that there is a conftant accumalation of icc and fros in the Alpine regione, our author makes the following remarks: 1. Between the years $177^{5}$ and 1785 the glacier of
$4 \% 2$ Grindeterald

## G LA $\quad\left[\begin{array}{lll}732\end{array}\right] \quad$ G LA

Glaciers. Grimdelevald had diminified to fuck a degree, that the foot which its extremity occupied in the former year, was at leaf 400 page, from that occupied by it in the later. 2. In the year 1785 the Murailles de Glace, which in 1776 he had delcribed as forming the border in the glacier of Boffin, no longer exited; and young trees had tho up in the parts which were then covered by the glacier of Montanvert. Still, however, it may be urged, that thee changes only take place in the valleys where the power of the fun is coniderable; and that from thence we cannot form any adequate idea of what pules in the more elevated regions, where in all probability more flow falls than can be diffolved. In fupport of this opinion, it is alleged, that the cold produced by the mats of ice already formed ought to augment it fill more; and that within the memory of tie prefent generation, many places have been covered with ice which were not fo before. To thee argumints, however, Mr Cove replies, that the causes, which diminish the ice in the upper regions, are no 1. f , powerful than the cold which tend to augment it. Thee are, 1 . Rain or thee; which falling upon the lower glaciers, thaw the ice, increate the rills on i. firface, excavate channels, and in many ways tend on diminish its quantity. 2. Evaporation, which takes place even from the furface of the ice iticif, acts fill more powerfully; and its action is not confined to any particular feafon. 3. The falling of the frow and ice; both that which comes gradually from the clouds, and that which defends from the mountains in great males, called by the natives avalanches. When thee lan fall down into milder regions, though formetimes they may refift the influence of the fun and form ice valleys, yet they generally dillolve. They are molt common in the upper glaciers, though lometimes they defend upon the lover, while the gradual defeent of frow from the clouds, which chiefly takes place in the lower, contributes very much to leffen the mats. 4. All the lower glaciers or valleys of ice reft on an inclined plane, are hollow, and undermined by torrents which are compliantly flowing from the upper glaciers, as well as from their own lowernolt furface. Their foundation being thus conflantly diminishing, the lower glaciers are carried imperceptibly forward into the cultivated fields, where an end is necellarily put to their progrefs by the heat of the fun. Hence we may fee the reafon of that ftrange phenomenon taken notice of by Mr Cove, that with one hand he could touch ripe corn, and with the other folid ice. This defeat of the glacier is demonitrable from the trees overturned by it, and the moraine always observed at the bottom of the lower glaciers. 5. The heat of the fun is an evident cause of the diminution of the galaciers. To this Mr Cove adds another cafe less generally known, viz, the "arm winds which blow by night as well as by day both in the upper and lower glaciers. "Thee warm winds (fays he) are during fummer fo common in thole parts, that I never croffed a glacier without feeling in lome particular politions a warmth Similar to the air of a hot bath." 6. Another cause is the mean temperature of the earth itself; which, where it is not exposed to the piercing cold of the atmofphere, is found to have a temperature always above the freezing point. As the vat thicknefs of the furperincumbent ice, therefore, is in the prefeat calf abut-
dankly fufficient to prevent the access of the ammoSphere, it is plain that the lower furface of it muff, by ling in contact with the earth, continually decay.With regard to the other argument drawn from the known increate of the ice in forme places, Mr Coze does not deny it ; but indicts, that there is no continual increate of the whole, but that if it increases in forme places, it diminifhes in others; and his opinion in this refpect was confirmed by thole who frequent the mountains.

GLACIS, in building, an eafy infenfible lope or declivity.

The defcent of the glacis is left Aten than that of the talus. In gardening, a defcent foretime begins in talas, and ends in glacis.

The glacis of the corniche, is an early imperceptible lope is the cymatium, to promote the deferent and draining off the rain water.

Glacis, in Fortification, that mas of earth which fives as a parapet to the covered way, flowing eafily towards the champaign or field.
GLiDE, in Gardening and Agriculture, an opening and light paflage made through a wood, by lopping off the branches ot trees along that way,

GLADIATORS, in antiquity, perfons who fought, generally in the arena at Rome, for the entertainment of the people.

The gladiators were ufually faves, and fought out of neceflity; though sometimes freemen made profeflion thereof, like our prize-fighters, for a livelihood.

The Romans borrowed this cruel diversion from the Afratics: forme fuppofe that there was policy in the practice, the frequent combats of gladiators tending to accultom the people to delpife dangers and death.

The origin of fuch combats feems to be as follows : From the earlieft times with which we have any acquaintance in profane hiftory, it bad been the cultom to facrifice captives, or prifoners of war, to the manes of the great men who had died in the engagement; thus Achilles, in the Iliad, lib. xiii. sacrifices twelve young Trojans to the manes of Patroclus; and in Virgil, lib. xi. ver. 81. 生neas fends captives to Evandcr, to be facrificed at the funeral of his ion Pallas.

In courfe of time they came alto to facrifice laves at the funerals of all perfons of condition: this was even efteemed a neceflary part of the ceremony; but as it would have appeared barbarous to have mallacred them like beafls, they were appointed to fight with each other, and endeavour to fave their own lives by killing their adverfary. This feemed fomewhat leis inhuman, becaufe there was a poflibility of avoiding death, by an exertion of thill and courage.

This occafioned the profelfion of gladiator to become an art : hence anole maters of the art, and men learned to fight and exercile. Thee maters, whom the Latins called lanifta, bought them laves to be trained up to this cruel trade, whom they afterwards fold to fuck as had occation to prelect the people with fo horruble a how.
There exhibitions were at firft performed near the fepulchre of the deceased, or about the funeral pile; but were afterwards removed to the circus and amphithe: tres, and became ordinary amulements.

The firll how of gladiators, called minus gladiatorium, was exhibited at Rome, according to Valerius Maximus,

## G L A [ 73.3 ] G L A

Gladia: as. by M. and D. Brutus, upon the death of their father, in the year of the city 490 . Oa this occafion there were probably only three pair of gladiators. In 53. , the three bons of MI. Emilias Lepidus the augur, who had been three times conful, entert ined the prople with the cruel piealure of leeing 22 gladiators fitht in the torum. In 5 , - , the firit Airicanus diverted his army at Ne: CorGhage with a how of rhdiators, which he exhibited in loneur ot his fither and uncle, who had begun the reanction of Spain. In procels of time, the Romans tecame fo fond of thefe blondy entertaimaten: that :ot only the beir of any great and rich citizon lately deceated, but all the principal magiftrates, pretented the people with hows of this nature, $t \rightarrow$ procure their affection. The adiles, pretors, confuls, and, above all, the candidates for offices, made their court to the fcuple, sy entertaining them frequently with thele fights: and the uriells were fometimes the exhibitors of the barisarous flows; for we meet with the ludi pontricales in Suetoniws, Augutt, cap. 44. and with the cha. i acerdorale, in Pliny, Eoit. Ho. vii. As for the emperors, it was io much their interelt to ingratiate themfelves with the populace, that they obliged them with combats of gladiators almoll upon all occanons; and as thefe increafed, the number of combatants increafed likewife. Accordingly, Julius Cufar, in his xedllehip, diverted the people with 320 couple. Titus exhibited a thow of gladiators, wild beafts, and reprefentations of tea fights, which lafted $1 \geqslant 0$ days; and Trajan continued a folemnity of this nature for 123 days; during which time he brought out to00 pair of gladiators. Before this time, under the repuislic, the number of gladiators was fo great, that when the confiracy of Catiline broke out, the fenate ordered them to be difperfed into the garrilons and fecured, left they thould have joined the difaffected party. See GlADIAgors liar.

Thefe fports were become fo common, and their confequences in a variety of relpects fo dangerous, that Cicero preferted a law that no ferfon ilould exlibit a how of gladiators within two years before he appeared candidate for any office. Julius Cufar ordered, that only a certain number of men of this profef. fion thould be in Rome at a time; Auguftus decreed, that only two thows of gladiators would be prefented in a vear, and never abuve divty couple of combatants in a how ; and Tiberius provided by an order of lenate, thit no perfon thou'd have the privilege of gratifying the :eople with fuch a folemnity unlefs he was vorth 400,000 fetterces. They were alfo conliderably segulated by Nerva.

The emperor Cladiss reffrained them to certain occaficas; but he foon afterwards annulled what he decreed, and private perfons hegan to exhibit them et pleafure as ufual ; and fome carried the brutal fatisfaition for as to have them at their ordinary feafts. And not llaves only, but niter perfons, would hire themfelves to this infimous atice.

The matter of the uladiators made them all firl fwear that tiey would toght to death; and if they failed, they were put to death either by fire, or fivords, clubs, : hips, or the like.

It was a crime for the wretches to complain when l!:ty were wounded, or to afk for death or feek to avo! : : when overcen*: but it was ufual for the em-
percere the people to grant them life when thay face cilut:ore (b) if wh of fear, lout witel the fital aloohe with con. rat t ad intereility: luguth čven derral l'at it anasis al ways be ranted them.

FF an haves an! frownen the inhaman fore on

 or the [enatorim order hould become gladasons ; an furn after he lad the fame $r$ titant on the knightr: navertheiels Nero is rol tel to bave brought uphand of Aco fewors and 602 Reman knights upon the atiax ; thongh Lipula- tike boti thele nu:nbers to be fulfied, and not without reion reduce, them to 49 finators and 60 knights: yet Domitian, that other monter of crucity, resined ufon Neru, exhitiving combats of women in the mingt time.

Coultantine the Great is laid to have firlt prohibite 1 the combats of gladiators in the Eatt. At leat he forbade thofe who were condemned to death for their crimes to be emuloyed; there being an order itill extant to the prefectus pretorii rather to fend them to wook in the mines in lieu thereof: it is dated at Bervtus in Phonnicia, the firit of October 325 .

The emperor Honorius forbade them at Rome on oc* cafion of the death of Telemachus, who coming ou: of the Ealt into Rome at the time of one of there Spectacles, went down into the arena, and ufed all his endeavours to prevent the gladiators from continuing the fport ; upon which the fpectators of that carnage, fired with anger, itoned him to death. It muit be obferved, however, that the practice was not entirely abolimed, in the Welt before Theoduric king of the Ollrogoths. Honorius, on the occalion firt mentioned, had prohibited them; but the prohibition does not feem to have been executed. Theodoric, in the year 500, abolilhect them fiaally.
$S$ me time before the day of combat, the perfon who prefented the people with the thows gave them notice thereof by programmas or bills, containing the names of the ghadiators, and the marks whereby they were to be ditinguiked: for each had his feveral badge; which was mot commonly a peacock's feather, as appears from the fcholiait of Juvenal on the 159 th verfe of the third fatire, and Turnebus Adverf. lio. ii. cap. 8. They alfo gave notice how long the thows would lant, and how many couples of gladiators there were; and it even appears, from the 52 d verfe of the feventh fatire of the fecond book of Horace, that the'g fometimes made reprefentations of thefe things in painting, as is practifed among us by thofe who have any thing to thow at fairs.

The day being come, they began the entertainment by bringing two kinds of weapons; the firit were ftaves or wooden foils, called rades; and the fecond were effective weapons, as fwords, poniard, \&c. The firlt were called arma luforia, or exercitoria; the fecond decretoria, as being given by decree or fentence of the pretor, or of him at whofe expence the fuectacle was exhibited. They began to fence or Rkirmilh with the firt, which was to be the prelude to the battle; and from thefe, when well warmed, they advanced to the lecond at the found of the trumpets, with which they fought naked. Then they were faid vertere arma. The terms of flriking were petere et repetere; of avoiding a blow, cer.?

## G L A [ 73i ] G L A

(ixdasors and when one of the combatants received a remarkable wound, his adverfary or the people cried out, Hatet, or Hoc halct. The firft part of the engagement was called vertilare, praludere'; and the fecond, dimicare at certion, or aejis armis prisnare: and fome authors think, with much probability, that it is to thefe two hinds of combat that St Paul alludes in the paflage ${ }^{1}$ Cor. is. 26, 27. "I fight, not as one that beateth the air; bat I keep my body, and bring it into fubjection."

If the vanquithed furrendered his arms, it was not in the victor's power to grant him life; it was the people during the time of the repullic, and the prince or people during the time of the empire, that were alone empowered to grant the boon. The reward of the conqueror was a branch of palm tree, and a furn of money, probably collected among the fpec1ators: fometimes they gave him his congé, or difmified him by putting one of the wooden foils or rudes in his hand; and fometimes they even gave him his freedom, putting the pileus on his head. The fign or indication, whereby the fpectators thowod that they gra:sted the favour, was premere pollicim, :which M. Dacier takes to be a clenching of the fingers of both hands between one another, and fo holding the two thumbs upright clofe together; and, when they would bave the combat fnifhed and the vanquilhed flain, verterunt pollicen, they bent back the thumb; which we learn from Juvenal, Sat. iii. ver. 36. The gladiators challenged or defied each other, by thowing the little finger; and, by extending this, or fome other, during the combat, they owned themfelves vanquifhed, and begged mercy from the people: Vilti effenfam digiti veniam à populo poflulabant, fays the old fcholiaft on Perfius.

There were vaious kinds of gladiators, dittinguilhed by their weapons, manner, and time of fighting, \&c. as, The andabata, mentioned under Andabate. The catervarii, who always fought in troops or companies, number againil number ; or, according to others, who fought promifcuoully, without any certain order. The dimachic, who fouglit armed with two poniards or fivorde, or with fword and dagger. The effedarii, who fought in cars. The ficales, or Cafariani, who belonged to the emperor's company; and who, being more robuft and desterous than the reft, were frequently called tor, and therefore named alfo $p$, 保latitii. Several other kinds are mentioned in the ancient authors.

Gladiators War (bellum Gladiatorium or Spartacum), called alfo the fervile war, was a war which the Romans: funtained about the year of their city 680. Spartacus, Crinus, and Oenomaus, having efcaped, with other gladiators to the number of feventy-four, out of the place where they had been kept at Capua, gathered together a body of llaves, put themfelves at their head, rendered themelelves mafters of all Campania, and gained feveral victories over the Roman praetors. At length they were defeatel in the year 682 , at the extrenity of Italy; having, in vain, attempted to pafo over into Sicily.

This war proved very formidable to the Romans. Craffios was not :ble to finith it : the great Pompey was forced to be fent as general.

The Mying Gladator, a mold valuable monument of ancicu: fculpture, which is now preferved in the pa-
lace of Chighi. This man, when he had received the mortal itroke, is particelarly careful u: procumbat lioncfe, "that he might fall honourably." He is feated in a reclining pofture on the ground, and has jult flrength fuficient to fupport himtelf on his right arm : and in his capiring moments it is planly feen, that he does not abaadon himelelf to grief and dejection; but is folicitous to maintain that firmnefs of alpect which the gladiators valued themfelves on preferving in this feafon of dilirefs, and that attitude which they had learnt of the mafters of defence. He fears not death, nor feems to betray any tokens of fear by his countenance, nor to thed one tear: quis mediocris gladiator ingcmuit, quis vultum mutavit unquam, quis non modo ftetut, verum etiamn dcculit turpiter, lays Cicero, in that part of his Tufculan where he is defcribing the aftonitiang firmnefs of thofe perfons. We fee, in this intance, notwithflanding his remaining ftrength, that he has but a moment to live; and we view him with attention, that we may fee him expire and fall: thus the ancients knew how to animate marble, and to give it almoft cuery exprcfion of life.

GLADIOLUS, Corn flag, a genus of plants belonging to the triandia clafs, and in the natural method ranking under the fixth order Enfatic. Sce Botasy Inder.

GLAIR of eggs, is the fame as the white of eggs, and is cfed as a varnifh for preferving paintings. For this purpofe it is beat to an unctuous confiftence, and commonly mixed with a little brandy or firit of wine, to make it work more freely, and with a lump of fugar to give it body and prevent its cracking : and then fyread over the picture or painting with a brufh.

GLAMORGANSHIRE, a county of South Wales, faid to have derived its name from a contraction of the Welih words Giuad Morgan, or "the county of Morgan," and fuppofed to have been thus called from a prince of this part of the country, faid to have been killed 800 years before the birth of our Saviour : but fome other writers detive the name from the word Mior, which in the Rritifh tongue fignifies the foa; this being a maritime county. It is bounded on the fouth, and part of the welt, by Briftol channel ; on the north-wett, by Caermarthenfhire; on the north, by Brecknockthire; and on the eat, by Monmouthhire. It extends $7^{8}$ milcs in length froin calt to weft, $2_{7}$ in breadth from north to fouth, and is 116 in circumference. It it divided into 10 hundreds, in which are onc city, 7 market towns, 118 parifhes, about 10,000 houfes, and 58,000 inhabitants. It is in the diocefe of Llandaff. This cuunty, in the time of the Romans, was part of the dillrict inhabited by the Silures, and had feveral Roman fations. Thus Boverton, a few miles to the fouth of Cowbridge, is fuppofed to be the Bovium of Antoninus: Neath to be his Nidum ; and Loghor, to the welt of Swanfey, to be his Leucarum. The principal rivers of this county are the Rlymuy, the Taff, the Ogmore, the Avon, the Cledaugh, and the Tave. The air, in the fouth part, towards the fca, is temperate and healthiul ; but the nerthern part, which is mountainous, is cold and lictring, full of thick woode, extremely barren, and thin of inhalitants. The mountains, havever, ferve to feed herds of cattle, and fend forth ftreams which add greatly to the fertility of the other parts of the

## $G$ L A $[735]$ i $\quad \leq A$

Gl: mur comen : the $y$ have likewife coal and lead ore. The fouth part is is remarkably fertile, pleatant, an 1 populous, that it is generally thled the garden of Wales; but it has no namufacture. This countr was formerly fuil of caftes, moft of which are now fallen to decay. It has many fmall harbours on the cout for evporting coals and prumition. Of the former it feads large quantities both to England and Ireland; but of the latter, to England almot folely, efpecially butter. It fends two members $)$ parliament, one for the chire, and one for the borough of Cardift the capital.

GLAMOUR, or Gtiver, an old term of popuIar fuperftition in Scotland, denoting a kind of magical miit bolieved to be raifed by forcerers, and which deluded their fpectaturs with vitions of things which had no real cxidence, altered the apearance of thofe which really did exif, 太心.-The eatlern nations have a fimilar fupertition, as we may learn from the Arabian Nights Entertainments and other works of oriental fiction.

GLAND, in Anatomy. See Anatoriy Imicx.
GL.ANDERS. See Farriery Intict.
GLINDORE, a town of Ireland, fituated in the county of Cork and proside of Mamter, neat the harbour of that name.

Glanvos.s Hari $u n$, fituated two leagues weft of the Galley-head in the comty of Corh, province of MinIter, N. Lat. 51. 22. W. I. mug. 8. 56. Between ti is harbour and Rofs the coatt contimucs high and boll, with only two imall coves; that to the eall called Willoye, and that to the wot Cowcove. Thi harbour lies three miles weft of Rofs; and though finall, is an exceeding good one; near it is a cattle of the fame name, and on the upper end is a deep and dangerous glin, called the Leop. Glandore gives title of earl to the family of Crobie.

GLANDULR Renalfs. See Avatomy Index.
GLANS, in Ahatomy, the tip or button of the penis, or that part covered with the prepuce, called allo bnanus. S.e Inatovy Index.

Glans is aifo uled to denote the tip or extremity of the clitoris, from its refemblance, both in form and ufe, to that oi the penis. See Asatowy Index.

GLINVIL, IOSEPH, a learned and ingenious, but fanciful and credulous, writer in the 17 th century, was bonn at Plymouth in 1656, and bred at Oxford. He became a great admirer of Mr Baxter, and a zealous perfon for a commonnealh. Atter the Reltoration, he publilled The Vonity of Dogmatizing; was chofen a fellow of the Reyal Socitty; and, taking orders in 1662, was prefented : 1 the vicarnge of Prome-Schwood in Somerfethire. The fintic year he publithed his Jux Orienalis: in $1 \mathrm{C}_{1} \mathrm{~S}_{5}$, his Scip/is Scientifica; and in the year following, Some Philofophical Condderations touching the being of Wi:ches and Witcheraft, and other rieces on the fame fubject. In 1660 , be publihined Phe ultra; or, The Progiefand Alvancement of KnowJedge fince the Days of Arifotle. He likewife publifhed A feaforable Recommendation ar. 1 Defence of Reafon; and Prizkopatia Pia, or A Difcourfe of the Religions Temper and Tendencies of the Experimental Philofophy. In 1078 he was made a prebendary of Worcefier, and died́ in $\mathbf{1 6 0 0}$.

GLARIS, out of the cantons of Suiferland, is
bounded on the catt, partly by the Gritons, and part ly by the territory of Sargans; on the north, by the bailinick of Gafer, and by the lake Wahlellatt; on the eari, ty the canton of Schwits; and on the foutin, by part of the canton of Uri, and part of the league of the Grifons. It is a mountainous country, being entirely within the Alps.

Glarls, a town of Swiferland, capital of the canton of the fame name, is feated in a plain, at the foot of high craggy mountains. The ftreets are large; and the houfes kept in good repair. It has fome public buildings; among which are two churches, one in the middle of the town, and the other without upon an eminence. In this eminence there is a cavern, with grotefque figures formed by the water that drops therein. The general aflemblies of the country were formerly held on the firft Sundays in May, where all the males above the age of fisteen were obliged to appear. Both the Calvinilts and the Roman Catholics are tolerated in this town, and they bave divine fervice by turns in the fame church. It is leated on the river Lint, E. Long. 9. 13. N. Lat. 47. 6.

GLASGOW, a large city of Lanerhhire or Clydefdale in Scotland, fituated in W. Long. 4. 30. N. Lat. 55.50.

Concerning the foundation of this city we have no authentic records. The word in the Gaelic languacre fignifies a gray forith; from whence it has been inferred, that fome fot in the moft ancient part of the city was originally the refidence of fome blackfmith who had become eminent in his profeflion, fo that the place went by his name.

In the year 562 , a bihopric is faid to have been Bifiopric o founded here by Saint Mungo, or Kentigera, fuppol- G!airaw, ed to be the fon of Thamates, daughter of Loth king tounded of the Picts; but in what Itate the town at that time was, is altogether uncertain. Moft probably the prielts and difciples who attended St Kentigern would contribute confiderably towards its advancement; the aged and infirm, who were unfit for the purpofes of war, or fuch as were religioutly inclined, would come and fettle round the habitation of the holy man, in order to have the benefit of his prayers; and as a number of miracles were faid to have been wrought at his tomb, the fame caufes rould itill contribute to the increafe of the town.

Hitory has not informed us of the umase of the prince who founded and endowed the bihapric of Clatgow in favour of S : Kentigezt. But from an abitract of the life of Kentigeen (contained in Mr Inucs's Critical Enlay on the Incient Inhabitants of Sootend), which was written in the 12 th century, we lam, that the faine being ill ufd isy Marken or Marens, one ot the kinge of the Briton, retired into Wales. On the invitation of Roderic, however, one of Marken's fucceflors, he returned to Glaigew, and exjoyed the fee till 6z:, when he died. He wa besied in the church of Glafgow, where his montument is tilll to be leen ; and we find him marked among the fints in the Roman kalendar, Itunary 13.577.

The immedate liuceftor of Kentigen were Baldrede and Cutwal. The tort ellablilied a religious boufe at lnchiman: the lecould went into Lothian to preach to the Sosons ; and buth of them are ranked as faints in the Roman kubadar, Bahdrede on the 6th of March,
$\qquad$
Glart.

Elafoce: Minin 608, and Conwal on the 18th of May 612. Irm this time, however, till the 1115 , we have no difinct accounts concerning the city or bihopric of

Tarinerity uf the pon. ple in the thene of David I Glakow. We find then, that Davil 1. king of Scotland made an attempt to retricve the people from a flate of grois barbarity into which they were fallen, and reftored to the church thate lands of which the had been robbed. The only a count we have of the tranlattions with regard to Glafgow, during that period, is in the inquifition made by David concerning the chureh lands of Glalgow, and is as follows.-" This church, by the divine appoistment, admitted St Kentigern into the bihopric, tho furnilhed large draughts of knowledge to thole thining after heavenly things, Sic. But a fraudulent dettroyer, employing his common wile:, brought in, after a long feries of time, unaccountable fandals into the Cumbrian church. For after St Kentigern and many of his fucceffors were removed to heaven, various dillurbances everywhere arifing, not only dellroyed the church and her poffeffions, but, watting the whole country, drove the inhabitants into exile. Thefe good men being deltroyed, various tribes of diferent nations flocking in from feveral quarters, pofleffed the forefaid deferted country; but beitg of different originc, and varving from each other in their language and cuitoms, and not eafly agreeing among themielves, they followe the manners of the Gentilcs, rather than thofe of the true faith. The inhabitants of which unhappy and abandoned country, though living like brutes, the Lord, who choufes that none fhould perifh, vouchfiled to vifit in mercy," \&c.

From the year 1116 to the Reformation, the records of the bihopric are tolerably complete. The moll remarkable particulars furnilhed by them are the following.

In 1136 , John Achaius, chofen bihhop of Glafgow by David 1. built and adorned a part of the cathedral, which he folemnly confecrated on the gth of July. The king was prefent at the ceremony; and beftowed on the church the lands of Perdeyk, now Patrick. This pie. late alfo divided the diocefe into the two arehdeanries of Glafgow and Teviotdale; and eftablifhed the offices of dean, fubdean, chancellor, treafurer, facrit?, chantor, and fucceffor; and fettled a prebendary upon each of them, out of the donatives he received from the king.

In 1i74, Joceline, abbot of Melrofe, was elected bihop, and confecrated by likilus, bihop of Lunden in Demmark, the pope's legate for that kingdom, on the if of June 1175 . He rebuilt the cathedral, or rather made an addition to the church already built by John Achaius. He alfo procured a charter from Wil-
$\stackrel{3}{3}$ ereated into a roy borough. liam king of Scotland, erecting Glafgow into a royal borough, and likewife a charter for a fair to be held there annually for eight days.
In 1335 , John Lindfay, bifhop of Glafrow, was killed in an engagement at fea with the Englifh, as he was returning home from Flanders. His fucceflor, William Rae, built the flone bridge over the Clyde. In the time of Mattiew Glendoning, who was elected bifhop in 1387 , the great lpire of the church, which had been built only of wood, was confumed by lightring. The bihop intended to have built another of flone: but was prevented by death, in 1,408 , from ac.
complifhing his purpofe. His fuccetor, William Law- Glafgow, der, laid the foundation of the veltry of the cathedral, $\underbrace{\text { Carg }}$ and built the great tower of ttune as far as the firit battlement. The great tower of the epilcopal palace was founded about the year 1437 , on which Bithop Cameron expended a great deal of money.

In 147\%, William 'Turnbull, a fon of the family of ${ }^{\prime}$ 'afgow Bedrule in Roxburghilire, was chofen bithop. He erected into obtained from King James II. in 1450 , a charter erect-a regaity, ing the town and the patrimony of che bilhops into und the a regality. He alfo procured a bull from Pope Ni- sunsed. cholas V. for erecting an univerfity within the city, which he endowed, and on which he allo beftowed many privileges. He died in 1454 , leaving behind him a mot excellent character. The eitaolithment of the college contributed more than any thing that had been formerly done towards the enlargement of the town. Before this time the town feems to have been inconfiderable. Mr Gibfon* is of opinion, that * Hif. of the number of its inhabitants did not exceed 1500 . Gla $\sqrt{5}$ ow, But though the eflablithment of the univerfity greatly $p 74^{\circ}$ increafed the number of ithabitants, it in fact deitroyed the freedom of the town. Bihop Turnbull feems to :which de. have made a point of it with King James II, that the ftross the city of Glafow, with the bihop's forelt, fhould befreedom or erected into a regality in his favour; which was accord the city. ingly done at the time above mentioned; and this at once touk away all power from the citizens, and tranf. ferred it to the bilhop. As the powers of the bifhop, however, were rechoned by Turnbull infufficient to convey to the members of the univerity all that freedom which he wilhed to betton upon them, he therefore obtained from the king a great many privileges for them; and afterwards he himelf, with the confent of his chapter, granted them many more.

The good effects of the ellablifhment of the college were very foon obvious in Glafrow. The rumber of $t$ Glifgow inhabitants increafed exccedingly; the high ftreet, increafed from the convent of the Elack Friats, to where the by the uni crofsis now placed, was very foon filled $u_{p}$; the ancient road which led to the common being too far diftant for the conveniency of the new inhabitants, the Gal. lows-gate began to be huilt. Soon after, the collerviate church of the bleffed Mary (now the Tron church) being founded by the citizens, occalioned the Trongate itreet to be carried to the weltward as far as the church. The reit of the city increaled gradually towards the bridge, hy the building of the Saitmarket flreet. The burough roads, and the cattle that grazed on the common, were now found infulicient to maintain the increated number of inhabitants; for which reafon a greater degree of attention than formerty was paid to the filling in the river. Many poor people fublited themfelves by this occupation; they vere incorpoated into a fociety; and in order that they might be at hand to protecute their bulinefs, they built a condiderable part of the frect now called the Bridje-gate, but at that time Fiflers gate.

Notwithfanding all thi, however, the city of Glafgow did not for a long time attain the rank among the other towns of Scotland which it holds at prefent. In $155^{\text {6 }}$, it held only the sith place anong then, as appeas by (gueen Mary's taxation. The int oduction of the reformed religion proved for fome time prejudicial to the opulence of the city. The money which

tincour tibution, hercher, was laid on. The city was compelle! to fray 50021 . in money, and 5001 . in goods; and on the return of the rebels from England, they were obliged to furnih them with 12,000 linen thirt, 6020 cloth coats, 6000 pairs of thoes, 6000 pairs of huie, and 6000 bumets. Theef goods, with the monejf formerly paid them, the expence of raifing and fubliftine the two city battalions, and the charge of maintaining the r . bel army in free quarters for ten days, con the community about 14,0001 . flering; 10,0001 . of which they recovered in $17+9$, by an application to parliament.

Change of radron allid methot ti hying.

About the ycar 1750 , a very coniderable change took place in the manner of living among the inhabitants of Glafgow. Till this time, an attentive indultry, and a frugality bordering upon parimony, had been their general characteriftic ; the feverity of the ancient manners prevailed in its full vigour : But now, when an extenfive commerce and increafed manufacures had produced wealth, the ideas of the yeople were enlarged, and fchemes of trade and improvement were adopted which people would formerly have been denominated madmen if they had undertaken; a new tyle was introduced in living, drefs, Luilding, and furniture; wheel carriages were fet up, Fublic places of entertaimment were frequented, and an afembly-room, ball-room, and playhoufe, were built by fubfripuion; and from this time we may dite ali the improvements that have taken place, not valy in Glafgow, but all over the weft of Scotland. The bell method, however, of eftimating the growing improvement of any town, is by the freguency of their applications for affiftance to parliament ; we thall therefore enumerate the acts of parliament which
13. have been paffed in favour of the city of Glafgow fince

Glafgow. This Lak canal, which was undertakea with Gtafgow, a views to reduce the price of coals, has not been attendud with the defired effect; but the other improvements have been productive of very grent advantages.

14
The moft ancient part of the city flands on a rifing Defription ground. The foundation of the cathedral is 104 feet of the crty. hig her than the bed of the river; and the defcent from the high ground reaches to about 100 yard: below the college. The reft of the city is built chiefly upon a plain, bounded fouthward by the Clyde, and northward by a gentle ridge of hills lying in a parallel direction with that river. Thefe grounds, till lately, confifted of gardens and fields; but are now covered with buildings, in confequence of the increafing wealth and population of the city. The ftreets are all clean and well paved; and feveral of them interfecting one another at right angles, produce a very agreeable effeet. The four principal ilreets, croffing one another in that manner, divide the city hearly into four equal parts; and the different views of them from the crofs, or centre of interfection, have an air of great magnificence. The houle, coniliting of four or tive floors in height, are built of hewn ftone, generally in an exceeding good tathe, and many of them elegant. The moft remarkable public buildings are,

1. The Cathedral, or High Church, is a magnificent of the cabuilding, and its fituation greatly to its advantage, as thedral. it itands higher than any part of the city. It has been intended to form a crofs, though the traverfe part has never been finilhed. The great tower is founded upon four large mafly pillars, each of them about 30 feet in circumference. The tower itfelf is $25 \frac{1}{\frac{1}{2}}$ feet fquare within; and is furrounded by a balluttrade, within which rifes an octangular fire terminated by a vane. The tower upon the weft end is upon the fame level, but appears not to have been finified, though it is covered over with lead. In this tower is a very large bell 11 feet four inches in diameter. The principal entry was from the weft; the gate if feet broad at the bafe, and 17 teet in height. The welt end of the choir is now appropristed for a place of divine workip; and is divided from the remaining part by a ltone partition, which is eaclofed by another ftone wall parting it from the nave. It is impofiible to form an adequate idea of the avfful folemnity of the place occanioned by the loftinefs of the roof and the range of pillars by which the whole is fupported.

The nave of the church rifes four fteps higher than the choir ; and on the wefl fide ftrod the organ loft, formerly ornamented with a variety of figures, but now defaced. The pillars here are done in a better tahe than thofe in the choir, and their capitals are ormamented with fruits. The arched roof of the altar is fupported by five pillars, over which was a fine terrace walk, and above it a large window of cunious worknamllip, but now thut up. Oin the north lide of the altar is the veitry, being a cube of 28 feet, the roof arcliced and vaultel at top, and fupported by one pillar in the centre of the houfe. Arched pillars from every angle terminate in the grand pillar, which is 19 feet high. The lower part of the fouth crols is made ufe of as a burying place for the clergy of the city; and is by much the fineft piece of workmanhip in the whole building. It is 55 feet long, 28 broal, and

## G L A $\quad 739$ i $\quad$ i i. is

Giarow. 15 high; axched and wauted at top, and fupported by a middle range of pillars, with their capitals highly ornamented; correcponding to which are columis adjoining to the walls, which, as they rife, fpring into femi-arches, and are everywhere mot at acute angles by their oppofites, and are ornamented with carvings at the clofing and croling of the lines. At the calt end of the choir you defeend by llights of tleps upon each fide into pafiages which, in former times, were the principal entries to the burying vault which is immediatcly under the nave. It is now made ufe of as a parih church for the barony of Glafgow; and is full of pillars, fome of them very mally, which fupport the arched roof: but it is a very uncomfortable place for devotion. The face under the altar and veftry, though now made ufe of as a burying place by the heritors of the barony, was formerly, according to tradition, employed for keeping of the relicks; and indeed, from the beautiful manner in which this place is finilhed, one would imagine that it had not been deflined for common ufe. Here is hown the monument of St Mungo, or Kentigern, with his figure lying in a cumbent pollure.

The whole length of the cathedral within the walls is 284 feet, its breadth 65 ; the height of the choir, from the floor to the canopy, 90 feet; the height of the nave, 85 feet; the height of the middle tower, 220 feet. This fabric was begun by John Achaius in 1123 , and confecrated in 1136 : and continued by fucceeding bifhops till fuch time as it was finilhed in the manner in which it ftands at prefent. The wealth of the fee of Glafgow, however, was not futficient for fo great an undertaking, fo that they were obliged to have recourfe to all the churches of Scotland for alliztance in it.
This venerable edifice was in danger of falling a rictim to the frenzy of fanaticifm in 1579 ; and oned its prefervation to the fpirit and good fenfe of the tradefinen, who, upon hearing the beat of drum for collecting the workmen appointed to demolilh it, flew to arms, and declared that the firt man who pulled down a fingle flone fhould that moment be buried under it.

Near the cathedral are the ruins of the billop's palace or cattle, enclofed with a wall of hewn itone by Archbilhop James Beaton; the great toner built by Archbilhop Cameron in 1426.
2. St Andrew's Church was begun by the community in 1739 , and finifhed in $\mathbf{1 7 5 6}$. It is the finelf piece of modern architecture in the city; and is built after the model of St Martin's in the Fields, London, whofe architect was the famous Gibibs. The length of the church is 124 feet, and its breadth 66 . It has a fine arched roof, well ornamented with figures in flucco, and fuftained by ftone columns of the Corinthian order. Correfpondent to the model, it has a place for the altar on the eafl, in which is a very ancient Vene. tian "indow; but the altar place being feated, makes this end appear to no great advantage. The fronts of the galleries and the pulpit are done in mahogany in a very elegant manner. The fipe by no means correfponds with the rell of the builuing; and, inftead of being an ornament, difgraces this beautiful fabric. Its teeight is 1 of feet.

Belides the cathedral (which contains three congre-
gations, and St Andeen's church, there is a momice chat an of others, as the Coilege church, Ram'-hor:, Trom, Wynd, \&c. together with an E.c. lith chapel, 11 ghand church, feveral feceding meeting houfe, and other for fectaries of varius denominations.

17
3. The Callesc.- The front of this building extonds The on along the eaft fise of the high itreet, and is upward of "je. 3,50 feet long. The gate at the entrance is decorated with ruthics, and over it are the hing's arms. The buiiding confins of two principal counts or iquare . The firit is 88 feet long and $f_{i}$ broad. The welt fide is elevated upon tione pillars, on which are placed pilafters fupporting the Doric entablature, and ormamented with arches forming a piazza. Above thefe is the public hall; the afcent to which is by a double tlight of fleps enclofed by a handiome ftone ballullade, upoa the right of which is placed a lion, and on the left an unicorn, cut in freeftone. The fipire flands on the eatt fide, is 135 fect high, and has a very good clock. Under this is the gateway into the inner and largef court, which is 103 feet long and 79 broad. Over the entry, in a niche, is a thatue of Mr Zacharias Boyd, who was a benefactor to the univerfity. On the eath fide of the court is a narrow paflage leading into a handfome terrace walk, gravelled, 122 feet long by $6 \not+$ feet broad. This walk is enclofed to the eall by an iron pallifade, in the centre of which is a gate leading into the garden. This lalt confifts of feven acres of ground, laid out in walks for the recreation of the thudents; and there is alfo a botanic garden. On the fouth lide of the walk flands the library; a very neat edifice, well conitructed for the purpofe intended, and containing a very valuable collection of books. Underneath are preferved in cafes all the Roman iufcriptions found on Graham's Dike, together with altars and oher antiquities collected from different parts of Scot-land.-Adjoining there is an obfervatory, well furnithed with aftronomical inftruments. The college alfo poifeffes, by bequeft, the late Dr Hunter's famous anatomical preparations, library, and mufeum. A building is now (1806) preparing for its reception.
4. The Tollooth, or Town-Houfe, is a magnificent Townand extremely elegant building. The front is adorned tho:st, \&:5 with a range of Ionic pilaters; and is clevated on flirong ruticated pillars with arches, forming a piazza for merchants and others to thelter themfelves from the weather when met upon bufinefs. Onc of the apartments was the alfembly hall; a neat room, 47 feet long, and 24 in breadth and height, frimhed in a good tafte, though too fmall for the city. The town hall is a very fpacious and lufty apartment, 52 feet long by 27 broad, and 24 in height. It is funilied in a very grand manner; the ceiling is divided into different compartments well ornamented. In it are full length portraits of King James VI. and VII. Charles I. and II. William and Mary, Queen Ame, King George 1. II. and III. and Arclibald duke of Argyll in his julticiary robes. The two ladt are by Ramay. (Oppofite to the front of this building is dee exchange wall, which is well paved with freelloac, and enclofed from the itrect by bone pillars. In the middle of this area is an equettrian tiatue of King William 1II. placed upon a lofty pedelat, and furrounded with an iron rail.-In 1781, the exclange under the piazzas was greatly enlarged, by taking down the loner fate of the town hell and anfembly

Hitors of the trade of Gilatgow.

The trade of Glafgow is faid to have been firf promoted by one Mr William Elphinitone in 1420 . This trade was moft probably the curing and exporting of falmon; but the firft authentic document concerning Glafgow as a trading city is in $154^{6}$. Complaints having been made by Henry V1II. king of England, that feveral Englifh flips had been taken and robbed by veffels belonging to Scotland, an order of council was iffued, difcharging fuch captures for the future; and among other places made mention of in this order is the city of Glafgow. The trade which at that time they carried on could not be great. It probably confifted of a few fmall veffels to France loaded with pickled falmon; as this fifhery was, even then, carried on to a confiderable extent, by Glafgow, Renfrew, and Dumbarton. Between the years 1630 and 1660 , a very great degree of attention feems to have been paid to inland commerce by the inhabitants of Glafgow. Principal Baillie informs us, that the increafe of Glafgow arifing from this commerce was exceedingly great. The exportation of falmon and of herrings was alfo colitinued and increafed. In the war between Britain and Holland during the reign of Charles II. a privateer was fitted out in Clyde to cruife againf the Dutch. She was called the Lion of Glafgow, Robert M•Allan commander ; and carried five pieces of cannon, and 60 hands.

A firit of commerce appears to have arifen among the inhalitants of Glafgow between the years 1660 and 1707. The citizens who diftinguihed themfelves moft during this period were Walter Gibfon and John Anderfon. Gibfon cured and packed in one year 300 latts of herrings, which he fent to St Martin's in France on board of a Dutch veffel called the St Agate of 450 tons burden ; his returns were brandy and falt. Hc was the firt who iipported iron from Stockholm into Clyde. Anderfon is faid to have been the firft who imported white wines.

Whatever their trade was at this time, it could not be confiderable: the ports to which they were obliged to trade lay all to the eaftward : the circumnavigation of the ifland would therefore prove an almoft unfurmountable bar to the commerce of Clafgow; and of confequence the people on the caft coaft would be pofteffed of almoft all the commerce of Scotland. The anion with England opened a field for commerce for which the fituation of Glafgow, fo convenient in refpect to the Atlantic, was highly advantageous. Since that time the commerce of the eaft coaft has declined, and that of the welt increafed to an amazing degree. No Lioner was the treaty of union figned, than the inhabitants of Glafgow began to profecute the trade to VirHinia and Maryland; they chartered veffels from Whitehaven, fent out cargoes of goods, and brought back tubacco in return. The method in which they of firt proceeded in this trade was ecrainly a very prti-
dent one. A fupercarge went out with every veffel. Gluigow. He bartered his goods for tobacco, until fuch time as he had either fold cif his goods, or procured as much tobacco as was fuflicient to load his veffel. He then immediately fet out on his return ; and if any of his gonds remained unfoid, he brought them home with him. While they continued to trade in this way, they were of great advantage to the country, by the quantity of manufactures which they exported; their own wealth began to increafe; they purchaled thips of their own; and, in 1718 , the firft veffel of the property of Glafgow crofled the Atlantic. Their imports of tobacco were now confiderable, and Glafgow began to be looked upon as a confiderable port; the tobacco trade at the ports of Brittol, Livcrpool, and Whitehaven, was obferved to dwindle away; the people of Glafgow began to fend tobacco to thele places, and to underfell the Englifh even in their own ports. Thus the jealoufy of the latter was foon excited, and they took every method in their power to deftroy the trade of Glafgow. The people of Briftol prefented remonftrances to the commiffioners of the cuftoms at London againit the trade of Glafgow, in 3717 . To thefe remonflrances the merchants of Glafgow fent fuch anfwers to the commiffioners, as convinced them that the complaints of the Brifol merchants were without foundation. But in 1721, a moft formidable confederacy was entered into by almoft all the tobacco merchants in South Britain againft the trade of Glafgow. Thofe of London, Liverpool, and Whitehaven, prefented feverally to the lords of the treafury, petitions, arraigning the Glafgow merchants of frauds in the tobacco trade. To thefe petitions the Glafgow people gave in replies; and the lords of the treafury, after a full and impartial hearing, were pleafed to difmifs the caufe with the following fentence: " That the complaints of the merchants of London, Liverpool, and Whitehaven, were groundlefs; and that they proceeded from a fpirit of envy, and not from a regard to the intereft of trade, or of the king's revenue."

But the efforts of thefe gentlemen did not ftop here. They brought their complaints into the houfe of commons. Commiffioners were fent to Glafgow in 1722, who gave in their reports to the houfe in 1723 . The merchants fent up dilinct and explicit anfwers to thefe reports; but fuch was the intereit of their adverfaries, that thefe anfwers were difregarded. New officers were appointed at the ports of Greenock and Port Glafgow, whofe private inftruclions feem to have been to ruin the trade if poflible, by putting all imaginable hardflips upon it. Hence it languidied till the year 1735; hut after that time it began to revive, though even after its revival it was carried on but lowly for a confiderable lpace of time.

At laft, however, the active and enterprifing firit of the merchants, feconding the natural advantages of their fituation, prevailed over all oppofition; and the American trade continued to flourilh and mereafe until the year 1775 , infomuch that the importation of tobacco into Clyde that year from the provinces of Virginia, Maryland, and Carolina, amounted to $57,1+3$ hogharads. But lince the breach with America, this trade las now greatly fallen off, and very large fims are faid to remain due to the merchants from that guarter of the world.

Wi:h regard to the mandazures of Cinfow, Mr Gioton is of onevion that the commerce to Anerica firt !ugge ed the idea of introducing them, in any conderable desece at leali. The firl attempts in this why woe abs: die year 1,25 , and then increafe for fome time was tery how, nor did they besin to be confiderable till grest encouragen.ent was given by the legilature to the linen masufueture in Scothand. The firdt caules of the fuccefs of this manufacture were the ast of parliament in 17,78 , whereby the wearing of French cambrics was prohibied under fevere penalties; that of $17: 1$, allowing weators in hax or hemp to fettle and exercife their trades anywhere in Scolland free from all corporation ducs; and the bounty of three halfpence per yard on all lineris exported at and under 18d. por yard. Since that tine a firit of manufacture has been evcitad among the inhabitants of Glafgow; and great variety of geods, and in very great quatuity, have been manufactured. Check:s, linen, and linen and cotton, are manufactured to a wreat extent. Printed linens and cottons were begun to be manufachured in 1738 ; but they only made garments till 1754 , when handkerchiefs were firf printed.

Incles were firit made here about the ycar :7ミニ. The engine loons wed at that time were to inconvenient, and took up fo much time in making the good; that the Dutch, who were the only people poffefled of the large incle lonas, were almoft foldy in pefletion of this manufacture. Mr Herser, who began this branch in Glafgow, was formie of the difadravages under which it laboured, that lie went over to HulPard; and in fite of the care and attention which the Dutch took to conceal their methods of manufacturing, he brought over with him from Hacrlem two of their Looms, and one of their workmen. This Dutchman remained fome years in Glatgow; but on fome difquit he went to Manchefter, and inftructed the people there in the method of carrying on the manuticture.

In I 757, carpets were begun to be made, and are now carried on to a confiderable extent. Hunters cloths, blankets, and other goods of the fame lind, are alfo made.

Pefides the ere, a great varicty of articles are manufactured at Glafgow, of which our limits will not permit us to enter into a detail, fuch as foap, refining of fugar, irommongery, braf, jewellery, glais both common and white, pottery, \&ic. Type for plinting are made in this city by Dr Withon and Sons, equal, if not fuperior, in beauty to any others in Britain. Frinting of books was firft begun here by George Anderfon about the year tóss. But there was no good printing in Glagow till the gat 1735 , when Robert Urie priated foveral buoks in a very clegant manner. The highef perfection, however, to wlich printing hath yet been carried in this place, or pethaps in any other, uas by the late Robert nud indrew Foulis, fwho beyan in the year 1740; as the many correct and fplendid ecitioss of bouhs printed by them in diferent languzes iuthecotly tellify. Some of their clatlire : $t$ is faid, are hell in furh high ellcem abread, a. to fell nearly at the price of ancient MSS. The fame ferthemen alf eitathined an academy of painting; but the weat:l of Scotland being unequal to the Wdertalins, it has leen lince given up.

maised, the morclants of Glatgow have tumed their Gimon: atiention more to manufachures, which have of late, efpecially that of cottons and mullins, increafed in a very rapid deave, and bid fair for putting the city in a noore flourihing condition than ever it was before. The manufisturing houfes, the intlux of people for carrying on the manufactures, the means and encouragement which thete afford to population, and the wealth thence derived by individuals as well as accruing to the community, have all tended lately to increale, and are daily increaling, the extent of the city, and the elegance of the buifdings. Befides vacious improvements in the old ftrects, feveral hatidfome new ones as well as new fquares have been added. The lite of theie new buildings is the tract of rifing ground alieady mentioned as the north boundary of the toma prevous to its late extenfion. The welterns pre of it, which is perfectly level, is occupied by $s^{2}$ factors fquaze, denominated Georse's Spuare; two hics uf wiich are buitt and inhabited, and a third besun. The grafs plot in the middle is enclofed with a handtome iron railing. The fquare is deficient in reGularity; the homes on the wett fide being a flory higher than ihote of the eaft; but in other relpects it is very neat. 'To the eaft of this fuare are levera? new itreets lad out and paved, and fome of them almot complately built on. The principal, though as yet the moil incomplete of thofe Ricets, is Ingram Strect, which runs from ealt to weft. From this the others begin ; fome of them being carried northward up the hill, others going fouthward and joining the main itreet of the town. One of the linett of thefe crofs Hreet, is Hutchefon Street.

The fouth boundary of the city was mentioned to rhe river., be the Clyde. Over this river there are two tridges. \&c. One of them, the Old Bridge, built about 400 years aso by Archbithop Rae, but fince repaired and partly rebuilt, confitts of eight arches; and conncets the fubunb of Gorbals, fituated on the oppotite fide of the niver, with the city. The other is the Now Bridge, defcribed above-On the banks of the river, ealtward, is the Green, a foot appropriated to the whe of the inhabitants, with conveniences for wathing and drying linens, and with agreeabie and cxtenfive walhs for recreation.

On the fame or fouth fide of the town, we tward, is the Broomiclaw, where the quay is fituated. Till within thefe fery years, the river ficre add for feveral miles dillance, was fo fhallow and fo woitructed by thoals, as to admit only of mall craft from Grcenock, Port Glafgow, and the Highlam? ; but of late it has been cleared and decpened for as to admit veliels of confiderable burden; and it is intended to m...ke the depth as nearly cyual as puffible to that of the canal, in order that the whel from Ireland and the wett coatt may not be inducel eaclufively to alcend the weft end of the canal and deliver their goond at Canal bafon, but may come up Clyde and unford at the Broumicla".

The gnvernment of the city of Glafyow is velled in G serna provoll and thece bailit, it dean of quild, deacon ant, rew. conveener, and a treafurer, with a common conacil of the wiv. 13 merrhant, and 12 mechonics. The provot and two of the bailies mult, by the lit of the borourgh, be cluated from the merchant rauk, and the other bailie

The climate of Glafgon, fmilar to tiat nowt other patis of the mand, is wable ; hat the are the circambancen peculiar to its leca! firuation whicis tend to atlech it mote than that of tome other place i eurcr the niddic of the country. That part of :Soce tinty in which Glafgow is fituted, is almol in the indromett part of the ithmus beenint t! e Forth and Clyede, from which potitio: the ait is frequently iefrethed tomperate breezes from the fea. ' lhe whi in furh-wat and wett for nearls tho-third of the year, which is laturated with vapear in its pallage actoi the diantic; and the ily being rrequently chutad with it, the heats of timme are not to intenfe ts in lome utler places. roge are not fo common as in the neinthourhed of Fdiabur l', and levere froits ate kldom of long continuance, nor are fnows ether very deep, nor do they lie lens. Thunder and lightning ine mare about Glafgow, and lidom deftructive.

The foll in the wicinty is party a ricia elos and partly a inglat fand. The grain rateu mund the city is not halicient for the conduns: of the inh..Litants, but vat cuantiticsare browda from Ireland, Aymise, and the caft contry. Winie digsimg the iudadation for the Tontine beidhngs in the midh of the city, a piece of at loat was found liveral feet below the tiurtace of the s.round, indedded in fand and grave, firm which it would appear that the channd of the river had once ran in that direction. In Jugul 1801 , while repairin s a divifion of the cathedral, $\{$ elos the pavement oppolite to the pulpit, alout two fect den, part of athe man fheleton was fuand, and at gold chain ahout 30 inche long lying abure the bones of the ieg. Whe date on the thene was 1509 . Wht the infitition in the Saxon character was wholly ctinced.

The frit time we hear of glafs made among the Romans was i,s the reign of Iiberiss, when lliny relates that an artit had his houfe d:m likhed for mok. ing glafs malleable, or ratier deable; thou, APetronius Arbitar, and fome others, allure us, that the emperor ordered the artil to be beheaded for his invention.

It appears, however, that before the coriguelt of Britain by the Romans, glafo houfes hat heen we?ed in this iftand, as well as in Gaul, Spain, and Irtly:Hence, in many parts of the country are to be tound enmulets of glafs, having a narrow perforation and thick rim, denominated by the remaining B itons s coma: na: redh, or glafs adairs, and which were 1 robably in furmer times ufed as amulcts by the diuidst. It can ts:e Aro fearcely be quettioned that the Brions were fufficientlygstmurz well verfed ia the monufacture of gids, to form out Cown. of it masy mere wiefnl inflruments than the glaf beids, Finkory indeed alfures us, that they did manufacture a comiderable quantity of glafs vellels. Thefe, like their annu'ets, wele molt probably grean, bluc, yellow, or blach, and many of them curioufly ftreaked with other colours. The procefs in the manufature wou'd be nearly the fame with that of the Gauls or Spariads. The land of their thores being reduced to a fuffi ient degree of finenefs by ant, was mixed with three-fourtl:s 5 B
of i:s welite of their nitre (m.toch the fome nith our h.ely $)$, and both were melted together. The metal was then poured into othe: veffels, where it was left to larden into a mafs, and afterwards replaced in the furnace, where it became tranfparent in the boiling, and was acterwads figured by blowing, or modelling in the lath, into fuch veifels as they wanted.

It is not probable that the arrival of the Romans would imptove the glafs manufacture among the Britons. The tafte of the Romans at that time was jutt the reverfe of that of the inhabitants of this iflanl. The former preferred fllver and gold to clafs for the compofition of their drinking veffels. They made indeed great improvements in their own at Rome, during the government of Nero. The veffels then formed of this metal rivalled the bowls of porcelain in their dearnefs, and equalled the cups of cryital in their tranfparency. Put thefe were by far too coltly for common ufe; and therefore, in all probability, were never attempted in Britain. The glafs commonly made ufe of by the Romans was of a quality greatly inferior; and, from the fragments which have been difcovered at the fations or towns of either, appear to have confited of a thick, iometimes white, but moflly blue green, metal.

According to venerable Dede, artificers fkilled in mahing glafs for windows were brought over into England in the year 6:4, by Abbot Benedict, who were emfloyed in glazing the church and monaflery of Wercmouth. According to others, they were firf brought over by Wilfrid, bithop of Worceller, about the Cume time. Till this time the art of making fuch glafs was whnown in Britain; though glafs windows did not bessin to be common before the year 1180 ; till this period they were very farce in private houfes, and confidered as a kind of luxury, and as marks of great magnificence. Italy had them firit, next France, from thence they came into England.

Venice, for many years, excelled all Europe in the faenefs of its glaffe; and in the thirteenth century, the Venctions were the only people that had the fecret of werking cryftal loohing glaffes. The great glafs works vere at Muran, or Murano, a village near the city, which furnithed all Europe with the fineft and larget glaftes.

The glafs manufacture was firf begun in England in 1557: the finer fort was made in the place called Crutched Friars, in London; the fine flint glafs, little inferior to that of Venice, was firft made in the Savoy houfe, in the Strand, London. This manufacture appears to have been much improved in 1635 , when it was carried on with fea coal or pit coal inftead of wood, and a monopoly was granted to Sir Robert Manfell, who was allowed to import the fue Venetian fint glaffes for driuking, the art of making which was not brought to perfection before the reign of William III. But the firft glafs plates, for looking glafles and coach windows, were made, 1673 , at Lambeth, by the encouragement of the cuke of Buckingham; who, in 1670 , introduced the mannfacture of fine glafs into England, $\mathrm{t} y$ means of Venetian artifts, with amazing fuccefs. So that within a century faft, the French and Englith have not only come up to, tut even furpaffed the Venctians, and we are now no longer fupplied from abroad.

The French made a confiderable improvement in the art of glafs, by the invention of a method to caft very
large plates, till then unknown, and fcarce practifed yet by any but themfelves and the Englifh. That court applied itfelf with a laudable indully to cultivate and improve the glafs manuficture. A company of glafs. men was eftablihed by letters patent; and it was provided by an arret, not only that the working in glafs fhould not derogate any thing from nobility, but even that none but nobles thould be allowed to work therein.

An extenfive manufactory of this elegant and valuable branch of commerce was fritt eftablihed in Lancathire, about the year 1773 , through the fpirited exertions of a very refpectable body of proprietors, who were incorporated by an act of parlianent. From thofe various difliculties conitantly attendant upon new undertakings, when they have to contend with powerfal foreign eliablihments, it was for fome time confiderably embarraffed; but government, of late, having taken off fome reftriclions that bore hard upon it, and made fome judicious regulations relative to the mode of levying the evcife duty, it now bids fair to rival, if not furpal, the molt celebrated continental manufactures, both with refpect to the quality, brilliancy, and fize of its productions.

With regard to the theory of vitrification, we are T1 cory of almoft totally in the dark. In general, it feems to be vitification that flate in which folid bodies are, by the vehement uncentain. action of fire, litted for being dillipated or carried off in vapour. In all vitrifications there is a plentiful evaporation: and if any folid fubftance is carried off in vapour by the intenfe heat of a burning fpeculum, a vitrification is always obferved previoully to take place. The difference, then, between the flate of fufion and vitrification of a folid body we may conceive to be, that in the former the ciement of fire acts upon the furts of the folid in fuch a manner as only to disjoin them, and render the fubitance fluid; but in vitrification the fire not only disjoins the particles, but combines with them in a latent Hate into a third fubflance; which, having now as much fire as it can contain, can receive no further change from that element except being carried off in vapour.

But though we are unable to effect this change upon folid bodies withont a very violent heat, it is otherwife in the natural procefles. By what we call cryfiallization, nuture produces more jerfect glaffes than we can make with our furnaces. Thefe are called precious fones; hut in all trials they difcover the effential properties of glas, and not of flones. The moft diftinguilling property of glafs is its rafifing thic force of tire, fo that this ekment camot calcine or change it as it does, other bodies, but can only melt it, and then carry it off in vapours. To this lait all the frecious ftones are fubject. The diamond (the hardelt of them all) may be difipated in a lefs degree of lieat than what would difipate common glafs. Nor can it he any objection to this idea, that tome kinds of glafs are capable of being converted into a kind of porcel in ly a long-continued cementation with certain matcrials. This change happens only to thole kinds of glafs which are made of alkaline falt and fand; and Dr Lewis hath fhown that this change is produced by the diffipation of the faline principle, which is the leaft fixed of the two. Glals, therefore, we may ftill confider as a fubftance uron which the fire

## G L A [ 7 7 ] $]$ G L A

Glais. has no ather effect than either to melt or diflipate it in vapour.

The other properties of glafs are very remankable, 3

 tome of which follow:I. It is one of the molt elaftic bodies in nature. It the force with which glas balls Itrike each other be reckoned 16 , that wherewith they recele by virtue of their elatticity will be nearly 15 .
2. When glafs is fuddenly cooled, it becomes exceedingly brittle; and this brittleneds is fometimes attended with very furpriling phenomena. Hollow balls made of unannealed glafs, with a fmall hole in them, will fly to pieces by the heat of the hand only, if the liole by which the internal and external air communicate be itopped with a finger. Some vellels, however, made of tuch unamealed glafs have been difcovered, which have the remarkable property of retilting very hard itrokes given from without, though they thever to ricces by the thocks received from the fall of bery light and minute bodies dropped into their cavities. Thele glafles may be made of any dhupe : all that needs be oblerved in making them is, that their buttom be thicker than their fides. The thicker the bottom is, the eafier do the glaftes break. One whole bottom is three fingers breadth in thicknefs alies with as much eafe at leant as the thinnett glafs. Some of thele vellels have been tried with Atrokes of a mallet fufficient to drive a mail into wood tolemably hard, and have held good without breaking. They have allo relited the hoock of feveral heavy bodies, let fall into their cavities, from the height of two or three feet; as mulket balls, pieces of iron, or other metal pyritec, jaiper, wood, bone, \&c. But this is not furprifing, as other glafles of the fame thape and lize will do the fame: but the wonder is, that taking a thiver of flint of the fize of a fmall pea, and letting it fall into the glafs only from the height of three inches, in about two feconds the glafis tiles, and fome imes at the very moment of the thock ; nay, a bit of flint no larger than a grain, dropped into feveral glaffes fucceffively, though it did not immediately break them, yet when i:t by, they all tlew in lefs than three quarters of an hour. Some other bodies produce the lame effect with flint; as lapphire, diamond, porcelain, hard tempered fteel; allo marbles fuch as boys play with, and likewife pearls.

Thefe experiments were made before the Royal Suciety; and fucceeded equally when the glafies were held in the hand, when they were relled on a pillow, put in water, or filled with water. I is alfo remarkable, that the glafies froke unon having their bottoms flightly rubbed with the finger, though fome of them did net fly till half an hour after the rubbing. If the glaffes are everywhere extremely thin, they do not break in thefe circumbtances.

Some have pretended to account for thefe phenomena, by faying, that the bodies dropped into thec vellels caufe a concution which is itronger than the cohenive force of the glafi, and confequently that at rapture muft enfue. But why does not a bull of ion, gold, ilver, or copper, which are perhays a thoutand time heavier than the Hist, produce the fame efled? It is becaufe they are not elanic. But fucely iron is "ere elathic than the end of one's finger. Mr Euler hat endesoured to account for theic apmearances f.o
his princip, of percathon. He thint.

 folute apparent ihength of the itroke. A .... to his principles, the geat hardnes and ata nf :\% it gute of the fint, which makes the made on co. with the glafs evtremely limall, noght to can.... . is . predion on the glats vally greater tima len, ". . other metal; and this may account for the wht; breaking the vellel, thagh the bullet, even follons froin a contiderable beight, does mo damme. H1allow cups made of green buttle glats, fome of tham th: es inches thick at the tottom, were inatuatly bre'sen by a thiver of thint weighins about two grams, thaugh time; had refiled the thock of a muflet ball from the incigh. of three fect.

That Mr Euler's theory cannot be conclutive mo: than the other, muli appear cvident from a very diy! condideration. It is not by angular bolics alone that the glafles are broken. The marbles with which chil dren play are round, and yet they have the lame cffee: with the angular flint. Belides, if it was the me: forse of percuffion which broke the glatle-, undoub: edly the fracture would Always take place at the very infant of the froke; but we have tem that this did not happen fometimes till a very contiderabic yace of time had elapled. It is evident, theretiote, thet :lis cffeit is occalioned by the putting in motion fome fubtile theid with which the libalance of the ghas is filled: and that the motions of this thuid, when unce excited in a particular part of the glafe, fün propagate themlelves through the whole or greatelt part of it, by which means the colnefive power becomes at latl ton weak to refift them. There can be little doube that the fluid jult now mentioned is that of electricity. I. is known to exit in glafs in very great quantity : and it alfo is known to be capable of breaking glafies even when annealed with the greateit care, if put into too violent a motion. Probably the cooling of glals ha:ity may make it more electric than is conment with it cohefive power, fo that it is broken by the leat i:creafe of motion in the electric flutl by friation or othenwite. This is evidently the cale when it is broken by rubbing with the finger; but why it thould allo break by the mere contact of tlint and the other bodies above mentioned, has not yet been fatisfuctorily accounted for.
 glafs tubes placed in cert in circumitances. Whan thede are laid beture a fire in a lowizontal polition, having ' their estrematies pronerly fupported, they a.. puire a rotatory metion round their axie, and i.llo a $1^{\text {ruggref- }}$ five motion toward, the fire, even when their fupposts are declining from the fire, fo that the tu'e wil move a little way up hill towards the fire. luis.
vol 1xviii. p. $47{ }^{\circ}$ Greater degree of exactnets than hath hitherto been found practicable; and fince his experiment; wace made, one of the tubes 18 inches long, being compared with a folid glal's rod of the fame length, tise former was found by a gyrometer to expand four times as much as the other, in a heat approaching to that of builing oil.-On account of the general quality which glats has of expanding lefs than metal, M. de Luc recommends it to be ufed in pendulums: and he fay; it has elfo thin good guabity, that its expanions are always equable, and proportioned to the degrees of heat; a mality which is not to te found in any other Fubitance yet hnown.
5. Glais appears to be more fit for the condenfation of wapours than metallic fubitances. An open glais thled with water, in the fummer time, will gather drops of water on the outide, juth as far as the water in tl:e infide reaches; 'and a perfon's breath blown on it manifettly moftens it. Glafs allo becomes moift with dew, when metals do not. See 1)
6. A drinking glafs partly fillod with water, and nubbed on the brins with a wet finger, yields mufical noies, higher or luwer as the glafs is more or lefs full; and will mahe the liquor trik and leap. See Hirmonici.
7. Glafs is poliffed of very great elecirical virtues.

Materials fur Making of GLass. The material, whercof claf is made, we have already mentioned to be falt and land or flones.

1. The fat here ufed is procured from a fort of athes brought fions the Levant, called pulovine, or ruchotta; which athes are thofe of a lont of water plant called $f_{a} / z+$, cut down in the fummer, dried in the fun, and $y$ burnt in leap, either on the grownd or on iron grates; the ahles falling into a fit, grow into a burd mals, or
sione, fit for ufe. It may allo be procured from com. Giafe. mon kelp, or the ahies of the fucus veficulofiss. See $\overbrace{\text { Gian }}^{\text {, }}$ Kelp.

To extract the filt, thefe ahes, or polverine, are powdered and fifted, then put into boiling water, and there kept till one third of the water be confumed; the whole being firred up from tine to time, that the ahes may facorporate with the Huid, and all its falts be extracted: then the veffel is flled up with new water, and boiled over again, till one half be confumed; what remains is a furt of ley, ftrongly impregnated with falt. This ley, boiled over again in freth coppers, thickens in about 24 hours, and fhoots its falt; which is to be ledled out, as it fhoots, into carthen pans, and thence into wooden vats to drain and dry. This done, it is giolsly pounded, and thus put in a fort of oven, called caliar, to dry. It may be added, that there are cther plante, belides kali and fucus, which sield a fait fit for gials : fuch are the commoit way thittle, bramble, hops, normwood, woad, tobacco, fern, and the whole leguninous tibe, as peafe, beans, 心.c.

Pearlathes form a leading tlux in the manufacture of gluf, an $c$ montly fupply the place of the Levant afhe, the barilius of Enain, aid many other hinds, w'sich were formenly b:uaght hew for making beth glats and toup.

There are other tluxes ufed ior different kinds of glaf, and fur vations purpoles, as calcined lead, nitre, fea falt, boras, arlenic, tmilhs clibkers, and woodathes, containing the carth and liviviate falts as produced by inciueration. With regard to thele feveral Hluxes, we may obferve, in general, that the more calx of lead, or other metallic earth, enters into thie compofition of any glars, fo much the more fulible, fift, coloured, and denfe this glals is, ind reciprocally.

The colours given to glais by calces of lead, are fhades of yellow: on the other hand, glaffes that contain only faline tiuxes partake of the properties of lalts; they are lefs heavy, lefs dente, harder, whiter, more brilliant, and moe brittle than the former ; and glatfes containing both faline and metallic fluxes do alfo partake of the properties of both thele fubitances. Glafes too faline are eafly fufceptible of alteration by the action of air and water : efpecially thofe in which alkalies prevail ; and thele are ailo liable to be injured by acids. Thofe that contain too much borax and arlenic, though at firf they appear very beautifal, quickly tarnilh and become opake when expofed to air. By attending to thefe properties of different fluxes, phlogitic or faline, the artif may know how to adjul the proportions of thele to fand, or fowdered tlints, for the various kinds of glafs. See the article Vimrification.
2. The fand or ftone, called by the artits sar/o, is the fecond ingredient in glati, and that which gives it the body atal firmmets. Thefo Emes, Agricola obferves, muld be fich as will fule; and of thele fuch as are white and tranfurent are teit; fo that cryftal challenges the precedency of all others.

At Venice they chictly ufe a fort of pebble, found in the river Telino, relembling white marble, and called cwerg. lo. Indeed Ant. Neri aflures us, that all flones which will atrike fire with fleel, are fit to vitrily; but Dr Moret hows, that there are fome exceptions from

 grity ; it in to se we!l wal... ', ...hich is all the foll. ration it neek. Oun ufbluatios are famile! wib
 foth and Mrettute in Korr, and whe the conver ior green glats from Wimhich?

Some mention a chird ing reation in aralt, wic. manganele, a kind ef piedo hadano cuy top in Germany, Ita'y, and ner in hondip tails in bomerterthere. Bui the poportion herear to the $-4 t$ is very fico fiCurable ; beille, that it is l.at mied in all glaff. Its olice is to purse of the natural seenilh colour, and give it fome other tinchure required.
For this purpote it fhould be cholen of a deep colour, asd tree from frecks of metalline appearame, os a ligliter calt ; manganere requires to le wecli calcined in a hut fumace, and then to undergo a therugh levization. The effect of mangane è in deftruing the coLuan of ghan, and heace caled the fory of glate, is accomed far by M. Monsany, in his Trasedes Comerers par la Putare on Emai, ia the fullowing maner: ti.e mangane?e de.troys the greeth, olive, and blue colu urs of glaf, by adding to them a p.eple tinge, and by the mixture produci:s a blackih browa colour; and as blectanc.s is cauled merely by an abforption of the rays of light, the bizekini tiage given to the glals by the mixture of coinur, prevent, the retlection of fo many rays, and thas renders the ghaf leff coloured ther befote. But the black prodiced by this fublance fuggells an obvius rafon for wint it very fraringly ia the fe compoitinas of glafs which are required to be very tranfparent. Nitre or faltpetre is allo uled with the bame intortion; for by delroying in a certain degree the phlogiton wiich gives a ffrong tinge of yellow to gla's repared vith lead as a hlux, it ferves to free it from this coloured tivge; and in friine glafies, nitre is sequilite in a fmaller profortion to render them fulfinently tranfparent, as in the cate of looking glats and oth er hinds of platec.

Kinds of Class. The manufactares glafs now in wer may be divilel haw thee asual kind; whie tranfarent glab, coloured giaf, and common green or bottie glas : Of the fiflt hind these is a great variety; as the lint whf, as it is calle 1 with us, and the German crinal alof, which are applied to the fame ufer ; the giafs for hartes, for mirrors, or looking glafes; the gleff for uindows and other lighte; and the glafs for phials and fanal veltels. And the fe again difer in the L.bitat a., emp loyed as fluxes in forming them, as well as in the coarfeneis or finenefy of fuch as are ufed fur the: tody. The fint and cryfurl, mirror and bet! windos clafs, not only require fuch purity in the fluxes, as may render it pration wile to fice the glafs pericetly from all colour; but firr the fame resfon liherif, rither the whice Ljon fond, calcind tlint, en w! ie ;etbere, thould be uiel. The others do not donaid the fame minely in the choice of the matcrials;

 d do ter. See Mace CCXLVII.

Lase cricar refembles an wer ton feet long, feven fret bow, and two deep; the fee, which ia Britain is fea coni, is put into a trench on one fide of the furnace; and the fime reverberuting from the roci up on the frit calcine it. The glaf furnace, or working furnace, is round, of three yalds diameter, and two high : or thas promorioned. I. is drived into three prow, ench of which is valtad. The lower part is proy erly called the croan, and is male in that form. IW ald is to keep a Lriks aire, which is never put out. The mouth is called the locca. There are ieveral holes in the arch of this crown, through which the flame palie finto the fecond vault or partition, and reverberates imto the pots filled with the ingredients above mentioned. Roun the infides are eight or more pots placed, and filing pots on them. The number of pots is alrays duuble that of the boccas or mouthe, or of the number of worlmen, that each may have one pot refined to work out of, and another for metal to refine in while he works out of the other. Through the working holcs the metal is taken out of the pots, and the pots are put into the furnace; and thefe holes are flopped with moreable coiers made of lute and brick, to fercen the workmen's cyes from the foorching hames, On each fide of the bocca or mouth is a bocarella olittle hole, out of which coloured glafs or finer mete! is taken from the pilin's pet. Above this oven there is the third uven or lecr, above five or fix yards long, where the vellis or glafs are annealed or cooled: this purt coifints of a tuwer, beifes the leer, into which the flame afends from the furnace. The tower has two mouths, through which the glafles ate put in with a fork, and fet on the floor or bottom: but they are drawn out on iron prans calted fraches, through the leer, to cool by degres; ; the that they are quite culd by the time they reach the mouth of the leer, which enters the fanofel or room where the glalfes are to be flowed.

But the green-glafs furnace is fquare; and at euth angle it has an arch for anncaling or cooting glafes. The metal is wrought on two oppolite fides, and on the other two they have their colours, into which ne made linnet holes for the fre to conse from the fur nace to bake the frit, and to dicharge the im the Fires are made in the arches to anneal the work, is that the: whole pricets is done in one furnace.

Thefe furnaces mu? not be of beick, but of hand fandy itones. In France, they build the out brifh; and the ineer mas, to luas the fire, is m. .

## G L A [ 750 ] G L A

 Sort cई fullers earth, or tubacco-pipe clay, of which anth they alio make their meiting pots. In Britain the pot: are made of Stourbridge clay.Nir Blancourt obferves, that the worf and roughet wook in this art is the changing the pots when they are worn out or cracked. In this cate, the great working hole mull be uncovered ; the faulty pot mult be tuhen out with iron hooks and forks, and a new orie muit be fpeedily put in its place, through the lames, by the hands only. For this work, the man guards himfclf with a garment made of lkins, in the thape of a pantaluon, that covers him all but bis eycs, and is made as wet as pomble; the eyes are defended with a proper lort of glafs.

Influmevts for Making of Glass. The infruments made ufe of in this work may be reduced to thefe that follow. A blowing pipe, made of iron, about two feet and a half long, with a wooden handle. An iron rod to take up the glafs after it is blown, and to cut off the former. Sciflars to cut the glafs when it comes off from the firt hollow iron. Shears to cut and thape great glafees, \&c. An iron ladle, with the end of the handle cafed with wood, to take the metal out of the refining pot, to put it into the workmen's pots. A fmall iron ladle cafed in the fame manner, to flim the alkalic falt that fivims at top. Shovel, onc like a peel, to take up the great glaffes; another like a fire-horel, to feed the furnace with coals. A hooked iron fork, to itir the matter in the pots. An iron rake for the fame purpofe, and to ftir the frit. An iron fork, to clange or pull the pots out of the furnace, \&c.

Compofitions for White and Cruflal Glass, I. To make crufal glafs , take of the whitef tarfo, pounded fimall, and fearced as fine as flour, 203 pounds; of the Galt of polverine 130 pounds; mix them together, and put them into the furnace called the calcar, firft heating it. For an hour keep a moderate fire, and keep flirring the materials with a proper rake, that they may incorporate and calcine together; then increafe the fire for five hours; after which take out the matter; which being now fufficiently calcined, is called frit. From the calcar put the frit in a dry place, and cover it up from the duit for three or four months. Now to make the glafs or cryftal: take of this cry tlal frit, called alfo iollito; let it in pots in the furnace, adding to it a due quantity of magnefia or manganefe: when the two are fufed, caft the fluor into fair water, to clear it of the falt called fandiver; which would otherwife make the cryftal obfcure and cloudy. This lotion muft be repeated again and again, as often as needful, till the cryital be fully purged; or this fcum may be taken off l,y means of proper ladles. Then fet it to boil four, five, or fix days; which done, fee whether it have manganefe enough; and if it be yet greenifh, add more manganefe, at difcretion, by little and little at a time, taking care not to overdofe it, becaufe the manganefe inclines it to a blackifh bue. Then let the metal clarify, till it becomes of a clear and hining coluur; which done, it is fit to be blown or formed into veffels at pleafure.
2. Flint gia/s, as it is called by us, is of the fame general hind with that which in other places is called cryital ghad. It has this name from being originally made with calcined flints, befure the wfo of the white
find was underlicod; and retains the neme, though no Ali.ts are now uled in the compofition of it. 'This tlint glafs differs from the other, in having lead for its tlux, and white fand for its body; whereas the fluve, wied for the cayfal hafs are falts or arfenic, and the body confilts of calcined tlints or white river pebbles, tarfo, or fuch ftones. To the whate fand and lead a proper proportion of nitre is added, to burn away the phlogiton of the lead, and alfo a fmall quantity of magnefia; and in fome works the g ufe a proportional quantity of arfenic to aid the tluxing ingredients. The moit perfect kind of thint glafs may be made by fufing with a very ftrong fire 125 pounds of the white fand, 50 pounds of red lead, 40 pounds of the belt pearl ahes, 25 pounds of nitre, and fise ounces of magnefia. Another compofition of tlint glafs, which is liid to come nearer to the kind now made, is the following: 125 pounds of fand, 54 pounds of the befl peanl athes, 36 pounds of red lead, i2 pounds of nitre, and 6 ounces of magnefia. To either of thefe a pound or two of arfenic may be added, to increafe the tlux of the compofitioni. A cheaner compofition of that glafs may be made with 120 pounds of white fand, 35 pounds of the beft pearl ahhes, 40 pounds of red lead, 13 pounds of nitre, 6 pounds of arfenic, and 4 ounces of magnefia; or inftead of the arfenic may be fubitituted 15 pounds of common falt; but this will be more brittle than the other. The cheapeit compolition for the worlt kind of flint glafs contifts of 125 pounds of white fand, 32 pounds of red lead, 20 pounds of the beft pearl athes, io pounds of nitre, 15 pound of common falt, and fix pounds of arfenic. The beft German cryftal glafs is made of 123 pounds of calcined flints or white fand, 70 pounds of the beft pearl ahes, 10 pounds of faltpetre, half a pound of arfenic, and five cunces of magnefia. And a cheaper compofition is formed of 122 pounds of calcined flints or white fand, $4^{6}$ pounds of pearl aflies, 7 pounds of nitre, 6 pounds of arfenic, and 5 ounces of magnefia.

A glals much harder than any prepared in the common way, may be made by means of borax in the following method: Take four ounces of boras, and an ounce of fine fand; reduce both to a fubtile powder, and melt them together in a large clofe crucible fet in a wind furnace, keeping up a Arong fire for half an hour ; then take out the ctucible, and when cold break it, and there will be found at the bottom a pure hard glafs capable of cutting common glafs like a diamond. This experiment, duly varied, fays Dr Shaw, may lead to feveral ufeful improvements in the arts of glafs, enamel, and factitious gems, and fhows an expeditious method of making glafs, without any fixed alkali, which has been generally thought an effential ingredient in glafs, and it is not yet known whether calcined cryftal or other fubflances being added to this falt inftead of fand, it might not make a glafs approaching to the nature of a diamond.

There are three principal kinds of glaffes, difinguihed by the form or manner of working them; viz. 1. Round glafx, as thofe of our veffels, phials, drinking glafics, \&ic. 1I. Table or window glafs, of which there are divers kinds; viz. cromn glaf, jealous glafs, \&ic. IIl. Plate qiafr, or mirror flafi.
I. Iorking or Blowins Round Glass. The working furnace, we have obleaved, is round, and has fix boccas

## G L A

 furnare is hatered, and the p to of firit ane at this bet in the furrace; two wher fmill holes, called lecerariad forve to lade or tahe out the neicied meti, at the end of an iron, to woh the ghat. At the uticier holes they fut in puts of fabible inseredient, to te preparsd, and at laft erpysticd into the lading por.
There are fix pois in cach furnace, all made of to-bacco-pipe clay, proper to furtain not only the lieat of the fire, but alfo the efeet of the pulcrine, which penecrates every thing, elic. There are only two of thefe pot that work : the reft ferve to prepire the mater for them. The fire of the furnace is make and kept up with dry hard wood, call in whihout intermilion at lix "ucrtures.

When the matter contained in the two pots is fufficiently vitrifed, they proceed to blow or fathion it. For this pupole the workman dips his blowing pipe iato the meltity pot; and by turning it about, the metal fichs to the iron more firmly than turpentine. This he repats four times, at each time rolling the end of hiv intrument, with the hot metal thereon, un a fiece of plate iron; over which is a vefil of water which help to cool, and to to confolitate and to difpole that matter to bind more firmly nith wiat is to be taken next out of the melting pot. But after l.e has dipt a fourth time, and the workman perceives there is meta enough on the pipe, he claps lis mouth inmediately to the other end of it, and blows erently through the iron tube, tili the metal lengthens line a bladder about a foot. Then he rolls it on a marble thone a little while to polifh it; and blows a fecond time, by which he brings it to the thape of a globe of about 18 or 20 inches diameter. Every time he blows into the pipe, be removes it quickly to his chech; otherwife he would be in danger, by often blowing, of drawing the thame into his mouth: and this globe may be fatiened by returning it to the fire ; and brought into any form by itamp irons, which are always ready. Whea the glafs is thus blown, it is cut off at the collet or neek; which is the narrow part that fluck to the iron. The methol of performing this is as follows: the pipe is relied on an iron har, clofe by the collet; then a drop of coll water being laid on the collet, it will crack about a guarter of an inch, which, with a fight blow or cut of the fhears will immediately feparate the collet.

After this is done, the operator dips the iron rod into the melting pot, ly which he extracts as much metal as ferses to attra t the glafs he has made, to which le now fixes this rod at the bottom of hi, work, ofpolite to the quering made by the breaking of the colle:. It this pwition the glals in carried to the great Locca or month of the over, to be heated and fealded; by which means it is auain put into fuch a foft flate, that, by the help of aa iron intlrument, it can the presced, opered, and widened, without breaking. Bat the seffel is rot failued till it is returned to the great Loech; vhere being again heated thoroughly, and turned ģuickly about with a circular motion, it will open to arty dize, by the mans of the heat and metion.

It there remain any fapenflaties, they are cut off with the thears; for till the ghfs is root, it remains in a hert texibe Atate. It is therefore taken from the beccen

## $751 \quad]$ <br> (; $1 . A$

and caricd to an easthen betich, covered with brands, Giaf. whish are coal) catmguthed, lieeping it turning; becaute that nowion prevents asy fettlins, and preferses an crames in the lace of the glaf, where, at it cools, it (rmes t) its conditiency; being firft cleared from the irou ra!! : a thight troke by the land of the workman.

If the wifel conceived in the workman's mind, and whole Lod's is alrealy made, requires a foot, or a handle, or any other menber or decoration, he makes them fepara:cly; and now eliays to join them with the help of hot netal, which he takes out of the pots with his i on rod: but the glafs is not brought to its true hardnels till it has pafled the leer or amealing oven, deferibed before.
11. IH rking or lowing of Winduze or Table Glase. The method of working rotend glats, or veffels of any furt, is in every particular arplicable to the working of window or table glafs, till the blowing iron has been dift the fourth time. But then inllead of rounding it, the wortman blows, and fo manages the metal upon the iron plate, that it extends two or three feet in the form of a cylinder. This cylinder is put again to the fire, and blown a licond time, and is thus repeated till it is extended to the dimenfions required, the fide to which the pipe is fixed diminilhing gradually till it ends in a pyramidal form ; fo that, to bring both ends nearly to the fame diameter, while the glais is thus flexible, he adds a little hot metal to the end oppofite the pipe, and draws it out with a pair of iron pincers, and immediately cuts off the fame end with the help of a little cold water as before.

The cylinder being now open at one end, is carried back to the bocca; and there, by the belp of cold water, it is cut about eight or ten inches from the iron pipe or rod; and the whole length at another place, by which alfo it is cut off from the iron rod. Then it is heated gradually on an earthen table, by which it opens in length; while the workman, with an iron tool, altemately lowers and raifes the two halves of the cylinder; which at latt will open like a theet of paper, and fall into the fame flat form in which it ferves for ufe; in which it is preferved by heating it over again, cooting it on a table of copper, and lardening it 24 hours in the annealing furnace, to which it is carried upon forks. In this furnace an hundred tables of glals may lie at a time, without injury to each cther, by feparating them into tente, with an iron thiver between, which diminithes the weight by dividing it, and keeps the takes flat and even.

Of window or table glefs thenc are various forts, made in different places, for the we of building. Thofe mofl hown among us are given un by the author of the Bulker's Dicionary, :a folluns:
3. Cirsth, of which, firs Neri, there are two kinds, difinguihed by the piaces where they are wrought; viz. K:atelifi crown glaf, whinh is the bedl and clearett, and was firth made at the Bear garden, on the Bamhfide. Soutlwath, but lince at Katcliff: of this there are 24 tables to the cafe, the tables being of a circubar form, alrut th: eve feet fix incher in dhancter. The other hind, o: Lambeth crown ghaf, is of a darker coluur than the fornor, and nore naclining to green.

The Lett window or crown glafs is made of white fatd 6 pounds, of purified jearl afhes 30 pounds, of Tiltu:

## G L A [ 52 j G L A

 nii - half a pound. It the slafs thould prove yellor, maznef. muld be addel. A cheaper compofition for w.: de" ghaf contifts of 10 pounds of whie fan ${ }^{1}, 25$ Founds af u: purified pearl ahes, 10 pounds of common falt, 5 pound of nitre, 2 pounds of a-fenic, and one cance and a halt of mazne:in. The common or crean $\because$ nitug glafs is compoled of 60 noun is of whie find, $\hat{\imath}$ pounds of unpurified pearl ahes, 10 pound, of comrion falt, 2 pounds of arfenic, and 2 ounces of masne. fa. But a chearer compotition for this purrofe confilts of 122 pourds of the clieapeft white fand, 30 pounds of unpurified pearl alles, $6^{-}$pound's of wend ahes, well burnt and fited, 20 pounds of common falt, an 55 pounds of arfenic.2. Frenc.? ghafs, callied a!fo Normaney ghaf, and formerly Lorromegla/s, becaule made in :tofe arovinces. At prefent it is made wholly in the nine gl fs works; fire whereof are in the forent of Lyons, four in the county of Eis; the laft at Beaumont near R ouen. It is of a thinner kind than our crown glafs; and when ?aid on a piece of white paper, anpears of a dirtyih green coloss. There are but 25 tables of this to the cafe.
3. German $\xi^{/} / \mathrm{s} / \mathrm{s}$ is of two kinds, the white ant the grect: the frit is of a whitifh celour, but is fubject to thofe fmall curved Areaks obferved in our Newcatle glafs, though free from the fpots and blemithes thereof. The green, befides its colour, is liable to the fome Areaks as the white, but both them are fraighter and lefs warged than our Nencafte glafs.
4. Dutch gla/s is not much un the our Newcafte glafs either in colour or price. It is frequently much warred like that, and the tables are but fm:11.
5. Newcafle gla/s is that moft ured in England. It is of an ath colour, and mach fubject to fnerks, freaks, and other blemifhes; and beddes is freguently warped. Leybourn fays, there are 45 tables to the cafe, each containing five fuperficial feet: fome fay there are but 35 tables, and ix fect in each tatle.
6. Phial glafs is a kind betwixt the fiint glafs and the common bottle or green glafs. The beft kind may be prepared with 120 pounds of white fand, 50 founds of unpurified pearl ahes, 10 pounds of common falt, 5 pounds of arfenic, and 5 ounces of magrefia. The compofition for green or common phial glafs confins of 120 pounds of the cheapelt white fand, 80 pounds of wood ahes well burnt and fifted, 20 pounds of year! afhes, 15 pounds of common falt, and 1 found of arfenic.

The common bottle or green is formed of fand of any kind fluxed by the afhes of burnt wood, or of any parts of vegetables; to which may be added the for ce or clinkers of forges. When the fofteft fand is ued, 200 pounds of wood afhes will fuffice for 100 pounds of fand, which are to be ground and mised to ether. The compofition with the clinkers confifts of $1 / \%$ pounds of wood afhes, 100 pounds of fand, and 50 pounds of clinkers or fcorice, which are to be ground and mixed together. If the clinkers cannot be ground, they muft be broke into fmall pieces, and mixed with the other matter without any grinding.
III. Hiorking of Plate or Alirror Glass. 1. The materials of which this glafs is made are much the
fome as thefe of other works of glafs, viz. sn alkit, fat: ane! himed.

We fit, however, fhould not be that estrened from polvecine es the ath's of the Syrian kili, but that trom Earlila, growing about Alicant in Spain, It is very rare taze we can have tae barilia pure: the Spaniards i: 'ural' the herb make a practice of mising another
 adhus hand to it to increale the weight, which is eatily diforered if the addition be only made atet the builiag of the afhes. but nex: to innoffible is made it the boil:ug. It is from this aduiteration that thele threats and nther defects in plate glafs ari.e. To presare the falt, they clean $i$ : well of all forejon mattes: pound or grind it with a kind of mill, anc finally Inf: it retty finc.

P-arl ahes, properly purified, will furaih the alkali falt renuitite for this parpofe; but it will be necelary to ald borax or common fatt. in order to facilitate the fu wat, ad prevent the glafs from fuffening in that devree of heas in mich is is to be wrought into plates. For purifing t'ee panl athes, dillolve them in four times their we:wnt of boiling water, in a pot of caft iron, al ways kept clean from rult. Let the folution be removel intu a clean tus, and remain there 24 hours or Hager. Hawing decanted the clear part of the Aluid from the dregs or fediment, put it azain in the iron port, and evaporate the water till the faits are left perfectly dry. Preferve them in ftone jars, well fecured from air and moiture.

Pearl alles may allo be purified in the higheft degrce, fo as to be proper for the manufacture of the molt tranfparent glafs, by pulverizing three pounds of the deit pearl afhes with fix ounces of faltpetre in a glafs or marble mortar, till they are well mised; and tisen putting part of ite mixture into a large crucible, and expofing it in a furnace to a ttrong heat. When this is red hot, throw in the reft gradually; and when the whole is red hot, pour it out on a moiltened ftone or marble, and put it into an earthen or clean iron por, with ten pints of water; heat it over the fire till the falts be entirely melted; let it then Itand to cool, and filter it through paper in a pewter cullender. When it is filtered, put the fluid again into the pot, and evaporate the falt to drynefs, which will then be as white as fnow ; the nitre having burnt all the phlogitic matter that remained in the pearl athes after their furmer calcination.

As to the fand, it is to be fited and wathed till fuch time as the water come off very clear; and when it is well dried again, they mix it with the falt, paf. fing the mixture through another fieve. This done. they lay them in the anuealing furnace for about two hours; in which time the matter becomes very light anc white: in this fate they are called frit or fritia; and are to be laid up in a dry clean place, to give them time to incornorate: they lie here for at ledit a year.

When they would employ this frit, they lay it for fome hours in the furnace, ading to fome the fragments or fiards of old and ill made glafles; taking care firft to calcine the hards by heating them red loot in the furnace, and thus cafting them into cold water. To the mixture mut likewife be add-

## $G$ L A

cis
ed rant: ${ }^{2}$ nefe, to promote the funo and purification.

The befl compofition for looking glafs plates confins of 60 pounds of white fand cleanfed, 25 pounds of puritied pearl ahes, 15 pounds of laltpetre, and 7 pounds of beran. If a yellow tinge hlould affect the glais, a fmall proportion of magnelia, mised with an equal quantity of arfenic, thould be added. An ounce of the magnelia may be fint tried; and it this proves infulicient, the quantity thuld be increafed.

A cheaper compontion for looking glais plate confils of 60 pounc's of the white fand, 20 pound of pearl athes, $t o$ pourds of eonmon fatt, 7 pounds of nitre, a pounds of ardenic, and I pound of boran. The matter of which the glantes are made at the farous manufacture of St Gobin in France, is a compotition of folder and of a very white land, which are carefully cleaned of all hetere eneous bodies; aiterwards watted for feveral times, and dried fo as to be pulverized in a mill, confliting of many peftles, which are moved by horfes. When this is done, the land is lifted through fills fieves and driad.

The matter thus far prepared is equally fit for plate glafs, to be formed either for blowing or by cufing.

The larget glafles at St Gobin are run; the middie fized and fmall ones ate blown.
2. Blowing the plates. The workhonfes, fumaces, \&c. ufed in the making of this kind of plate glats, are the fame, excent that they are fimbler, and that the carquaifes are dipoled in a large covered gallery, over ugainit the furnace, as thofe ii the following article, (1) which the reader is referred.

After the materials are vitrified by the heat of the fire, and the glafs is futiciently refine el, the norkman dips in his blowing iron, fix teet long, and two inches in diameter, fharpened at the end which is put in the mouth, and widened at the other, that the matter may adhere to it. Ey this means be takes up a fimall ball of matter, which flicks to the end of the tube by conItantly turning it. He thet, Llows into the tubé, that the air may fuell the annexed ball; and carrying it over a bucket of water, which is placed on a fupport at the height of about four feet, he prinkles the end of the tuve to which the matter adheres, with water, till turning it, that by this cooling the matter may coalcfee with the tube, and be fit for futaining a greater weight. He dips the tube again into the fame pot, and proceeds as before ; and dipping it into the pot a third time, he takes it out, loaded with matter, in the flape of a pear, about ten inches in diameter, and a foot long, and corls it at the bucket; at the lame time blowing into the tuke, and with the affliance of a latourer, giving it a balancin: motion, he caufes the matter to lengthen; which, by repeating this operation feveral times, alfumes the form of a cylinder, terminating like a ball at the bottom, and in a point at the ton'. Alse athltant is then placed on a ioon three Teet and a lalf hirh; and on this ftool there are two upright pieces of timber, with a crofs bean of the fame, ior fupportiag the glafs and tule, which are Sont in an oblisue profition by the allitant, that the mater wohman may with a puncheon fet in a wooden handle, and with a mallet, make a bole in the mals: this liole is drilled at the centee of the ball that ormifates the cylinder, and $i$ abuot an inch in diameter.

V's. IX. Furt II.

When the glas is pierced, the defects of it are ret. $\qquad$ coived; if it is tolerably pertect, the wowman lays the tab horizontally on a little iron treflel, plamed on the fuppert of the apurtare of the furnace. Hivi.gg expoted it to the heat fur about half a quarter of ak hour, he tahes it awy, and with a pair of ling and broa! heats, extremely harp at the end, widens the glaf, by mimating the thear, in:o tire hole made with the punciroon, whilit the allitant, munted on the Rool, turns it round, til! at latt the opening is fo large as to make a perfect cylimder at bostom. When this i, dune, the workman lays his glai upon the tuefiels at the m uth of the furnace to heat is: he then gives it to his atlitart on the Itool, and with large thears cuts the mafs of matter up to half its height: There is at the mouth of the furnace an iron tonl called pomtil, which is now heatins, that it may unite and coalefce with the glas jult cut, and perform the office which the tube did before i was farated from the glats, This pontil is a piece of iron fix feat long, and in the fonm of a cane or tuine, havine at the end of it a frall iron bar, a tunt bong, lid equally upon the long one, and making with it a 1 . Tin little bor is full of the matter of the olsts, about four inches thick. This red hot pontil is prefented to the dianctia of the glaf, which conicices immediately "ith the matter romin the puntil, fo as to fupport the glafs for the foilowing operation. When this is done, they feparate the tube from the glaf, by friking a few blows with a chiliel u:on the end of the tube which has been couled; fo that the glafs treaks dircitly, and makes this feparation, the tulse being difcharçed of the elf ifs now adhering to the pontil. They next prefent to the furnace the pontil of the glafs, laying it on the treffel to heat, and redden the end of the glats, that the workman may open it with his hears, as he has already opened one end of it, to complete the cylinder the affilant holding it on his ftool as before. For the lait time, they put the pontil on the tenfel, that the glafs may become red hot, and the workm*is cuts it quite open sith his ihears, right over agsint the fore, mentioned cut ; this he does as before, taing care that both cuts are in the fame line. In the mean time,
 ceive the glats upon an iron fhovel two feet and a half long without the hanile, and two fee: wide, with a finall border of an inch and a half to the right and left, and towards the handle of the hovel. Upon this, the glafs is loid, flatening it a little with a frall itick a fout and a half lome, fo that the cut of the glafs is turned upuards. They feparate the glafs from the pontil, by driking a few gentle hlows between the two with a chifiel. 'Ale glats is then removed to the mouth of the hot carquallie, where it becomes red hot gradually ; the workman, with :3 iron toul fix feet long, and widened at the end in form of a chan at cards four inches lones, and two inches wide on each tide, very flat, and not half an inch thick. gradually lity up the cut part of the glafs to unfold it out of its form of a thattened cylinder, and reader it finouth, by turning it duwn uma the hoarth of the carquafle. The tool already d-fcibed heing intinuted within the cylinder, werforms this operation by heing puthed bard againt all the parts of the glafs. When the glats is thos made quate faupth, it is muted to the bottom of the

$$
\text { sC } \quad \text { carquaite }
$$ cargavifte or amealing furnace with a firall iton raker, and ranged thue with a little iron hook. When the carquaile is full, it is ftopped and comented as in the calc of ron glanes, and the olats romains there for a fortuift to be annealed; alter which time they are trken out to be polthed. A worknan can make but one glafs in an hour, and he works and relts for fix hours alternately.

Such was the mothod formerly made ufe of for blowing plate ghts, looking glanos, \&ic.; but the workmen. by this method, cound never exceed 50 inches in lencth, and a proprorional breadth, becaufe what were laryer were ahoss found to warp, which prevented them from reflecting the objects regularly, and wanted fubftance to bear the necellary grinding. Thefe imperfections have been remedied by the following invention of the Sieur Abraham Thevart, in France, about the year 1683 .
3. Celine or Running of Large Mirror Glass Plates. The furnace is of a sery large dimenfion, environcarguaifes, befides others for making of frit and cal- cining old pieces of glafs. This furnace, before it is fit to run glafs, conts 35001 . It feldom lafts above three years, and even in that time it mult be refitted every fix months. It takes fix months to rebuild it, and three montlis to refit it. The melting pots are as big as large hog theads, and contain abont 2000 weight of metal. If one of them burfts in the furnace, the lofs of the matter and time amounts to 2501 . The materials in thefe pots are the fame as defcribed before. When the furnace is red hot, thefe materials are put in at three different times, becaufe that helps the fufion; and in 24 hours they are vitrified, refined, fettled, and fit for calting. A is the bocca, or mouth of the furnace; B is the ciltern that conveys the liquid glafs it receives out of the melting pots in the furnace to the calting table. Thefe cifterns are flled in the furnace, and remain therein fix hours after they ate filled; and then are hooked out by the means of a large iron chain, guided by a pulley, placed upon a carriage with four wheels marked C, by two men. This carriage has no middle piece ; fo that when it has brought the ciften to the cafting table D , they ilip off the bottom of the ciftern, and out ruhhes a torrent of diaming matter upon the table: this matter is confined to certain dimenfions by the iron rulers EE, which are moveable, retain the fluid matter, and determine the width of the glafs; while a man, with the roller $F$ retling on the edge of the iron rulers, reduceth it as it cools to an equal thicknefs, which is done in the Cpace of a minute. This table is fupported on a worden frame, with trufles for the convenience of noving to the annealing furnace; into which, firewad with find, the new plate is thoord, where it will hardu in about 10 days.

What is moft furprifing throughout the whole of this operation, is the nuickncfs and addrefs wherewith fuch madly cifterns, lilled with a flaming matter, are taken Wut of the furmace, conveyed to the table, and poured therein, the glafs ipread, \&cc. The whole is inconceivable to fuch as have not been eye witneffes of that furpring inamfacture.

As fatl us the cillems are emptid, they carry them back to the furnace and take firth ones, which they sputy as before. Thus they cominue to do fo long as
there are any full cilterns; laying as many plates in each crarquainie as it will hold, and fopping them up with duur of baked earth, and every chink with cement, as foon as they are full, to let them ameal, and cool again, which requires about 14 days.

The firit running being difpatched, they prepare another, by filling the citterns anew from the matter in the pots; and after the lecond, a third; and even a fourth time, till the melting pots are quite empty.

The ciflerns at each running thould remain at leaft fix hours in the furnace to whiten; and when the firlt annealing furnace is full, the catting table is to be carried to another. It need not here be oblerved, that the carquaifes, or annealing furnaces, mult firit have been heated to the degree proper for then. It may be obierved, that the oven full, or the quantity of matter commonly prepared, fupplies the running of 18 glaties, which is performed in 18 hours, being an hour for each glats. The workmen work fix hours, and are then relieved by others.

When the pots are emptied, they take them out, as well as the citterns, to fcrape off what glafs remains ${ }_{2}$ which otherwile would grow green by continuance of fire, and poil the glaffes. They are not filled again in lefs than $3^{6}$ hours; fo that they put the matter into the furnace, and begin to run it every 54 hours.

The manner of heating the large furnaces is very fin. gular ; the two tifors, or perfons employed for that purpofe, in their hirts, run fiviftly round the furnace without making the lealt itop: as they run along, they take two billets, or pieces of wood, which are cut for the purpofe: thefe they throw into the firt tiffart; and continuing their courfe, do the fame for the fecond. This they hold without interruption for fix hours fucceffively; after which they are relieved by others, \&c. It is furpriing that two fuch fmall pieces of wood, and which are confumed in an initant, fhould keep the furnace to the proper degree of heat; which is fuch, that a large bar of iron, laid at one of the months of the furnace, becomes red hot in lefs than half a minute.

The glafs, when taken out of the melting furnace, needs nothing farther but to be ground, polithed, and foliated.
4. Grinding and Polißing of Plate Glass. Glafs is. made tranfparent by fire ; but it rcceives its luftre by the fkill and labour of the grinder and polifher; the former of whom takes it rough out of the hands of the maker.

In order to grind plate glafs, they lay it horizontally upon a Hat dlone table made of a very fine grained frectone; and for its greater fecurity they plafter it down with lime or itucco; for otherwife the force of the workmen, or the motion of the wheel with which they grind it, would move it about.

This ftone table is fupported by a ftrong frame A, made of wood, with a ledge quite round its edges, riling about two inches higher than the glafs. Uponthis glafs to be ground is laid another rough glafs not above half fo big, and fo loofe as to dide upon it ; but cemented to a wooden plank, to guard it from the injury it muft otherwife receive from the feraping of the wheel to which this plank is fattencd, and from the weights laid upon it to promote the grinding or triture of the glailes. The whole is covered with a wheel $\mathrm{B}, \mathrm{rixL} \mathrm{A}$. t

\end{array}\right.
$$

Elafs. made of hard hight wool, about fix inches in diameter, by pulling of which backwards and forwards alternately, and fometimes tuming it round, the workmen, who always iland oppotite to each other, produce a coniant attition between the two glaties, and bring then to what digree of moothnels they pleafe, by tirt pouring in water and corrle land; after that, a finer fort of fand, as the work advanceth, till at laft they mult pour in the powder of fmalt. As the upper or incumbent glats polithes and grows fmoother, it muft be taken away, and another from time to time put in its place.

This engine is called a mil? by the artilts, and is uled only in the largelf fized glalles; for in the grinding of the lefier glalles, they are content to work without a wheel, and to have only foxr wooden handles faftened to the four corners of the slone which loads the upper plank, by which they work it about.

When the grinder has done his part, who finds it very difficult to bring the glafs to an exact plaimefs, it is turned over to the poliher; who, with the fine powder of tripoli ftone or emery, brings it to a perfect evennefs and luitre. The initrument made ufe of in this branch is a board, $c c$, furnihed with a felt, and a fmall roller, which the workman moves by means of a double handle at both ends. The artif, in working this roller, is affilted with a wooden hoop or fpring, to the end of which it is fixed : for the fpring, by contantly bringing the roller back to the fame points, facilitates the action of the wo:kman's arm.

Colouring of Glass. That the colours given to glafs may have their full beauty, it muft be oblerved, that every pot when new, and firf uled, leaves a foulneis in the glafs from its own earthy parts; fo that a coloured glafs made in a new pot can never be bright or perfectly fine. For this reafon, the larger of thefe, when new, may be glazed with white plals; but the fecond time of ufing the pots lofe this foulnefs. The glazing may be done by reducing the glal's to powder, and moiltening the indide of the pot with water; while it is yet moift, put in fome of the powdered glals, and hake it about, till the whole inner furface of the pot be covered by as much as will adhere to it, in confequence of the moifture. Throw out the redundant part of the powdered glais; and the pot being dry, fet it in a furnace fulliciently hot to vitrify the glafs adhering to it, and let it continue there fome time; after which, care mult be taken to let it cool gradually. Thote nots which have lerved for one colour muft not be ufed For another; for the remainder of the old matter will foil the colour of the new. The coloursmuft be very carefully ealcined to a proper degree; for if they are calcined either too much or two little, they never do well ; the proper proportion, as to quantity, mult alfo carefully be regarded, and the furnaces mult be fed with dry hard wood. And 11 the procentes fucreed much the better if the colour le uted diviledty, that is, a part of it in the frit, and the rell in the melied metal.

A hard glaf, proner for receiving colours, may be Ireared by puisericing 12 pounds of the beti fand, clearfed by wathing in a glafs or thint motar, and mis. ing feven pounds of pearl afles or any fixed alhaline ialt purified with sitre, one pound of dialtpetie, and half a pound of boras, and punding them together. A glais lets hard may be prepared of terelve pounds
 rified with fatpetre, one pound of nitre, half a pround of iomax, and four ounces of afienic prepared as before.

Amoly! coiur. Sce Pioric below, and the article - dutifust.

Balas culour. Put into a pot cryllal frit, thrice wall ed in water; tinge this with mansonefe, prepared into a clear purple ; to this add alum n cativom, lifted fine, in imall quantities, and at leveral times : this will make the glafs grow yellowih, and a little reddib, hat not blackilh, and always dilipates the mangacie. Thu latt time you add manganele give no more of the niamen corvum, unlel's the colour be too full. Thas will the glats be exactly of the colour of the balss ruby. See Ruby Gisass.

Whe common black co! $k r$. The glafsmakers take oid broken glafs of diferent colours, grind it to powder, and zd d to it, by different parcels, a fufficient quantity of a mixture of two parts $z$ affer and one part manganefe : when well purified, they work it into velfels, \&e.

Glafs beads are coloured with manganefe only.
Biace velvet colour. To give this deep and tine colour to glafs, take of cryltalline and pulverine frit, of each 20 pounds; of cals of lead and tin, four pounds; fet all together in a pot in the furnace, well heated; when the glats is formed and pure, take fleel well calcined and powdered, fcales of iron that dy off from the fmith's anvil, o: each an equal quantity ; powder and mix them well; then put fix ounces of this powder to the above defcribed metal while in fufion: mix the whole thoroughly together, and let them all boil itrongly together ; then let it itand in fution 12 hours to purify, and after this work it. It will be a molt clegant velvet black.

There is another way of doing this, which allo produces a very fair biack. It is this: take a hundred weight of rochetta frit, add to this tiso pounds of tartar and fix pounds of manganele, both in tine powder; mix them well; and put them to the metal while in thon, at different times, in feveral parcels; let it find in fution after this for four day a, and then work it.

A glafs perfectly biack may alio be formed to ten pounds of either of the compolitions for hard glals above defcribed, one ounce of zaffer, fix drachms of manganefe, and an equal quantity of iron trongly calcine 1.

B/ue colour. A full blue may be made by aldiars fix drachns of zafter and two drachms of manganete to ten pounds of either of the compontions for hard glafs, detcribed above. For a very cool or pure blue glats, halt an ounce of calcined copper may be ufed impead of the mandanefe, and the propostion of zaffer diminilied by one half. Glafs refembling lapphire may be made with ten peands of either of the compontions for hard giafs, three drachms and one feruple of zaficr, and one drach m of the caln caffi: or precipitation of gold by tin ; or, inllead of this later ingredient, two dachma and two leruplen of mancancfe. Or a tapplire-coloured ghas mav be made ly ming with any guantity of the barit glals one eighth of its wetght of tmalt. A beautifus blue glafs is :1to produced from the oside of cubat.

Finctian brown, wath goll fonmter, commonly calle i
G L A [ $\left.755^{\circ}\right] \quad$ G L A

Glafs. the pri'spher' Rone, may be prepared in the following mather : take o', the fecond com utition for hard glafs above defcri tell and of the compotition for prle, of each five poonds, and ot highly calcined iron an ounce; mix them woll, and fufe them till the iroa be perfectly vitrified, and has tinged the glafs of a deep tranfparent rellow brown colvur. Powder this glafo, and add to it two pounds of poodered glafs of antimony ; grind them together, and thus mix them well. Take part of this mixture, and rub into it 8 . or 100 leaves of the counterfeit leaf gold called Dutch gold; and when the parts of the gold feem fufficiently dwided, mix the powder containing it mith the other part of the ghafs. Fule the whole with a moderate heat till the purder run into a vitreous mafs, fit to be wrought into any of the figures or velfels into which it is ufually formed; but avoid a perfect liquefaction, becaufe that in a thort time deftroys the equal diffufion of the fpangles, and vitrifies, at lealt in part, the matter of which they are compofed; converting the whole into a kind of tranfparent olive-coloured glafs. This kind of glafs is ufed for a great variety of tovs and ornaments with us, who at prefent procure it from the Venetian.

Chalcedony. A mixture of feveral ingredients with the common matter of glafs, will make it reprefent the femi-opake gems, the jafpers, agates, chalcedunics, \&c. The way of making thefe feems to be the fame with the method of making marbled paper, by feveral colours diffolved in feveral liquors, which are fuch as will not readily mix with one another when put into water, before they are catl upon the paper which is to be coloured. There are feveral ways of making thefe varioully coloured glafles, but the beit is the following.

Diffolve four ounces of fine leaf filver in a glafs veffel in frong aquafortis; fop up the vefiel, and fet it alide.-In another veffel, difiolve five ounces of quickfilver in a pound of aquafortis, and fet this afide.In another glafs vefiel, difiolve in a pound of aquafortis three ounces of fine filver, firf calcined in this mamer: amalgamate the filver with mercury, mix the amalgam with twice its weight of common falt well purified; put the mixture in an open fire in a crucible, that the mercury may fly off, and the filver be left in form of powder. Mis this powde: with an equal quantity of common falt well purified, and calcine this for fix hours in a Atrong fire; when cold, wath off the falt by repeated boilings in common water, and then put the Giver into the aquafortis. Set this folution alfo afide. - In another velfel, difolve in a pound of aquafurtis there ounces of fal anmoniac; pour off the folution and ditolve in it a quarter of an ounce of gold. Set this alto atide. -10 another veffer, diffoive three ounces of lal amniouriac in a pound of aquafurtis; then put into the folution cimabar, crocus martis, ultramarine, and ferretto of Spain, of each half an ounce. Set this alfo alide. - In another veffel, difolve in a pound of aqua. foris three ounces of ial ammoniac; then put into it crecus martis made with vinegar, calcined tin, zafficr, and cinnatar, of each halt an ounce; let each of thele be poodered very finc, and put gently into the aquafrris Sct this alfo alide.- ln another veffel, dixolve three ounce of lat ammoniac in a pourd of apuafortic, and add to it brafs calcined with brimitone, brafs thrice
calcined, manganefe, and fcales of iron which fall from the finith's anvil, of each half an ource; lit each be w.ll powdered, and put gently into the veif. Then fet this allo :tide.-In another velfel, diffolve two ounces of fal ammoniac in a pound of aquafortis, and put to it verdigrife an wunce, red lead, crude antimony, and the capat mortum of vitriol, of each balf an ounce ; put thefe well powdered lefiurely into the velfel , and fet this alfo afice. - In another veffel, diffolve two ounces of fal ammoniac in a pound of aquafortis, and add orpiment, white arfenic, painters lake, of each half an ounce.

Kecp the above nine veffels in a moderate heat for 15 days, fhahing them well at times. After this pour ail the matters from thefe veffels into one large veffel, well luted at its bottom; let this fland fix days, thaking it at times; and then fet it in a very gentle heat, and evaporate all the liquor, and there will remain a powder of a purplifh green.

When this is to be wrought, put into a pot very clear metal, made of broken cryitalline and white glafs that has been ufed; for with the virgin frit, or luch as has never been wrought, the chalcedony can never be made, as the colours do not tick to it, but are confumed by the frit. To every pot of 20 pounds of this metal put two or three ounces of this powder at three feveral times; incorporate the powder well with the glafs; and let it remain an hour between each time of putting in the powders. After all are in, let it fland 24 hours; then let the glafs be well mixed, and take an affay of it, which will be found of a yellowin blue; return this many times into the furnace; when it begins to grow cold, it will thow many waves of different colours very beautifully. Then take tartar eight ounces, foot of the chimney two ounces, crocus martis made with brimitone, halt an ounce; let thefe be well possdered and mixed, and put them by degrees into the glafs st fix times, waiting a little while between each putting in. When the whole is put in, let the glafs boil and fettle for 24 hours; then make a little glafs body of it; which put in the furnace many times, and lee if the glafs be enough, and whether it have on the outtide veins of blue, green, red, yellos, and other colours, and have, belide thefe veins, waves like thofe of the chalcedonies, jafpers, and oriental agates, and if the body kept within looks as red as fire.

When it is found to anfiver this, it is perfect, and may be worked into toys and veffe's, which will always be beautifully variegated: thefe malt be well annealed, which adds much to the beauty of their veins. Mafles of this may be polilhed at the lapidary's wheel as natural flones, and appear very beautiful. If in the working the matter grow tranfparent, the work muit be ftopped, and more tartar, foot, and crocus martis, nuft be put to it, which will give it again the neceffary body and opacity, without which it does not how the coluars well.

Chryfolite colour may be made of ten pounds of either of the compolitions for hard glait defcribed above, and fix drachms of calcined iron.

Red cornclian colsur may be formed by adding one pound of glafs of antimony, t"o anece of the calcined vitriol callel/farlet ochere, a. to se hachm of minganefe or magncina, to two poundis either of the com-

## G L A [ 757 ] G L A

'G'se pofitions for harl glats. The glafs of antimony and magnefia are first fuled with the other glats, and then fowdered and ground with the feariet ochre : the whole minure is aiterwards fufed with a sentle heat till all the ingredients are incornozated. A glafs refembling the white cornelian may be male of two pounds of either of the compolitions for inard glafs, and two drachms of yellow ochre weil waned, and one ounce of calcined bones: grind them tozether, and fule them with a genthe heat.
Einerald coluar. See Green below.
Garnet colour. To give this colour to glafs, the workmen take the following method. They take equal quantities of cryftal and rochetta frit, and to every hundred weight of this mixture they add a pound of manganefe and an ounce of prepared zaffer: thefe are to be powdered feparately, then mixed and added by degrees to the frit while in the furnace. Great care is to be taken to mic the manganele and zaffer very perfectly; and when the matter has thood 24 hours in fution, it may be wurked.

Giats of this kind may be made by adding one pound of glation a timony, one drachm of manganefe, and the fame quantity of the precipitate of gold by tin, to two pounds of either of the compolitions for hard glafs ; or the precipitate of gold may be omitted, if the quantities of the glafs of antimony and manganele be doubled.

Gold colour. This colour may be produced by taking ten pounds of either of the comporitions for hard glats, omitting the faltpetre; and for every pound adding an ounce of calcined borax, or, if this quantity doth not render the glafs furficiently fuible, two ounces; ten ounces of red tartar of the deepeit colour ; two ounces of magnefia; and two dra hms of charcoal of Callow, or any other foft kind. Precipitates of filver baked on glafs will ftain it yellow, and hewsife give a yellow colour on being mixed and melled with 40 or 50 timics their weight of vitreous compofitions; the precipitate from aquafortis by fixed alkali lecms to anfser beft. Yellow glaffes may alfo be obtained with certain preparations of iron, particularly with Pruflian bhec. But Dr Lewis obferves, that the colour does nut comfanty facceed, nor approach to the high colvur of gold, with fiver or with iron. 'The nearelt imitaticus of gold which he has been able to prodace have been effected nith antimony and lead. E jual pasts of the glats of antimony, of lint calcined and powdere 1 , and of minium, formed a glafs of a high yellow; and with two parts of glals of antinony, two of niniem. and three of powdered thint, the colour approached thil more to that of gold. The lat compoition exinibited a multitude of himill fparkles interfeerfed throughout its win'e Giblance, which gave it a beautitul at "arate in the mals, but were rally inperfectione, owing to air bubiblec.

Neri directe, for a gold yellow colour, ni" part of red tart ir and the fame quanticy of men wele, to be mixad with a hundred part of frit. Bur Karckel obferve, that thefe :moporions are fulty; that o: a part, or one and a quaser, of mancaan fe, is futficent for a la du d of frit; bu that fix parts of turtar are larlly mus. h, wilef the tartar is of a dark red colour, almunt blackills; and that i. fuend it expelient to add to the tartas if inut a cearth of its neight of fordered charcual. He
adds, that the glafs fwells up very much in mating, and that it muth be left unflirres, and worhed as it tlands in fulion. Mir Samuel More, in repeating and varying this procefs in order to render the colour more perfect, found that the innuganefe is entirely unefiential to the gold colour ; and that the tartar is no otherwife of ule than in virtue of the coaly maiter to which it in in part reducell by the fire, the phlogifton or inflammable part of the coal appearing in feveral experiments to be the direct tinging fubfance. Mr Pott alio obferves, thit common coals give a yellow colour to glafs; that difo ferent coaly matters difier in their tinging power; that caput mortuum of foot and lamp black anfwer better than cummon charcoal; and that the fparkling coal, which remains in the retort after the rectification of the thick empyreumatic animal oils, is one of the moit active of thefe preparations. This preparation, be fays, powdered, and then burnt again a little in a clofe veffel, is excellent for tinging glafs, and gives yellow, brown, reddih, or blackith colour, according to its quantity; but the fiit mule not be very hard of fution, for in this cale the itrons fire will deftroy the colouring fubflance before the glafs inelts: and he has found the following compofition to be nearly the belt ; viz. fand two part, alkali three parts; or fand twi, alkali three, calcined borax one; or fand two, alkali two, calcined borax one: and though faltpetre is hardly wien at all, or very faringly, for yellov glafles, as it too much volatilizes the colouring fubftance ; yet here for the molt part a certain proportion of it, eatily detesmined by trial, is yery neceiliary; for without it the concentrated colouring matter is apt to make the glals too dark, and even of an opake pitchy blacknefs. It does not certainly appear that there is any material diverfity in the effects of different coals, the difference being probably owing to the diferent quantities of the inhammable matter which they contain ; io that a little more thall be requited of one kind than of anuther for producing the fanse degree of colour in the glats. Nor does the foftnefs or fulivility of the frit appear to be in any relpect necelfary.

Gold-coloured fuangles may be diffefel through the fulstance of glafs, by miving the yellow talcs with powdered glafs, and bringing the mixture into fufion.

Grecn. This colour may be imparted to ghat by adding three ounces of copper precipitated from aquafortic, and two drachms of precipitated iron to nine prounds of cither of the componitions for hard glais. The fineat method of giving this beatifill coloar to glals is this: Take five pounds of cryftalline met.1 that ha, beea puffed feveral times through wher, and the fame quantity of the common white metal of polverinc, four pounds of common polverine frit, and th:ee lounds it red lead; mix the rod loa! we! wi!! t!e frit, and then fut all int') a pot in a farnace. In a fey lours the whole innefs sill be well putined: then ratt ne where into water, and leparate and the our : ! !ead; then return the me:al into the pot, ad let it thud a diay lones er in fufion; then put in thapowhe of the renduran of the vitriol of copper, wad as ty male roncus mantic, there will be produced a mon: livis nod elepat giem, fearec inferior to that of the coctal cmeraled. Thaer ane many ways of givin a mew the at but all an

## C L A [ 75 B $]$ G L A

Ginis mutt be added at firf to the metal. The crsftal frit mult be inclted thus alone ; and the fait, which fwims like oil on it, top, muit be taken oft with :tn izon ladle very carefully. Then to a pot of twenty pounds of this metal add fix ounces of calcined brafe, and a fourth part of the quantity of powdeted zater: this powder muft be well mixed, and put into the glals at three times; it will make the metal fivell at firlt, and all mult te thoroughty mixed in the pot. After it has food in fufion three hours, take out a little for a proof: if it be :oo pale, add more of the powder. Twenty-four hours after the mixing the powder the whole will he ready to work; but mut be well taired together from the bottom, lett the colour thould be deepett therc, and the metal at the top lefs coloured, or even quite colourle's. Some ufe for this purpole half cryital frit and half rochetta frit, but the culour is much the finelt when all cryital frit is ufed.

Lasir lazuli colour. See Lapis Lazeti.
Obal colour. See Opal.
Purole of a dect, and brizht colotur may be produced by adding to ten pounds of either of the compofitions for hard glafs, above deferibed, fix drachms of zaffer and one drachon of gold precipitated by tin; or to the fame quantity of either compolition one ounce of manganefe and half an ounce of zaifer. The colour of amethyit may be imitated in this way.

Red. I blood red glafs may be made in the following manner: Put fix pounds of glats of lead, and ten pounds of common glafs, into a pot glazed with wirite glafs. When the whole is boiled and refined, add by fmall quantities, and at fmall diflances of time, copper calcined to a sednefs as much as on repeated proofs is fut: fuficie:t: then add tartar in powder by imall quantities at a time, till the glafs is become as red as blood; and continue adding one or other of the ingredients till the colour is quite perfect.

Rulu. The way to give the true fine red of the ruby, with a fair tranfarence, to glaf, is as follows: Calcine in earthen veflels gold diflived in aqua regia; the menitruan heing evaporated by dilillation, more afua resia adled, and the abfraction repeated five or fix times, till it becomes a red powder. This operation vill require many days in a hot furnace. When the powder is of a proper colour. take it out : and when it is to be uted, melt the fneit cryital glafs, and purify it hy often cating it into water; and then add, by fmall guantities, enough of this red powder to give it the true colour of a ruby, with an elegant and perfect tranfarence.

The procefs of tinging glafs and enamels by preparations of gold was firlt attempted about the beginning of the lat contury. Libavius, in one of his tracts entitled Alr/ismia, printed in 1606 , conjectures that the colour of the zuby proceeds from gold, and that gold dinolved and brought to rednefs might be made to communicate a like colour to factitious gems and glafs. On this principle Neri, in his Art of Giafs, dated in 1611, gives the procels above recited. Glamber in 1648 pablihed a method of producing a red colour by gold, in a motter wlich is of the vitreous kind, though not periect laf. For this purpote he ground powdered tiont or fand with four times its weight of fixed alkaline falt: this misture melts in a moderately ferong fire, 2ad when cool looks like glats, but expoled to the ais
runs into a higuid itate. On adding this iiquer to folution of gold in aqu-regia, the gold and thint precipitate tosether in tom of a yellow powder, which by cslcination hecomes purple. By miving this ponder with three or four times its weight of the alkeline folution of thint, drying the misture, and me!ting it in a ftrong fire for an hour, a mafs is obtamed of a tranfparent ruby colour and of a vitreous appearance; which nevertheiels is foluble in water, or by the moilture of the air, on account of the redundance of the falt. The Honourable Mi Boyle, in a work publifhed in 1680 , mentions an experiment in which a like colour was introduced into glafs without fufion: for having kept a mixture of gold and mercury in digettion for fome months, the fire was at laft immoderately increafed, fo that the glafs burfl with a violent explofion; and the lower part of the glafis was found tinged throughout of a tranfparent red colour, hardly to be equalled by that of rubies.

A bou: the fame time Caffus is faid to have difcovered the precipitation of gold by tin, and that glafs might be tinged of a ruby coiour by melting it with this precipitate; though he does not appear, fays $\operatorname{Dr}$ commeres of Lewis, from his treatife De Auro, to have been the Arts, p. $17 \mathrm{~ms}_{\mathrm{s}}$ difcoverer of either. He defcribes the preparation ${ }^{621}$. Sic. of the precipitate and its ufe; but gives no account of the manner of employing it, only that he fays ore drachm of gold duly prepared will tinge ten pounds of glafs.

This procefs was foon after brought to perfection by Kunckel; who fays, that one part of the precipitate is futticient to give a ruby colour to 1280 parts of gldfs, and a fenfible redneis to upwards of 1900 parts; but that the fuccefs is by no means conitant. Kunckel alfo mentions' a purp!e gold powder, refembling that of Neri; which he obtained by infliflating folution of gold to dryacfs; abitracting from it frelh aqua-regia three or four times, till the matter appears like oil; then precipitating with ftrong alkaline ley, and wathing the precipitate with water. By difolsing this powder in fpirit of falt and precipitating again, it becomes, he fays, extre:nely fair ; and in this thate be directs it to be mixed with a due proportion of Venice glafs.

Ortchal, in a treatife entitled $S_{o l} l$ fine $V_{e} / t$, gives the following procels for producing a very fine ruby. He directs the purple precipitate made by tin to be ground with fix times its quantity of Venice glafs into a very fine powder, and this compound to be very carefully mingled with the frit or vitrous compolition to be tinged. His frit confifs of equal parts of botax, nitre, and fixed alkaline fait, and four times as much calcincd flint as of each of the falts; but he gives no directions as to the prorortion of the gold precipitate or mode of fuffon. Hellot defuribes a preparation, which, mixed with Venice glafy, was found to give a beautiful purple enamel. This preparation cuatils of equal parts of folution of geld and of folution of zinc in aqua-regia mised together, with the addition of a volatile fait prepared from fal ammoniac by quicklime, in furicient quantity to precipitate the two metals. The precipitate is then gradually heated till it acquires a violet colour. However, though a purble or red colour, approaching o that of ruby, may, by the methods above recited, be haked on elitis omamels, and introduced into the malis by fuson, the way of equally diffuting

## G L A

c, brs. fuch a colour through a quantity of fuid glafs is alll, fays Dr Lewris, a lecret. The following procefs for mahing the ruly glafo was communcated to Dr Lewis ty $2 n$ atint, who afcribed it to Kunckel. The gold is directed to be diflolved in a mixture of one part of fpirit of falt and three of aquafortis, and the tin in a mixture of one part of the former of thefe acids with two of the liatter. The folution of gold being properly diluted with water, the folution of $t$ in is added, and the mixture left to itand till the purple matter has fettled to the botom. The coloukhiliquor is then poured off, and the purple fediaent, while moir and not very thick, is thoroughly mixed with puwdered flint or fand. This mixture is well ground with powdered nitre, tartar, borax, and arienic, and the compound melted with a fuitable fire. The proportions of the ingredients are 2560 parts of fand, $3^{8} 4$ of nitre, 240 of tartar, 240 of borax, 28 of arienic, tive of $t i n$, and five of gold.

Topaz Colcur. Glafs refembling this fone may be made by pulverizing ten pounds of either of the compofitions for hard glafles with an equal quantity of the gold-coloured glas, and fufing them together.

White spake and fomitran/parent glais may be made of ten pounds of either of the compofitions for hard glafe, and one pound of well calcined horn, ivory, or bone; or an opake whitenefs may be given to glais by adding one pound of very white arfenic to ten pounds of tlint glats. Let them be well powdered and mixed by grinding them togethe:, and then fufed with a moderate heat till they are thoroughly incorporated. A glafs of this kind is made in large quantities at a manufactory near London; and ufed not only for difietent kinds of vef. fels, but as a white ground for enamel in dial plates and fnuff boxes, which do not require finihing with much fire, beeaule it becomes very white and fulble with a moderate heat.

## Tellow. See Goldicolour above.

Painting in $G_{L . A s s}$. The ancient manner of painting in glafs was very fimple : it confited in the mere arrangement of pieces of glats of different colours in fome fort of fymmetry, and conitituted what is now called mofaic zuork. Sce Moasic.

In procels of time they came to attempt mose regular defigrs, and alio to refrefent figures heightencd with all their thades: yet they proceeded no farticr than the contours of the figures in black with water colours, and hatching the d:apcries after the fame manner on glalies of the colour of the obiect they deligned to paint. Fur the carnation, they ufed ghlafs of a bright red colour ; and upon this they drew the principal lineament of the face, \&ic. with black.

At length, the talte for this kind of painting improving confiderably, and the art being tomend applicable to the adomine of clurches, Lanilice, ※c. they fromed out means of incorporating the colour in the glatis itfelf, by heating them in the fire to a proper devrec: having firft laid on the colcurs. A French painter ac Mateilles is faid to have given the firt notion of this improvement, upongoing to Reme under the pontificate of Julius II.; but Althert Durer an: Lucas of Leyden were the firit thet carried it to any hetight.

This art, honever, has frequently met with much instrruption, and fonctimes Lecn almolt tu tally loft; of
which Mr Walpole gives us the following account, in
ons his Inecdotes of Pionting in England.
"The fint interruption given to it was ly the reformation, which banilhed the art out of churches; yot it was in fome meafure kept up in the efcutcheons of the nobility and gentry in the windows of their feats. To wards the end of Qucen Elizabeth's reign it was omitted even there ; yet the practice did not entirely ceafe. The chapel of our Lady at $\mathrm{V}_{\text {arwick }}$ was omamented anew by R cbert Dulley earl of Leicefter, and lise countels, and the cipher of the glafs-painter's nanic yet remains, with the date 1574 : and in fome of the chepeis at Oxford the art again appears, dating itfelf in 1622 , by the hand of no contemptible matter.
"I could fupply even this sap of 48 years by many dates on Flemilh glafs; but no body ever fuppofed that the fecret was loff fo carly as the reign of James I. and that it has not perithed fince will be evident from tho following feries, reaching to the prefent hour.
"The pontraits in the windows of the library at All Souls, Osford. In the chapel at Queen', College there are lwelve undows dated $1 ; 18$. P. C. a cipher on the painted glats in the chapel at Warwich, 1574 . The windaws at Wadham's Colleze; the drawing pretty good, and the culours fine, by Betnard Vaa Linse, 1622. In the chapel at Lincoln's Inn, a window, with the name Beriard, 1623 . This was probably the preceding Van Linge. In the church of St Leonard, Shoreditch, two windows by Baptita Suttom, 163 The windows in the charel at Cnivernty Coilege, Fien. Gilcs pinxut, $168 \%$ it Chrilt Chureli, Ilaac Oliver, aged 84, 1700. Windoss in Merton Chapel, William Price 1700 , Windows at Quebn's New Coliege, and Maunlin, by Willian Price, the fon, now living, whofe colours are mine, whofe drawing is good, and whole tate in ornaments and mofaic is far fuperior to any of his predecellors; is equal to tire antipue, to the good Italian matters, aind only fureafied by his own fingular modelty.
"It may nor be unwelcome to the curious reader to fce fome anecdotes of the revival of tatle for painted glat, in England. !rice, as we have faid, was the only painter in that ftyle for many years ii, Eugland. Afterwards one Rowell, a plumber at Reading did fune thinge, particularly for the late Hemy earl of Pembroke; but Rowell's coiours foon vanilled. At latt he found out a very durable and beautiful red; but he died in a year or two, and the lecret wihh him. A man at Birmingham began the famse art in 1750 or 1737 , and fitted up a windur for Lord Eyttleton, in the charch of llagley; but foon broke. A little atter him, one Peckitt at York began the fame butheti, and ha* made good proniciency. A few loveric of that art collected fome diprerid panes firm tacient building, particularly the late Lord Colbatn, "ho erected a Gothic temple at Stowe, and filled it with arm of the old nobility, \&e. Aboat the year $1 / 53$, one Meioti, an italian, whlo had murrida a ilemid. numan, bruaght a parcel of paintel glatio fren Ftanders, and fold it for a few guineas to the Mmowrable Mr Butemen, of OUd Windior. Upon that 1 temt Acciotti again to Flander, who brought me 45 = rieces, for which, including the cxpense of his jurney, I paid him thirty-fin guiweas. His wite made mork journeys for the lima pur- poie; and fold her cargoes to one Palmer a glazier in St Martin's lane, who immediatediy raifed the price to one, two, or five guineas for a ingle piece, and fited up entire "indons with them, and with mofecs of plain glats of different colours. In 176t, Paterfon, an attionect at Iflex houfe in the Stand, exhioted the two fint austions of painted giafs, imported in He manner from Flanders. All this manufacture contilled in rounds of Scripture itorice, flamed in black and yellow, or in fma!l figures of black and white; birds and Howers in colours, and Flemilh coats of ams.

The colous ufed in painting or ftaining of glafs are very difierent from thofe ufed in painting either in water or oil colours.
For black, take fcales of iron, one ounce ; fcales of copper, one ounce; jet, half an ounce: reduce them to powder, and mix them. For blue, take powder of blue, one pound; fal nitre, half a pound: mix them and grind them well together. For carnation, take red chalk, eight ounces ; iron fcales, and litharge of filver, of each two ounces; gum arsbic, half an cunce: difolve in vater; grind all together for half an hour as iliff as you can; then put it in a glafs and flir it well, and let it ftand to fettle 14 days. For green, twhe red lead one pound; fcales of copper, one pound; and !lint, five pounds: divide them into three parts; and add to them as much fal nitre; put them into a crucible, and melt them with a ftrong fire; and when it is cold, powder it, and grind it on a porphyyy. For gold colour, take filver, an ounce; antimony, half an ounce: melt them in a crucible; then pound the mals to powder, and grind it on a copper plate; add to it yellow ochre, of brick dult calcined again, 15 ounces; and grind them well together with water. For purple, take minium, one pound; brown ftone, one pound; white tlint, five pounds: divide them into three parts, and add to them as much fal nitre as one of the parts; calcine, melt, and grind it as you did the green. For red, take jet, four ounces; litharge of filver, two ounces; red chalk, one ounce: powder them fine, atd mix them. For white, take jet, two parts; white timint, ground on a glafs very fine, one part: min them For yellow, take Spanith brown, ten parts; leaf filver, one jart; antimony, half a part: put all into a crucible, and calcine them well.

In the windows of ancient churches, \&c. there are to be feen the molt beautiful and vivid colours imaginable, which far exceed any of thofe uted by the moderns, not fo much becaute the lecret of making thofe colours is entirely leff, as that the moderns will not go to the charge of them, nor be at the neceflary pains, by reafon that this fort of painting is not now io much in ettem as formerly. Thofe beautitul works which were made in the glafs houles were of two kinds.

In fome, the colour was diffufed through the whole fabnlance of the glafs. In others, which were the more common, the colour was only on one fide, fcarce penetrating within the fubfance above one $t$ lird of a line; Wough this was more or lefs according to the nature of the colour, the yellow being always found to enter the deepct. Thefe iaft, though not fo ftrong and beautiful as the former, were of more advantage to the work. men, by reafon that on the fame ylafs, though already coloured, they could fhow other kinds of coleurs where
there was occafion to embroider draperies, enrich them with loliages, or reprefint other ornaments of gold, filver, \&c.

In order to this, they made ufe of emery, grinsing or wearing down the furface of the glafs till fuch time as they were got through the colour to the clear glas. This done, they applied the proper colours on the other fide of the glats. By thefe means, the new colours were hindered from rumning and mising with the former, when they expuled the glanfes to the fire, as will appear' hereafter.

When indeed the ornaments were to appear white, the glafs was only bared of its colour with emery, without tinging the place with any colour at all; and this was the manner by which they wrought their light and heightenings on ail kinds of colour.

The firli thing to be done, in order to paint or fain glafs, in the modern way, is to defgn, and even colour, the whole fubject on paper. Then they choofe fuch pieces of glals as are clear, even, and finooth, and pro. per to receive the leveral parts; and proceed to diftribute the defign itfelf, or papers it is drawn on, into pieces fuitable to thofe of the glafs; always taking care that the glaffes may join in the contours of the figures and the folds of the draperies; that the carnations, and other finer parts, may not be impaired by the lead with which the pieces are to be joined together. The diftribution being made, they mark all the glaffes as well as papers, that they may be knuwn again: which done, applying every part of the defign upon the glafs intended for it, they copy or transfer the defign upon this glafs with the black colour diluted in gum water, by tracing and following all the lines and ftrokes as they appear through the glafs with the point of a pencil.

When thele ftrokes are well dried, which will happen in about two days, the work being only in black and white, they give a fight wah over "ith urine, gum arabic, and a little black; and repeat it feveral times, according as the thades are defired to be heightened; with this precantion, never to apply a new wath till the former is fufficiently dried.

This done, the lights and riings are given by rubbing off the solour in their refpective places with a wooden point, or the handle of the pencil.

As to the oilher colours above mentioned, they are ufed with gum water, much as in painting in miniature ; taking care to apply them lightly, for fear of effacing the outlines of the defign; or even, for the grenter fecunty, to apply them on the other ide; efpecially yellow, which is very pemiciums to the other colours, by blending the:ewith. And here too, as in pieces of black and white, particnlar regard muft always be had not to lay colour on colour, or lay on a new lay, till fuch time as the former are well dried.

It may be added that the yeliow is the only colour that penetrates through the glals, and incorporates therewith by the fire; the rett, and particularly the blue, which 15 very dificult to ule, remaining on the furface, or at leait entering very little. When the painting of all the pieces is finithed, they are carried to the furnace or oven to anneal or bake the colours.

The furnace here ufed is frall, built of brick, from 18 to 30 inches fquare. At lix inches from the bottom is an aperture to put in the fuel and maintain the

## 

G.af inte. () , the overture is a erate made of thee fotare bars of i.un, which traverle the furnace, an! divide it ieto two pats. Jwo inclies above this partion is anothen littic ancrture, throush whech they take ont feces to examine liow the coction gees forward. On the errite :- placed a fopure carthen pan, fix of feven inches cieen, and tive or lix inche lede every way than th.e perimser of the furnace. On the other fide hereof is a liale aycruse, through whieh to make trials, placed direetly copo ite to that of the furnace: dellined for the fane e:id. In this pan are the piecen of glafs to be placed in the fullowis manner: Filt, line buttom of the pan is cuvered wish three thrata or layers of equicklime pulsorized; thoie itreta being foparated by two uthers of old bruken glat, the denign whereut is to fecure the painted glafs from the too intenle heat of the fire. 'illis done, the glatiss are laid horizontal's on the laft or uppermoft laver of lime.

The finf row of glifs they cover over with a layer of the fame powder an inch deev; and over this they lay anotler range of glaides, and thos alternately till the par is quite full ; twing care that the whole heap always end with a layer of the lime powder.

The pan being thus prepared, they conr un the furrace with tilec, on a fquare table of earthen wate, clolely luted all round; only leaving five litile apertares, one at each corner, and another in the middle, to ferve as climneys. Thines thus difpofed, there remains nothing tut to give the fire to the work. 'Ihe fire for the two firt hours muit be sery moderate, and mult be increated in proportion as the coction advances, for the face of ten or twelve hours; in which time it is ufully compleied. At latt the fire, which at frit was ctarcoal, is to be of diry wood, to that the flame cuvers the whole pan, and even iffues out at the chimneys.

During the lat hours, they make didys, from time to time, by taking out picces lid for the purpoe through the little aperture of the furnace and pan, to fee whether the yellow be perfect, and the other colours in good order. When the amealing is thought futfient, they procted with great bante to extinguin the fire, which otherwife would toon Lurn the colours, and break the glaffes.

GLAss Balls, which are circular, or otherwite thaped hollow veffels of glacs, may be coloured within, fo as to imitate the femipellucid gems. The method of doing it is this : make a itrong folution of ichthyocolla, or ifinglafs, in common water, by boiling ; pour a quantity of this while warm into the hollow of a white glafs veffel ; thake it thoroughly about, that all the lides may be wetted, and then pour of the reft of the moilure. Immediately after this, throw in scal leat, thake it and turn it aloout, throw it into many places with a tube, and the moiture will make it fich and run in waves and pietty bugures. Then throw in forne of the painters blue fruat, and make it run in waves in the ball as the red lead; then do the fene with verdigrite, next with orpiment, then with red lake, all well ground; always caflig.g in the colours in diferent places, and turaing tbe glat, that the multare within may run $\therefore$ Aem i to the waves. Ifers tahe fine plafter of Paris, and put a quantity of it into the 5,1 ; fuake it alfo rimbly sout; this will everywhere trich firmly to the ${ }_{4}$ lat, and give it a ftrong imber cuat, keeping all the Fol. IX. Part II.
colours on very fairly and ftrongly. Thefe are tei on $C_{i}$ frames of carved wood, and much etteemed as omaments in many places.

Glass Drop. Sce Rufert's Drapi.
Engravin? on Gl.iss. Proterlor Beckmana has penved, that fo early as the yeat 16 -0 the art of etchin? upon glafs was difcoverd by Henry Shwanhard, lon of Geurve Sohwanhard, who was a celebrated glatscutter, phatomize 1 by the emperor Ferdinand 111. about the midale of the tat ceatury. At the time of his deati, 16.7 , the fither practiled his art at Prague and Ratibon. Whatier the fon followed the lame buinte's at the tane thwis, or removed to Nurembere, is 1tot very evident; but in the year above menti ned, fone aciza rega (aitro-muriatic acio) having accilentully fallen on his fpecticles, he wat furpried to mind the glafs corroded by it, and become quite foft. He thus, it is faid, found himelf in pollellion of a liquid by which he could etch writing and fintes upon plates of glafs.

But it is probable, as Reckmann feems to thi: $h$, that be had difcovered the tluoric acid itfelf; for in the year 1725 there appeared in a periodical work the following receipt for making a powerful acid, by which ligures of every kind can be e:ched upon gla is.
"When the fpritus nitri per diftillationem has pafed int o the recipient, ply it with a lifong fire, and sise well dephlegmated, pour it, as it corroles oidiary glafs, into a We:denourg tlafk. Then throw into it : pulverifed green Bohemian emerald, otherwife called befourus (which, when reduced to puwder, and heat ef, emits in the dark a green likht), and place it in Warm fand for 24 hours. Take a pice of glate wrll cleaned, and ficed from all greate by meatis of a ley put a border of wax round it, about in inch in heigle, and cover it all over with the above acid. The longen you let it \&tand fo much the betier; and at the end of fone time the glafo will be corroled, and the figure which have been traced out with fulphur and vanil: will appear as if raited above the pane of glaf:."

That the Bohemian emerald or hefphorias nentisam: in this receipt is green fparry duor, cannot, liys the profellor, be doubted; and he feems to have as littie doubt of the receipt itielf having pafted foum Scimats hard and his fcholar t's the periodical work of 1725 . from which it was inferted in the ©Ekonomiche Encgclopedie of Krunitz. This fuppofition cert ninly aç"ize: a coniderable degree of probability from the fimilaity of Schwanhard's method of etching to the.t which is here recommended, and which is fo different from what is now followed. Ar prefent, the ghals is covered with a varnifh either of ilinglafs difisued in water, or of turpentine oil mised with a little white lead, through which the figures to be etched are traced as on copper , bu: Schwanhard, when he had drawn his figures, co vered them with varnilh, and then by his liquid cor. roded the glafs around them. His figures, therefore, when the varnilh was removed, remained finouth and clear, appearing raifed from a dim or dark ground; and M. Beckmann, who perfuaded fome ingenious artilts to make trial of this ancient method of etchine, declares, that fuch figures have a much better effect than thofe which are cut into the glafs.

Foliating of Glass. See Folisting and Loosing. glafs

Giding
$G_{\text {L.tss of }}$ Leat, a glafs made with the addtion of a large quantity or lead, of great ufe in the art of makin: enenterfeit gems. The mathod of making it is this: Put a lorge quanti'y of lead into a porsers liln, ar keep it in a bate of then with a moletate fire, till it is calcined to a gray loole poster; then fread it in the Ahs, and civit it gienter hest, continnolly itirnom it to heep it fron mming into lums: conthey $t^{1}$ is foveral brars, till the po:dur become of a fair yellow; then take it oat, and lift it fine: this is called ca'corco. liad. Take of thin calcined lead 15 pounds, and c.yftalione or other iri: 12 pounds; mix thefe as well as potible together; put them into a pot, and fet them in :ie fumace for ten hours; then catt the whole, which will be now perfectly melted, into water; feparate the Sunfe lead from it, and return the metal into the pot; and after ftanding in fufion 12 hours more, it will be f: to work. It is very tender and brittle, and mult be wioried with great cate, taking it fluwly out of the fot, and continually wetting the marile it is wrought uper:

It is well lanon that ccrufe or white lead, rainium, Oitla.ge, ani all the other preparations and catces of laad, are eafily fufed by a m-derate fire, and furmed into a tranfparent glefo of a deep yellow colour. Bett this glafs is fo penetrating and powerful a flux, that it is necefaty to give it a greater conflence, in order to render it fit for ufe. With this view, two parts of calk of lead, e. g . minium, and one part of fand or powdered dimis, mas be put into a crucible of refractory clay, and batied into a compact body. Let this crucible, :rell cluted with a huted lid, be placed in a melting arnace, an! gradually heated for an hour or an hour and a half; and afterisards let the heat he increafed io as to whain a complete fution, and continued in that fate for the fame time : let the crucible remain to coul i: the furnace; and when it is brolen a very tranfarat yellow coluared ghats will be found in it. Some add nitre and commois fatt to the abore misture, bec whe thele lalts promote the fuliun and the more equal diftribution of the land. This slats of lead has a cunnderable fjecifie gravity, and in lowell part is alw:ys The hearief. It is an immotan tiax in the anfoys of oees to ficilitate their fentincation.

Cilds of lead is capalle of all the colous of the gems $\therefore$ iey great periecion. The methods of giving them are thefe: for green, take pulverne fit 20 pounds, lead calcined if pounts; fift both the powders very fine; then $n$ ot them into a glats, feparating the umixed had, by pluming the mals in watur; afier this return it into the pot, and add brals thrice calcined fix onnces, atw orr polnyweight of crocus martis made with vinegar; put his in at lix different times, duays carefolly mining it torgether, and take a proof of it; when the coloner is right, let it ltand eight houre, and then work it. It inkead of the calcined hrats the fame quantity of the caput mortaum of the vitriolum vencris be wed, the green is yet much finer.

Fur topaz colour, tithe cryilal frit 1 ; pounds, calcined koul 12 pounds; mix them well together, by fiftine the powder through a fine lieve; then fet them in a farnace on two hot, and feparate the fuperliwous
ummisul ledd, by cantiog the whole into water; repeat this twice: then atd half gold yellow glafs, and let then incorporate and purny, and thay will be of the the and exact colour of the oriental topazes.

For lea green, tahe crytal frit 16 pounls, calcined lead 10 pounds; mix and fit then tosether, and iot them in a pot in a fumace ; in 12 houri the whole will be melted ; then calt it into water, and feparate it foon the loofe lead; put them into the furnece agait Fin chat hours; then ferarate the look lead by wah ing a lecond time, and retarn it to the put for eight hows more.

Paining on (ilass ly means of Prinis. See Backpainting.

GLair Prcclain, the name given by many to a modem inventin of initating the china ware with glats. The method given by J. Keaumur, who was the nift that caried the aitemet to any degree of nerfection, is flortly this: The glafs velfels to be converted into purcelan: are to be put into a large earthen vellt, fuch a. the cormon fine earthen duthes are balied in, or into fulticiontly large crucibies; the vellels are to be th1cat with a mixture of fine whice lind, and of tine syfum or plafter ftone burnt inte what is called filater of Paris, and all the intertices art to tre filled up with th.e fame powder, fo that the glals venels may wowhere tuach either one anoiher, or the lides of the venel they are baked in. The vellel is to be then covercd down and luted, and the fire does the ret of the work; for this is only to be pat into a common potter" tirnace, and when it has itood there the wital time of the baking the other veffels, it is to be taken out, and the warle conteats will be found no longer ghats, but convelted into a white opaque fublatice, which is a vely elegunt prechan, and has amoit the prepertics of that of Chima.

The powder which tas ferred once will do again as well as frech, ant that for a gleat may thes : ndy, it leum, ever to often. Whe caute of this transtomation, fiys Macyuer, is probably that the sriolic acid of the gyfimm fuits its hafis of calcureous carth, and unite; with the alkuline falt and faline earth of ti.e glali, whth which it furms a hind of tait, differeat from the caicaroous felenite, Iy the interpotition of which matter the ghas actuines the quabities or porcciain.

Cifiss ''ts, the refitls in the glals trade ufed for maltitg the chats. Thofe fur the white glats worksare made of a turacco pipe cliy, broush from the ille of Widht, which is hill well wathed, then cakenel, and aftemards ground to a fine powder in a mill; whith I cing mived with water, is then thud with the bere fect bli it is of a proper cumbtance to mould with the hands into the proper thaye ot the venels. When the e arc thas mad, fiey are aternands anneated over the furnace. 'ilwhe tor the geen glais work ane nade of the wanduch, and amothe: font of cly from stemordthire; they mal.e theie to lirge as to hold three or four handerd wici ha $u^{+}$metai. And Ledides thede, they hase a fimall fort callod piding pots, which they fet upon the larser, and which contan a finer and more nice metal fit for the nicent work.
'The clay 1 at is ued for this purpofe then' 1 be of the parett and mull retactory kind, and well clanfed from all tandy, fornuginous, of pyitous mattes; and

Drinking Glasfer, are fimple veliels of common glalis or cry.tal, ufually made in form of an inverted cone.

Each giafs confits of three parts, viz. the bowl, the bottom, and the foot; which are all wrought or blown foparately.

N thing can be more dexterous and expeditious than the manner of blowing thefe parts: two of them opened, and all three joined together. An idea is only to be had thereof, by feeing it adtually done. For the method of gilding the elves of drinking glathes, fee Gilding on Enamel and Ga/s.

## Oplical Glasses. See Oprics.

The improvement hitherto mate in telefenpes by means of combining lenfes made of different kinds of glaf, though very great, are yet by no means adequate to the ex,ectations tinat misht reafonably be formed if opticians could fall on any method of o'taining pieces of glafs fultiently large for purfung the a tvantases of Mr D, llond's difcovery. Unfortunately, howser, though the board of longitude have offered a comberable reward for bringing this ant to the requifite perfection, no attempt of any conlequence has hutherto been made. Mr Keir is of opininn, that the aceomplikment of this is by no meats an eafy tuflk ; as it requize not only a cometent knowledg at the mopere ties of ghaf fittert for the purpote the fults not beins evident to common infpestion), but a cuntiderable de. gree of chemical knowled $e$ is alfo necellyy in order to invent a com olition by which thele fiults may be avoided; and latly, a kind of leverity in the ex cution of the wo k, which cal only be a.puired by practice. Our author, however, thinks, that if the lunje ? were more eenerilly undertond, an' the difonlti.. more fully noilted out, for which puip ble he makes the following renarks, the end may be more eanly ace comoliget.

1. The rays of light palfing through a grats kens or reifm, or through any other mediun of arem the thick. nefi, are refrafted; but not in an ephl menter, the tue, violet, \&c. being more rufracted than the red.
2. Hence it happens, thet the rays $\boldsymbol{o}^{\circ}$ lighit, $:^{\text {'s:a }}$ refracted! y a common lens, do not all unite in one focus, but in reality fum at many dikerent fuci as there one colout: ; and herce arife the primetic colntre, of iride, whels apmen tomards the border of the imese fan d by the conmon convex lanice, and which ren der the sition evtrom ty inflitinct.
3. The ind latiat as of vition product by this caufe.
 creales in fo ereat a propurtion, viz. an th.. catem the

 them to a very inconvenient length, un'els this confit tion of coleuts could e cormeted.
4. It was known that diferent tranfareat bo:lics pos firla dithent degrees of refrative power ; and arth Mr Dollond dilesvered the contrary, it wa lippoled, ilou the refrations of the colourd iays were alwus it a determined ratio to one another. U. this bimponiton it jeemed immolhble to correct the fult of retamen, theicopes : for it wav happoided, that it the dipenhom a Wi fht produced by a consix lens were contriveled b, shother lens of medium of a concave fum, the ratraction would be totally deltroved; and this indeed wan'l be the cald, if the two mediums were made of the "ome notter ; and from tome experiments ma le by sir 1 b: Newton, thin was fuppoled to be actually the cate in ant fubitonces whatever.
5. From confidering that the eycs of animals are formed of inediums of lifferent colours, it occurred firt to Mr D.wid Gregory, the ceiebrated proledior of ailronony at Oxford, and then to Mr Euler, that, by a combination of mediums which had ditierent refractive powers, it might be pomble to rencly the imperfections of dioptric telefopes. It does not, however, a\% pear, that either of thate gentlemen undertood the true principle on which the fe phenomena depend. Mr Fiuler executed his idea by forming a compound object lens from two glak lenies with water interpole l, but his attemp+ was mot attended with litecelis. Mr Dollend, hou. ever, wa led by fome arramests addaced by Mr Klin. genitiernt of S :-dनa, to re cor ume of Sir Ifac Nembons experiment, as. A which hadindured eventhat ureat phi-
 wath esecutvi oy Mr Dolload was in,orable. This experinctht was make by sir lfo Newton, by phenites a clifo rifm : ithin a primatic vale filled with water, in is 4 a moner that tize ram of hat whim were me fractel 'sy the tak prifm thon't, ak throu hand he refrached in a enntay diation by the water prifin. ## C L A [ $7^{60}$ ] G L A

Glas. the greateft diferfive power in proportion to its refraction, which was allo very great. On comparing thefe two ex: etiy together, he found, that a wedre of whitellint glals whofe angle was atout 25 degrees, and another of crown glats whole amgle was 29 degrees, sefracted very ocarty alike. He found aifo, that, when the wedses were round to fuch angic, the refaction prodaced by the fint glals was to that produced by the crown giafs nearly as two or three; the refracted light was then free from colour. On meaning the general refracting powers of thefe two glaffe, he found, that in the glais, the line of itcidence of the raves was to the fine of mean refraction as 1 to 1.53 ; and that in crown glafs, the fine of incidence was to the fine of mean refraction as 1 to 1.53 .

The methods of deternining the difitrent refiactive powers of glafs are given under the article Orncs. Here we hall cnly obferve, that two kinds of glats are ancelfary for the conftuetion of achromatic telefcopes; one of which thall pollefs as fmall, and the other as great, dif erfice powers, relative to their mean refracting wer, as can be produced. The diference of glalles in $t$ 's refnect cicpends on the quality of the intre. dients emploved in their composition. Crown glais, Aich is compofed of fand melted by means of the whes of lea weeds, barilia, or kelp, both which Huxes are known to corfit of segetable carth, alk ilf, and neatral falt, is toath to cive the fmalleil difperive fower. Plate slafs, which conints of fand nelted by means of fived vegerable alkali, with little or no vegetatle eath, gives a greater diperfive power ; but both thefe give much lefs than thint glafs, which contitis of fand melted by means of minium and fixed allali. It appears, therefore, that the difperfon of the rays is greatest when minium, or probably other metallic calces, are made ufe of; and that alkalies give a greater power of diferfion than vegetable or other earths. Mr Zieher of Peterfourgh, however, informs us, that he thas made a kind of glafs, much fuperior in this refpect to tlint glaf; ; but it does not as yet appear whether it be more fit for optical purpofes than that commonly made ufe of. There feems no dificulty in augmenting the difperive power, as that is found to depend on the quantity of minium or other flus: but thus we unfortunately increafe alfo the capital fault to which tint glafs and all compofitions of that kind are fubject ; namely, the being fubject to veins or fmall threads rumning through it. By thele, even when fo fmall as to be imperceptible to the naked eye, the rays which f.lll on them are diverted from their proper direction, and thereby render the images confufed. This is owing to the greater denfity of the veins, as appears by their inage being received on white paper, when the ghafs is held between the paper and the fun or a candle a. a proper diflarce. The rays of light being then made to converge by the fuperior dentity of the veins, their images will appear as bright lines bordered with obfeure edges on the paper. Flint glafs is fo much fibject to this hind of imperfection, that it is with difficulty the opticions can pick out pieces of the fize commonly ufed from a large quatity of the glafs. It is farther to le regretted, that the minium which frodures the greateft difperfive power, is likewife the very fuldatice which renders thint glafs much more fu'jest to the re imperfections than any other. The.
reafon is, that the fand and earthy matters mix uniform! y in fulion; and having nat only a coufderable degree of affinity towards each other, but ahio being not much different from each other, they are not apt to feparate. On the other hand, when fuch a heavy fubitance as minium is added to thele earthy fubflances, though it has a pretty itrong tendency to unite whit the earthy fulfances, it has none with the fised alkali, which is ancther ingredient in this glai). Hence fome parts of the olafs will contain more metallic matter than the reft; particularly that near the bottom of the pot, which is fo full of large veins as to be applied only to the mahing of wares of hitle value. The veins in this cale are formed by the defcent of the minium at the bottom, which in its paflage forms threads or veins by dragging other parts of the glafs along with them.

The correction of this fault appears therefore to be very difficult. M. Macquer informs us, that he had in vain tried to remove it by very lony fution and a fierce fire; which indced others have fuund by experience not to correit, but to augment the evil. Mr Keir is of opinion that fome new compoition mult be difcovered, which, along with a fufficient refractive power, hould poffefs a greater vniformity of texture; but he is likewife of opinion, that feance any alteration in this refpect could be mave sithout injuring the colour of the giats. For ontical purpofes, however, our author does not think that an alteration in the colour of the ingredients would be very detrimental. "1 am con vinced (fays he), that glafles fenfibly tinged with colour, might tranfmit as much or more light than the beft flint glafs. For the colourlefs appearance of flint giafs is an optical deception. The minium gives it a confiderable tinge of yellow, and the alkali inclines it to a bluilh calt, bendes the colour arifing from a greater or lefs impurity of the materials; fo that the glafs would actually be very fenfibly coloured, unlefs by the addition of manganefe, which is known to give a purplifh red. Thus the other tinges are counterasted, but not effaced or deffroyed as has been frequently imagined. By the misture of the threc principal colours, red, yeliow, and blue, more or lels exactly counterpoifed, a certain dark thade is introduced, in which, as not any one of the colours predominates, no coloured tinge appears, but the effect is merely a dininution of the tranfparency of the giafs, which, however, is too limall for ordinary oblervation." Mr Keir is even of opinion, that a certan tinge of yellow would in many cafes be of fervice, becaule it would exclude fome of the blue rays, which being moil refrangible are moll injurious to the ditinctuefs of vinion.

Very coufiderable difficulties, however, mult arife in attempting improvenents of this kind; as the experiments muit all be tried on a very large fcale. This is not only attended with a very heavy expence in ittelf on account of the quantity of materials employed, but from the heavy duty of excile which is rigoroullv exacted whether the glais be manufactured into faleable articles or not. It is oblerved in the manufacture of every kind of glafs, that the gla's in the middle of the area or traniverle fection of a pot is much purer and freer from veins and other imperfections than the past which is near the fides, and that the glats at the bottom is the wortt of all. Confequently it is chielly in large pots, fuch as are ufed in manufactures, that there

:2:ㅅ, n,t at the trouble of thus previoully naking a pare Whts of iead. Their ufual compoticu far alazing thes wo is fomed of white hand to pounds, of zed lead 22 pounde, of penl atius 20 poud, and of common fait 12 p unds. Pumber the fand by grinding it, and then aid it to the (ther ing edients and gind them toFother: ater which caicue them for fume time with a a whate heat, and when the minture in cold, pound is to powder; ald when wanted for nefe temper it wit's a ater. The nroportion of theie ingredients may be cocatomally vaited. The ware afur being tumed on the Wheel and deied in the open air, is covezed over with the wove compation ly means of a brull ; and when fet On the furnace the violent luat foon reduce, it to a perxif ginf, covering the whole internal and enternal furface of the vellel.
We may obferve, however, in seneral, that lead ought to be excluded fiom the compolition of glazings, and wher fluxes fublituted in its Read. A trongarent giazing may be propared without lead, hy calcining to pounts of wilite fand, 25 pounds of pearl alles, and 15 pounds of common falt ; and procecding as before : and a more perfect tranfarent hlazing may le made of fand 40 potuds, of wood ahes perfectly burnt 50 pounds, of pearl athes 12 pourch, and of common falt 12 pounds. The following receipts are taken for the mott part from Kunckel, who fays, that they are the true glazings ufed at Delft and other Dutch manafasontice.

Black is made of eight parts of red lead, iron filings three, copper athes three, and zaffer two meafures. This when melted will make a brown black; and if you want it blacker, add more zaffer to it.
Blue is thus prepared: Take lead afles or red lead one pound, clear fand or powdered flints two pounds, common lilt two pounds, white calcined tartar one pound, Venice or oticer glafs half a pound, zaffer half a pound; mix them well together and melt them for fereral times, quancling them always in cold water. If you would have it fine and good, it will be projer to put the mixture into a glals furnace for a day or two.

Another blue glazing may be formed of one pound of tartar, a quarter of a pomed of ied lead, half an ounce of zaffer, and a gurrter of a pound of powdered flints, which are to be fuled and manared as in the laft reccipt. Or, taketwo pounds of calkined lead and tin, add five pounds of common filt, five pounds of powdered flints, and of $e$-ller, tartar, and Venetian glaf, each one pound. Calciae and fute the misture as before. Or, again, take of red lead one part, of fand thes part, and of zaffer che part. For a violent blue glazing, take four omers of t.mar, two ounces of red lead, five ounces of pondered tlints, and half a drachm of mituganefe.

Brown is made of red lead and thints of each $1+$ parts, and of manganele two parts fufed; or of rel lead 12 part, and manganeic one vart fuled. A brown glazing, to be kid on a white ground, may be made of manganefe two patt, and of red lead and white glafy of e:ch one part, twice fufed.

Fic/l. coluarell is made of 12 parts of lead anles, and one of white old

Gold coluured. Take of litharge three parts, of fand or calcined lint one prrt; fond and mix thefe very
well tugether, then run them into a yellu: ghefs with S : z'ong. a ftrorg ine lown this glat, and find it into a fabtic puw r, whoth numen with a well hoturated fotson of filver ; woke 1 into a pafe, which put into a craritle, and cwr with a cover. Give at mit

 t'a fin agan, anderinist to a fne powder; nuak a ti is purdar with tome beer, fo that by meses of a
 1 ince wi earthen wie. The wheis that are pande! or covered over vith tifi: glaziag rufl be n:ll will hated, thon put inder a matie; and as foon as the glafs ruas, you mant in oke them, by lolding them over lurnimes yegetables, and take out the wrick. Mr Hembes of Peterflurgh, who fent this receipt to thic Royal Suciety, ulen the words afthare al es funnm, whith is ret tered frote thom, in the Trandacions. Pail. 'Tranl'. No ifos. S. 6.

Kunckel gives feveral preparations for a gold colourat yellow graine. This may be produced by tufing a miskure of three parts of red lenel, tho parts of antimons, and one part of faifron of Mare; by again molting the pondesed mats, and repeating the opera. tion fyur time, or by fuling four or five times a compofition of red lead and ant:mony of each an ounce, and of fcales of iron half an ounce : or hy calcining and fuing together eight parts of red lead, iix parts of flints, one part of yellow ochre, one part of antimony, and one pait of white glafs. A tranfuarent goldcoloured glazing may be obtained by twice fufing red lead and white tlints, of each 12 parts, and of filings of iron one part.

Green may be prepared of eight parts of litharge or red lead, eight parts of Venice glats, four parts of brafs duit or filings of copper; or of ten parts of litharge, twelve of tlint or pebble, and one of ass uflum or copper athes.-A fine green glazing may be produced by fufing one part of the Bohemian grarate, one part of filings of copper, one part of red lead, and one part of Venctian glas; or by fufing one part of white ghafs, the fime quantity of red lead, and allo of flings of copper; powdering the mats, and adding one part of Bohemian granate to two parts of this powder. A fine green may be obtaine ? by mising and grinding together any of the yellow glazings with equal quantities of the blue glazings; and all the fhades and teints of green will be had by varying the proportion of the one to the other, and by the choice of the kind of yellow and blue.

Soa grecn is made of five pounds of lead afles, one pound of tin ahhes, three pounds of tint, three quarters of a pound of falt, half a pound of tartar, and half a pound of copper duft.

Iron colour is prepared of 15 pact of lead afhes or red lead, 15 of white fand or tlints, and five of calcined copper. This mixture is to be calcined and futed.

Liser colour is prepared of 12 parts of litharse. eight of falt, fix of peoble or fint, and one of nam gat nefe.

Puphe brown confills of lead ahhes 1 : parts, clean f.and or pondered thits 13 parts, mang.ne it .i. p...rt, and white chifs 15 nocafures, to which lome ind one meafure of zaflier.

Gicent.gh of Imthurl, however, by the aflitance of the Pope, Glifion continued long after this period to elect biliops and abbots to Glendalagh, though they had neither reve-
nues or authority, beyond the diltrict of Tuathal, which was the wellern part of the county of Wicklow; in confequence of which the city was futicered to decay, and had become nearly a defert, in 1497 , when Densis White, the laft titular bithop, futrendcred his right in the cathedral church of St Putrick, Dublin. From the ruins of this ancient city ftill remaining; it appears to have been a place of confequence, and to have contained [aven churches and religious houfes; fmall indeed but built in a neat elegant ftyle, in imitation of the Greek architecture : the cathedral, the walls of uhich are yet ftanding, was dedicated to S: Peter and St Paul. South of the cathedral ftands a frall church roofed witl: ftone, nearly entire; and in feveral parts of the valley are a number of ftone crofles, fome of which are curioully carved, but without any niferiptions. In t'se north-welt corner of the cenetery belonging to the cathedral ftands a round tower, 95 feet high, and 15 in diameter; and in the cemetery of a fmall church, on the fouth ide of the river, near the great lake, called the Rhefoart church, are fome tumbs, with Irih infcriptions, belonging to the OTools. In a perpendicular projecting rock on the wuth fige of the great lake, 30 yards above the furface of the water, is the celebrated bed of St Kevin, hewn out of the rock, exceedingly diticult of accels and terrible of profpect. Amongit the r:ins have been difcovered a number of Atones, curonfy carved, and containing inferiptions in the Latin, Greek, and Irifh languages. As this city was in a valley, furrounded on all tides, except the eaft, by high, barren, and inaccefible mountains, the attificial roads leading thereto are by no means the lealt curious part of the remains; the principal is that leading into the county of Killare through Glendafon. This road for near two miles is yet perfect, compofed of ftones placed on their edges, making a firm and durable pavement, about 10 feet broad. At a fmall diftance from St Ke$\because$ in's bed, on the fame fide of the mountain, are to be feen the ruins of a fmall fone building cailed Saint Ke. rin's cell.

GILNOIDES, the name of two cavities, or fmall Aeprelims, in the inferior part of the firft vertebra of the neck.

GLiMMER, or Glist. See Mica, Mineralo. sy Index.

GLINUS, in Botany, a genus of plants belonging to the decandria clafs; and in the natural method ranking ander the 22d clafs, Caryoplyyllea. See Botany Index.

GLIRLS, the name of Linnxus's fourth order of mammalia. See Mammalia Index.

GLISSON, Francis, a learned Englifh phyfician in the 17 th century, was educated at Cambridge, and was made regius profeffor of that univerfity. In 1634 he was admitted a fellow of the College of Phyficians in London. During the civil wars, he practifed phytic at Colcheiter, and afterwards fettled in Londen. He greatly improved phyfic by his anatomical diffections und obfervations, and made feveral new difoveries of fingular wfe towards efablifhing a rational practice. He wrote, 1. De rachitide, \&ic 2. Dc lymphaductis nupe-
repertis: with the Anatomica prolegonena, et Anatomia hipatis. 3. De nature fubfantia energitica; fou de via wite naturee, ciufque tribus primis facultatibus, \& c. quarto. 4. Tratfatus deventriculo et inteftinis, \&<. The world is obliged to him for the caphla communis, or vagina porte.

## GLISTER, in Surgery. See Clyster.

GLOBBA, a genus of plants belonging to the monandria clafs. See Botany Inder.

GLUSE, is Geometry, a round or fpherical body, more ufually called a Sphere. See Sphire.

Globe is more particularly ufed for an artificial fohere of metal, plater, paper, or other matter; on whole convex furface is dravn a map, or reprefentation either of the earth or heavens, with the leveral circles conccived thereon. See Geugr.aphy.

Globes are of two kinds, terrefirial and celefial; each of very coniderable ufe, the the in atronomy, and the other in geography, for performing many of the operations thereof in an ealy obvious manner, fo as to be conceived without any knowledge of the mathematical grounds of thofe arts.

The fundamental parts, common to both glokes, are an axis, reprefenting that of the world; and a flyerical fhell, or cover, which makes the body of the globe, on the external furface of which the reprefentation is drawn. See Geography Index.

Globes, we have obferved, are made of different materials, viz. Nilver, brals, paper, plafter, \&c. Thofe commonly ufed are of plafter and paper. For the conitruction of globes, fee Geography Index.

For the ules, \&c. of the globes, fee Geography and Astronony.

Globe Ahimg!. See Amminclee.
Globe Fifh. Sce Ostrachon, Ichthyology In- o dex.

Globulakia, globllar blue daisy; a genus of plants, belonging to the tetrandria clafs; and in the natural method ranking under the 48 th order, Aggregatce. See Botany Indicx.

GLOBULE, a diminutive of globe, frequently ufed by phyficians in fpeaking of the red particles of the blood. See Blood.

GLOCESTER, the capital of Glocefterfhire in England, rot miles from London. It is an ancient city; and by Antoninus is called Clevum, or Glevum, which Camden thinks was formed from the Britifh Caer-Glowe, fignifying "a fair city." It was one of the 28 cities built by the Britons before the arrival of the Romans, who madc it one of their colonies, and in the eighth century it was efteemed one of the nobleft cities in the kingdom. It has futfered confiderably by fire at different periods. It ftands upon a bill; and from the middle of the city, where the four principal ffrcets meet, there is a defceat every way, whith makes it not only clean and healthy, but adds to the beauty of the place. Forging of iron feems to have been its manufacture fo early as the tine of William the Conqueror. King Henry VIII, male it the fee of a bifhop, with a dean and fix prebends. Its cafle which was erected in the time of William the Conqueror, is very much decayed; patt of it is leated out by the crown; and the reft ferves for a prifon, one of the keft in England. In its cathedral, which is an ancient Lut magnificent fabric, and has a tower reckoned

Civiniden Foref fif Dian, was formerly almoat entirely overnun with wood, and extended 20 miles in lungth, and 10 in hreadth. It was then a neft of robbers, efpecially towads the Sevem; but now it contains many towns and villages, contitimg chiefly of miners, empluyed in the conl pits, or in digeing for or forging iron ore, with both which the foret abounds. Thefe miners have thair particular lans, cultome, court, and judges: and the king, as in all royal forets, has a fwain-mote for the prefervation of the vert and venifon. This foreft was anciently, and is ttill noted for its oaks, which thrive here furpiingly; but as there is a prodigious confumption of wood in the forges, it is continually dwindiang away. A navigable canal is made from Stroul to Framilode, forming a junction between the Severn and Thames. Its chalybeate fprings are, St Anthony's well, in Abbenhall parilh; at Barrow and Maredon, in Bodington parih; at Ah-church, near Tenkellury; at Dumbleton, near Winchcomb; at Esington, near Durley; and at Cheltenham. Its ancient fortifications, attributed to the Romans, Savons, or Danes, are Abiton and Wick, and at Dointon, Divton, Addletthorp, Kinole, Over Utton, Hanham Bodington, and Bourton on the Water.

GLOCHIDON, a genus of plants, belonging to the moncecia clafs. See Botisy Indev.

GLOGAW, a trong town of Germany, in Silefia, and capital of a duchy of the fame name. It is not sery large, but is well fortified on the fide of Poland. It has a handiome caftle, with a tower, in which feveral counfllors were condemned by Duke John, in 149 , to perith with hunger. Befides the Papilts, there are a great number of Proteflants and Jews. It was taken ly afiault, by the king of Pruflia, in $17+H^{1}$, and the garriton made prifoners. After the peace in 1742, the king of Pruffia fettled the fupreme court of jutice lere, it being, nest to Breliaw, the molt populous pace in Silefia. It is feated on the river Oder, in L. Long. 15.13 . N. Lat. 51.4

Glogan the Less, a town of silefa, in the duchy of Opelen, now in the poffellion of the hing of Prulia. it is two miles fouth-ealt of great Glogaw, and +5 nurth-weft of Buetlaw. E. Lon. 16. 15. N. Lat. 51. 38.

GLORIA Patri, anong ecclefiatical writers. See Doxologey.

GLORIOSA, silerb lily, a genus of plants, 'selonging to the hexandia clats, and in the natural metind ranking under the itth order, Sarmintofie. See Botasy Index.

GLORY, renown or celebrity. The love of renown, or defire of fame and repatation, appears to be one of the principal fering of adion in human tociety. Clory, thercfore, is not to be contemed, as fome of the ancient philofoplens whected to teach: but it im. ports us to regulate our purfuit after it by the dictates of 1 cifon; and it the public approbation will not folko: us in that couric, we mall leave her behind. We ought to have our judgments well inflructed as to what actions are truly glorions; and to remember, that in every innortant enterprife, as Soneca ohlerves,
 sium gf: "The reward of a thing well done, is to have done it ; the fruit of a grod office, is the office itficf." Thofe who by cther mathods ficatter their naples into
many month, how they rather hunt after a great reputation than a good one, and their reward is oftener infamy than fume.

Men generally, and almolt intinctively, affix glory orly to fuch actions as have been produced by an innate defire for public good; and we meafure it by that degree of influence which any thing done has upon the common happinefs.

If the actions of the hero conduct foonelt to glory and with the greatell fplendour, and if the victurious general is fo great after a fignal engagement; it is becaufe the fervice he has done is for the moment, and for all; and becaufe we think without reflecting, that he has faved our habitations, our weath, and our chiidren, and every thing that attaches us to life. If the man of icience, who in his itudy has difcovered an I calculated the motions of the hearenly boties, who in his alembics has unveiled fome of the fecrets of nature, or who has exhibited to mankind a new art, rites to fame with lefs noife; it is becaufe the utinty which he procures is more widely diffufed, and is often of lefs fervice to the prefent than to fucceeding generations.

The confequences, therefore, of thefe two advantages are as oppofite as the caufes are different; and while the benefits procured by the narrior appear to bave no more intacence, and while his glory becomes obfcure, that of a celebrated witer or inventor ifill increafes, and is more and more enlarged. His works every day bring back his name to that age which ufes them, and thus lill add to his celebrity and fame.

This pofthumous fame indeed has been decried by fome writers. In particular, the author of the Relis ion of Noture delineated has treated it as highly irrational and abfurd. "In reality (fays he) the man is not known ever the more to potterity, becaule his name is tranlmitted to them: He doth not live, becaufe his name docs. When it is faid, Julius Cixfar fubdued Gaul, conquered Ponpey, \&-. it is the fame thing as to day, the conqueror of Pompey was Julius Citar ; i. e. Cietar and the conqueror of Ponpey is the fame thing ; Cofar is as much hnown by one defignation as by the other. The amom then is only this, that the conqueror of Pompey conquered Pompey; or fomeLody conquead Pompey; or rather, fince Pompey is as lithe known now as Cefar, fornebody conquered fomebody. Suth a poor bumets is this bualted inmortality ! and fuch is the thing called glory among us ! To dilcerning men this fame is mere sir, and what they detpife if not thua."

Eut furely it were to confider too curioully (as Horatio lays to Hamict) to confider thas. For (as the elegant author of Fitzonlorne's Letters obferves) although fane with polierity thould be, in the ilrict amalyit of it, no other than what is here deferibed, a mere uninterelting propofition, amounting to nothing more than that fomebody acted meritoriouly; yet it would not necellatily follow, that true philofophy would banim the detire of it from the human breall: for this paffien may be (as molt certainly it is) wifely implanted in our ipecice, notwithtanding the correfonding object thould in reality be very diflerent from what it appears in imagination. Do not many of our molk refined and even contemplative pleafures owe the ir caifence to our miltikes? It is but extending fome of our fenles

## G L O

Glery to a ligher degree of acutenefs than we now pofiefs them, to make the fairent views of nature, or the noblett productions of art, appear horrid and deformed. To fee things as they truly and in themfelves are, would not always, perhaps, be of advantage to us in the intellectual world, any more than in the natural. But, after all, who inall certainly affure us, that the pleafure of virtuous fame dies with its poflellor, and reaches not to a farther fcene of exiltence? There is nothing, it ihould feen, either abfurd or unphilotophical in fuppofing it poifible at leatt, that the praifes of the good and the judicious, the fweetelt mufic to an honcit ear in this world, may be echoed back to the menfions of the next; that the poet's defcription of Fame may be literally true, and though the walks upon earth, the may yet lift her head into lieaven.

To be convinced of the great advantage of cherim. ing this high regard to poitcrity, this noble defire of an after life in the breath of others, one need only look back upon the hittory of the ancient Greeks, and Romans. For what other principle was it which produced that exalted frain of virtue in thofe days, that may well ferre, in too many refpects, as a model to thefe? Was it not the confontiens laus bonorum, the incorrupta vox leni judicantium (as Tully calls it), " the concurrent approbation of the good, the uncorrupted applaufe of the wife," that animated their moft generous purfuits,

In fhort, can it be reafonable to extinguih a paffion which nature has univerfally lighted up in the human breaft, and which we conftantly find to burn with moft ftrength and brightnefs in the noblelt and beft formed bofoms? Accordingly revelation is fo far from endeavouring to eradicate the feed which nature has thus deeply planted, that fhe rather feems, on the contrary, to cherith and for eard its growth. To be cualied with honour, and to be had in everlufing remembrance, are in the number of thofe encouragements which the Jewih difpentation offered to the virtuous; and the perfon from whom the facred Author of the Chriltian fyttem received his birth, is herfelf reprefented as rejoicing that all generations , hould call her bleffed.

GLOSS, a comment on the text of any author, to explain tis fenfe more fully and at large, whether in the fime language or any other. See the article Counextary.-The word, according to fome, comes from the Greek $\gamma \lambda \omega \sigma \sigma \alpha$, "tongue ;" the ollice of a gh/f being to explain the text, as that of the tongue is to difaver the mind.

Clons is likewife ufed for a literal trambation, or an interyretation of an author in another language word for word.

Gions is alfo ufed in matters of commerce, Sc. for the lutre of a filk, thuif, or the like.
GLOSSARY, a fort of dictionary, explaining the of cure and antiquated terms in fome old author; Juch are Dad Cange's Latin and Greck Glomirice, Spelman's Cilofary, and Kennet'? Gloflary at the end of his Paroctial intiquities.
 Hishy, a kird of estraneous fotil, fumerlat in form
 of Multa : ind ther flane.

The velear notion i , that they are the tongues of ferpents petrined; and hence theis mance, which i.

## $\because 1]$ Cr $\quad$ ○

 Hence alfo the ir traditionary vitue in curng the titeo of terpents. The gencral opinion of maturalt, is. C: that they are the teeth of filme, left at land by ive waters of the deluge, and fince petrified.

The feveral fizes of the tecth of the fame foectio, and thofe of the feveral different liee ice of thark, :at ford a wall variety of thefe folfil fablaneses. Their ufual colours are black, bluih, whitilh, yellowihh, or brown; and in ilape they ufusliy approach th a triangular figure. Sonc of them are thaple; where are tricufidate, having a imall point on each tide of the large one: many of them are quite flraght ; but they are frequently found crooked, and bent in all dirce tions; many of them are ferrated on their cdges, an 1 others have them plain; fome are andulated on theis edees, and tilightly ferrated on thefe undulations. They differ alfo in fize as much as in figure; the larger being four or five inches long, and the fmaller lefs thate a quarter of an inch.

They are moit ufually found with us in the flrata of blue clay, though fometimes allo in other fubtance, and are frequent in the clay rits of Richmond and other places. They are very frequent alfo in Germany, but nowhere fo pentiful as in the ill mal of Milta.

The Germans attributc many virtues to thefe fomb teeth; they call them cordials, fudorific, and alexipharmics: and the people of Malta, where they are extremely plentiful, hang them about their children's necks to promote dentition. They may poffibly be of as much fervice this way as an anodune necklace; and if fufpended in fuch a manner that the child can get them to its mouth, nay, by their hardnets and fmoothnef, be of the fame ule a a a piece of conal.

GLOTT1S, in Anatomy, the narrow fit at the upper part of the afpera arteria, which is covered by the epiglottis when we hold our breath and when we fwallow. The glottis, by its dilatation and contraction, modulates the voice. See Anıtony, $\mathbb{N}^{\circ} 15_{j}$.

GLOVE, a covering for the hand and writ.
Gloves, with refpect to commerce, are dilinguithed into leathern glows, filk gloves, thread yloves, cotion ghove, worl-d gloves. \&c. Leathern gloves are made of charioi, kid, lamh, doe, clk, buth, \&c. Gloves now pay a duty to the hing, which incre,fes according to their value.

To throw the glowe, wes a practice or ceremony very ufual among our forefathers; being the chatlenge wherely another was deficd to ingle combat. It is fill retained at the coronation of our lings; whea the hing' champion calls his glove in Wectminker hall. Sec Chambos.

GLUVER, Richard, the author of Leomilus and riveral uther elleemed works, was the fon of Richard islover, a Hamburgh merchant in London, an! wis Lom in St Mlartin's lare in the year 1712. He very *aty howed a brong propertity to and gentat for poetry; and while at thool, he vacte, amonert colher pieces, a poem to the memory of Sir lidac iventa, Frefixed to the view of that incomparabie authonss thilotophy, publillea in + to, in 1728 , by his intimaie then 1 D. Pembeton. Bat though poleled of tile its which were calcolated to esce! in the terasy worn, he $v a>$ coutent to devote hi attention to commerce, and ut a proper periol commenced a Hamburgh meachant. Hestill, however, cultivated licerature, and ankattod whithole who were eminent in fience. One of his 6 Ilien frienls was IItthew Green, the ingeniour bat whente author of iume admirable pooms, which in 3737, after his death, were collected and publithed lig Mir Giover. In 1737, Mr Gluves married Mif Numn, with whom he ruceived a handfome fortune; and in ibe hame month publined Lecuidas, a poea in to, which in this and the next year pailed through three editions. This poem was intcibed to Lord Cubham; and on its fr!t appearance wa received by the world whegreat aprobation, thoe, h it has firee been unsccountably aechected. Lord Lyttelton, in a popular publication catled Common Same, and in a poem addiefled to the auther, prifid it in the warm an terms; ad Dr Parrterton pubilihed, Odfervations on Puctry, ti ecially eric, occafioned by the late poem unon Lemidia, $173^{3}$, 1 amo, mercly with a vieve to point out its hacaties. In 17:99, M1r Glover publimed " l.ondon, or the Progets of Comme.ce," 4 to a and a balad enAtled, Hubers Gladt. Both thete pieces ferm to have loen witton with a siew to iarite the public to refent the minchaviour of the Spanam!s; and the latter had a vary conderable effect. The political dillenfons at thin yesiod raged with geat violence, and more efpe ci. 11 ; in the metropolis; and at different mectings of d.e livery en thofe occalions, Mr Glover wis alway caic ito tie chas, and acquitted himfelt in a wory able mone lis conduct veing patrotic and his feeches rhoute I Ilis talents for public fpealing, his knowtadge of political aftairs, and his information concern-

I: : : e jear $17+4$ Wied the duchefs of Imabor ugh,
and by her will hifi to Mr Glover and Mis Mrillet sosi. cach, to wite the Hitory of the Duke of Mrlboromg's Lite. This beçuelh, however, never tojk place. It is ruppoied that MI Glover very early renounced his Ahere of it; and Mathet, thous he continued to talk of peifoming the talk almost as long as he lived, is row hown never to have made the leat progrels in it. Abe.t this period MIr Glover withdrew a good deal form public notice, and lived at life of retirement. He had leen undaccefsul in hos tufnefs; and with a very Latalie delicacy bad prefered an obsure retreat to popatar obfervation, until his ardies thould put on a more priferous apperance. He lud been honoured with the atantion of Froderick !ince of Wales, who once prefented him with a complete fet of the chalics, degantly bound; and, on his actenting himfelf for come time en account of the embarratment in his circumfances, fent him, it is taid, $j 201$. The priace dicd in March s-51 ; and in May tollowing Mr Glover was once mose drawn from his re-reat by the importunity of lis friends, and ftood candidate for the Flace of chanber'ain of London. It mfortunately baprentd that he wed not deckere hindelf until moti of the livay bad ery ocd theis votes; Ly which means he lot his el-ction.

In 1-53. NIr Glover proctucde a* Drury Lane his tragedy of soadicea: which was acted nine nithts, in the month of Lecomier. It had the adrmage of the performance of Mir Gartick, Mir Nopo , Nro Cibber, and Mis Pitchard. Fiom the proiogne it feems to have been patronized ly the author", fiends in the city ; and $D_{1}$ Pemberton vute a pamphla to recommend it--In 1761, Mr Gover publihed Nedea, a tangedy writen on the Greck model ; but it was not acted until $1-67$, when it appeared for the fint time on the ftage at 1 ): ury Lane for ? I's Yate’s beneft. At the accelinon of his prelint m .jety, he appeas to lave furmounted the dificulties of hin fouation. In the palliment which was then calle J, he wats chofen member for Weynouth, and continued $t$, fit as fuch mosi the dirulation of it. He, aoout this time, interefted himfif about India amars, at one of thir Sullivan's elediuns; and in a lpech introduced the fable of the man, hors, and bear; and drew this concluion, that, whenever merchants made ufe of armed force, to maintain their trade, it would end in their dolutation.

In 1770 , the poem of Leondas requims a new edition, it was republihed in two volumes $12 m 0$, corrected throushont, and exteriad from nime bouns to tweive. It had alfo fertral new chara*ters adued, befide placing the old ones in new fituation:. The improvements made in it were very confiderable; but we belive the public curionity, at this period, was not fufficiently alive to recompenfe the pains belowed on this once popalar performance. The calamities arining from the woht.ds given to public crodit, in June 1752, by the falue of the bark of Dougla, Fkeron, and Čo. in Scuthant, ocoufincel Mr Ghovers taking a very active put in the fotting tho compliated concerns, and
 buay 177.4, le called the anmuitants of that bankinghouke togelher, at the Wiag's A:n.5 twem, and laid 1ropotab before them fur the fecuity of their demands, with which they wate fully fatisfed. He allo $\because$ d.tack to manage the intere?s of the merchants

Glue. fe:ding you: at the fame time I mult beg of you, or sour correlpondents, that where it may be correched in iny manner, it may be done, and I thall feel myicli obiiged by the attention.
"Glue is an infpiffated jelly, made of the parings of hides or homs of any kind, the pelts cixamed 'rom furriers, and the hoofs and ears of korles, oxen, calves, Theep, \&c. quantities of all which are importec in addition to the home fupply, by many of the great manufacturers of this article: theie are firlt digetled in lime water, to cleanfe them as far as it can from the greafe or ditt they may have contracted; they are then iteeped in clean water, taking care to tir them well from time to time; afterwards they are laid in a heap, and the fuperabundant water prefled out; then they are boiled in a large brafs caldron with clean water, thimmins off the dirt as it rifes, and further cleanfed by putting in, after the whole is diilolved, a little melted alum or lime fincly powdered, which, by the ir deterfive roperties, itill further purge it : the fimming is coninued for fome time, when the mafs is itrained through bafkets, and fufiered to fettle, that the remaining impurities, if any, may fubfide; it is then poured gently into the kcttle again, and further evaporated by boiling a lecond time, and frimming, tintil it becomes of a clear but darkith brown colour: when it is thought to be 1lrong enough (which is known either by the length of time a certain quantity of water and materials have boiled, or by its appearance during ebullition), it is poured into frames or moulds of about fix feet long, one broad, and two deep, where it hardens gradually at the heat decreafes : out of thefe troughs or receivers it in cut, when cold, by a fpade, into fquare pieces or cakes, and each of the placed within a fort of woodc:1 bos, open in three divifions to the back; in this the glue. as yet foft, is taken to a table by women, where they divide it into three pieces ( 1 ) with an intrument not unlike a bow, hating a brats wire for its ttring; with this they thand behind the box and cut by its openings, from front to back: the pieces thus cut are taken out into the open air, and dried on a kind of coarfe net work, faftencl in moveable theds of a hout four feet figuare, which are placed in rows in the gluemaker's fidd (every one of which contains four or tive rows of net work); when perfeetly dry and hard, it is fit for fale.
"That is thought the beft glue which fwells confiderably without melting, by three or four days immer. fion in cold water, and recovers its former dimenfions and properties bs drying. Glue that has got froft, or that looks thick and black, may be melted over again and refined, with a futticient quantity added of freth to overcome any injury it may have futtaine 1 ; Lut it is generally put into the kettle after what is in it has been nu-ced $m$ the fecond boiling. 'loknow good from ats ine, is is neceflary for the purchater to ? .old it is en: his eve and the light, and if it appears of a ftrmes ark hrown colour, and free from cloudy or What $f$ ots, the art $;$ is gene."

A giue that is colowief and of fuperior quality, is
obtained from the ©ikiss of eels, and known by the name of $\therefore \approx$. It is tven procured from vellum, parchment, and tome of the white fpecies of leather ; but for common purpofes this is by far too expenfive, and is only made ufe of in thofe cales of delicate workmanhip where glue would be too grofs. The thins of the rabbit, lare, and cat, are made ufe of in the manufacthins of fize, by thole who are employed in gilding goid, polihais, and painting, in various colours.

From the experiments of Mr Hatchett it appears, that membra'se yic: do different quantities of gelatine, the folutions of which evaporated to dry nels, atforded him an opportunity of obl-1 ving the different degrees of vifcidity and tenacity of mucilage, inze, and glue. He alfo found that the more vilcid glues are obtained with greater dificulty than fuch as are lefs fo. When a cake of giue has been fleeped three or four days in cold water, it is confidered of the beit quality, if it fwell much without being diffolsed, and if, when taken out, it recovers its original figure and hardnefs by drying.

On comparing the fkins of different animals, Mr Hatchett found, that fuch as were molt flexible more readily yielded their gelatine, and that produced from the fkin of the shinoceros was by far the mott vifcid of any. The true ikin of any animal was moft affected by long boiling; but the hide of the rhinoceros was the molt infoluble.

He found that hair was not fo much affected as ikin; but the cartilages of the joints, when boiled long in water, were as perfectly foluble as the cutis, which is not the cale with the other cartilages, as they afford little or no gelatine. The horns of the ox, ram, and goat, are very different from thofe of the ftag; and the fmall quantity of gelatine they are found to contain, is produced mose gradually, and with greater dificulty.

According to Hatchett, the effects of diluted nitric acid on the ubllances commonly entployed in the manufacturing of glue, were evactly snalogous to thofe of boiling water, and were always mott poiserful on thofe fubitances which contained the greatell quantity of gelatine. Almoft all animal fubftances are convertible either into glue or foap, with this additional advantage, that thofe parts of them $w$ ich : cutid not be employed in making the one, are the nout proper in the manufacture of the other.

Another the fuecies of glue, known by the name of i/ingla/i, is the produce of cottain finh, very commou in the Rullian leas, fow on entering the rivers Wolga, Lyak, Don, ani D mbe. I: Mofrovy it is prepared of the huree, and the /lorled, which yiekt the mott beatilut inm...ts. 'The fith from freih water are efleemed the bett, is they afford an iningias mose flexible and turn went an and arer.

When the bints ris extracted, it is wathed in water to free i: om in ,ool, if any adheres to it, but not otherwit. it is thet. cut longitudimally, and the outer nembrate sken wh, the colour of which is brown, while the otacr memarane is fo fine and white as to be with

Gonelt. Gertin was felcited along with two ohers, as property
the couvdaries of Sineria. The denartment of natural l.hory was atligned to our autior. He had with him and his companions, if fudent:, two dratimen, two lunters, two miners, fun lamfervevors, and 12 bldiers, with a ferjent and drummer. They begon their journey on the roth of Aucuit 1733; and in 1736, s.rlke and a painter jpined their fuciety, in order to athet Gonelin in his ardums labours.
F. exploring kamtichatin, they hoped to accomflim their milton in a fatistaztory manner, for wish purpote Steller procceded to this phace, and the rest of the fociety commaed their travels through siberia. In February 1,43 Gmedin returned to Peterburgla in fafety atter a dangerous journcy which lated nine years and a hatf, but proved of the utmoft importance to various branches of fience. He refumed the offices which he had filled before; and having paid a vilit in $1 \sim 47$ to his native country, he was chomen profetor, whie abfent, in the rom of Bachmeiter decealed. He was feized with a violent fever in May 1755 which pat a period to his valuable life, in the $45^{\text {th }}$ year of his age. He was undoubtedly one of the molt eminent botaniis of the lat century, and has renderd his name inmortal by his Fiura Sibirica, fell helloria piantarum Su :ria, in four parts, large quartu. He determined the boundaries between Eurofe and Alia, which every celebrated geocrapher has adopted fince his day. Through ail his works the traces of great monetty, a facred regard to truth, and the molt extenive kions ledge of nasure, are remarkably conficuous.

Gumbis, Dr Saruel, was born in 1743 at Tubingen, where he alfo itudied, and became doctor in medicine in 1763 . He was afiernads admitted a member of the Imperial Acadery of Sciences at St Peterfwarg. He commenced his travels in June $1-68$; and having raverfed the provinces of No!cor, Voronetz, New Rulia, Azof, Calin, and Altracan, he vilited, in $17 \%=$ and 1771. the different harbours of the Caffian, and cxamined with peculiar attention thole parts of the Perfian provinces which border upon that fea, of which he has piven a circumtantial accom: in the three volumes of his travels already publihed. Actuated by a zeal for extending his oblervations, he at:empted to fras through the weftern provinces of Persia, which arc in a perpetual itate of warfase, and infelted by numerous banditti. Upon this expedition, he quitted, in April 1772, Einzillee, a fmall trading place in Ghilun, upen the fouthern fhore of the Cafian; and, on aecount of many difficuities and dengers, did not, until December 2.1773, reach Silizer, a town fituated upon the mouth of the river Kour. Thence be procealed to Baku and Kuba, in the province of Shirran, where! met with a friendiy reception from Ali Feth Khar, the ruverign of that difrict. After he hat foen sed by zo U'ralian Collacks, and when he was ir d iouncy from the Rulion mortres Kither, te

Gonatics. It annears from fereral paffiges of the facred writinge, marticularly I Jolan ii. 18. I Tim. vi. 25. and Col ii. \&. that many perluns were infeeted with the Gnoftic herefy in the firlt century ; though the feet did not render iticlf confpicuous, either for number or reputation, lefore the time of Adrian, when fome writers erroneouly date it, rice.

The name is formed of the Latin cnoficus, and that
 know;" and was adopted by thofe of this fee?, as if they were the only perfions who had the true knowledge of Chritianity. Accordingly, they looked on all other Chritians as fimple, ignorant, and barbarous perfins, who explained and interpreted the facred writings in a too low, literal, and unedifying fignification.

At firft the Gnoftics were only the philofophers and wits of thofe times, who formed for themfelves a peculiar fyitem of theology, agreeable to the philofophy of Pythagoras and Plato; to which they accommodated all their interpretatioss of Scripture. But

Grostics afterwards became a general name, com. prehending divers fects and parties of herctics, who rofe in the firit centuries, and who, though they differed among themfelves as to circumflances, yet all agreed in fome common principles. They were fach as corrupted the doctrine of the gofpel by a profane misture of the tenets of the oriental philofophy, concerning the origin of evil and the creation of the world, with its divine truths. Such were the Valenciuians, Simonians, Carpocratians, Nicolaitans, \&ic.

Gsostics was fometimes alfo more particularly attributed to the fucceffors of the firl Niculaitans and Carpocratians, in the fecond century, upon their laying afide the names of the firft authors. Such as would be thoroughly acquainted with all their doztrines, reveries, and vikons, may confuit St lienaios, Tertullian, Clemens Alexandrinus, Origen, and St Epphanius; particularly the firf of there riters, who relates their fentiments at large, and confutcs them at the fame time: indeed, he dwells more exprefily on the Vaientimians than any other fort of Gnoitics; but he itows the general principles whereon all their mitaken opinions were founded, and the method they followed in explaining feripture. He accufes them of introducing into religion ceftein rain and ridiculors genealogiec, i. e. a kind of divine procellions or emanations, which had no other feandation but in their own wild imaginations.

In efiect, the Groftics confeffed, that thefe rons or emanations were nowhere expretily delivered in the facred writings; but infinied at the fame time, that Jefus Chrif had iatimated them in parables of fuch as could underfland tim. They luilt their theology not only on the gofects ard the cyitities of St Paul, but alfo on the law of Nofes and the prophets. Thefe latt laws were peculiarly fervice able to them, on account of the allegroce ard allufons with which thes almund, which are cavable of tifferent irterpretatio:s: 1 louch their doctine, concening the creation of the wolld by one or more inferior beings $1 f$ an exil or impofed 1 ature, led them to deny the divine authorit of the books of the Old Teflament, which contradicted thit idle fiction, and filked them with an al horrence of Mois and the religion be taught, aile girs, that he was actuated Vot. IX. Pat 16.
by the malignant author of this world, who couflied r.w. his own glory and authority, and not the real atwaitage of men. Their perivation that exil refid. $\mathrm{d} \mathbf{i}_{1}$ madter, as its centre and lource, made them treat the body with consmpt, difouraye marriage, and rejest the doctine of the relurrection of the body and its re-union with the in imortal fpitit. Their notion, that malesolent genii pretided in nature, and occatoned difeale" and calamities, wars, and defolations, induced them to apply themfelves to the thudy of magic, in order to weaken the powers or fuipend the intuence of their malig. nant ageats.

The Gnotics confidered Jefus Chril as the Son of God, and confequently inferior to the Father, who came into the world for the refcue and happinec of mifcrable mortals, opprefied by matter and evil being; but they rejected our Lord's humanity, on the principle that every thing corporeal is cfentially and intrinfically evil ; and therefore the greateft part of them denied the reality of his fi:ferings. They fet a great value on the beginning of the golpel of St John, where they fancied they faw a great deal of their sons, or emanations, under the Word, the Life, the Light, \&ic. They divided all nature into three kinds of beings, viz. hylic, or material ; $A / y$ chic, or animal; and preumatic, or ppiritual. On the like principle they alio ditlinguilhed three forts of men; material, animal, and /piritual. The firt, who were material and incapable of knowledge, incvitably perilhed, both foul and body; the thitd, fuch as the Gnotics themlelves pretended to be, were all certainly faved; the pfychic, or animal, who were the middle betwee the other two, were capable either of being faved or damned, according to their good or evil actions.

With regard to their mural doctrines and conduct, they were nuch divided. The greatelt part of the lect adopted very aultere rules of life, recommended rigorous abfinence, and proferibed fevere bodily mortiications, with a view of purifying and exaling the mind. However, fome maintained, that there was no moral difference in human actions; and thus, confounding right with wrong, they gave a loofe rein to all the palfions, and aflerted the finnocence of following blindly all their motions, and of living by their tummans dictates. They fupported their opinions and practice by various authorities: fome referred to fictitious and apocrephal witings of Adam, Abraham, Zoroatter, Chrif, and his atoglties; whers boatied, that they had deducel their fentiments from fecret doelrines of Chift, concealed from the vulvar; o hers atiirmed, that they arrivei it fagerior degrees of wifdom by an innate vigeur of mind; and others afferted, thet they were infiruted in thefe myfterious parts of the togical cience by Theudas, a difciple of St Paul, a and by Muthias, one of the fricuds of our Lord. The tenet, of the aucient Goftio, were revived in S win, in the fourtin century, by a lect called the Prifcillenvits.

The appellation Gn, fic fometinue alto creurs in a good fenfe, in the anceat eccerciatical writers, and particularly Clemens Alewa drinus, who, in the ferfon of his Guollic, defcritas the chatacters and qualities of a per.ett Chrillian. This point $b$ latours in the $f e$ venih book of his Stromata, where he thows thent none but the Gnollic, or larned perfon, has any true religion. He affirms, that were it pofible tor the 1 now 5 F ledge

Gio?.
beage of Giat to be feparated from eternal hatuation, the Gnotice woutd make no feruple to choofe the knowledge; and that if Gud would promile him impunity in doing of any thing he has once fpoken againll, or offer tim heaven on thofe terms, he would never alter a whit of his meafures. In this fenfe the father ufes Gnoltics, in oppotition to the heretics of the fame name; aftirming, that the true Gnottic is grown old in the tiudy of the holy feriptures; and that he preferves the orthodos ductrine of the apoltles and of the church; whereas the falle Gmoltic abandons all the apoftolical traditions, as imagining himfelf wifer than the apotles. At length the name Gnofic, which originally was the moft glorious, became infamous, by the idle opinions and diflolute lives of the perfons who bore it.

GNU, or Gnou. See Capra, Minmalia Index.
GOA, a large and ftrong town of Afia, in the peninfula on this fide the Ganges, and on the Nalabar coath. It was taken by the Purtuguefe in 1508 , and is the chief town of all their fettlements on this fide the Cape of Good Hope. It Itands in an ifland of the fame name, about 12 miles in length, and fix in breadth; and the city is built on the north fide of it, having the conveniency of a fine falt-water river, capable of receiving lhips of the greatelt burden, where they lie within a mile of the town. The banks of the river are beautified with a great number of handfome ftructures; fuch as churches, caltles, and gentlemen's houfes. The air within the town is unwhofefome, for which reafon it is not fo well inhabited now as it was formerly. The riceroy's palace is a noble building; and flands at a fmall difance from the river, over one of the gates of the city, which leads to a fpacious ftreet, terminated by a beautiful church. This city contains a great number of handfome churches, convents, and cloithers, with a ftately large hofpital; all well endowed, and kept in good repair. The market place takes up an acre of ground; and in the thops about it may be had the produce of Europe, China, Bengal, and other countrits of lefs note. Every church has a fet of bells, tome of which are continually ringing. There are a great many Indian converts; but they generally retain fome of their old cuitoms, particularly they cannot be brought to eat beef." The chergy are very numerous and illiterate; but the churches are firely embellithed, and have great numhers of images. In one of thefe churches, dedicated to Kon Jefus, is the chapel of St Francifco de Xaviere, whofe tomb it contains: this chapel is a moft fuperb and masnificent place; the tomb of the faint is entireIy of fine black marble brought from Litbon; on the tour fides of it the principal actions of the life of the lint are moft clegantly carved in baffo relievo; thele reprefent his converting the different nations to the Catholic faith: the figures are done to the life, and nost admirably executed: it extends to the top in a p,yramidial form, which terminates with a coronet of mother-of-pearl. On the fides of this chapel are ex-- elient painting, done by Italian matters; the fubjects chietly from Scripture. This tomb and the chapel apfertaining to it, mult have colt an immenfe fum of motiey; the Portogucle juitly eiteem it the greateft rarity in the place. The houfes are large, and make a fine fhow: but within they are but poorly furnihied. The shabitants are cuntened with greens, fruits, and
roots; which, with a little bread, rice, and filh, is their principal diet, though they lave hogs and fowls in plesty. The river's mouth is defendes by feveral tort, and batteries, well planted with large cammon on both fides; and there are feveral other torts in different places.

Gua is the refidence of a captain general, who lives in great fplendour. He is alio commander in chief of all the Portuguefe forces in the Eat Indies. They have here two regiments of European infantry, three legions of fepoys, three troops of native light horfe, and a militia; in all about five thoufand men. Goa is at prefent on the decline, and in little or no citimation with the country powers; indeed their bigotiy and fuperftitious attachment to their faith is fo general, that the inhabitants, formerly populous, are now reduced to a few thinly inhabited villages; the chief part of whom have been baptized; for they will not fuffer any Muffulman or Gentoo to live within the precinct of the city : and thefe few are unable to carry on the huibandry or manufactures of the country. The court of Portugal is obliged to fend out ammually a very large fum of money, to defray the current expences of the government ; which money is generally lwallowed up by the convents and foldiery.

There was formerly an inquifition at this place, but it is now abolifhed ; the building ftill remains, and by its black outfide appears a fit emblem of the cruel and bloody tranfactions that pafied within its walls! Provifions are to be had at this place in great plenty and perfection. E. Long. 74. O. N. Lat. 15. 31.

GOBELIN, Giliss, a celebrated French dyer, in the reign of Francis I. difcovered a method of dyeing a beautiful icarlet, and his name has been given ever fince to the finelt French farlets. His houfe, in the fuburb of St Marcel at Paris, and the river he made ule of, are till called the Gobelins. An academy for drawing, and a manufactory of fine tapeftries, were erected in this quarter in 1666 ; for which reafon the tapeltries are called the Gobelins.

GOBIUS, a genus of fifhes belonging to the ordes of thoracici. See Ichthyology Index.

GOBLET, or Gobelet, a kind of drinking cup, or bow?, ordinarily of a round figure, and without either foot or handle. The word is French, gobelet; which Salmafius, and others, derive from the barbarous Latin cupa. Budeus deduces it from the Greek xu $\pi$ inion, a fort of cup.

GOD, one of the many names of the Supreme Being. Spe Christinvity, Metaphisics, Moral Philosophy, and Tueology.

GoD is allo ufed in fpeaking of the falfe decties of the heathen:, many of which were only creatures to which divine honours and worilip ware fuperititionily paid.

The Greeks and Latins, it is obfervable, did noz mean by the name Gud, an all-perfect being, whereof cternity, infinity, omniprefence, \&c. were effential attributes; $\ldots:$ them, the word only implied an excellent and hag rive ninture; and ascordingly they gave

## C O D $\left[\begin{array}{ll}3+\infty\end{array}\right] \quad$ rion

 he fold to Chales 11. for sosel, and which 1) Lither afiure, us wa only the volatile fipirit of raw tik restified with oil of cimamon or fome other elential ail. But he clams more particular regard, if what bihhop Seth Ward fays be true, that he was the firt Englinman who made that nolle allonomical intrument, the telefornc.
(iODDESS, a heathen deity of the female fex.
The ancien, had almon as many qodeftes as god: fuch were, Juno the goddefs of air, 1hina the goddelof wood, \&c. and under this charafter were reprefented the virtues, graces, and principal advantages of life: truth, jultice, picty, liberty, fortune, victory, \&c.
It was the peculiar privilege of the goddefies to bs reprefented naked on medal? ; for it wa fupporid that the imagination muft be awed and rellained by the confiderition of the divine character.
GODFATHERS and Godnothers, perfons whe. at the baptifm of infants, anfwer for their future conduct, and folemnly promife that they will renounce the devid and all his works, and follow a life of piety an: virtue; and by this means lay themelves under an in difpenfable obligation to intruat them, and watch ores their condust.

This cultom is of great antiquity in the Chrintiar church; and was probably intituted to prevent children being brought up in idolatry, in cafe their parents died before they arrived at years of difcretion.
The number of godfathers and godmothers is reduced to two, in the church of Rome; and three, in the church of England: but formetly they had as many as they fleafed.

GODFREY of Bouillon, prince of Lorrain, a moft celebrated crufader, and victorious general. He was chofen general of the expedition which the Chriflians undertook for the recovery of the Holy Land, and fold his dukedon to prepare for the war. He took Jerufalem from the Turk, in 1299; but his piety, as hiforians relate, would not permit him to wear a diadem of gold in the city where his Saviour had been crowned with thorns. The faltan of Egypt afterwards fent a terrible army againt him; which he defeated, with the thuchter of about 100,000 of the enemy. He died in 1165.
GODMANCHESTER, a town of Hantingdonthite 16 miles from Cambridge, and 57 from London. It has a bridge on the Oule, oppolite to Huntingdon; was furmerly a Ruman city, by the name of Durofiponte, where many Roman coins have been often dug up; and according to old writess, in the time of the Saxons it was the fre of a bihop, and had a cattle built by one Gormun a Danih king, from which the town was catled Gormanclefer. I: is reckoned one of the largent villares in Lingland, and is feated in a fertile foif, abounding with corn. It is faid that no town in England kept more ploughs at work than thi has done. The inhahitants boatt they formerly received our kings a. they made a progrefs this waty, with nine fooplouglis at a time, finely adorned with their trappings \& C. Jance I. made it a corporation by the name of twe b illifs, 12 aTitants, and the commonalty of the borough of Godmanchenter. Here i a thonl, called the Firee Grammar-S houl of Guen Filizateeth. Or the weit fide of the tomn is a muthe thoushancin of fut - 1 ?
ras. the arpulation fads to all beings of a raki or clals higher and more perfent than that of mem; and efiecially to thofe who were inferior agents in the divinc alminitration, all furjeit to the one Supreme. Thus alminitration, all fuye to the one Supreme. Thus
men themfelves, according to their lyhtem, might become gods after death; inalmuch as their fouls might attion to a degree of excellence fuperior to what they were capable of in life.

The firl divines, Eather Bofla obferves, were the
pocts: the two functions, thưgh now feparated, were originally combined; or, rather, were one and the fame thing.
Now the great variety of attributes in Gull, that is, the number of relations, capacitie, and circumitances, wherein they had occanon to comider him, put thefe wherein they had occahon to combider him, put thefe
poets, Sc. under a neceflity of making a partition, and of feparating the divine attributes into feveral perfons; becaute the weaknefs of the human mind could not conceive fo much power and action in the fimplicity of one fingle divine nature. Thus the omnipotence of Gud came to be reprefented under the perfon and anpellation of Jupiter; the widdom of God, under
that of Alinerva; the juftice of God, under that of anpellation of Jup:ter; the widdom of God, under
that of Minerva; the jutice of God, under that of Juno.

The firt idols or falfe gods that are faid to have been adored, were the ftars, fun, moon, \$c. on account of the light, heat, and other beneits, which we derive from them. Afterwards the earth came to be deified, for furnilhing fruis, neceflary for the fubifitence of men and animals ; then fire and water became objects of divine worhip, for their ufefulnefs to human life. In procefs of time, and by degrees, gods became multiprocefs of time, and by degrees, gods became multi-
piied to infinity: and there was farce any thing but the weaknefs or caprice of forue devotee or other elevated i:nto the rank of deity; things ufelefs or even deltructive not excepted. See Mythoiogy.

GODALMANG, a town of England, in the county of Surrey, fituated on the river Wye, 3.5 miles from London. Here is a manufactory of mised and blue kerfeys, and of thockings; the place is allo famous for Diquorice, and fore of peat that burns better than pit-
coal: in 739 , the fmall-pox carried off above 500 pernquorice, and ftore of peat that burns better than pit-
coal: in 1739 , the fmali-pox carried off above 500 perFons here in three months, which was more than a third of the inhabitants. GODDIRD, JosIThas, an eminent phyfician and chemin, and one of the firt promoters of the Royal chemit, and one of the firlt promoters of the Royal
Socety, was born about the year 1617. Hc was elected a fellow of the college of phyficians in 16,46 , and appointed render of the anatomical lecture in that colappointed reader of the anatomical lecture in that col-
lege in 1647. As he took part againf Charles 1 accepted the wardenhis of Merton-college, O, ford, from Oliver Cromisell when chancello:, and fat fole reprefeatative of that univernity in Cromwell's parliament, fentative of that univerity in Cromwell's parliament,
he was removed from his wardenthip in a manner difgracefal to him by Charles 11. He was however then profefior of phylic at Greham college, to which he reprofefior ut phylic at Grefham college, to which he re-
tired, and continued to attend thofe meetings that gave birth to the Royai Society; upon the fint ellablimment of which he was nominated ore of the council. Being fully perfuaded that the preparation of medicines was fuly perfuaced that the premaration of medicines was
no lefs the phyfician's duty than the fr.feribin r them, Le conflartly prepared his orms and in is68 pullibhed 2 treatife recommending his example to gene ral prartice. He died of an apople atic fit in t int: and his memury was prefered ly the dapo that bure hio name,

Guvitury of thic earl of Sandwich. Near this place, in the London road between Huntingdon and Castor, is a tree well known to travellers by the nane of Beggar's Bull.

GODSTOW, : $1^{\text {tace }}$ noth-wef of Oxford, in a fort of iland formed by the divided fleeams of the Ifis after being joined by the Evenlode. It is noted for catching of lifh and drefing them; but more fo for the ruins of that nunnery which fair Rofamond quit. ted for the embraces of Henry II. The people fhow a great hole in the earth here, where they fay is a fubterraneous pafigge, which goes under the river to Woodnlock, by which the vied to pafs and repafs. Little nore remains at prefent than ragged walls, fcattered over a confiderable extent of ground. An arched gateway, and another vencrable ruin, part of the tower of the conventual church, are flill flanding. Near the altar in this church fair Rofamond was buried, but the body was afterwards removed by order of a bilhop of Lincoln, the vifitor. The only entire part is fimall, formerly a private chapel. Not many years fince a ftone coffin, faid to have been Rofamond's, who, perlaps, was removed from the church to this place, was to be feen here. The building has been put to various ufes, and at prefent ferves occafonally for a ftable.

GODWIN, Frangis, fucceffively biftop of Landaff and Hereford, was born in 1567. He was eminent for his learning and abilities; being a good mathematician, an excellent philofepher, a pure Latinift, and en accurate hiftorian. He underftood the true theory of the moon's motion a century before it was generally known. He firt flarted thofe hints afterwards purfued by Bifhop Wilkins, in his "Secret and fwift meffen. ger ;" and publifted " A catalogue of the lives of Enclifh billops." He has neverthelefs been accufed as a great fimoniac, for omitting no opportunity of difpofing of preferments in order to provide for his children. He died in $16_{4} 8$.

GODWIT. See Scohopax, Ornithology Indix.
GOES, or TER Goes, a ftrong and confiderable cown of the United Provinces, in Zealand, and capital of the iiland of South Beverland. It communicates with the fea by a canal; and is 10 miles ealt of Middleburgh, and 30 north of Ghent. E. Long. 3. 50 . N. Lat. 51.33 .

GOG and Magog, two names generally joined together in feripture, Ezek. xxxviii. 2, 3, \&c. xxxix. 1, 2, \&e. Rev. xx. 8.) Mofes fpeaks of Magog the fon of Japhet, but fays nothing of Gog, (Gen. x. 2 . 1 Chr. i. 5.). Gog was prince of Magog, according to Ezckicl. Magog fygnifies the comntry or people, and Gog the king of that country. The generality of the ancients made Magog the father of the Scythians and Tartars; and feveral interpreters difcovered many footlepe of their name in the provinces of Great Tartary. Others have been of opinion that the Perlians were the defcendants of Magog; and fome have imasined that the Guths were defeended from Gog and Magoz; and that the wars defcribed by Ezekiel, and undentaken by Gog againg the faints, are no other than thofe $w$ bich the Goths carried on in the fifth age againit the Roman empire.

Eochart has placed Gog in the neighbourhood of Caucafus. He derives the name of this celebrated
nountain from the Hebrew Gog chafan "the fortrefs of Gusyites Gog." He maintains that Prometheus, faid to be chained to Caucafus by Jupiter, is Gog, and no other. There is a province in Iberia called the Gogarene.

Lattly, the gencrality belicve, that Gog and Magog, mentioned in Ez-kiel and the Revelation, are to be taken in an allegorical fenfe, for fuch princes as were enemies to the church and faints. Thus many by Gog in Ezekiel underitand Antiochus Epiphanes, the perfecutor of the Jews who were firm to their religion; and by the perfon of the fame name in the Revelations, they fuppofe Antichrift to be meant, the great enemy of the church and faithful. Some have endeavoured to prove that Gog, fpoken of in Ezekiel, and Cambyfos king of Perfia, were one and the fame perfon; and that Gog and Magog in the Revelation denote all the enemies of the church, who fhould be perfecutors of it to the confummation of ages.

GOGGLES, in Surgery, are inftruments ufed for curing fquinting, or that diltortion of the eyes which occafions this diforder. They are flort conical tubes, compofed of ivory ftained black, with a thin plate of the fame ivory fixed in the tubes near their anterior extremities. Through the centre of each of thefe plates is a fmall circular hole, about the fize of the pupil of the eye, for the tranfmifion of the rays of light. Thefe goggles munt be continually worn in the daytime, till the mufcles of the eye are brought to act regularly and uniformly, fo as to direct the pupil ftraight forwards; and by thefe means the cure will be fooner or later effected.

GOGMAGOG hills, are hills fo called, three miles from Cambridge, remarkable for the intrenchments and other works caft up here: whence fome fuppofe it was a Roman camp; and cthers, that it was the work of the Danes.

GOGUET, Antony-Yyes, a French writer, and author of a celebrated work, intitled, L'Origine des Loix, des Arts, des Sciences, do de leur Progrès che ies anciens Peuples, 1758,3 vols 4 to. His father was an advocate, and he was born at Paris in 1716. He was very unpromifing as to abilities, and reckoned even dull, in his early years; but his underftanding developing itfelf, he applied to letters, and at leagth produced the above work. The reputation he gained by it was great ; but he enjoyed it a very flort time ; dying the fame year of the fmall-pox, which diforder, it fecms, he always dreaded. It is remarkable, that Conrad Fugere, to whom he left his library and his MSS. was fo deeply affected with the death of his friend, as to die himfelf three days after him. The above work has been tranllated into Englifh, and publifhed in 3 vols 8 vo .

GOITO, a town of Italy, in the duchy of Mantua, taken by the Germans in 1701, and by the prince of Heffe in 1706 . It is feated on the river Mincio, between the take of Mantua and that of Garda, 10 miles north-weft of Mantua. E. Long. 11. O. N. Lat. 45. 16.

GOLCONDA, a kingdom of Afia, in the peninfula on this fide the Ganges. It is bounded on the north by that of Oixa, on the well by that of Balagate, on the fouth by Bitnagar, and on the ealt by the gulf of Bengal. It abounds in corn, rice, and cattle; but thit which senders it wett remark

Gold. able are the diamond-mines, they being the moft con$\mathrm{f}_{1}$ lerable in the world: they are ufually purchafed of the black merchants, who buy parcels of ground to fearch for thefe precious flones in. They fometimes fail in meeting with any, and in others they find immenfe riches. They have alfo mines of falt, fine iron for fword-blades, and curious callicoes and chintzes. It is fubject to the Great Mogul; and has a town of the fame name, feated at the foot of a mountain, being one of the largeft in the Eait Indies. It is about fix miles in circumference; and was formerly the refidence of the kings, till it was conquered by the Great Mogul. It is now much frequented by the European merchants. E. Long. 70. 10. N. Lat. 10́. 30.

GOLD, the molt valuable of all the metals, is of a bright yellow colour when pure, but becomes more or lefs white in proportion as it is alloyed with other metals. It is the heavieft of all known bodies, platina only excepted. See Chemistry and Mineralogy Index.

Method of Recovering Gozn from Gilt Works. The folubility of gold, and the indifolubility of filver, in :e qua regia, affords a principle on which gold may be feparated from the furface of filver; and, on this foundation, different procefles have been contrived, of which the two following appear to be the belt.- Some powdered fal ammoniac, moiftened with aquafortis into the confiftence of a paite, is fpread upon the gilt filver, and the piece heated till the matter fmokes and becomes nearly dry : being then thrown into water, it is rubbed with a feratch brufh compofed of fine brafs wire hound together; by which the gold eafily comes off. The other way is, by putting the gilt filver into common aqua regia, kept fo hot as nearly to boil, and tuaning the metal frequently till it becomes all over black; it is then to be wafhed with a little water, and rubbed with the fcratch bruih, to get off what gold the aqua regia may have left. This laft method appears preferable to the other; as the fame agua regia may be made to ferve repeatedly till it becomes faturated with the gold, after which the gold may be recovered pure by precipitation with fulphate of iron.

For feparating gold from gilt copper, fome direct a iolution of borax to be applied on the gilt parts, but nowhere elfe, with a pencil, and a little powdered fulplur to be fprinkled on the places thus moiltened; the principal ufe of the folution of borax feems to be to nutke the fulphur adhere; the piece being then made red hot, aid quenched in water, the goid is faid to be fo far loofened, as to be wiped off with a brulh. Others mix the fulphar with nitre and tartar, and form the mixture with vinegar into a patte, which is fpread upon the gilt parts.

Schlutter recommends mechanical means, as being yenerally the leatt expetifive, for feparatiog fold from the furface both of flver and copper. It the gilt vefiel is round, the gold is conseniently got off by turning it in a lathe, atd applying a proper tool, a fkin being glaced undernath for receiving the lhavings: he fays it is eafy to collect int.) two ounces of ilhesings all the foid of a gilt veliel weighing thrice as many pounds. Where the figure of the prece docs not admit of this methud, it is to be properly fixed, and ferapers apfiled of diferent kinds according to its fize and figere; fome large, and furnibied with two handles,
one at each end; others finall and narrow, for penetrating into deprefled parts. It the gold cannot be got off by either of thefe ways, the file mult be had recourle to, which tahes off more of the metal underneath than the turning tool or the fcraper, particularly than the former. The gold fcrapings or filings may be purified from the filver or copper they contain, by the methods defcribed under the article Me.tallevgy.

The editors of the Encyclopedie give a method of recovering the gold from wood that has been gilt on a water-fize : this account is extracted from a memoir on the fame fubject, prefented to the Academy of Sciences by M. de Montamy. The gilt wood is iteeped for a quarter of an hour in a quantity of water futticient to cover it, made very hot : the fize being thus foftened, the wood is taken out, and ferubbed piece by piece, in a little warm water, with fhort ftiff brittle bruihes of different fizes, fome fuall for penetrating into the carvings, and others large for the greater difpatch in flat pieces. The whole mixture of water, fize, gold, \&c. is to be boiled to drynefs, the dry matter made red hot in a crucible to burn off the fize, and the remainder ground with mercury, either in a mortar, or, where the quantity is large, in a mill.

Gold-Coa/t. See Guinea.
Gozd-Itire, a cylindrical ingot of filver, fuperficially gilt or covered with gold at the fire, and alterwards drawn fucceffively through a great number of little round holes, of a wire-drawing iron, each lefs than the other, till it be fometimes no bigger than a hair of the head. See IIIRE-Drawing.

It may be oblerved that, before the wire be reduced to this exceffive finenefs, it is drawn through above 140 different holes; and that each time they draw it, it is rubbed afreih over with new wax, both to facilitate its paflage, and to prevent the filver's appearing throw h it.

Gola-Wire fiatted, is the former wire flatted between two rollers of polithed fteel, to fit it to be fpun on a ftick, or to be uled Hat, as it is, without finning, in certain fuffis, laces, embroideries, \&ic. Sce Stuff, \&ic.

GoLD-Thread, or Spun-gold, is flatted gold, wrapped or laid over a thread of filk, by twilting it with whel and iron bobbins.

To difpofe the wire to be fpun on filk, they pafs it between two rollers of a litule mill : thefe rollers are of nicely polifined iteel, and about three inches in diameter. They are fet very clole to each other, and turmed by means of a handie fatened to one of them, which gives motion to the other. The gold wire in paffing between the two is rendered quite hat, but without lofing any thing of its gilding; fnd is rendered to exccedingly thin and tlexible, that it is catily ipun on fikthread, by means of a hand-wheel, and fo wound on a fool or bobbin. See Wikn-Irawins.

Gold Leaf, or Buaten liold, is gold besten with a hammer into excceding thin leaves, to that it is computed, that an omke may be keaten into 1600 leaves, each three inclies fquare, in which llate it takes up more than 159,052 times ite former lur ace.

The preparation of gold leaf, according to $\mathrm{D}_{\mathrm{r}}$ Lewis, is as follo: : :
"The gul! is melted in a black-kead cruciule, with

Guld.

## G O L $\left[\begin{array}{cc}7 \delta 2\end{array}\right] \quad \mathrm{G} O \quad \mathrm{O}$

Goit. fome borax, in a wind furnace, called by the workmen a wind hole: as foon as it appears in perfect fulion, it is poured out into an iron ingot mould, fix or eight inches long, and three quarters of an inch wide, previouly grafed, and beated, fo as to make the tallow ron and fmoke, but not to take flame. The bar of gold is made red hot, to burn ofi the unctuous matter, and forged on an anvil into a long plate, which is further extended, by being paffed repeatedly between polihed fleel rollers, till it becomes a ribbon as thin as paper. Formerly the whole of this extenfion was procuted by means of the hammer, and fome of the Freach workmen are itill faid to follow the fame practice: but the ufe of the tlatting mill both abridges the operation, and renders the plate of more uniform thicknefs. The ribbon is divided by compafies, and cut with dheers into equal pieces, which confequently are of equal weights: thefe are forged on an anvil till they are an inch fquare; and afterwards well nealed, to correct the rigidity which the metal has contracted in the hammering and flatting. Two ounces of gold, or $9^{\text {ro }}$ grains, the quantity which the workmen ufually melt at a time, make $1 ; 0$ of thefe fquares, whence each of them weighs fix grains and two fifths; and as 902 grains of gold make a cubic inch, the thicknefs of the fquare plates is about the -66 th part of an inch.
6. In order to the further extenfion of thefe pieces into fine leaves, it is neceflary to interpofe fome fmooth body between them and the hammer, for foftening its blow, and defending them from the rudenefs of its immediate action: as allo to place between every two of the pieces fome proper intermedium, which, while it prevents their uniting together, or injuring one another, may fuffer them freely to extend. Both thefe ends are anfwered by certain animal membranes.
"The goldbeaters ufe three kinds of membranes; for the outfide cover, common parchment made of Sheep thin; for interlaying with the gold, firit the imoothetl and clofeft vellum. made of calf $k$ in; and afterwards the much finer fkins of ox gut, fiript off from the large firaight gut tlipt open, curioufly prepared on purpofe for this ufe, and hence called goldbeater's /kin. The preparation of thefe laft is a diftinct bufinef, practifed by only two or three perfons in the kingdom, fome of the particulars of which I have not fatisfactorily learned. The general procefs is faid to confirt, in applying one upon another, by the fmooth fides, in a moift ftate, in which they readily cohere and unite infeparably; ftretching them on a frame, and carefully fitaping off the fat and rouch matter, fo as to leave only the fine exterior membrane of the gut ; beating them between double leaves of paper, to force out what untuolity may remain in them; moiftening them once or twice with an infufion of warm fpices; and lafly, drying and prefling them. It is faid, that fome calcined gypfum, or platter of Paris, is rubbed sith a hare's foot both on the vellum and the ox gut Kins, which fills up fuch minute holes as may happen i1. them, and prevents the gold leaf from thicking, as it won's do to the finule animal membrane. It is of fervable, that, notwithlanding the valt extent to which the cold is beaten between thefe fkins, and the great tenuity of the itims themfelves, yet they futain continual repetitions of the procefs for feveral monthe,
nithout estenilisg or growing thinner. Our work. men find, that, after 73 or $8=$ repetitions, the inins, thong! they contract no Haw, will no longer permit the gold to extend bctween them; but that they may be agein rendered fit for ufe by impregnating them with the virtue which they bave loit, and that even holes in them may be repaired by the dexterous application of freth pieces of thin : a microfcopical examination of fome kins that had been long ufed plainly ftowed thefe repairs. The method of reftoring their virtue is faid in the Encyclopedie to be, by interlaying them with leaves of paper moiftened with white wine vinegar, beating them for a whole day, and afterwards rubbing iem over as at firt with plafter of Paris. The gold is faid to extend between them more eafily, after they have been ufed a little, than when they are new.
"The beating of the gold is performed on a fnooth ${ }_{1}$ block of black marble, weighing from 200 to 605 pounds, the heavier the better; about nine inches fquare on the upper furface, and fornetimes lefs, fitted vito the middle of a wooden frame, about two feet Iquare, fo as that the furface of the marble and the frame form one continuous plane. Three of the fides are furminhed with a high ledge; and the front, which is open, has a leather tlap faltened to it, which the gold-beater takes before him as an apron, for preferving the fragments of gold that fall off. Three hammers are employed, all of them with two round and fomewhat convex faces, though commonly the workman ufes only one of the faces: the firit, called the cuich hammer, is about four inches in diameter, and weighs 15 or 16 pounds, and fometimes 20 , though few workmen can manage thofe of this laft fize: the fecond, called the fooddering lammer, weighs about 12 pounds, and is abont the fame diameter: the third, called the gold bammer, or finifbing lammer, weighs 10 or II pound;, and is nearly of the fame width. The French ule four hammers, differing both in fize and flape from thofe of our workmen : they have only one face, being in figure truncated cones. The firit has very little convexity, is near five inches in diameter, and weig' is $1+$ or 15 pounds: the fecond is more convex than the firit, about an inch narrower, and farcely half its weight: the third, ftill more convex, is only abuut two inches wide, and four or five pounds in weight: the fourth or finihing hammer is near as heavy as the firlt, but narrower by an inch, and the moft convex of all. As thefe hammers difier fo remarhably from ours, I thought proper to infert them, leaving the workmen to judge what advantage one fet may have above the other.
"A hundred and fifty of the pieces of gold are interlaid with leaves of vellum, three or four inches fquare, one vellum leaf being placed between every two of the pieces, and about 20 more of the vellum leaves on the outfides; over thefe is drawn a parchment cafe, open at both ends, and over this another in a contrary direction. fo that the affemblage of gold and vellum leaves is kept tight and clofe on all dides. The whole is beaten-with the heavielt hammer, and every now and then tarned upfide down, till the godd is tretched to the extent of the vellum; the cafe being from time to time ofened for lifeovering how the exteufion gece on, and the packet, at times, tent and

## ( $0 \quad \mathrm{~L} \quad\left[\begin{array}{lll}7 & 7 & 6\end{array}\right] \quad \mathrm{G} O \quad \mathrm{~L}$

Gois. rolled as it were between the hards, for frocuring fufficient freedom to the gold, or, as the worhmen lay, to make the gold work. The picces, taken out from hetween the vellum leave are cut in four with a theel knife; and the 600 divifions, hence refulting, are interlaid, in the fame manner, with pieces of the ox-gut Sius five irches fquare. The beating being repeated with a lighter bammer till the golden plates have again acquised the exsent of the thins, they are a fecond time divided in four : the inftrument uled for this divilion is a piece of cane cut to an edge, the leaves being now fo light, that the moifture of the air or breath condenfing on a metaline hnife would occanon them to ftick to it. Thefe laft divitons being fo mumerous, that the fiins necelfary for interpoling between them would make the packet too thick to be beaten at once, they are parted into three parcels, which are beaten feparately, with the fmalleft hammer, till they are fretched for the third time to the dize of the akins: they are now found to be reduced to the greateft thinnefs they will admit of; and indeed many of them, before this period, break or fail. The Freuch workmen, according to the minute detail of this procefs given in the Encyclopedie, repent the divition and the beating once more; but as the fquares of gold, taken for the firt operation, have four times the area of thofe ufed among us, the number of leaves from an equal area is the fame in both methods, viz. 16 from a fquare inch. In the beating, however fimple the procefs appears to be, a good deal of addrefs is requifite, for applying the hammers fo as to extend the metal uniformly from the middle to the fides: one im. proper blow is aft not only to break the gold leaves, but to cut the 0kins.
"After the laft beating, the leaves are taken up hy the end of a cane inftrument, and, being blown that on a leather cuflion, are cut to a fize, one by one, with a filare frame of cane made of a proper tharpnefs, or with a frame of wood edged with cane: they are then titted into books of 25 leaves each, the paper of which is well fmoothed, and rubbed with red bole to prevent their ticking to it. The French, for fising the leaves, ufe only the cane knife; cutting them tint flaight on wre nide, fitting them into the book by the ftraight lide, and thea paring off the fuperfluous parts of the gold about the edges of the bouk. The fize of the French gold leaves is from fomewhat lefs than three inchee, to three and three quarters fquare ; that of ours, fom three inches to three and three-cighths.
" The procefs of gold-beating is conliderably infiuenced by the neather. In wet weather, the ikins grow fomewhat dit $a^{\prime}$, and in this thate make the estenfon of the gold more tedious: the French are faid to dry and preis them at every time of ufing; with care not to overdry them, which would render them unft for farther fervice. Our worhmen complain more of frot, which appears to affect the metalline beaves therifelves: in frot, a gold leaf cannot eafily be biunn that, but breaks, wrimklec, or runs together.
"Guld leaf ousht to be prepared from the fincit seld; as the admixture of other metals, though in too fmall a proportion to affect fenfibly the colour of the ieds, would difpofe it to lofe of it, beauty in the air. And indeed there is little temptation to the workman is he any other; the gecater hardnef of alloyed gold
occafoning as much to be loit in point of tine and latour, and in the greater number of leaves that break,

Gorid. as can be gained by any quantity of alloy that mould not be at once dicoverable by the eye. All metals reider gold harder and more difficult of extenmon. Even tilver, which in this refect feems to alter its quality lefs than any other metal, produces with gold a mixture fenfibly harder than either of them feparately, and this hardhefs is in no art more felt than in the goldbeater's. The French are faid to prepare what is called the grecn gold leaf, from a compofition of one part of copper and two of lilver with eighty of gold. But this is probably a miltake : for fich an admisture gives no greennefs to gold: and 1 have been intormed by our workmen, that this kind of leaf is made from the fame fine gold as the highent gold-coloured fort, the greenih hue being only a fuperficial teint induced upon the gold in fome part of the procels: this greenih leaf is little otherwife uled than for the gilding of certain books.
" But though the goldbeater cannot advantageoufly diminith the quantity of gold in the leaf by the ad. misture of any other fubftance with the gold, ye: means have been contrived, for fome particular purpoles, of faving the precious metal, by producing a kind of leaf called party-gold, whofe bafis is filver, and which has only a fuperficial coat of gold upon one fide: a thick leaf of filver and a thimer one of gold, laid tlat on one another, heated and preffed together, unite and cohere; and being then beaten into fine leaves, as in the foregoing procefs, the gold, though its quantity is only about one fourth of that of the filver, continues everywhese to cover it, the extenfion of the former heeping pace with that of the latter.

But it is obferved by Mr Nicholfon, that pure gold is too ductile to be worked between the goldbeaters fkin. The newert fkins will work the finett gold, and make the thinnert leaf, becaule they are the fmoothelt. Old tkins, being rough or foul, require coarfer gold. The firer the gold, the more ductile; infomuch that pure gold, when driven out by the hammer, is too foft to force itielf over the irregularities, but would pafs round them, and by that means become divided into narrow hips. The finet goid for this purpofe has three grains of alloy in the ounce, and the coarfeit twelve grains. In general, the alloy is fix grains, or one-eightieth part. That which is called pale gold contains three pensyweights of filver in the ounce. The alluy of leaf gold is filver, or copper, or hoth, and the colour is produced of various tints accordingly. Two ounces and two pernyweights of gold is delivered by the makler t, the workman, who, if extraordirarily fkilful, returns two thouland leave:, or eighty boob of gand, together with ote ounce an 1 fix pennyweights of wate cuttings. If ace o: ee brok wei hs 4.8 grain ; and as t'oc leane meature 3.3 inclars in the fide, the thicknef of the it if is one two lundet $]$ and eighty-two thoufond h par: of an inch.

The yellow metal c..tled Datel gold is fine brat. It is fad to be made liom copper plates, by cementation with calamine, without fubfequent fufion. It: thicknefs, compared with thet of le f gold, prov-d as 19 to 4 , and under equal tuntace it is contider bly muse than tuice is heisy as the gold. Your vol. i.

## G O L $\quad\left[\begin{array}{ccccc}84 & \text { I }\end{array}\right.$

Cioll, Guiden.

It muft be obferved, however, that gold is beaten more or lefs, according to the kind or quality of the work it is intended for ; that for the gold-wire-drawers to gild their ingots withal, is left much thicker than that for gilding the frames of pictures, \&ec. See Ginmene.

Gold Brocade. See Brocade.
Fulminating Gold. See Chemistry Index.
Myfaic Gold, is gold applied in pannels on a proper ground, diltributed into fiquares, lozenges, and other compartments ; part of which is fhadowed to raife or heighten the rell. See Mosaic.

Gold Plates for Enamelling are generally made of ducat gold, whofe finenefs is from $23_{\frac{1}{2}}$ to $23 \frac{3}{3}$ carats; and the fincit gold is the beft for this purpofe, unlefs where fome parts of the gold are left bare and unpolifhed, as in watch-cafes, fnuff-boxes, \&c. for which purpofe a mixture of alloy is neceflary, and filver is preferred to copper, becaufe the latter difpoies the plates to tarmith and turn green. See Exavilling.

Shell-Goid is that ufed by the gilders and illuminers, and with which gold letters are written. It is made by grinding gold leaves, or gold-beaters fragments, with a little honey, and afterwards feparating the honey from the powdered gold by means of water. When the honey is wathed away, the gold may be put on paper or kept in fhells; whence its name. When it is ufed, it is diluted with gum-water or foap-fuds.The German gold-powder, prepared from the Dutch gold-leaf in the fame manner, is generally ufed; and when it is well fcoured with varnih, anfwers the end in japanners gilding as well as the genuine.

GoLd Size for burnilhed gilding is prepared of one pound and a half of tobacco-pipe clay, balf an ounce of rod chalk, a quarter of an ounce of black lead, forty drops of fweet oil, and three drams of pure tallow; grind the clay, chalk, and black lead, feparately, very fine in watcr; then mix them together, add the oil and tallow, and grind the mixture to a due confiftence.

Gold fize of japanners may be made by pulverizing gum animi and afphaltum, of each one ounce; red lead, litharge of gold, and umber, of each one ounce and a half, mixing them with a pound of linfeed oil, and boiling them, obferving to ftir them till the whole be incorporated, and appears on growing cold of the confiftence of tar: Atrain the mixture through a flannel, and keep it flopsed up in a bottle for ufe. When it is ufed, it muft be ground with as much vermilion as will give it an opake body, and diluted with oil of turpentine, fo that it may be worked freely with the pencil. A fimple preparation confifts of one pound of linfeed oil and four ources of gum animi; powder the gum, and mix it gradually with the boiling cil; let it continue to boil till it becomes of the confiftence of tar; Atrain it through a coarfe cloth; keep and ufe it as the other.

Gold Fi\%. See Cyprints, Ichthyology Index.
GOLDEN, fomething that has a relation to gold, or comitits of cold.

Golden-Calf, was a figure of a calf, which the Ifraelites cr:t in that metal, and fet up in the wildernefs to wrilhip during Mofes's abfence in the mount; and which that legiflator at bis return burnt, grinded
to powder, and mixed with the water the people were to drink of: as related in Exod. xxxii. The commentators lave been divided on this article: the pulverizing of gold, and rendering it potable, is a very dificu't operation in chemiltry. Many, therefore, fuppofe it done by a miracle; and the rell, who allow of nothing fupernatural in it, advance nothing but conjectures as to the manner of the procefs. Mofes could not have done it by dimple calcination, nor amalgamation, nor antimony, nor calcination; nor is there one of thofe operations that quadrates with the text.
M. Stahl has endeavoured to remove this dificulty. The method Mofes made ufe of, according to this author, was by difolving the metal with hepar fulphuris; oaly, inttead of the regetable alkali, he made ufe of the Egyptian natron, which is common enough throughout the ealt.

Golden-Flecte, in the ancient mythology, was the kin or fleece of the ram upon which Phryxus and Hella are fuppofed to have fwam over the fea to Colchis; and which being facrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazenhoofed buils, and a monffrous dragon that never flept; but was taken and carried off by Jafon and the Argonauts.

Many authors have endeavoured to fhow that this fable is an allegorical reprefentation of fome real hiftory, particularly of the philofophers ftone. Others bave explained it by the profit of the wool trade to Colchis, or the gold which they commonly gathered there with fleeces in the rivers. See Argovauts.

Order of the Golden Fleece, is a military order inftituted by Philip the Good, duke of Burgundy, in 1429. It took its denomination from a reprefentation of the golden fleece, borne by the knights on their collars, which confifted of flints and Iteels. The king of Spain is now grand-mafter of the order, in quality of duke of Burgundy : the number of knights is fixed to thirty-one.

It is ufually fuid to have been inftituted on occafion of an immenfe profit which that prince made by wool; though others will have a chemical myitery couched under it, as under that famous one of the ancients, which the adepts contend to be no other than the fecret of the eliwir, wrote on the fleece of a theep.

Oliver de la Marche writes, that he had fuggefted to Philip I. archduke of Aultria, that the order was inflituted by his grandiather Philip the Good duke of Burguady, with a view to that of Jafon; and that Jolm Germain bihop of Chalone, chancellor of the order, upon this occation made bim change his opinion, and affiured the young prince that the order had been inlituted with a view to the fleece of Gideon. William bithop of Tournay, chancellor likewife of the order, pretends that the duke of Burgundy had in view both the golden heece of Jafon and Jacob*s fleece; i. e. the fecked fheep belonging to this patriarch, according to agreement made with his father-inlaw Laban. Which fentiment gave birth to a great work of this prelate, in two parts: in the firt, under the fymbol of the tleece of Jafon, is reprefented the virtue of magnaninity, which a knight ought to poffefs; and under the fymbol of the tieece of Jacob he reprefents the virtue of jurtice.

GOLDONI, Charles, a comic writer of confiderable eminence, was born at Venice in the year 1707, in which city his father acted in the capacity of phyfician. His attachment to the drama became confpicuous even in childhout, which his father was fond of countenancing, erecting a theatre in his own houfe, where young Goddoni and fore of his companions were the actors. It is faid that he even drew the outlines of a comedy of his own invention when he was no mure than 8 years of age,-a mot extraordinary indication of his future eminence. He nuudied thetoric at Perugia, in the college of the Jefuits, and profecuted his philofophical itudies at Rimini. The ftage, however had too many charms to allow him to pay much attention to Ar:ftotle or Quintilian, and he eloped from Rimini with a company of comedians when they removed to Chioz2a. In vain did his father attempt to make him fall in love with phyfic, or the ftudy of the law; yet his ardent imagination was fo forcibly ftruck with a particular church-ceremony, that he formed the refolution of commencing capuchin, but the dilipation of Venice foon deftroyed this refolution. After the demife of his father, he was prevailed upon by his furviving parent to take up the profeffion of the law for immediate fup. port, but fome unknown reafons induced him to quit the bar, after which he went to Milan, where he was appointed fecretary to the Venetian refident.

At Milan he brought out his firit performance, under the title of $/ /$ Gondoliere Veneziano. He removed afterwards to Verona, where he joined himfelf to a company of players; and here too he entered into a itate of wediock. He compofed a number of pieces for the players to whom he attached him'elf. While at Venice, be formed the laudable refulution of reforming the Italian Itage, which at that time was difyraced by contemptible farce and low buffoonery. He made himIeli acquainted with the true nature of comedy, and hept within the limits of nature and decorum. Such was the fertility of his genius, and fuch his indefatigable indulry, that he produced no fewer than fateen

YoL. IX. Part II.
comedies and $f_{2}$ other theatrical pieces in the cenie of twelve months! And what is mof atlonilhing, tome of thete hally performances are deemed his matterpieces.

Ilis works in 10 vols. 8vo. were firtt printed in 1753 , and in 1761 his new pieces amounted to 59. Dhem: this time he was invited to Paris by the manager of the Itaian theatre in that city, to compule pieces for the Itase, of which invitation he accepted. Wis firlt at tempt was unfuccelful, becaufe he had to contend with the pantomime drollery, which was moft agrecable to the depraved tafte of the times. When about to leave Paris on the expiration of his engagement, he was introduced to the court, and appointed teacher of the Italian language to the priacefles. He had lodgings in Verfailles, but his penfion was not fufficient to keep him fiom writing for the llage. When 62 years old, he ventured to compofe in a foreign language, hi, La Bourru Bienfaifant, which was received in the court theatre with extraordinary applaufe. He was deprived of his penfion in confequence of the revolution, and reduced to indigence. It ought to be confelled, however, that this verfatile nation was juft about to make him amends when he expired in 1792, and in the $85^{\circ} \mathrm{L}$ year of his age. If the rapidity with which Goldoni compofed was fuch as to present him from ratiki:c with authors of the firlt clafs, it cannot be denied th: his talent for comedy was very great. Some lave give" him the appellation of the Moliere of Ita/y, but thiperhaps is too flattering a title. His whole nort, wert printed at Leghorn about the yeats 1,83 and $1 \% 1$, in 31 volumes 8 vo.

GOLDSMITH, or, as fome chon ${ }^{2} \mathrm{e}$ to exprefs it filverfmith, an artift who makes veffels, uteminhs, $a \cdot i$ ornaments, in gold and filver.

The goldfmith's work is either performed in the mould, or beat out with the hammer or other engire All works that have raifed figures are catt in a mould, and afterwards polihed and finihed; plates or dilhes, of filver or gold, are beat out from thin that plates; and tankards, and other veifels of that kind, are formed of plates foldered together, and their mouldings are beat, not caft. The bulinefs of the goldfmiths formerly required much more labour than it docs at prefent; for they were obliged to hamme: the metal from the ingot to the thinnefs they wanted; but there are now invented flatting-mills, which reduce metals to the thinnefs that is required, at a very fmall expence. The goldfmith is to make his own moulds; and for that reafon, ought to be a good defigner, and have a tafte in fculpture: he ought alfo to know enough of metallurgy to be able to aflay mixed metals, and to mix the alloy.

The goldfiniths in London employ feveral hands under them for the various articles of their trade; fuch are the jeweller, the fnuff-box and toy-maker, the fil-ver-tumer, the gilder, the burniher, the chafer, the refiner, and the gold-beater.

Goldfmiths are fuperior tradefmen; their wares muft be affayed by the wardens of the company of this name in London, and marhed; and gold is to be of a certain touch. No goldfmith may take above one thilling the ounce of gold, befides what he has for the fathioning, more than the buyer may be allowed for it at the hing's exchange; and here any falfe metal 1hall befeized and forfeited to the hing. The cities 5 G

Goidnuth, Ohaer, a celebrated Englih wrier, was buns at Rutcomann in Ireland in the year 1731. inis fatiner, who poriefficd a fmall eltate in that county, Lad nine ions, of whom Oliver was the third. He was originaliy intended for the church; and with that wiew, afier being well inftructed in the clafines, was, with his brother the Rev. Henry Goldinith, placed in Trinity-college, Dublin, about the latter end of the year $17+9$. In this feminary of learning he contiiued a tew years, when he took a bachelor's degree: Lut his brother not being able to obtain any preferment titier be left the college, Oliver, by the advice of De:n Goldfroith of Cook, turned his thoughts to thic fuady of phyfic ; and, aftur uttending fome courfes of anatomy in Dublin, proceeded to Edinburgh in the year 1751, where he itudied the feveral branches of medicine uider the different profofios in that univerfity. His benencent difooition fon involved him in mexpected diffeculties: and he was obliged precipiwately to leave Scotind, in confequence of engaging limelf to pay a conliterable furn of money for a falow-itudent.
i iew days after, about the beginning of the year 17.4, he arrived at Sunderland, near Newcathe, where lie was arrelfed at the fuit of a taylor in EdinLureh, to whom he had given licurity for his friend.

By the goed offices of Laughlan Maclane, Eiq. and Dr Sleigh, who were then in the cullese, lie was fow delisered out of the hands of the ballifi; and © A bis pafic e on board a Dutch hip to Roterdam, Where, ater a thort llay, he proceeded to Brufiels; fie tira wifidd great part of Flanders; and after palCos fome time it Sunturg and Louvain, where he obtained a degree of bathelor of phytic, he accompawied an Eusliih genteman to Berne and Geneva.

It is undubtediy fict, that this ingenious unfortusate man travelied on foot moll past of his tour. He fod Jeit England with very little money; and being if a philutoplical turn, and at that time pofficling a to ly capable of fultaning every fatigue, and a heart not cailly tervified at danger, he became an enthufiat to the cefign he had formed of leeing the mamers of aifferent comatrics. He had fome knowledge of the French lansuage and of melic, and he played tolerably well on the German thite; which, from an anufemont, tcoame at forne timis the means of fublitence. His learning produced him a hofpitable reception at moit of the crigious houles; and his mufic made him welocme to the feafanto of Flanders and other parts of Germ:ns. " Whenever I approached," he ufed to fay, " a pafitin's houfe towards night-fall, I played one of my moll merry turse; and that procured nue not oaly a lodging, bit fulliftence for the next day: hut in truth (hic conftant exprethion), I muil onis, wheneser 1 attempted to chetrain perfors of a higher rath, they always thwegh my periomance odious,
and never made ne any return for my endeavours to Guidinth. pieale them."

On Mr Goldimith's arrinal at Geneva, he was recomnended as a proper petfon for a travelling tutor to a young man, who had been unexpected!y left a conliderable fum of money by his uncle $\mathrm{Mr} \mathrm{S}-$, formerly an eminent pawubroher near Holcorn. This youth, who had been atticled to an attorney, on receipt of his fortune determined to fee the world; and. on his engaging with his preceptor, made a puevifo that he ihould be permitted to govern him1elf; and Goldfmith foon found his pupil underitood the art of directing in monev-concerns catremely well, as avarice was his prevailing palfion. His queltions were ufually how money might be faved, and which was the leall expenive courfe of traveling; whether any thing could be bought that would turn to account when dippofed of again in London? Such curiolities on the way as could be feen for nuthing he was ready eaough to look at; bat if the fight of them was to be paid for, he ufually afierted that he had beea told they were 1 :ot worth lecing. He never paid a bill that he nould not obferve how amazingly expenfive traveling was; and all this, though he was not yet twenty-one. During Goldfmith's continuance in Switzerland, he affiduoully cultivated his poetical talent, of which he had given fome fltiking proofs white at the college of Edinburgh. It was bere he fent the fril §eech of his delight'ul poem called the Traecl'or, to his brother the clergyman in Ireland, who, giving $u_{i}$ fame and fortune, had retired with an amiable wife to happinei's and obfcurity, on an income of only $4: 1$. a-ycar.

From Geneva Mr Goldfinith and his pupil whited the fouth of France; where the young man, upon fome dilagreenent with his preceptor, paied him tie fumali part of his falary which was due, and embarked at Niaricilles for England. Our wanderer was left once mose upon the world at large, and paffed thragh a variety of difficultics in traverfing the greatel? part of France. At length his curiohity being fatiated, he bent his courle towards England, and arrived at Dover the beginning of the winter 1758 . When he came to London, his Hoch of cafh did not amount to two liveres. An entire flanger in this metropolis, his mind was filled with the molt gloomy reflections on his embarrafled fituation. With fome dificulty he difcovered that part of the town in which his old acquaintance Dr bleigh refided. This gentleman received him with the warmell afiection, and liberally invited him to Alare his purle till fome effablihment could be prucurud for him. Goldfmith, unwilling to be a burden to his friend, a thort time after eagerly embraced an offer which was made him to allift the late Rev. Dr Miner in influcting the young gentlomen at the academy at Pechham; and acquitted himfelf greatly to the Ductor's fativaction for a hort time: Lut hawing obtained fome reputation by the criticilms be had writen in the Monthly Review, Mr Grifith, the proprictor, engaged him in the compilation of it; and, refolving to purfue the profeflion of writing, lic returned to London, as the matt where abilities of every hind vere fure of mecting dillinction and reward. As his finatices were by no means in a good llate, he deternined to adopt a plan of the frictell cecomy : and
took.

## G 0 L

$\underbrace{\text { Goidfmit }}$ took lodgings in an obfcure court in the O.1 $1 \mathrm{~B}, \because$, where Fe wrote feveral ingenious little pieces. 'I late $\operatorname{Mr}$ Newhery, who at that time gave gre it en!courngement to men of literary abilitic, became a kind of patron to our young author; and introduced him as one of the writers in the Public Ledger, in which his Citizen of the World originally appeazed, under the title of Chindi Lettier.

Fortune now fecmed to take fome notice of a man the had lony neglected. The timplicity of his character, the integrity of his heart, and the merit of his productions, made his company very acceptahle to a mamer of relpectable families; and he emer ed from his thabby apartments in the Old Bailey to the polier air of the Temole, where he took handiome chambers, and lived in a genteel flyle. The publication of his Traveller, and his Vicar of Wakefe?d, was followed by the periommance of his consed; of the Gond-natured Man at Covent Garden theatre, and placed him in the firlt ran': 0 : th - puets of the prelent age.

Among many other perfons of diftinction who were deftrous to know him was the duke of Northumberland; and the circumftance that attended his intioduction to that nobleman is worthy of being related, in order to thow a ftriking trait of his character. "I was invited," faid the Doctor (as he was then univerfally called) by my friend Mr Piercy, to wait uron the duke, in confequence of the fatisfaction he had received from the perulal of one of my productions. I drefted mylelf in the bett manner I could; and, after ftudying fome compliments I thought neceffary on fuch an occafion, proceeded to Northumber!andhoufe, and acquainted the fervants that I had particular bufinefs with his Grace. They fhowed me into an antichamber; where, after waiting fome time, a gentleman very genteelly dreffed made his appearance. Taking him for the duke, I delivered all the fine things I had compofed in order to compliment him on the honour he had done me; when, to my great aftonifhment, he teld me I had miftaken him for his maller, who would fee me immediately. At that inflant the duke came into my apartment; and I was fo confufed on the occafion, that I wanted words basely fufficient to exprefs the fenfe I entertained of the duke's politenefs, and went away extremely chagrined at the blunder I had committed."

Another feature of his character we cannot holp laying before the reader. Previons to the publication of his Deferted Village, the bookfeller had given him a note for one hundred guineas for the copy, which the Doctor mentioned a few hours after to one of his friends: who obferven, it was a very great fum for fo thort a performance. "In truth," rewlied Goldrwith, "I think fo too ; I have not been eafy fince I receised it ; therefore I will ro back and return him his note ;" which he abfolute'y did; and left it entirely to the bookfeller to pay him according to the erolit produced by the fale of the piece, which turned out very confiderable.

During the latt reherrfal of his comedy intitled She Ateops to Conquer, which Mr Coleman had no opinion would fucceed, on the Doctor's obiecting to the repectition of one of 'Tonv Lumkin's fecere, teing apprehenfue it might ini .ee the play, the mamger with great kecnnef replied, "Piba, mi dear Ductor, do mot
boferial af aila, siten we bate bee: fo: a de

 ant Godimith prile was fo funt by the teoses ow the aboce ubtersation, that it entiely put an etal as !. frendhip for the reatem on that mo it.

Nut with ten lins he areat furceis oi lis , i.a.e. . . fome of whish it is afterted, unon enord rai ity, he cleared 1 sozol. in ase year, his cibemftames wese ley no means in a proforess litu:tion; which wan partly owing to the linezality of hin difpoltion, and po.t'y to an unfortunate habit h. had comacte! of g omant: the arto of which lie know very livto o and con quently became the prey of the fe who :ucre u"prime pled emung to take adrantage of his fimshive.

Juil before his death he had formed a de ion tor es ecuting an Univerial Ditionary of Ats and science, the profpetus of which he actually pullibed. In this worh feveral of his literary frimh (maticulary Sir Johma Reynolds, Dr Johnfon, No Beaciute, an I Mr Garrick), had undertaen to fur ith tim with ar tickes upon different lubjects. He had entertancel the moll finguine expectation from the fucceti of it. The undertaking, however. did not mect with that encosragement from the howlithos which hec hat intaned it would undoubtedly receive; and he wied to 1 mont this circumitance almolt to the latt hour of his e". illence.

He had been for lome year, afficted, at differem: times, with a violent itrmgury, which contrimued nou a little to embitter the latter part of his life; and which, united with the rexations which he fuffered upon other occafions, brought on a kind of habitul defpondency. In this unhappy condition he was attacked by a nerwous f-ver, which, being improperly treated, terminated in his diflolution on the $4^{\text {th }}$ of April 177.4 .

As to his character, it is ftrongly illallated 1 y Mr Pope's line,

In wit a mar, fimplicity a chidd.
The learned leifure he loved to enjoy was too often interrapted by diftrefles which arofe from the liker, lity of his temper, and which fometimes threw him i:t, load its of pation: bet this impetuonty was correa. ed upon a moment's rellection; and his fervants have been known, upon thele occation, purporely to throw themfelves in his way, that they misht profit by it immediately atter: for he who hid the gool fortme tor br reprovel, w"w retain of being remardet for it. The univerfal efterm in whish hoem, wem helu, and the reneard plafure theo gise in the peads!, in a firiking telt of their merit. He was a lludions and correct ob'e ver of nature; hapov in the leleetion of his images, in the choice of hir fulject, and in the hornomy of h.s verification: mal, thouh his emburutid dituation weventel him from putting the lail hand to many of his poofurions, his Hermit, his Traveller, and his Deforted Villase, hill fair to chim a place anons the molt finilud piece it: the Enchith lassuage.

GOLF, the name of a certain game among the Scct, and laid to be peculiar to their country. Among them it has been very ancient; for there are itatutes prohibiting it as early as the year 1457, left it thould interfere with the fport of archery. It is commonly played on rugged broken ground, covered with Dhart grafs, in the neighbourhood of the fea thore. A field of this furt is in Scotland called links. The g mee נs generally played in parties of one or two on each fide. Each party has an exceeding hard ball, fomewhat larger than a hen's egg. This they itrike with a fiender and elallic club, of about four feet long, crook$\epsilon \mathrm{d}$ in the head, and having lead ran into it, to make it heavy. The ball being ftruck with this club, will tly to the dilance of 200 yards, and the game is gained by the party who puts bis ball intu the hole with the feweif ftrokes. But the game does not depend folely upon the ftriking of the longent ball, but alfo upon meafiring the ftrength of the troke, and applying it in fuch direction as to lay the ball in fmooth ground, :nhence it may be eafily moved at the next itroke. 'lo encourage this amufement, the city of Edinburgh, A. D. $17+4$, gave to the company of golfers a dilver club, to be played for annually by the company, the victor to append a gold or filver piece to the prize. It has been played for every year fince, except the years 1746 and 1747 . For their better accommodation, 22 members of the company fubferibed 301 . each in the year ${ }^{1768}$, for building a houfe, where their meetings might be held. 'The fot chofen for this purpefe was the fouth-weit corner of Leith Links, where an area was taken in feu from the magiftrates of Edinburgh, and a commodious houfe and tavern built upon it.

GOLIUS, JAmes, a cclebrated profeffor of Arabic ..nd the mathematics at Leyden, was defcended from a very honourable family, and born at the Hague in the year 1596 . He was put to the univerfity of Leyden, where he tludied under Erpinius; and having made himfelf mafter of all the learned languages, applied himfelf to the mathematics, phyfic, and divinity. He afterwards travelled into Arrica and Afia; and became greatly efteemed by the king of Morocco, and the fult.mn of the Turks. He at length returned to Leyden, 1. oded with manufripts; and in 1624, fucceeded Erpinius in the Arabic chair. As he had been an eyewitnefs of the wretched fate of Chriltianity in the Mahometan countries, he was filled with the compaffion of a fellow-chrilian; and none ever folicited for a place of honour and profit with greater eagernefs, than he for procuring a new edition of the New Teltament, in the original language, with a tranflation into the vulgar Greek, by an Archimandrite ; and as there are fome of thefe Chriftians who ufe the Arabic tongue in divine fervice, he alfo took care to have difperfed among them an Arabic tranflation of the Confeffion of the Proeftants, together with the Catechifm and Litercy. In $16 i 26$, he was alfo chofen profefior of mathe atics; and difcharged the functions of both profeil whips with the greatell applaufe during 40 years. If was likewife appointed interpreter in ordinary to the fates for the Arabic, Turkith, Perian, and other ealt-
ern languages, for which he had an annual penfion, Gotrius. and a prefent of a gold chain, with a very beautiful medal, which he wore as a badge of his office. He publihed, 1. The life of Tamerlane, written in Arabic. 2. The hitory of the Saracens, written by Elmacin. 3. Alferganus's Elements of Aftronomy, with a new verfion, and learned commentaries. 4. An excellent Arabic lexicon. 5. A Perfian Dictionary. He died in 1667 .

GOLTZIUS, Hexry, a famous engraver and painter, born in $155^{\circ}$, at Mulbreck in the duchy of Juliers. He was taught the art of engraving by Theodore Cuerenhert ; and fucceeded very wonderfully in it, notwithitanding the difadvantage of a lame hand, which was occafoned by his falling into the fire whilft young. He was firlt employed by his matter, and afterwards he worked for Philip Galle. Domettic troubles and ill health occafioned him to travel. He went through Germany into Italy; and paffed under a feigned name, that his iludies might not be interrupted. He vifited Bologna, Florence, Naples, and Venice, conftantly applying himfelf to drawing from the antique flatues, and the works of the great matters. At Rome he refided the longeft ; and there he produced leveral exce!lent engravings from Polidoro Raphacl, and other eminent painters. On his return to his native country he eftablifhed himfelf at Haerlem, where he engraved many of the drawings which he had made during his abode in Italy. He died at Haerlem in 1617 , aged 59. He is faid to have been 40 years old before he began to paint : yet his pictures are fpoken of with great commendation; but as he did not produce any great number of them, they are rarely to be met with. As an engraver, he deferves the higheit commendation. No man ever furpaffed, and few have equalled, him in the command of the graver and freedom of execution. He copied the ityle of Albert Durer, Lucas of Leyden, and other old matters, with attonilhing exactnefs. Sometimes his engtavings are neat in the extreme; at other times they are performed in a bold open manner, withont the leaft reitraint. He alfo engraved feveral of his own defigns on wood, in that manner which is dittinguithed by the appellation of chiaro-fcuro. Of his prints, which are very numerous, it may here fuffice to fpecify two or three of the molt celebrated: 1 . Six large upright plates, known by the name of his mafferpieces. Thefe, it is faid, he engraved to convince the public that he was perfectly capable of imitating the ftyles of Albert Durer, Lucas Van Leyden, and other matters, whofe works were then held in higher eftimation than his own: for he had adopted a new manner, which he purfued becaufe he thought it fupcrior, and not because he was incapable of following the others. It is reported that with one of them, the Circumcifion, which he fmoked to give it the more plaufible air of antiquity, he actually deceived fome of the moft capital connoifeurs of the day; by one of whom it was bought for an original engraving of Albert Durer. The fubjects of thefe plates are, The Annunciation of the Virgin ; the Meeting of the Virgin with Elizabeth, called the Vilitation; the Nativity of Chrill ; the Circumcifion of Claritt ; the Adoration of the Wife Men; the Holy Family. 2. The Judgment of Midas, a large plate lengthwife. 3. The Venetian Ball, a large plate le:gthwife, from Theodore Bernard. 4. The Boy and

Gomtau': Dog, a middling fized upright plate, from a defegn of Gontrow his own; an admirable print. 5. The Necromance:, a miduine-fized upaglt oval prist, in chiaro-Scur'n 6. Nigh in her Chariot, the fame.

GOMBAULD, Jun (HARK DE, one of the beit French poets in tik $17^{\text {th }}$ cent:oy, and one of the firit nembers of the Freach suadery, we born at St Jut de Laffe. He acquired the efteen of liary de Medicis, ard of the wits of his tinie. He was a Proteitant, and died in a very adranced age. He wrote many worhs in verie and profe. His epigrans, and tome of his frmets. are particularly efteemed.

GOMIEROON, br the natives called Bantor Alfaf, a city of Peria, fit ted in N. Lat. 2\%.42. E. Long. 55.32. I we anne of (imbron, of Cunerong, Captair. Hamikon te!'s us, it had from the Portaguefe; becauie it was remarkable for the number of prawns and itrimps caught on iss con?e, by them called carerrong. This city owes its wealth and grandeur to the demolition of Ormes, aad the downfal of the Portuguete empire in the Eat Indies. It is now jutty accounted one of the greatert marts in the Lait, was built by the great Shah Abas, and from him, as fome think, obtained the name of Bander Athaj, which fognifies the court of Abac. It ftands on a biy about nine leagues to the northward of the calt cmd of the illand of Kifhminh, and three league from the famous Ormus. The Englith began to fettle tere about the year 1631 , when, in condideration of their lervices. againt the Purtuguefe, Shah tbas granted then half the cultoms of that port. This was confirned by a phirmaund, and duly regarded, till the Englih began to ncglest the fervices they had itipulated. Whether the company has any emolument from the cuftoms at prefent, is what we cannot pretend to afcertain. The town is large, but its fituation bad; wanting almolt every thing that contributes to the happinefs and even fupport of life. Towards the land it is encompafed by a fort of wall; and towards the fea are feveral fmall forts, with a platform. and a cattle or citadel, mounted with cannon to fecure it and the road from the attempts of an enemy by fea. The houfes in molt of the itreets are fo out of repair, fome half down, others in a heap of rubbith, that a ftranger would imagine the town had been facked and ravaged by a barbarous people; not a veltige of the wealth really contained in the place appering in view. The bazars and thops round them are kept, for the moft part, by Banian, whofe houles are generally in good order. Molt of the houfes are built with earth and lime, but fome of the belt with fone. Many of them have a fort of ventilators at top, which contributes greatly to the health of the inhabitants in the hot fealons of the year. The moft fickly months here are Apuil, May, September, and Oatober. With fith and mutton the ithabitants are well funplied. Rive is imported from India; and wheat is fo plente, that the poor fublift chietly on bread and dates. The country hereabouts abounds in the moft delicious fruits, as apricots, peaches, pomegrenates, pearc, mangoes, grapes, quavas, plums, fireet quinces, and water melons. The apricots, however, are fmall, and extremely dangerous if eaten to excers.

Thofe conveniences are more than overhalanced by the farcity of freth water, with whic' the inh witan:
are fupplied from Alieer, a place feven miles difar!, fimmon. there not being a fring or well in the town. Pefions Gometi, of condition keep a camel conftantly employed its bribging freth and wholefome water. Captain Hamilton gives it as his opinion, that one caute of the uar wholefomenefs of this city is the reliectica of the sass of light from a high mountain to the nortis of it. He fays, that when the beams are: reflecie. from this mountain, they almont fire the ais, and, for $t$ or three months in the year, render the fituation intulerable. For this realon the people of condion retire into the cou:try, to pafs the heats of Junc, July, and Auguit. The very fea, during this feafon, is aftected, infomuch that the ttench is no lefs difagzeeable than that of putrid carcafes; and this is increated by the quantities of hell-fith left on the thore, from which an exhalation arifes that tarnibes gold and fllver, and is lefis tolerable than the bilge-water of a tight thip. A: Affeen the Englifh factory have a country houle and gardens, to which they retire occalionally. Here they have whole groses of Seville orange trees, which. though not natural to the country, thrive very well, and are always verdnat, bearing ripe and green fruit, with bloffons, all at the fame time. They have like wife tanks a:id ponds of tue treft water, with every thi:g cile that can modes.ate the heat of the climate, and reader life agreeable and elegant. About 10 miles from Aleen is a pace called Min a, where are cold and hot natural baths, rechoned infailible in the cure of all fcrophulous diforders, rheumatifns, and other difeales, by bathing.

Gombroon is extremely populous, on account off the commerce carried on by the Datch and Englith tactories, as wall as the natives. The Englith factory is clo e by the fea, at fome dittance from the Dutch, which is a commodious and fine new building. A great part of the company's profits arifes from freights. As the natives have nut one good thip of their own, and are extremely ignorant of navisation, they freight their goome for Surat, and other Indian marts, in Enrlilh and Datch botioms, at an exarbitant rate. The comunodities of the Gombroon market are, fine wines of different kinds, rainns, alinonds, kih-mithee, prunellas, dutes, piltachio-nuts, ginger, filks, carpets, leather, tutty, galbanum, ammoniac, allsetida, tragacanth, with other gums, and a variety of thop medicines. Thefe are in a great meafure the produce of Carmania, which they bring to Gombroon in caravans. The Englith company had once a finall factory in the province of Carmania, chietly for the fake of a fine wool produced there, and ufed by the hatters. The faid company had once a project of carrying a breed of the Perfian goats to St Helena; but whether it was executed, or what: fuccefs it met with, we cannot fay. Althungh the company pay no cuftoms, yet they ufually make a prefent to the flabander, to avoid the trouble he has it in his power to give them. All private traders with the company's pafics, anjoy the fame privilçes, on payinc two per cent. to the company, one to the agent, and one to the broker. All private trade, either by European or country hips, has long been engrofied by the company's fervants.

GONDAR, the capital of Abyfinia; fituated, ac-- ording to Mr Bruce*s obfervations, in latitude 12.34 . north, and longitude 37. 33. eat fiom Greenvich. It lies upon the top of a hill of confiderable height, and confifls of about 10,020 familiss in times of peace. The houfes are chiefly of clay, with roofs thatched in the form of cones. At the welt end of the town is the hing's palace; formerly, as Mr Bruce informs us, a thructure of confiderable confequence, being a large liquare building four tories high, flanked with fquare towers, and affording from the top of it a magnifcent view of all the country fouthward to the lake Tzana. It was built in the time of Facilidas, by matons from India, and by fuch Abyfinians as had been intructed in architecture by the Jefuits before their expulion. Great part of it is now in ruins, having been burnt at different times; but there is ftill ample lodging in the two loweft floors, the audience chamber being above i20 feet long. By the fide of this Itructure there have been built by different kings apartments of clay only, in the fallion of their own country. The palace, with all its contiguous buildings, is furrounded by a double tone wall thirty fect ligh and a mile and a half in circumference, with batllements upon the outer wall, and a parapet roof between the outer and inner, by which you can go along the whole and look into the Atrect. The hill on which the town is built rifes in the middle of a deep valley, through which ruw two rivers: one of which, the $\mathrm{K} a k h a$, coming from the Momentain of the Sun, flanks all the fouth of the town; while the other, called the Angrab, falling from the mountain Woggora, encompafics it on the north and north-ealt ; and both rivers unite at the bottom of the bill about a quarter of a mite fouth of the town. Upon the bank oppofite to Gondar, on the other fide of the river, is a large town of Mahometans; a great part of whom are employed in taking care of the king's and nobility's equipage, both when they tahe the field and when they return from it. They are formed into a borly under prop:r officers; but never fisht on either file, being cutirely confined to the coupation jut mentioned, in whicla thy their care and
destaity in pituling and friking the tents, and in leading and conducting the baggage-waggons, they : $=$ of wrat fervice. - The valley of Gondar is deforibed as having three cutiets; one fouth, to Dembea. Matha, and the Agows; another on the northwe: ${ }^{-}$. twards Eennaar, fom which it is difant 180 milc, over the Mountain of the Sun; and the third 1.atin, lading to Woggora, over the high momit.in Lamamon, and to on t!rough Tigre to the Red fet.

GONDI, Johs Fr.ivers Paul, Cardinal de Retz, was the fon of Philip Emanuel de Gondi, Count de Joigny, lieutenant-general, \&c. and was born in 1613 . From a doctor of the Sorbonne, he firlt became coadjutor to his uncle John Erancis de Gundi, whom lie fuceeeded in 1654 as archbiltiop of Paris; and was finally made a cardinal. This extraordinary perfo: has drawn his own character in his memoirs with impartiality. He was a man who, from the greatef degree of debauchery, and ftill languithing uader its conlequences, mate himfelf adored hy the reople as a preacher. At the age of 23 , he was at the head of a conliracy againf the life of Cardinal Richelieu; he precipitated the parliament into cabals, and the people into fedition: he was (fays M. Vultare) the firlt bithop who carried on a civil war withut the mafk of religion. However, his intrigues and fehemes turned out fo ill, that he was obliged to quit France; and he lived the life of a vagrant exile for five or fix years, till the death of his great enemy Cardinal Mazarin, when he returned on certain ilipulated conditions. After afliting in the conclave at Rome, which chofe Clement IX. he retired fiom the world, and ended his life like a philofopher in 1659 ; which made Voltaire fay, that in his youth he lived like Catiline, and like Atticus in his old age. He wrote bis Memoirs in his retirement; the beff edition of which is that of Amiterdam, 4 rols $12 \mathrm{mo}, 1719$.

GONDOLA, a that boat, very long and narrow, chiefly uled at Venice to row on the canals. The word is ltalian, gondula. Du Cange derives it from the vulgar Greek xovitinces, "a bark," or " little thip;" Lancelot deduces it from yoviv, a term in Athenæus for a Iort of vale.

The middle-fized gondolas are upwards of thirty fect long and fuur broad: they alsays terminate at each end in a very harp point, which is raifed perpendicularly to the full height of a man.

The addrefs of the Venctian gondoliers, in paffing along their narrow canals, is very remarkable : there are ufually two to each gondola, and they row by pulhing lefore them. The fore-man reits his oar on the left thie of the gondola: the hind-man is placed on the ftern, that he may fee the head over the tilt or covesing of the gondola, and rells his oar, which is very lone, on the right lide of the gondola.

Goxdola is allis the name of a palluge-boat of fix or eight ars, ufed in uther parts of the coatt of Italy.

GONIOMETRY, a method of meaturing angles, fo called by M. de Lagny, who gave feveral papers, on this methed, in the Memens of the Royal Academy an. 1724, 1725,1729. M. de Lazny', method of goniometre conifts in meaturing the angles with a pair of comparies, and that without any fale whatever, except an undrited femicircle. Thu, heving any angle

 nence may in clear weather be difcovered at a confiderable diftance; and is called the Table-mountain from its appearance, as it terminates in a flat horizontal furface, from which the face of the rock defcends almoit perpendicularly. In the mild or fummer feafon, which commences in September, and continues till March, the Table Land or Mountain, is fometimes fuddenly capped with a white cloud, by fome called the fpreading of the Table-cloth. When this cloud feems to roll down the fteep face of the mountain, it is a fure indication of an approaching gale of wind from the fouthealf; which generally blows with great violence, and fometimes continues a day or more, but in common is of flort duration. On the firit appearance of this cloud, the thips in Table Bay begin to prepare for it, by friking yards and top-mafts, and making every thing as frug as pofible - A little to the weitward of the Table Land, divided by a fmall valley, flands on the right hand fide of Table Bay a round hill, call. ed the Sugar Loaf; and by many the Lion's Head, as there is a continuance from it contiguous to the fea, called the Lion's Rump; and when yca take a general view of the whole, it very much retembles that animal with his head erect. The Sugar Loaf or Lion's Head, and the Lion's Rump, have each a flag ftaff on them, by which the approach of fiips is made known to the governor, particularizing their number, nation, and the quarter from which they come. To the eaftward, feparated by a fmall chafm from the Table Land, flands Charles's Mount, well known by the appellation of the Devil's Tower, or Devil's Hiad; and io called from the violent gutts of wind fuppofed to iffue from it when it partakes of the cap that covers the Table Land, though thefe gufts are nothing more than a degree of force the wind acquires in coming through the chafm. When this phenomenon appears in the morning, which is by no means fo frequent as in the evening, the failors have a faying, as the Devil's Tower is almoft contiguous to the Table Land, that the old gentleman is going to breakfaft; if in the middle of the day, that he is going to dinner; and if in the evening, that the cloth is fpread for fupper. Table-mountain rifes about 3567 feet above the level of the fea; the Devil's Tower, about 3368 ; and the Lion's Head, 2764 . In the neighbourhood of the latter lies Con/tantia, a diltrict confifting of two farms, wherein the famous wines of that name are produced.

The above defcribed high lands form a kind of amphitheatre about the Table-valley, where the Capetown ftands. This is fituated at the bottom of the middle height, or Table-mountain; and almoft in the centre of the Table Bay, fo called from that moun. tain.-This bay, it is obferved in Phillips's Voyage, " cannot properly be called a port, being by no means a flation of fecurity; it is expofed to all the violence of the winds which fet into it from the fea; and is far from fufficiently fccured from thofe which blow from the land. The gufts which defeend from the fummit of Table-mountain are fufficient to force fhips from their anchors, and even violently to annoy perfons on the fhore, by deftroying any tents or other temporary edifices, which may be erected, and raiing clouds of fine dult, which produce very troublefome effects. A gale of this kind, from the fouth-ealt, blew for three days fuccefively when Captain Cook lay bere

792 ] G O O
in his firft voyage; at which time, he informs us, the Good Hope. Refolution was the only hip in the harbour that bad not dragged her anchor. The ftorms from the fea are itill more formidable; fo much fo, that thips have frequently been driven by them from their anchorage, and wrecked at the head of the bay. But thefe accidents happen chiefly in the quaade mouffon, or winter months, from May $1^{1} 4^{\text {th }}$ to the fome day of Augut ; during which time few fhips venture to anchor here. Our fleet arriving later, lay perfectly unmolefted as long as it was neceffary for it to remain in this ftation. -Falfe Bay, on the fouth-eaft fide of the Cape, is more fecure than Table Bay during the prevalence of the north-weft winds, but ftill lefs fo in ftrong gales from the fouth-eaft. It is, however, lefs frequented, being 24 miles of very heavy road diftant from Cape Town, whence almoit all neceffaries mult be procured. The mott fheltered part of Falfe Bay is a recefs on the weft fide, called Simon's Bay."

Mr White, in his Journal of a Voyage to New South Wales, thus defcribes Cafe Town. From the fhipping, he obferves ${ }^{*}$, the town appears pleafantly fituated, but at the fame time fmall; a deception that arifes from its being built in a valley with fuch flupendous mountains directly behind it. On landing, howerer, you are furprifed, and agreeably difappointed, to find it not only extenfive, but well built, and in a good fyle; the ftreets fpacious, and interfecting each other at right angles with great precifion. This exactnefs in the formation of the Areets, when viewed from the Table Land, is obferved to be very great. The houfes in general are built of ftone, cemented together with a glutinous kind of earth which ferves as mortar, and afterwards neatly plaftered and whitewaihed with lime. As to their height they do not in common exceed two flories, on account of the violence of the wind, which at fome feafons of the year blows with great ftrength and fury. For the fame reafon thatch has been ufually preferred to tiles or flingles; but the bad effects that have proceeded from this mode when fires happen, has induced the inhabitants in all their new buildings to give the preference to flates and tiles. The lower parts of the houles, according to the cuftom of the Dutch nation, are not only uncommonly neat and clean in appearance, but they are really fo; and the furniture is rather rich than elegant But this is by no means the cafe with the bedrooms or upper apartments; which are very barely and ill furnifhed. The ftrects are rough, uneven, and unpaved. But many of the houfes have a fpace Hagged before the door; and others have trees planted before them, which form a pleafant hade, and give an agreeable air to the ftreets.

The only landing-place is at the eaft end of the town, where there is a wooden quay running fome paces into the fea, with feveral cranes on it for the convenience of loading and unloading the fcoots that come alongfide. Tothis place encellent water is conveyed by pipes, which makes the watering of thips both eafy and expeditious. Clofe to the quay, on the left hand, tands the caftle and principal fortrefs; a flrong extenfive work, having excellent accommodations for the troops, and for many of the civil officers belonging to the company. Within the gatec, the company have their principal fores; which are fpacious as well as convenient. This fort covers and defends the talt pait of the town and har-

## $\mathrm{G} 0 \mathrm{O} \quad\left[\begin{array}{lll}793\end{array}\right] \quad \mathrm{G} \quad \mathrm{O} \quad \mathrm{O}$

Good Hove hour, as Andterdam fort does the wett part. The latter, which has been built fince Commodore Johniton's expedition, and whereon lorh French and Dutch judgment have been united to render it effectual and Alrong, is admirably planed and calculated to annoy and harafs fhips cumiry into the lay, some fmaller detached fortifications extend along the coalt, buth tos the eatt and weft, and make landing, which was not the cafe betore the late war, hazardous and fitficult. In a word, Cape Cown is at this time fortined with ftrength, regularity, and judgment.

The governor's houfe ivilelightfully fitusted, nearly in the centre of an extenfive garden, the property of the Dutch Ealt India company, ufefuliy planted, and at the fame time elegantly laid out. The governor's family make what ufe they pleate of the produce of the garden, which is various and abundant; but the original intention of the company in appropriating fo extenfive a piece of ground to this purpofe was, that their hofpital, which is generally pretty full when their thips arrive after long voyages, my be well fupplied with fruits and vegetables, and likewife that their thips may receive a limilar fupply. This garden is as public as St James's park; and for its handiome, pleatant, and well-haded walks, is much frequented by perfons of evcry defcription, but particularly by the fathionable and gay. At the upper end of the principal walk is a finall face walled in for the purpofe of contining fome latge oftriches and a few decr; and a little to the right of this is a fmall menagery, in which the company have half a dozen wild animals and about the famo number of curious birds.

There are two churches in the town; one large, plain, and unadorned, for the Calvinits, the prevailinc fect; and a fmaller one for the Lutherans. The hofpital, which is large and externive, is ituated at the upper end of the town, clofe to the company's garden; where the convalefcents reap the benefit of a wholefome pure air, perfumed with the exhalations of a great variety of rich fruit trees, aromatic fhrubs, and odorous plants and flowers; and likewife have the ufe of every production of it.

Befides their hofpital, the Dutch Eait India company have \{everal other public building, which tend to improve the appearance of the town. The two principal of thefe are, the ftables and a houle for their flaves. The former is a handfome range of buildings, capable of containing an incredible number of horfes. Thole they have at the Cape are lmall, pirited, and full of life. The latter is a building of contiderable extent, where the flaves, both male and female, have feparate apartments, in a very comfortabic 1.yle, to refide in after the fatigues and toil of the day; and there are feveral officers placed over them, who have commodious apartments, and treat them humanely.

The inhabitants of the Cape, though in their pertons large, ftout, and athletic, have not all that phleym about them which is the characteritic of Dutchmen in general. The phyfical influence of climate may in fome Segree account for this; for it is well known that in all fouthern latitudes the temper and difpolition of the people are more gay, and that they are more inclined to luxury and amufements of every kind, than the inhabitants of the northern hemifphere. The ladies are lively, sond natured, and familiar ; and from a peculiar gay Yoi. IX. Part II.
turn, they admit of liberties that would be thought re-coot H pe prehentible in England, though perhaps they as feldom overleap the bounds of virtue as the women of other countries.

The heavy draft work about the Cape is motly performed by oxen; which are here brought to an uncommon degree of ufefulnefs and docility. It is not: uncommon to tee 14,16 , and fometimes 18 , in one of their teams; when the roads are heavy, they fometimes, though rarely, yoke 20; all which the Hottentots, Malays, and Cape flaves, have in the moft perfect fubjection and obedience. One of thefe fellows places humielf on the fore part of the waggon, or, when loaded, on the top of the load, and with a tremendous long whip, which from its fize he is obliged to hold in both his hands, manages thefe creatures with inexprefible ad. drels. When he finds expedition needful, he can make them keep whatever pace he choofes, either trot or gallop, (a gait performed or kept up with difficulty by European oven', and that with as much eafe as if he was driving horfes. They likewife mmage horfes with the fame devierity; and to tee one of them driving three, four, five, and fometimes fix pair, in hand, with one of thefe long whips, would make the moit complete maIter of the whip in England cut a defpicable figure. Carriages are not very numerous at the Cape, as the inhabitants in general travel in covered waggonc, whicis better fuit the roughnefs of the country. The governor and fome few of the principal people keep coaches, which are a good deal in the Englith ftyle, and always drawn by fix horfes.

The Cape of Good Hepe was taken by the Britilh on r 7 th Augutt 1796 , with little or no difficulty, and afterwards given up at the peace of 180 s . It has been fince retaken, and is at prefent (18c6) in the poffeffion of the Britith.

When the news of the capture of this important fettlement reached England, it was confidered as of incalculable value to the Eatt India Company in particular, forming a barrier or grand outwork to their im menfe pollefions in India. They obtained the unconditional grant of fupplying the Cape with India and China goods, and care was taken to deteat every a. tempt that could be made to undermine their interest. Aware of it, great importance, it was the refolution of minittry, "that no foreign power, directly or indirectis, hould obtain poftefion of the Cape of Good Hoje, for that it was the phyfical guarantee of the Britith territories in India." While all were convinced of its political importance, none diffuted its comnercial advantages.

Its geographical poftion on the gle'se is tio commanding a feature, that the mere looking it a map, independent of any other information, nust thew it, value and importance in variow refpects. It ditank e from the coatt of Brazil is a month's voyage; from the Dutch colonies of Surinam, Berbice, atid Effequib, it is a voyage of fix wecks; it is about c pually dillont from the Red Ea, and two month from Coromandel and Malabar. It is half way fetween ${ }^{\text {B }}$ Brit.in and India, in a temperate climate, and productive of every lipecies of refrellament in great abuad mes.

Contidere 1 in the light of a naval fation, the importance of the Cape is equally confficuous. It may ferve as a port for refrething and refitting the thips of
the

Gooldopethe Iat India Company; a fation fur hips of war $\xrightarrow[\sim]{\sim}$ keeping the entrance into the Indian feas, and affording by its geographical pofition, a ready communication with every part of the globe. There is no place, in the homeward brund woyage from India, fo proper or convenient for the valuable fleets of the Eaft India Company, to aliemble at for convoy, as the Cape of Good Hope. Their crews might be refreihed with fruits, vegetables, and frefh provilions, at a very reaionable rate. Salt beef for the remainder of the voyage might there te laid in. An ettablithment for curing falt provifions, would be an incalculable faving to the Company, as well as a fingular convenience. The moderate expence at which a tleet could here be maintained, is a circumilance that deferves attention. At the Cape a failor may be furnihed his ration of frefl beef or mutton, bifcuit and wine, for one-iourth of what the fame ration of falt beef colls the government when fent out from Britain. He can have a pint of wine for threepence, and were it not for the monopoly of that article, he might purchafe it for half the fum.

It a naval eftablihment was formed at Saldanha bay, many coafting veffels and filhing thips would be comitructed in it, as it abounds with every convenience that could be reouired for building thips, which would Le the means of very much increating the coalting trade.

To what extent the Cape might have been rendered advantageous to the Britifh empire as an emporium of catern produce, as furnihling articles of export for confumption in Eurore and the Weft Indies, and taking articles of Britih growth and manufacture in exchange for colonial produce, it may be proper to enquise. The chief objcetion againt this ufe of the Cape is the prefudice it would occafion to the fales of Leadenhall ftreet, and the diminution of his majefly's ratoms; for though the Eait India Company might be made refponfible to the crown for the duties on the amount of its fales at the Cape, yct the intention of the emporium would be entirely defeated, if the duties cemanded there fo far enhanced the value of the Indian commodities, as to make it equally eligible for foreign thipping to procced to India, or to refort to the London market. The Eaft India Company could fupply their emporiam at the Cape with the produce and manufaciure of Great Britain to any amount, and at fo cheap a rate as to underfell any other nation.

Should the Cape beconie a commercial depot in the hands of the Ealt India Company, the confumption in Spanilh and Portuguefe America, of eattern produce, would increafe to a very great extent, for all which they would pay in fpecic, of which the Company ftand in the greateft need for their China trade.

A new branch of tranic might be opened between the Cape and New South Wales, the latter fupplying the former with coals, of which they have abundant mines, in exchange for cattle, butter, wine, and articles of clothing.

The Cape may alio be confidered as of adrantage to the Britifh nation, by furnihhing articles of esport for general confumption in Europe and the Weft ladies. Thefe are grain and pulie, wine and brandy, wool, hidec, and ihins, whale oil and bone, dried fruits, falt - provifions, foap and candles, alocs, ivory, and tubacco.

Were a depot for the fouthern whale fifhery eftabiifi.-
ed at the Cape, it might be attended with beneficial confequences. By promoting navigation, the ftrength and fecurity of the Britifh empire are allo promoted, and its very exitence as an independent nation is owing to the fuperiority of its navy. A nation of fithermen implies a nation of feamen, a race of bold and hardy warriors. The cultivation of the fitheries would afford a never-failing fupply of men fo initructed, increafe our conveniency, and promote our commerce.

The colony of the Cape comprehends at leaft 120,000 fquare miles, yet the whole population of whites, blacks, and Hottentots, does not exceed 60,000 fouls, or a fingle individual for every two fquare miles. The upper regions of the mountains are maffes of fandftone, and where the waters break out in fiprings upon the furface of the plains, vegetation is very luxuriant. In the vicinity of the Cape, where the foil is coloured with iron, or oxide of iron combined with clay, the molt luxuriant crops of grapes are produced. The climate in general is friendly to vegetation, but being within the influence of the periodical winds, the rains are very unequal.

The chief rivers on the fouth coaft are the Gauritz, Knyfna, Keurboom, Camtoos, Zwarthops, Sunday, and Great Fith rivers, and the two principal rivers on the weftern coalt are the Berg, or mountain river, and the Oliphant river, which falls into the Southern Atlantic in $3 t^{\circ} 30^{\prime} \mathrm{S}$. Lat. *

## Good Manners. See Manners.

GOOINGS, in fea-language, are clamps of iron bolted on the ftern-puit of a lhip, whereon to hang the rudder and keep it fteady; for which purpofe there is a hole in each of them, to receive a correfpondent fpindle bolted on the back of the rudder, which turns thereby as upon hinges.

GOOSE. See Anis, Ornithology Index. The goofe was held in great efteem amongit the Romans, for baving fared the Capitol from the invation of the Gauls by cackling and clapping its wings. Geefe were kept in the temple of Juno; and the cenfors, when they entered upon their office, provided meat for them. There was alio an annual fealt at Rome, at which they carried a filver image of a goofe in ftate; and hanged a dog, to punith that animal becaufe he did not bark at the arrival of the Gauls.

Guose-Ander. See Mergus, Ornithology Index. Goose-Bcrry. See Ribes, Botany Index.
Goase-Neck, in a thip, a piece of iron fixed on the one end of the tiller, to which the laniard of the whip-1taff or the wheel-rope comes, for fteering the thip.

Gooss-lIing, in the fea language. When a chip fails before, or with a quarter-wind on a freih gale, to make the more halle, they launch out a boom and fail on the lee-fide; and a fail fo fitted is called a guofe-wing.

GORCUM, a town in South Holland, which carries on a conliderable trade in checfe and butter. It is fituated on the rivers Ligne and Maele, in E. Long. 4. 55. N. Lat. 51. 49.

GORDIANUS 1. (a Roman general), was for his valuor and virtues chofen emperor by the army in the reign of Maximinus, A. D. 237 ; but his fon, whom he had allociated with himfelt in the throne, being fimin by Capellian, the govemor of Mauritania for

Masiminus,

## G $O \quad \mathrm{R}$

Gordianas Maximinus, Gordianus killed himicti the fame year.
Gurdon. See Rovif.

Gordianus III. (erandfon of the former), a renowned warris, and ityled The guardian of the Roman commonvealih. He was treacheroully affaflinated by Philipus, an Arabian, one of his generals; who, to the eternal difgrace of the Romans of that era, fucceeded him in the empire, A. D. 24t. Sie Rowe.

GORDI : N-kvor, in antiquity, a knot made in the leathers or harnets of the charint of Gordius king, of Phrygia, fo very intricate, that there was no finding where it began or ended. The inhabitants had a trasition, that the oracle had declared, that he who untied this knot floould be matter of Aria. Alevander having undertaken it, was unable to accompliih it; when tearing left his not untying it hould be deemed an ill augury, and prove a check in the way of his conquelts, he cut it alunder with bis fword, and thus either accomplished or eluded the oracle.

GORDIUS, the hair-wors, a genus of infects belonging to the clats of vermes intefina. See Hetminthology Index.

Gordius, king of Phrygia, and father of Midas, was a poor huibandman, with two yokes of oxen, wherewith he ploughed his land and drew his wain. An eagle fitting a long while upon one of his oxen, he confulted the foothfayers; a virgin bid him facrifice to Jupiter in the capacity of king. He married the virgin, who brought forth Midas. The Perfians inftructed by the oracle to fet the firlt perfon they met in a wain upon the throne, met Gordius, and made him king. Midas for this good fortune dedicated to Jupiter his father's cart. The knot of the yoke, they fay, was fo well twifted, that he who could unloofe it was promifed the empire of Afia; hence the proverb of the Gordian knot had its original. See Gordian Knot.

GORLON, AlexaNder, an excellent draughtfman and a good Greek fcholar, who refided many years in Italy, vilited moft parts of that country, and had alfo travelled into France, Germany, \&c. was fecretary to the Society for Encouragement of Learning: and afterwards to the Egyptian Club, compofed of gentlemen who had vifited Egypt (viz. Lord Sandwich, Dr Shaw, Dr Pococke, \&c.) He fucceeded Dr Stukeley as fecretary to the Antiquarian Society, which office he refigned in 1741 to Mr Jofeph Ames. He went to Carolina with governor Glen, where, befides a grant of land, he had feveral offices, fuch as regifter of the province, \&c.; and died a jultice of the peace, leaving a handfome ellate to his family. He publihed, 1. Itinerarium Septentrionale, or a Journey through moft parts of the Counties of Scotland, in two parts, with 66 copperplates, 1726 , folio. 2. Supplement to the Itinerarium, $173^{2}$, folio. 3. The Lives of Pu!c Alexander VI. and his fon Cafar Borgia. 4. A complete Hitory of the ancient Amphitheatrec, 1730, 8vo. afterwards enlarged in a fecond edition. 5. An Elfay towards explaining the hierog! phical figures on the Cotlin of the ancient Mummy belonging to Capt. William Lethieuller, 3737 , folio, with cuts. 6. Twenty-five Plates of alf the Egyptian Nummies and other Eigyptian Antiquities in Encland, 1739, folio.

Gornos, Thomas, noted for his tranlations and political writings, was born at Kirkcudbtight in Nurth

Britain. If came young to Loudon; where he faj- enrion d ported himfelf by teaching language, until he oxt- Girey. red employment under the earl of $\mathrm{O}_{\mathrm{a}} \mathrm{H}$ d in O :cen $\underbrace{\text { G rey. }}$ Atme's time. but in what capacity is not no.: ham wa He firt dilinguilhed himbelf in the detence of $\mathrm{Dr}_{\mathrm{r}}$ Headley in the Bangorian controverly; which recommended him to Mr Trenchard, in conjunction whith whom he wrote the weil-known Cato's Letters, upon a variety of important public fulpjests. Thefe were followed by another periodical piper, under the title of the Independent Whig; which was continued fome years ater Mr Trenchaid"s death, by Gurdon alone, asainlt the hierarchy of the chure $h_{1}$; but with more acrimony than was thown in Cato's letters. At length Sir Rotert Walpole retained him to deferd his adminiftration, to which end he urote leveral pamphlet. At the time of his death, July 29 th 1750, he was firlt commiffioner of the wine licences, an office which he had enjoyed many years. He was twice married. H: fecond wife was the widow of his great friend Trenchard, by whom he had children.-He publiked Englifh trantlations of Salluft and Tacitus, with additional difcourfes to each author, which contain much good matter. Alfo, two collections of his tracts have bee: preferved: the firit entitled, A Cordial for Lowfpirits, in three volumes: and the fecond, The Pillars of Prieitcraft and Orthodoxy haken, in two volumes. But thefe, like many other polthumous things, had better have been fuppreffed. In his tranflations as well as his other works he places the verbs at the ends of fentences, according to the Latin idiom, in a very ftiff and affected manner.

GORDONIA, a genus of plante, belonging to the monadelphia clds. See Botasy Index.

GORE, in Heraldry, one of the abatements, whicl:, according to Gullim, denotes a coward. It is a figure confilting of two arch lines drawn one from the diniter chief, and the other from the finitter bate, both meeting in an acute angle in the middle of the fefs point. See Heraldry.

GOREE, a fmall illand of Africa, near Cape de Verd, fubiect to the Freach. It is a fmall fpot not exceeding tho miles in circumference, tat its importance arifes from its fituation for trade fo near Cape Verd, and it has been therefore a bone of contention between European nations. It was firlt poffeffed by the Dutch, from whom, in 1663 , it was taken by the Englith; but in 1665 it was retaken by the Dutch, and in 1677 fubdued by the French, in whofe pulief. fion it remained till the year 1759, when the Britith arms were every where triumphant; and it was reduced by Commodore Keppel, but reltored to the French at the treaty of peace in 1963 . It was retaken by the Englifh in the laft war, but again rettored at the peace of 1783 . E. Long. 17. 25. N. Lat. 14. 43 .

Gorfe, the capital tome of an illand of the lame name in Holland, eight miles fuuth of Biicl. E. Long. 3. 55. N. Lit. 5t. 55 .

GORIF, a borosigh, tair, and poftown in the county of Wexford, province of Lcintter, otherwife called Vew $_{\text {a }}$ borough. It itands about 18 miles north of Wexford town, and 45 from Dublin. N. La'. 52. 72 . W. Long. 6. 35 . It fends two members to parlianent ; patronage in the tamily of Ram.

GORGE,

Gege GORGE, in ArchiteGure, the narroweh part of the $\underbrace{\text { Grtponia. }}$ Tufcan and Doric capitals, lying between the aftragal, above the thaft of the piliar, and the ansulets.

Gorge, in Fortification, the entrance of the platform of any work. See Fortification.

GORGED, in Heraldry, the bearing of a crown, coronet, or the like, about the neck of a lion, a fwan, \&c. and in that cafe it is faid, the lion or cygnet is borged with a ducal coronet, Ec.

Gorged is allo ufed when the gorge or neck of a peacock, fwan, or the like bird, is of a different colour or metal from the reit.

GORGET, a kind of breatt-plate like a half-monn, with the arms of the prince thereon; worn by the officers of foot. They are to be either gilt or firver, according to the colour of the buttons on the uniforme.

Gorget, or Gorgeret, in Surgery, is the name which the French give to the concave or cannulated conductor, ufed in lithotomy. See Surgery Inder.

GORGONA, a fmall illand of Italy, in the fea of Tufcany, and near that of Corfica, about eight miles in circumference; remarkable for the large quantity of anchovies taken near it. E. Long. 10. O. N. Lat. 43.22.

Gorcona, a fmall ifland of the South fea, 12 miles welt of the coaft of Peru, in America. It is indifferent high land, very woody, and tome of the trees are very tall and large, and proper for malts. It is about 10 miles in circumference, and has feveral fprings and rivulets of excellent water, but is fubject to conftant rains. W. Long. 79. 3. S. Lat. 30.

GORGONI ${ }^{1}$, in Xatural Hifory, a genus of zoophytes, which formerly were called ceratophiytons, and are known in Englilh by the names of fea-fans, fea-feathers, and fea-whips. Limous and Dr Pallas confider them as of a mixed nature in their growth, between animals and vegetables; but Mr Ellis foows them to be true animals of the polype kind, growing up in a branched form refembling a ihrub, and in no part vegetable. They differ from the frefh water polype in many of their qualities, and particularly in producing from their own tubitance a hard and folid fupport, ferving many of the purpofes of the bone in other animals. This is formed by a concreting juice thrown out from a peculiar fet of longitudinal parallel tubes, running along the internal furface of the fiefly part: in the coats of thefe tubes are a number of fmall orifices, through which the offeous liquor exudes, and concreting, forms the layers of that hard part of the annular circles, which fome, judging from the confiflence rather than the texture, have erroneoully denominated wood. The furface of the gorgonia is compofed of a kind of fcales, fo well adapted to each other as to ferve for defence from external injuries: and the ileh, or, as fome have called it, the bark or cortex, confifts of proper mufcles and tendons for extending the openings of their iells; for fending forth from thence their polype fuckers in fearch of food; and for drawing them in fuddenly, and contracting the fphincter mufcles of thefe ftarry cells, in order to fecure thefe tender parts from danger; and alfo of proper fecretory ducts, to furninh and depolit the offeous matter that forms the ftem and branches as well as the bafe of the bone. Mr Ellis affirms, that there are ovaries in thefe animals, and
thinks it very probable that many of them are vivi Oorgons parous. See Coralines.

GORGONS, in sintiquity and Mythoiogj. Au- Gorlitz. thors are not agreed in the account they give of the Gurgons. The pocts reprefent them as three fitters, whom names were Sthens, Euryale, and Medufa; the latter of whom was mortal, and, having been deflowered by Neptune, was killed by Perieus; the trso former were fubject neithor to age nor death. They are defcribed with wings on their thoulders, with ferpents round their heads, their hands were of brafs, and their teeth of a prodigious lize, fo that they were objects of terror to mankind. After the death of Medufa, her fifters, according to Virgil, were appointed to heep the gate of the palace of Pluto.

## Multaque preterea variarum monfra ferarumGorcones, IIarpyiugue--

Diodorus Siculus will have the Gorgons and Amazons to have been two warlike nations of women, who in habited that part of Libya which lay on the lake Tritonidis. The extermination of thete female nations was not effected till Hercules undertook and performed it.

Paufanias fays, the Gorgons were the daughters of Phorbus; after whofe death Medufa, his daughter, reigned over the pcople dwelling near the lake Tritonidis. The queen was paffionately fond of hunting and war, fo that fhe laid the neighbouring countries quite wafte. At laft, Perfeus having made war on them, and killed the queen herfelf, when he came to take a view of the field of battle, he found the queen's corpfe fo extremely beautiful, that he ordered her head to be cut off, which he carried with him to thow his countrymen the Greeks, who could not behold it without being itruck with altonifhment.

Others reprefent them as a kind of monftrous women, covered with hair, who lived in woods and forelts. Others, again, make them animals, relembling wild theep, whofe eyes had a poifonous and fatal influence.

GORITIA, or Gorirz, a ftrong town of Germany, in the circle of Auttria, and duchy of Carniola, with a caftle; feated on the river Lizonzo, 20 miles north eaft of Aquileia, and 70 north-ealt of Venice. E. Long. 13. 43 . N. Lat. 46. 12.

GORL化US, Abraham, an eminent antiquary, was born at Antwerp, and gained a reputation by collecting medals and other antiques. He was chiefly fond of the rings and feals of the ancients, of which he publifhed a prodigious number in 1601, under this title, Dactyliotheca; five Annulorum Sigillarium, quorum apud prifcos tam Gracos quam Romanos ufus ex ferro, are, argento, et auro, Promptuarium. This was the firf part of the work: the fecond was entitled, Variarum Gemmarum, quibus antiquitas in fignando uti folita fcu/pturce. This work has undergone feveral editions, the beft of which is that of Leyden, 1695 : for it not only contains a vaft number of cuts, but alfo a fhort explication of them by Gronovius. In 1608 , he publihed a collection of medals: which, however, if we may believe the Scaligerana, it is not fafe always to truft. Gorlæus pitched upon Delft for the place of his refidence, and died there in 1609 . His collections of antiques were fold by his heirs to the prince of Wales.

GORLITZ, a town of Germany, in Upper Lufatia, fubject

Gorteria fubjeet to the elector of Suxony, It is a handfume
flrong place, and feate 1 on tiee river Neilfe, in E. $\underbrace{\text { Gortamer }}$ bong. $15.15 . \mathrm{N}$. Lat. 51 . 10.

GORTERIA, a genus of plants belonging to the fyngeneiia clafs, arad in the natural meethod anking under the $4^{\text {th }}$ th order, Compofitie. See Lotasiy Index. GOSH tWk. Se Falco, Orimithoga Indtr. GOSHEN, in Anciat Geggrap'h, a canton of Egypt, which Jofepla procured for his father and his brethren when they came to dsell in Egyyt. It was the moft fruitful part of the country: and iss name feems to be derived from the Hebrew, Gu, /bern, which fignifies "rain ;" becaufe this province lying very near the Mediterranean, was expoled to rain, which were very rare in other catom, and more efpecially in Upper Egypt. Calmet does not quertion but that Gothen, which Jofhua (x. 41. xi. 16. xv. 51.) makes part of the tribe of Judah, is the fame as the land of Gother, which was given to Jacoo and his fous by lharaoh king of Egypt; (Gea, vlvi. 28). It is certain that th. country lay between Paledine and the city of Tanais, and that the allotment of the Hebrews reaclied fouthward as far as the Nile, (Joth. xiii. 3.) ,

GOSLAR, a large and ancient town of Lower Saxeny, and in the teritory of Brunfwick: it is a free imperial city, and it was here that gunpowder was firlt invented, by a monk as is generally fuppofed. It is a large place, but the buildings are in the ancient tatie. In 1728 , 280 houtes, and St Stephtin's fine church, were reduced to ahhes. It is feated on a mountain, near the river Gole, and near it are rich mines of iron. The inhabitants are famous for brewing excellent beer. E. Long. 3. 37. N Lat. 5 1. 55.

GOSPEL, the hittory of the life, a ations, death, sefurrection, afcenfion, and doctrine of Jefus Chrit,The word is Saxon, and of the lame import with the latin termerangeilium, which fignilies " glat tidings," or " good new:"

This hillory is contained in the writings of St Matthew, St Mark, St Luke, ar. 1 St John; who from thence are called caangelijis. The Chritian church never acknowledged any more than thefe four gotpels as canonical; notwithatanding which, feveral apocry phal goipels are handed down to $u$ e, and others are entirely loit.

GOSPORT, a town of Hamptiite, 79 miles from London, in the parith of Alvertick. It has a ferry over the mouth of the harbour to Porffinouth, and is a large town and of great trade, efpecially in time of war. Travellers choofe to lodge here, where every thing is cheaper and more commodious for them than at Portmouth. The mouth of the harbour, which is not fo broad here as the Thames at Wefminitter, is fecured on this fide by four forts, and a platfurni of alove 20 cannon level with the water. Here is a nuble hofpital built for the cure of the fick and wounded failors in the fervice of the navy; belides a free school.

G6SSAMER is the trame of a fine filmy fublance, line robwebs, which is feen to tloat in the air, in clear days in autumn, and is more obfervable in flubble. fields, and upon furze and other low bulles. This is probably formed by the llying fider, which, in traverling the air for food, thoo.s out thefe threads from $i: 3$ annc, which are borne down by the dew, \&c.

GOSSXPIUM, or Cotros, a genus of plants be-corinm, longing to the monadelphia ciafs, and in the nat:-n 1 othe. method ranking under the $37^{\text {th }}$ order, Crlunvifir... See Botavy Index.

The Americaa illands produce cotton nornbe o" vo. rious fize, which rife and frow wn whe they the ture; elpeciaily in low and marlly yround. Ih ir produce is of a pale red; lom: paler t: wh others, iout fo mort that it camot be fpun. Nowe of the is in ou fo: to Europe, though it might be uffefly emplowed is making of hats. The little that is picined in, A. No to make matrafic, and pillows.

The cotoon-lirub that fupplies our mannfactures, ace quires a dry and Itony foii, and thrives betk in groun ts that have already been tilled. Not but that the pant appears more ilourifhing in freth lands than in thote which are exhaulted; but while it prodaces mure wood, it bears lefs fruit.

A wellern expofure is fitteft for it. The culture of it begins in Mareh and Ap:il, and continues during the firlt fpring-rains. Holes are made at feven or cight feet ditance from each other, and a few feeds thrown in. When they are grown to the height of fave or fix inches, ail the items are puiled up, except two or three of the ffrongett. Thefe are cropped twice befure the erd of Augur. This precaution is the more necelfary, as the wood bears no fruit till after the fecond prunitig; and, if the thrub was fuffered to grow more than four feet high, the crop would not be the greater, nor the fruit fo cafly gathered. The fame method is purfurd for three years ; for fo long the thrub may continue, if it cannot conveniently be renewed oftener with the profpect of an adrantage that will compenfate the trouble.

This ufeful plant will not thrise if great attention is not paid to pluck up the weeds that grow about it. Fiequent rains will promote its growth; but they mult not be incefliant. Dry weather is particularly necentiry in the months of March and April, which is the tires of gathering the cotton, to prevent it from being difico. loured and lpotted.

Whea it is all gathered in, the feeds mult be picked out from the wonl with which they are naturally mixed. This is done by means of a cotton-mill; which is an engine compofed of two rods of hard wood, about is feet long, 18 lines in circumference, and fluted two lines deep. They are confined at both ende, to as to leave no more ditance between them than is neceffary for the feed to flip through. At one end is a kind of little millitone, which, being put in motion with the foot, turns the rods in contrary directions. They feparate the cotton, and throw out the feed contained in it.

GOTHA, a town of Germany, in the circle of $U_{P}$ per Saxony, and capital of the duchy of Saxe-Gotha, in E. Long. 10. 36. N. Lat. 51. Some tancy this town had its name from the Goths, and that they furtified it in their march to Italy; but it was only a villaze till fuprounded with walls by the bithop of Mentz in 964 . It is lituated in a fine plain oa the river Leina, well built and 1 trongly fortifed. Here are two handfome churches and a very good hopital. Its chisef trade i. in dyers wood, of which they hase three cro ", but the third grows wild. The neighbouring comentry producen a vatt deal of corn. The caitl- or ducal pal ine

Erneft, furnamed the Pious, who caufed both that and the town to be encompafled with ditches and ramparts; and gave it the name of Fricden/tein, or the Cafle $f$ Peace, in oppofition to its ancient name of Grimwer. Pain, or the Carle of the Furies. It is fituated on a neighbouring eminence, from whence there is a valk profpect of a fruitful plain. In one of the apartments Were is a collection of valuable raities, and a noble libeary.

The dukedom of Saxe Gotha is about 32 mie; long, and 12 broad. The reigning duke is Lewis Ennett, born in 1745, and married to the princeis Maria Charlotte of Saxe Meningen, by whom he has ifiue. He is the head of the Erneftine line of Saxony, defcended from the elector John Frederick the Magn:animous, who was deprived of the electorate by the emperor Charles V : in $157+$; fince which the youngeft branch called the Albertine has enjoyed it. He has feveral other principalities befdes that of Saxe Gotha; and his revenues are computed at 200,0001 . a-year, with which he maintains about 3000 regular troops. As he is the molt powerful of all the Saxon princes of the Ernettine branch ; fo of all the courts of Saxony, next to that of Drefden, he has the moft numerous and the moft magnificent. His guards are vell clothed, tis liveries rich, and his tables ferved with more elegance than profufion. And yet by the prudent management of his public fnances, his fubjects are the leatt burdened with taxes of any flate in Germany. The religion is Lutheran.

GOTHARD, one of the highef mountains of Switzerland; and from the top, where there is an hofpital for monks, is one of the fineft profpects in the world. It is eight miles from Aldorf.

GOTHEBORG, Gothenberg, or Gottenburs. See Gotterberg.

GOTHIC, in general, whatever has any relation to the Goths : thus we fay, Gothic cutoms, Gothic architecture, \&c. Sce Architecture.

GOTHLAND, the moft fouthern province of Sweden, being a peninfula, encompaffed on three fides by the Baltic Sea, or the channel at the entrance of it. It is divided into feveral parts, which are, Eaft Gothland, Weft Gothland, Smaland, Halland, Bleahing, and Schonen. It was a long time in the poffeffion of the kings of Denmark, but was ceded to Sweden in 1654. The principal towns of Gothland are Calmar, Landfcroon, Chritianople, Daleburg, Gothenburgh, Helmftat, Lunden, Malmone, and Vexio.

GOTHS, a warlike nation, and above all others samous in the Roman hitfory, came originally out of Scandinavia (the name by which the ancients ditinfuifhed the prefent countries of Sweden, Norway, Lapland, and Finmark). According to the moft probable accounts they were the firlt inhabitants of thofe countries; and from thence fent colonies into the illands of the Baltic, the Cimbrian Cherfonefus, and the adjacent places yet deftitute of inhabitants. The time of their firf fettling in Scandinavia, and the time when they firlt peopled with their colonies the above-mensioned illands and Cherfoncfus, are equally uncertain; though the Guthic annals fuppofe the latter to have happened in the time of Seruy the great grandfather of

Abraham. This fint migration of the Goths is laid to have been conducted by their ling Eric ; in which all the ancient Gothic chronicles, as well as the Danih and Swedih ones, agree. Their fecond migration is fuppofed to have happered many ages after; when, the abovementioned countries being overlockel with peopie. Berig, at that time hing of the Goths, went out with a fleet in queft of new fettlements. He landed in the country of the Uhmerugians, how Pomerania, drove out the ancient inhabitants, and uivided their lands smony his followers. He fell next upon the Vandals, whofe comntry bordered on that of the Clmerugians, and overcame them; but initead of forcing them to ajandon their country, he only made them inare their poffeltions with the Goths.

The Guths who had fettled in Pomerania and the adjacent parts of Germany being greatly increafed, infomuch that the country could no longer contain them, they undertook a third migration in great numbers, under Filimer furnamed the Great, their fifth prince after leaving Scandinavia; and taking their route eathward, entered Scythia, advanced to the Cimmerian Bofphorus, and driving out the Cimmerians, fettled in the neighbourhood of the Palus Mieotis. Thence in procefs of time, being greatly iucrealed in Scythia, they refolved to feek new fettlements; and, accordingly taking their route ealtward, they traverfed feveral countries, and at length returned into Germany.

Their leader in this expedition was the celebrated Woden, called alfo Voden, Othen, Oden, Gadan, and Guadan: Of this Woden many wonderful things are rel ted in the Sueo-gothic chronicles. He was king of the Afgardians, whom the northern writers will have to be the fame with a people called A/purgians mentioned by Strabo and Ptolemy. By Strabo they are placed near the Cimmerian Bofphorus. Afpurgia was the metropolis of a province which Strabo calls $A / / a$; and Woden and his followers are ftyled by the ancient Gothic writers A/ce, A/tatue, and A/iotue. The kings of Atpurgia were mafters of all that part of Scythia which lay to the weftward of Imaus, and was by the Latins called Scythia intra Imaum, or "Scythia within Imaus."

At what time Woden reigned in this country, is quite uncertain; but all hitorians agree, that he went out in quett of new fettlements with incredible numbers of people following him. He firft entered Roxolania, comprehending the countries of Pruffia, Livonia, and great part of Mufcovy. From thence he went by fea into the north parts of Germany ; and having reduced Saxoty and Jutland, he at latt fettled in Sweden, where he reigned till his death, and became fo famous that his name reached all countries, and he was by the northern nations worlbipped as a god. He is fuppofed to have brought with him the Runic characters out of Afia, and to have taught the northern nations the art of poetry; whence he is ityled the father of the Scaldi or Scaldri, their pocts, who defcribed in verfe the exploits of the great men of their nation, as the barls did among the Gauls and Britons.

The Romans diftinguithed the Goths into two claffes; the Ollrogoths and Vifigoths. Thefe mames they received before they left Scandinavia, the $V_{i} / \mathrm{Ig}_{\mathrm{g}}$ ths be-
 who inhabited the wellern patt of Scandinavia, as the ()hroguths we:e thoie who inhabited the entern part of that eountre. Their hitory attords nothing of mument till the time of their quarrelling with the Romans; which happened under the reign of the emperor Caracalla, fon to Severus. After that time their hillory becomes fo clofely interwoven with that of the Romans, that for the molt remarkable particulars of it we nutit refer to the article Rome. After the dettruetion of the Roman empire by the Heruli, the O.troEuths, under their king Theodoric, became maters of the greate!t part of Italy, having overcome and put to deatio Odoacer king of the Hermli in 494. They retained their dominion in this country til. the yoar 553; when they were finally conquered by Narfe, the cmperor Jutinian's general. See (Hiltory of) Iraly. The Viagotlis tett!ed in Spain in the time of the emperor Honorius, where they founded a kingdom which continued till the country was iubdued by the Saraceus. See Spain.

The Giths were famous for their hofpitality and kindneis to itrangers, even betore they embraced the Chriftian religion. Nay, it is faid, that from their being eminently good, they were called Goths by the neighbouring nations; that name, according to Grotius and molt other writers, being derived from the German word gaien, which fgnities " good." They encouraged, fays Dio, the ftudy of philolophy above
all other bubarous or fureiga nation, and ofen chofo kings from among their philofophers. Polygamy was not only allowed but countenanced among them; every one being valued or refpected according to the aumber of his wises. By lo many wites they had an incredible number of children, of whom they kept but orve at home, fonding out the rell in quelt of new fettle ment, ; and hence thode fiwarms of people which overran fo many countries: With them adultery was a capital crime, and irremilibly punihed with death. This ieverity, and likewife polygamy, prevailed among them when they were hnown to the Romans only by the name of Getce (their moft ancient name); as appears from the poet Menander, who was himfelf one of that nation; and from Horace, who greatly commends the chattity of their women. Their laws fell little fhort of thofe of the ancient Romans. Their government was mosarchical ; their religion was much the fame with that of the ancient Germans or Celtes; and their drefs is defcribed by Apollinaris Sidonias in the following words: "They are fhod (fays lee) with high fhoes made of hair, and reaching up to their ankles; their knees, thighs, and legs, are without any covering; their garments of various colours fearee reaching to the knee; their lleeves only cover the top of their arms; they wear green calfock's with a red burder; their belts haing on their houlder; their ears are covered with twitted locks; they whe hooked lances and miffile weapons."
